Oracle® Fusion Middleware
Administering Oracle WebCenter Portal
12c (12.2.1)
E48252-05

February 2016
Documentation for system administrators that describes how to
administer Oracle WebCenter Portal. System administrators
will learn how to deploy portals, configure back-end servers,
monitor performance, implement backup and recovery
strategies, and more, using tools such as Oracle Enterprise
Manager Fusion Middleware Control, Oracle WebLogic Server
Administration Console, Oracle WebLogic Scripting Tool
(WLST) commands, and WebCenter Portal administration
pages.

Part I  Introduction to Oracle WebCenter Portal

1  Introduction to Administration for Oracle WebCenter Portal

1.1  Introducing Oracle WebCenter Portal.......................................................................................... 1-1
1.2  Oracle WebCenter Portal Architecture......................................................................................... 1-2
  1.2.1 WebCenter Portal Framework............................................................................................ 1-2
  1.2.2 Application Development Framework ............................................................................ 1-2
  1.2.3 Portal Composer ................................................................................................................ 1-2
  1.2.4 Tools and Services ............................................................................................................ 1-3
  1.2.5 Discussion Server ......................................................................................................... 1-3
  1.2.6 Analytics ...................................................................................................................... 1-3
1.3  Oracle WebCenter Portal Topology ............................................................................................. 1-4
  1.3.1 Oracle WebCenter Portal Topology Out-of-the-Box ....................................................... 1-4
  1.3.2 Oracle WebCenter Portal Managed Servers ................................................................ 1-5
  1.3.3 Oracle WebCenter Portal Startup Order ......................................................................... 1-5
  1.3.4 Oracle WebCenter Portal Dependencies ........................................................................ 1-6
  1.3.5 Oracle WebCenter Portal Configuration Considerations ............................................... 1-7
  1.3.6 Discussions Server Configuration .................................................................................. 1-8
  1.3.7 Oracle WebCenter Portal State and Configuration Persistence ..................................... 1-8
1.3.8 Analytics Considerations ........................................................................................................ 1-8
1.3.9 Oracle WebCenter Portal Log File Locations ........................................................................... 1-8
1.4 Understanding the Oracle WebCenter Portal Installation.......................................................... 1-9
1.5 Understanding Administrative Operations, Roles, and Tools.................................................... 1-9
1.6 Performance Monitoring and Diagnostics ..................................................................................... 1-11
1.7 Understanding Security .................................................................................................................. 1-11
1.8 WebCenter Portal Application Deployment .................................................................................. 1-12
1.9 Data Migration, Backup, and Recovery ....................................................................................... 1-12
1.10 Oracle WebCenter Portal Administration Tools ..................................................................... 1-12
1.10.1 Oracle Enterprise Manager Fusion Middleware Control Console ..................................... 1-12
1.10.2 Oracle WebLogic Server Administration Console .............................................................. 1-13
1.10.3 Oracle WebLogic Scripting Tool (WLST) ............................................................................ 1-14
1.10.4 System MBean Browser ......................................................................................................... 1-16
1.10.5 WebCenter Portal Administration Pages ............................................................................. 1-17

Part II Getting Started

2 Getting Started Administering WebCenter Portal

2.1 Role of the System Administrator ............................................................................................. 2-1
2.2 Installing WebCenter Portal ...................................................................................................... 2-2
2.3 Setting Up WebCenter Portal for the First Time (Roadmap) .................................................... 2-2
2.4 Customizing WebCenter Portal for the First Time (Roadmap) ................................................ 2-6
2.5 System Administration for WebCenter Portal – Fusion Middleware Admin Role (Roadmap) ...................................................................................................................... 2-7
2.6 System Administration for WebCenter Portal – WebCenter Portal Admin Role (Roadmap) .......................................................................................................................... 2-10

3 Starting Enterprise Manager Fusion Middleware Control

3.1 Displaying Fusion Middleware Control Console ........................................................................ 3-1
3.2 Navigating to the Home Page for WebCenter Portal ............................................................... 3-2
3.2.1 Home Page for WebCenter Portal ....................................................................................... 3-3
3.2.2 Navigating to the WebCenter Portal Home Page .................................................................. 3-5
3.3 Navigating to Dependent Components ..................................................................................... 3-6

4 Starting and Stopping Managed Servers and Applications for Oracle WebCenter Portal

4.1 Starting Node Manager ............................................................................................................. 4-2
4.2 Starting and Stopping Managed Servers for WebCenter Portal Application Deployments ......... 4-2
4.2.1 Oracle WebCenter Portal Managed Servers ......................................................................... 4-2
4.2.2 Starting and Stopping Managed Servers ............................................................................ 4-3
4.3 Starting and Stopping the WebCenter Portal Application ....................................................... 4-4
4.3.1 Starting WebCenter Portal Using Fusion Middleware Control ......................................... 4-5
4.3.2 Starting WebCenter Portal Using WLST ........................................................... 4-5
4.3.3 Stopping WebCenter Portal Using Fusion Middleware Control ...................... 4-5
4.3.4 Stopping WebCenter Portal Using WLST ....................................................... 4-6

Part III Administering Tools and Services

5 Managing Tools and Services
5.1 Introduction to Managing Tools and Services ...................................................... 5-1
5.1.1 Back-end Repositories for Tools and Services .................................................. 5-3
5.2 Configuring Back-end Data Repositories for Tools and Services ......................... 5-6
5.2.1 Setting Up the MDS Repository ......................................................................... 5-7
5.2.2 Setting Up Database Connections ....................................................................... 5-7
5.2.3 Setting Up Back-end Server Connections ........................................................... 5-8
5.2.4 Setting Up a Proxy Server .................................................................................. 5-8
5.2.5 Setting Up External Application Connections .................................................. 5-9
5.3 About Tools and Services in WebCenter Portal .................................................... 5-10
5.3.1 Enabling and Disabling Tools and Services in WebCenter Portal ..................... 5-11
5.3.2 Configuring Tools and Services for WebCenter Portal ..................................... 5-12

6 Managing Connections to Oracle WebCenter Content Server
6.1 About Oracle WebCenter Content Server Connections ....................................... 6-1
6.2 Prerequisites for Configuring Oracle WebCenter Content Server ....................... 6-3
6.2.1 Installation Prerequisites for Oracle WebCenter Content Server .................... 6-3
6.2.2 Installation Prerequisites for Inbound Refinery .................................................. 6-4
6.2.3 Configuration Prerequisites for Oracle WebCenter Content Server and Inbound Refinery ................................................................................................................. 6-4
6.2.4 Security Prerequisites for Oracle WebCenter Content Server and Inbound Refinery ................................................................................................................. 6-5
6.3 Configuration Roadmap for Oracle WebCenter Content Server .......................... 6-5
6.4 Configuring Oracle WebCenter Content Server .................................................. 6-9
6.4.1 Enabling Mandatory Components ..................................................................... 6-10
6.4.2 Configuring the Dynamic Converter Component ............................................. 6-13
6.4.3 Configuring the Inbound Refinery ..................................................................... 6-15
6.4.4 Setting Up SSL for Oracle WebCenter Content Server .................................... 6-19
6.4.5 Configuring the SES Crawler ........................................................................... 6-19
6.4.6 Setting Up Site Studio ....................................................................................... 6-19
6.4.7 Enabling Full-Text Search ............................................................................... 6-21
6.4.8 Creating Content Profiles in Oracle WebCenter Content Server ..................... 6-22
6.4.9 Enabling Digital Asset Manager ....................................................................... 6-22
6.4.10 Additional Optional Configurations for Oracle WebCenter Content Server .... 6-23
6.4.11 Registering the Default Oracle WebCenter Content Server Repository .......... 6-27
6.5 Creating a Connection to Oracle WebCenter Content Server ............................. 6-30
6.5.1 About Creating a Connection to Oracle WebCenter Content Server ............... 6-31
6.5.2 Creating a Connection to Oracle WebCenter Content Server Using Fusion Middleware Control................................................................. 6-33
6.5.3 Registering Oracle WebCenter Content Server Using WLST .............................................................. 6-45
6.5.4 Oracle WebCenter Content Server Connection Parameters for RIDC Socket Types 6-46
6.6 Changing the Default Oracle WebCenter Content Server Connection ................................................................. 6-49
6.6.1 Changing the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control .................................................................................................................. 6-49
6.6.2 Changing the Default Oracle WebCenter Content Server Connection Using WLST 6-50
6.6.3 Setting Connection Properties for the Default Oracle WebCenter Content Server Connection ........................................................................................................................................... 6-51
6.7 Modifying Oracle WebCenter Content Server Connection Details ................................................................. 6-53
6.7.1 Modifying Oracle WebCenter Content Server Connection Details Using Fusion Middleware Control ......................................................................................................................... 6-54
6.7.2 Modifying Oracle WebCenter Content Server Connection Details Using WLST 6-54
6.7.3 Modifying Cache Settings for Content Presenter .......................................................................................................................... 6-55
6.7.4 Configuring the Cache to Check for External Oracle WebCenter Content Server Changes ................................................................. 6-61
6.8 Deleting Oracle WebCenter Content Server Connections ................................................................. 6-66
6.8.1 Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control ................................................................................................................................. 6-66
6.8.2 Deleting Oracle WebCenter Content Server Connections Using WLST 6-67
6.9 Changing the Maximum File Upload Size................................................................................................................. 6-67

7 Managing Analytics

7.1 About Analytics in WebCenter Portal ................................................................................................................. 7-2
7.1.1 Analytics Components ................................................................................................................................. 7-2
7.1.2 Analytics Task Flows ....................................................................................................................................... 7-3
7.2 Configuration Roadmap for Analytics ..................................................................................................................... 7-4
7.3 Analytics Prerequisites .......................................................................................................................................... 7-5
7.3.1 Analytics – Installation ................................................................................................................................. 7-5
7.3.2 Analytics – Configuration ................................................................................................................................ 7-5
7.3.3 Analytics – Security Considerations ............................................................................................................. 7-5
7.3.4 Analytics – Limitations .................................................................................................................................... 7-6
7.4 Configuring Analytics Collector Settings ............................................................................................................. 7-6
7.4.1 Setting Analytics Collector Properties Using WLST ......................................................................................... 7-6
7.4.2 Setting Analytics Collector Properties Using Fusion Middleware Control ......................................................... 7-7
7.5 Registering an Analytics Collector for Your Application ....................................................................................... 7-9
7.5.1 Registering an Analytics Collector Using Fusion Middleware Control ......................................................... 7-9
7.5.2 Registering an Analytics Collector Using WLST ............................................................................................ 7-11
7.5.3 Disabling WebCenter Portal Event Collection ............................................................................................. 7-11
7.6 Validating Analytic Event Collection .................................................................................................................... 7-12
7.7 Viewing the Current WebCenter Portal’s Analytic Event List ................................................................................ 7-13
7.8 Purging Analytics Data ......................................................................................................................................... 7-14
8 Managing Announcements and Discussions

8.1 About Discussions Server Connections .............................................................. 8-2
8.2 Discussions Server Prerequisites ........................................................................... 8-2
  8.2.1 Discussions Server - Installation ........................................................................ 8-3
  8.2.2 Discussions Server - Configuration ................................................................. 8-4
  8.2.3 Discussions Server - Security Considerations .................................................. 8-5
  8.2.4 Discussions Server - Limitations ...................................................................... 8-6
8.3 Registering Discussions Servers ............................................................................ 8-7
  8.3.1 Registering Discussions Servers Using Fusion Middleware Control ................. 8-7
  8.3.2 Registering Discussions Servers Using WLST .................................................. 8-10
8.4 Choosing the Active Connection for Discussions and Announcements ............... 8-11
  8.4.1 Choosing the Active Connection for Discussions and Announcements Using
       Fusion Middleware Control ................................................................................... 8-11
  8.4.2 Choosing the Active Discussion for Discussions and Announcements Using
       WLST ..................................................................................................................... 8-12
8.5 Modifying Discussions Server Connection Details ................................................. 8-12
  8.5.1 Modifying Discussions Server Connection Details Using Fusion Middleware
       Control .................................................................................................................. 8-12
  8.5.2 Modifying Discussions Server Connection Details Using WLST ...................... 8-13
8.6 Deleting Discussions Server Connections ............................................................ 8-13
  8.6.1 Deleting a Discussions Server Connection Using Fusion Middleware Control ...... 8-13
  8.6.2 Deleting a Discussions Server Connection Using WLST .................................... 8-14
8.7 Setting Up Discussions Defaults ........................................................................... 8-14
8.8 Setting Up Announcements Defaults ..................................................................... 8-15
8.9 Testing Discussions Server Connections ............................................................. 8-15
8.10 Granting Administrator Permissions on the Discussions Server ......................... 8-16
8.11 Granting Administrator Role on the Discussions Server ..................................... 8-16
  8.11.1 Granting the Discussions Server Administrator Role using WLST ................... 8-16
  8.11.2 Granting the Discussions Server Administrator Role using the Admin Console ... 8-16
  8.11.3 Revoking the Discussions Server Administrator Role ...................................... 8-17
8.12 Configuring Discussion Forum Options for WebCenter Portal ............................ 8-18
  8.12.1 Accessing the Discussions Server Admin Console .......................................... 8-19
  8.12.2 Specifying Where Discussions and Announcements are Stored on the Discussions
       Server .................................................................................................................. 8-20
  8.12.3 Choosing How Many Discussion Topics to Save In Portal Templates ................ 8-21

9 Managing Calendar Events

9.1 About Events Connections ..................................................................................... 9-2
9.2 Configuring Personal Events for WebCenter Portal .............................................. 9-2
9.3 Events Prerequisites for Personal Events ............................................................. 9-4
  9.3.1 Microsoft Exchange Server 2013 Prerequisites .................................................. 9-4
9.3.2 Microsoft Exchange Server 2010 Prerequisites ................................................................. 9-7
9.3.3 Microsoft Exchange Server 2007 Prerequisites ................................................................. 9-9
9.4 Registering Events Servers ........................................................................................................ 9-11
  9.4.1 Registering Events Servers Using Fusion Middleware Control ........................................ 9-11
  9.4.2 Registering Event Servers Using WLST ............................................................................. 9-13
9.5 Choosing the Active Events Server Connection .................................................................... 9-13
  9.5.1 Choosing the Active Events Server Using Fusion Middleware Control ............................ 9-14
  9.5.2 Choosing the Active Events Server Connection Using WLST ........................................ 9-14
9.6 Modifying Events Server Connection Details ......................................................................... 9-15
  9.6.1 Modifying Events Server Connection Details Using Fusion Middleware Control ............... 9-15
  9.6.2 Modifying Events Server Connection Details Using WLST ............................................. 9-15
9.7 Deleting Event Server Connections ....................................................................................... 9-16
  9.7.1 Deleting Event Server Connections Using Fusion Middleware Control ............................ 9-16
  9.7.2 Deleting Event Server Connections Using WLST ............................................................. 9-16
9.8 Testing Event Server Connections .......................................................................................... 9-17

10 Integrating Other Oracle Applications
10.1 About Integrating Other Oracle Applications ........................................................................ 10-1
10.2 Integrating Siebel Applications ............................................................................................. 10-2
  10.2.1 How to Integrate Siebel Applications as Web Services ...................................................... 10-2
  10.2.2 How to Integrate Siebel Applications Using the Siebel Web Engine ................................ 10-6
10.3 Integrating E-Business Suite Applications ............................................................................ 10-7
  10.3.1 About Integrating EBS Applications ................................................................................ 10-7
  10.3.2 Required Configurations for Integrating EBS ................................................................. 10-8
  10.3.3 How to Integrate EBS Applications as WSRP Portlets .................................................... 10-13
  10.3.4 How to Integrate EBS Applications as Data Controls ..................................................... 10-17
10.4 Integrating JD Edwards Applications .................................................................................... 10-20
  10.4.1 How to Prepare the JD Edwards Application for Remote Access ..................................... 10-20
  10.4.2 How to Register the Producer .......................................................................................... 10-20
  10.4.3 How to Add the JD Edwards Portlet to a WebCenter Portal Page .................................... 10-21
  10.4.4 How to Test the Portlet Connection ............................................................................... 10-21
10.5 Integrating PeopleSoft Applications ..................................................................................... 10-21
  10.5.1 About Integrating PeopleSoft Applications ...................................................................... 10-22
  10.5.2 How to Integrate PeopleSoft Applications as WSRP Portlets .......................................... 10-22
  10.5.3 How to Integrate PeopleSoft Applications as Data Controls in WebCenter Portal ........... 10-38
10.6 Integrating Oracle Business Intelligence Presentation Services .......................................... 10-46
  10.6.1 About Integrating Oracle Business Intelligence Presentation Services ......................... 10-46
  10.6.2 How to Configure Credentials for Connecting to the Oracle BI Presentation Catalog ........ 10-47
  10.6.3 How to Integrate Oracle Business Intelligence Objects in WebCenter Portal ................. 10-52

11 Managing Instant Messaging and Presence
11.1 About Instant Messaging and Presence Connections ............................................................ 11-2
11.2 Instant Messaging and Presence Server Prerequisites ........................................................... 11-2
  11.2.1 Microsoft Lync - Installation........................................................................................... 11-2
  11.2.2 Microsoft Lync - Configuration...................................................................................... 11-2
  11.2.3 Microsoft Lync - Security Considerations ................................................................. 11-10
11.3 Registering Instant Messaging and Presence Servers ....................................................... 11-10
  11.3.1 Registering Instant Messaging and Presence Servers Using Fusion Middleware Control ........................................................................................................... 11-10
  11.3.2 Registering Instant Messaging and Presence Servers Using WLST ........................ 11-13
11.4 Choosing the Active Connection for Instant Messaging and Presence ........................... 11-13
  11.4.1 Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control ........................................................................................................... 11-13
  11.4.2 Choosing the Active Connection for Instant Messaging and Presence Using WLST ............................................................... 11-14
11.5 Modifying Instant Messaging and Presence Connection Details ..................................... 11-14
  11.5.1 Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control ........................................................................................................... 11-14
  11.5.2 Modifying Instant Messaging and Presence Connections Details Using WLST ............................................................... 11-15
11.6 Deleting Instant Messaging and Presence Connections ................................................... 11-15
  11.6.1 Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control ........................................................................................................... 11-15
  11.6.2 Deleting Instant Messaging and Presence Connections Using WLST ............................................................... 11-16
11.7 Setting Up Instant Messaging and Presence Defaults ....................................................... 11-16
11.8 Testing Instant Messaging and Presence Connections ..................................................... 11-17

12 Managing Mail

12.1 About Mail Server Connections...................................................................................... 12-2
12.2 Configuration Roadmap for Mail.................................................................................... 12-2
12.3 Mail Server Prerequisites ............................................................................................... 12-3
  12.3.1 Mail Server - Installation ......................................................................................... 12-3
  12.3.2 Mail Server - Configuration .................................................................................... 12-3
  12.3.3 Mail Server - Security Considerations ....................................................................... 12-6
  12.3.4 Mail Server - Limitations ........................................................................................ 12-6
12.4 Registering Mail Servers ................................................................................................. 12-6
  12.4.1 Registering Mail Servers Using Fusion Middleware Control .................................. 12-6
  12.4.2 Registering Mail Servers Using WLST ..................................................................... 12-11
12.5 Choosing the Active (or Default) Mail Server Connection ............................................. 12-12
  12.5.1 Choosing the Active (or Default) Mail Server Connection Using Fusion Middleware Control ........................................................................................................... 12-12
  12.5.2 Choosing the Active (or Default) Mail Server Connection Using WLST ................ 12-13
12.6 Modifying Mail Server Connection Details ..................................................................... 12-13
  12.6.1 Modifying Mail Server Connection Details Using Fusion Middleware Control ........................................................................................................... 12-13
  12.6.2 Modifying Mail Server Connection Details Using WLST ........................................ 12-14
12.7 Deleting Mail Server Connections.................................................................................. 12-14

16 Managing Subscriptions and Notifications

16.1 About Subscriptions and Notifications ................................................................. 16-1
16.2 Setting Up Default Subscription Preferences ......................................................... 16-2
  16.2.1 About Subscription Defaults .............................................................................. 16-2
  16.2.2 Setting Subscription Defaults .......................................................................... 16-4
  16.2.3 Setting Subscriptions Preferences in WebCenter Portal ................................ 16-8
16.3 Setting Up Notifications ......................................................................................... 16-8
  16.3.1 About Connection Channels .......................................................................... 16-9
  16.3.2 Notification Prerequisites ............................................................................. 16-9
  16.3.3 Configuration Roadmap for Notifications ..................................................... 16-11
  16.3.4 Specifying the Notifications Channel Using Fusion Middleware Control ...... 16-12
  16.3.5 Specifying the Notifications Channel Using WLST ....................................... 16-13
  16.3.6 Example - Setting Up Mail Notifications for WebCenter Portal Using WLST ... 16-13
16.4 Creating and Applying Custom Notification Templates ........................................ 16-15
  16.4.1 About Overwriting Default Notification Templates ....................................... 16-15
  16.4.2 Overwriting a Default Notifications Template .............................................. 16-18
16.5 Testing the Notifications Connection .................................................................... 16-19

17 Managing the SOA Connection for WebCenter Portal Membership Workflows

17.1 Configuration Roadmap for WebCenter Portal Workflows .................................... 17-2
17.2 About BPEL Connections ..................................................................................... 17-4
17.3 BPEL Server Prerequisites ..................................................................................... 17-4
  17.3.1 BPEL Server - Installation and Configuration ............................................... 17-5
  17.3.2 BPEL Server - Security Considerations ....................................................... 17-5
17.4 Specifying the BPEL Server Hosting WebCenter Portal Workflows ...................... 17-6
17.5 Configuring WebCenter Portal Workflow Notifications to be Sent by Email .......... 17-8
17.6 Excluding Webcenter Portal Workflows URL in OAM ........................................ 17-9

18 Managing Portlet Producers

18.1 About Portlet Producers ......................................................................................... 18-1
18.2 Registering WSRP Producers ................................................................................. 18-3
  18.2.1 Registering a WSRP Producer Using Fusion Middleware Control .................... 18-4
  18.2.2 Registering a WSRP Producer Using WLST ................................................... 18-5
  18.2.3 Adding a Grant to the Policy Store for a Mapped User Identity ......................... 18-5
  18.2.4 Registering a WSRP Portlet Producer in WebCenter Portal ......................... 18-6
18.2.5 WSRP Producer Connection Parameters .............................................................. 18-7
18.2.6 WSRP Producer Security Connection Parameters ................................................. 18-9
18.2.7 WSRP Producer Keystore Connection Parameters ................................................ 18-12
18.3 Testing WSRP Producer Connections ......................................................................... 18-13
18.4 Editing WSRP Producer Registration Details .............................................................. 18-14
  18.4.1 About Editing WSRP Producer Registration Details .................................................. 18-14
  18.4.2 Editing WSRP Producer Registration Details Using Fusion Middleware Control ... 18-14
  18.4.3 Editing Producer Registration Details Using WLST ................................................ 18-15
  18.4.4 Editing WSRP Producer Registration Details in WebCenter Portal ....................... 18-15
  18.4.5 Migrating WSRP Producer Metadata to a New WSDL URL .................................... 18-16
  18.4.6 Editing the Portlet Client Configuration ................................................................... 18-16
18.5 Deregistering WSRP Portlet Producers ......................................................................... 18-17
  18.5.1 About Deregistering Portlet Producers .................................................................... 18-17
  18.5.2 Deregistering a WSRP Portlet Producer Using Fusion Middleware Control .......... 18-18
  18.5.3 Deregistering a WSRP Portlet Producer Using WLST ............................................ 18-18
  18.5.4 Deregistering a WSRP Portlet Producer in WebCenter Portal ................................ 18-19
18.6 Deploying Portlet Producer Applications ..................................................................... 18-19
  18.6.1 Preparing Portlet Producer Applications for Deployment ........................................ 18-20
  18.6.2 Deploying a Portlet Producer Application Using Fusion Middleware Control .......... 18-21
  18.6.3 Deploying a Portlet Producer Application Using Oracle WebLogic Server Administration Console ........................................................................................................... 18-23
  18.6.4 Deploying a Portlet Producer Application Using WLST ....................................... 18-24
  18.6.5 Deploying a Portlet Producer Application Using Oracle JDeveloper ..................... 18-26
18.7 Managing Oracle PDK-Java Portlet Producers ............................................................ 18-26
  18.7.1 Registering an Oracle PDK-Java Portlet Producer .................................................. 18-26
  18.7.2 Testing Oracle PDK-Java Producer Connections ..................................................... 18-28
  18.7.3 Editing Oracle PDK-Java Portlet Producer Registration Details .............................. 18-28
  18.7.4 Deregistering an Oracle PDK-Java Portlet Producer ............................................... 18-29
  18.7.5 Oracle PDK-Java Portlet Producer Connection Parameters .................................... 18-31

19 Managing Pagelet Producer

  19.1 About Pagelet Producer ............................................................................................... 19-1
  19.1.1 Overview .................................................................................................................. 19-2
  19.1.2 Using the Pagelet Producer Console ....................................................................... 19-2
  19.1.3 Exposing WSRP Portlets ......................................................................................... 19-3
  19.1.4 Exposing OpenSocial Gadgets ................................................................................. 19-3
  19.1.5 Exposing WebCenter Interaction Portlets ............................................................... 19-3
  19.2 Registering Pagelet Producer ...................................................................................... 19-3
  19.2.1 Registering Pagelet Producer Using Fusion Middleware Control .......................... 19-4
  19.2.2 Registering Pagelet Producer Using WLST ............................................................. 19-4
  19.2.3 Configuring the Pagelet Producer Service for WebCenter Portal ......................... 19-5
  19.2.4 Registering Pagelet Producer Using WebCenter Portal .......................................... 19-5
  19.2.5 Redeploying Pagelet Producer to a Different Context ............................................. 19-6
19.3 Registering WSRP Portlet Producers in Pagelet Producer .................................................... 19-7
19.4 Using Portlet-Based Pagelets .................................................................................................. 19-9
19.5 Configuring the Trust Service Identity Asserter .................................................................... 19-9
  19.5.1 About the Trust Service Identity Asserter .................................................................... 19-9
  19.5.2 Preparing for Configuring the Trust Service Identity Asserter .................................. 19-9
  19.5.3 Executing Trust Service Identity Asserter Configuration ........................................ 19-10
19.6 Managing Import, Export, Backup and Recovery of Pagelet Producer Components .... 19-11
  19.6.1 Exporting and Importing Pagelet Producer Resources ........................................... 19-11
  19.6.2 Exporting and Importing Pagelet Producer Metadata Using WLST ..................... 19-13
  19.6.3 Backing Up and Restoring Pagelet Producer ............................................................ 19-14

20 Managing External Applications

20.1 About External Applications .................................................................................................. 20-2
20.2 Registering External Applications .......................................................................................... 20-2
  20.2.1 Registering External Applications Using Fusion Middleware Control ...................... 20-3
  20.2.2 Registering External Applications Using WLST .......................................................... 20-8
20.3 Modifying External Application Connection Details ............................................................... 20-8
  20.3.1 Modifying External Application Connection Using Fusion Middleware Control ........ 20-9
  20.3.2 Modifying External Application Connection Using WLST ......................................... 20-9
20.4 Managing External Applications with the WebCenter Portal Administration Console ... 20-9
  20.4.1 Registering External Applications ............................................................................... 20-10
  20.4.2 Editing and Deleting External Applications ............................................................... 20-10
20.5 Testing External Application Connections .............................................................................. 20-11
20.6 Deleting External Application Connections ........................................................................... 20-11
  20.6.1 Deleting External Application Connections Using Fusion Middleware Control ... 20-11
  20.6.2 Deleting External Application Connections Using WLST ...................................... 20-11

21 Managing REST Services

21.1 About REST Services .............................................................................................................. 21-1
21.2 Performing Required Manual Configurations to Enable REST ............................................. 21-2
  21.2.1 Configuring an Identity Asserter .................................................................................. 21-2
  21.2.2 Configuring the WebLogic Server Credential Store .................................................. 21-2
21.3 Understanding Security Tokens ............................................................................................... 21-2
21.4 Changing the REST Root Name ............................................................................................... 21-3
21.5 Using Compression ................................................................................................................... 21-3
21.6 Handling Authentication ............................................................................................................ 21-4

Part IV Monitoring

22 Monitoring Oracle WebCenter Portal Performance

22.1 Understanding Oracle WebCenter Portal Performance Metrics ............................................. 22-1
  22.1.1 Understanding Oracle WebCenter Portal Metric Collection ...................................... 22-2
  22.1.2 Understanding the Key Performance Metrics .............................................................. 22-4
22.1.3 Using Key Performance Metric Data to Analyze and Diagnose System Health ... 22-6
22.1.4 Understanding Some Common Performance Issues and Actions ...................... 22-11
22.1.5 Understanding Page Request Metrics .............................................................. 22-12
22.1.6 Understanding Portlet Producer Metrics ......................................................... 22-18
22.1.7 Understanding WebLogic Server Metrics ......................................................... 22-29
22.1.8 Understanding Security Metrics ................................................................. 22-36
22.1.9 Understanding Page Response and Load Metrics .............................................. 22-37
22.1.10 Understanding Portal Metrics ............................................................... 22-38
22.1.11 Understanding Tool and Service Metrics .............................................. 22-40
22.2 Viewing Performance Metrics Using Fusion Middleware Control ...................... 22-76
22.2.1 Monitoring Recent Performance Metrics for WebCenter Portal .................... 22-77
22.2.2 Monitoring Portal Metrics .............................................................................. 22-78
22.2.3 Monitoring Page Metrics for WebCenter Portal .............................................. 22-78
22.2.4 Monitoring Service Metrics for WebCenter Portal ....................................... 22-79
22.2.5 Monitoring All Metrics Through the Metrics Palette .................................... 22-79
22.3 Customizing Key Performance Metric Thresholds and Collection .................. 22-80
22.3.1 Understanding Customization Options for Key Performance Metrics .............. 22-80
22.3.2 Understanding Default Metric Collection and Threshold Settings .................. 22-81
22.3.3 Configuring Thresholds for Key Metrics .......................................................... 22-82
22.3.4 Configuring the Frequency of WebLogic Server Health Checks .................... 22-84
22.3.5 Configuring the Number of Samples Used to Calculate Key Performance Metrics .................................................................................................................................................. 22-85
22.3.6 Editing Thresholds and Collection Options for WebCenter Portal ............... 22-85
22.4 Diagnosing and Resolving Performance Issues with Oracle WebCenter Portal .... 22-87
22.5 Tuning Oracle WebCenter Portal Performance ............................................. 22-87
22.6 Improving Data Caching Performance ............................................................. 22-87
22.6.1 Summary of Coherence Cache Types ......................................................... 22-88
22.6.2 Default Coherence Caches in WebCenter Portal ........................................ 22-88
22.6.3 Overriding the Default Configuration ....................................................... 22-89

23 Managing Oracle WebCenter Portal Logs
23.1 Introduction to Diagnostic Logging ...................................................................... 23-1
23.1.1 WebCenter Portal Diagnostics Log ............................................................... 23-1
23.1.2 Oracle WebCenter Portal Message IDs ....................................................... 23-2
23.1.3 Out-Of-Bound Conditions for Oracle WebCenter Portal Performance Metrics ... 23-4
23.1.4 Loggers ........................................................................................................... 23-5
23.2 Viewing and Configuring Log Information ....................................................... 23-5
23.2.1 Viewing and Configuring WebCenter Portal Logs ........................................ 23-5
23.2.2 Viewing and Configuring Error Messages in WebCenter Portal ............... 23-5

24 Managing Oracle WebCenter Portal Audit Logs
24.1 Introduction to Managing Audit Logs ................................................................. 24-1
24.2 Configuring Audit Logging ............................................................................... 24-2
24.2.1 Setting the Logging Level ................................................................................................ 24-2
24.2.2 Configuring the Audit Store Database ........................................................................... 24-2
24.3 Viewing WebCenter Portal Audit Events ........................................................................... 24-3
  24.3.1 Using WebCenter Portal Audit Logs ............................................................................ 24-3
  24.3.2 Querying the Audit Schema .......................................................................................... 24-4

Part V Administering Security

25 Managing Oracle WebCenter Portal Security
  25.1 Introduction to Application Security .................................................................................. 25-1
  25.2 Default Security Configuration .......................................................................................... 25-4
    25.2.1 Administrator Accounts .............................................................................................. 25-4
    25.2.2 Application Roles and Enterprise Roles ....................................................................... 25-4
    25.2.3 Default Identity and Policy Stores .............................................................................. 25-5
    25.2.4 Default Policy Store Permissions and Grants ............................................................... 25-6
    25.2.5 Post-deployment Security Configuration Tasks ........................................................... 25-7

26 Configuring the Identity Store
  26.1 Reassociating the Identity Store with an External LDAP Server ......................................... 26-2
  26.2 Configuring the GUID Attribute for External LDAP Identity Stores .................................. 26-5
  26.3 Adding Users to the Embedded LDAP Identity Store .......................................................... 26-6
    26.3.1 Adding Users to the Identity Store Using the WLS Administration Console .............. 26-7
    26.3.2 Adding Users to the Identity Store Using an LDIF File .............................................. 26-8
  26.4 Moving the Administrator Account to an External LDAP Server ....................................... 26-12
    26.4.1 Migrating the Discussions Server to Use an External LDAP ...................................... 26-13
    26.4.2 Changing the Administrator Group Name .................................................................... 26-16
  26.5 Configuring Oracle WebCenter Content to Share the WebCenter Portal Identity Store LDAP Server ........................................................................................................... 26-17
  26.6 Aggregating Multiple Identity Store LDAP Servers Using libOVD .................................... 26-18
    26.6.1 Configuring libOVD for Identity Stores with Complete User Profiles ........................ 26-18
    26.6.2 Configuring libOVD for Identity Stores with Partial User Profiles ............................. 26-19
    26.6.3 Restoring the Single Authenticator .............................................................................. 26-21
  26.7 Configuring Dynamic Groups for WebCenter Portal .......................................................... 26-21
    26.7.1 Creating a Dynamic Group Using an LDIF File .......................................................... 26-21
    26.7.2 Creating a Dynamic Group Using the Oracle Directory Services Manager ................ 26-22
  26.8 Configuring the REST Service Identity Asserter .................................................................. 26-23
    26.8.1 Understanding the REST Service Instance and Identity Asserter ............................. 26-23
    26.8.2 Setting up the Client Application ................................................................................. 26-25
    26.8.3 Configuring the WLS Trust Service Asserter ............................................................... 26-26

27 Configuring the Policy and Credential Store
  27.1 Creating a root Node .......................................................................................................... 27-2
  27.2 Reassociating the Credential and Policy Store Using Fusion Middleware Control ............. 27-2
### 27 Reassociating the Credential and Policy Store Using WLST
- 27.3 Reassociating the Credential and Policy Store Using WLST .................................................. 27-2
- 27.4 Managing Credentials .................................................................................................................. 27-3
- 27.5 Managing Users and Application Roles .................................................................................... 27-3
  - 27.5.1 Granting the WebCenter Portal Administrator Role .................................................. 27-4
  - 27.5.2 Granting Application Roles ............................................................................................ 27-6
  - 27.5.3 Using the Runtime Administration Pages .................................................................... 27-8
- 27.6 Configuring Self-Registration By Invitation in WebCenter Portal ........................................... 27-9
- 27.7 Setting the Policy Store Refresh Interval and Other Cache Settings .................................. 27-9
  - 27.7.1 Setting the Policy Store Refresh Interval .................................................................. 27-10
  - 27.7.2 Setting the Connection Pool Cache ............................................................................. 27-10
  - 27.7.3 Setting User Cache Settings ....................................................................................... 27-10
  - 27.7.4 Setting Group Cache Settings ..................................................................................... 27-11

### 28 Configuring Single Sign-On
- 28.1 Introduction to Single Sign-On .................................................................................................. 28-1
- 28.2 Configuring Oracle Access Manager ........................................................................................ 28-2
  - 28.2.1 OAM Components and Topology ................................................................................ 28-2
  - 28.2.2 Roadmap to Configuring OAM ..................................................................................... 28-5
  - 28.2.3 Installing and Configuring OAM 11g ........................................................................... 28-6
  - 28.2.4 Configuring the WebLogic Domain for OAM ............................................................. 28-13
  - 28.2.5 Installing and Configuring the Oracle HTTP Server .................................................. 28-16
  - 28.2.6 Additional Single Sign-on Configurations .................................................................... 28-19
  - 28.2.7 Testing Your OAM Installation .................................................................................... 28-24
  - 28.3.1 SAML Components and Topology .............................................................................. 28-26
  - 28.3.2 Configuring SAML-based Single Sign-On .................................................................. 28-28
- 28.4 Configuring SSO for Microsoft Clients .................................................................................... 28-42
  - 28.4.1 Microsoft Client SSO Concepts .................................................................................... 28-42
  - 28.4.2 System Requirements .................................................................................................... 28-44
  - 28.4.3 Configuring Microsoft Clients ..................................................................................... 28-44
- 28.5 Configuring SSO with Virtual Hosts ....................................................................................... 28-49
  - 28.5.1 Understanding the Need for a Virtual Host ................................................................ 28-50
  - 28.5.2 Configuring Virtual Hosts for OAM 11g .................................................................. 28-50

### 29 Configuring SSL
- 29.1 Securing the Browser Connection to WebCenter Portal using SSL ...................................... 29-1
  - 29.1.1 Creating the Custom Keystore ..................................................................................... 29-2
  - 29.1.2 Configuring the Custom Identity and Custom Trust Keystores .................................. 29-4
  - 29.1.3 Configuring the SSL Connection ................................................................................. 29-5
- 29.2 Securing the Connection from Oracle HTTP Server to WebCenter Portal with SSL .......... 29-6
  - 29.2.1 Wiring the WebCenter Portal Ports to the HTTP Server ......................................... 29-6
  - 29.2.2 Configuring the SSL Certificates ............................................................................... 29-7
- 29.3 Securing the Browser Connection to Discussions with SSL ................................................. 29-8
29.3.1 Creating the Custom Keystore for Discussions ........................................................... 29-8
29.3.2 Configuring the Identity and Trust Keystore for Discussions................................. 29-10
29.3.3 Configuring and Securing the SSL Connection for Discussions ......................... 29-11
29.4 Securing the WebCenter Portal Connection to Portlet Producers with SSL .......... 29-12
  29.4.1 Creating the Custom Keystores for Portlet Producers......................................... 29-12
  29.4.2 Configuring the Identity and Trust Keystores for Portlet Producers............... 29-13
  29.4.3 Configuring the SSL Connection for Portlet Producers...................................... 29-15
  29.4.4 Registering the SSL-enabled WSRP Producer and Running the Portlets 29-15
29.5 Securing the WebCenter Portal Connection to the LDAP Identity Store .......... 29-16
  29.5.1 Exporting the OID Certificate Authority (CA).................................................... 29-16
29.6 Securing the WebCenter Portal Connection to Content Server with SSL .............. 29-18
  29.6.1 Configuring a Keystore and Key on the WebCenter Portal (Client) Side .......... 29-18
  29.6.2 Configuring a Keystore and Key on the Content Server Side ....................... 29-19
  29.6.3 Verifying Signatures of Trusted Clients............................................................ 29-19
  29.6.4 Securing Identity Propagation.............................................................................. 29-20
29.7 Securing the WebCenter Portal Connection to IMAP and SMTP with SSL .......... 29-21
29.8 Securing the Connection to Oracle SES with SSL.................................................... 29-22
  29.8.1 Securing Oracle SES with SSL ......................................................................... 29-22
  29.8.2 Securing the Connection to Oracle SES with SSL .......................................... 29-24
29.9 Securing the WebCenter Portal Connection to an External BPEL Server with SSL .... 29-25

30 Configuring Web Services Security
  30.1 Configuring WS-Security for a Typical Topology ...................................................... 30-1
    30.1.1 Creating the WebCenter Portal Domain Keystore .............................................. 30-2
    30.1.2 Creating the SOA Domain Keystore.................................................................... 30-5
    30.1.3 Configuring the Discussions Server...................................................................... 30-10
  30.2 Configuring WS-Security for Multiple Domains....................................................... 30-16
    30.2.1 Setting Up the WebCenter Portal Domain Keystore .......................................... 30-17
    30.2.2 Creating the SOA Domain Keystore.................................................................... 30-17
    30.2.3 Configuring an External Discussions Server.................................................. 30-17
    30.2.4 Creating the External Portlet Domain Keystore ............................................... 30-22
  30.3 Securing WebCenter Portal for Applications Consuming WebCenter Portal Client API with WS-Security......................................................... 30-24
    30.3.1 Configuring a Typical Topology for Applications Consuming WebCenter Portal Client API........................................................... 30-24
    30.3.2 Configuring a Multiple Domain Topology for Applications Consuming the WebCenter Portal Client API........................................... 30-24
  30.4 JKS Command Summary for a Typical Topology ................................................... 30-25
  30.5 JKS Command Summary for Extensions to a Typical Topology ......................... 30-26

31 Configuring Security for Portlet Producers
  31.1 Securing a WSRP Producer ....................................................................................... 31-1
    31.1.1 Deploying the Producer .................................................................................... 31-1

    35.3.1 Backing Up Portals Using WLST ................................................................. 35-5
    35.3.2 Backing Up Discussions and External Data for a Portal ............................... 35-6
  35.4 Restoring Portals from a Backup ........................................................................... 35-6
    35.4.1 Restoring Portals from an Archive Using WLST ............................................ 35-7
    35.4.2 Restoring Discussions and External Data for a Portal .................................. 35-7
  35.5 Backing Up an Entire WebCenter Portal Installation .......................................... 35-8
    35.5.1 Backing Up and Restoring All WebCenter Portal Schema Data ................... 35-9
    35.5.2 Backing Up and Restoring All MDS Schema Data .......................................... 35-11
    35.5.3 Backing Up and Restoring All WebCenter Content Data ............................... 35-13
    35.5.4 Backing up and Restoring Discussion Schema Data .................................... 35-14
    35.5.5 Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET) .... 35-17
    35.5.6 Backing Up and Restoring LDAP Identity Store ............................................. 35-20
    35.5.7 Backing Up and Restoring Policy Stores (LDAP and Database) .................... 35-20
    35.5.8 Backing Up and Restoring Credential Stores (LDAP and Database) .............. 35-21
    35.5.9 Backing Up and Restoring a WebCenter Portal Domain ................................ 35-21
    35.5.10 Backing Up and Restoring Portlet Producer Metadata .................................. 35-21
    35.5.11 Backing Up and Restoring Pagelet Producer Metadata ................................ 35-22
    35.5.12 Backing Up and Restoring Analytics Metadata ............................................ 35-22
    35.5.13 Backing Up and Restoring Audit Repository Configuration .......................... 35-22
  35.6 Migrating Entire WebCenter Portal to Another Target ........................................ 35-23
    35.6.1 Understanding Import and Export for WebCenter Portal ................................ 35-23
    35.6.2 Prerequisites for WebCenter Portal Export and Import .................................. 35-28
    35.6.3 Exporting WebCenter Portal to an Archive .................................................... 35-29
    35.6.4 Importing a WebCenter Portal Archive .......................................................... 35-31
  35.7 Restoring an Entire WebCenter Portal Installation .............................................. 35-33
  35.8 Using Scripts to Back Up and Restore WebCenter Portal ...................................... 35-34
45.1.6 Understanding How Device Settings are Applied ................................................................. 45-6
45.2 Creating and Managing Devices ............................................................................................. 45-7
  45.2.1 Creating a New Device ......................................................................................................... 45-7
  45.2.2 Editing a Device .................................................................................................................. 45-9
  45.2.3 Copying a Device .................................................................................................................. 45-9
  45.2.4 Filtering the List of Devices ............................................................................................... 45-10
  45.2.5 Deleting a Device ............................................................................................................... 45-10
45.3 Creating and Managing Device Groups ................................................................................ 45-10
  45.3.1 Creating a Device Group ..................................................................................................... 45-11
  45.3.2 Editing a Device Group ....................................................................................................... 45-13
  45.3.3 Copying a Device Group ..................................................................................................... 45-13
  45.3.4 Showing and Hiding Device Groups .................................................................................. 45-14
  45.3.5 Setting a Default Device Group ........................................................................................ 45-15
  45.3.6 Ordering Device Groups ................................................................................................... 45-16
  45.3.7 Filtering Device Groups ..................................................................................................... 45-17
  45.3.8 Deleting a Device Group .................................................................................................... 45-17
45.4 Managing Device and Device Group Life Cycles .................................................................. 45-17
  45.4.1 Downloading a Device Group or Device ......................................................................... 45-18
  45.4.2 Uploading a Device Group or Device ............................................................................... 45-18
45.5 Previewing Devices ............................................................................................................... 45-19
45.6 Guidelines and Best Practices for Device Settings .............................................................. 45-19
45.7 Discovering Device Attributes: A Sample Task Flow .......................................................... 45-20

46 Customizing Task Flows
  46.1 About Task Flow Customization at the Application Level .................................................. 46-1
  46.2 Customizing Task Flows at the Application Level ............................................................... 46-2
  46.3 Removing Task Flow Customizations .................................................................................. 46-6

47 Analyzing Portal Usage
  47.1 About the Analytics Task Flows and Service ....................................................................... 47-1
  47.2 About the Analytics Administration Page ............................................................................ 47-2
  47.3 Working with Analytics Task Flows ..................................................................................... 47-3
    47.3.1 Understanding Analytics Task Flows ............................................................................... 47-3
    47.3.2 Adding Analytics Task Flows to a Page ......................................................................... 47-9
    47.3.3 Customizing Analytics Reports ...................................................................................... 47-10
    47.3.4 Personalizing Your Analytics Report .............................................................................. 47-10
    47.3.5 Setting Analytics Task Flow Properties ......................................................................... 47-14

Welcome to *Administering Oracle WebCenter Portal*!

This guide describes how to administer Oracle WebCenter Portal, including how to start, stop, and configure WebCenter Portal components, configure back-end servers and security, monitor performance, and also how to back up, recover, and migrate portal deployments and services.

**Audience**

This document is intended for system administrators responsible for Oracle WebCenter Portal installations. For a complete description of these roles, and other WebCenter Portal personas, refer to *Who’s Who*.

This guide assumes that the audience is familiar with the concepts and content described in Administering Oracle Fusion Middleware.

**Related Documents**

For more information, see the following documents in the Oracle Fusion Middleware 12c (12.2.1) documentation set:

- *Administering Oracle Fusion Middleware*
- *Installing and Configuring Oracle WebCenter Portal*
- *Using Oracle WebCenter Portal*
- *Building Portals with Oracle WebCenter Portal*
- *Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper*
- *WebCenter WLST Command Reference*

**Conventions**

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><strong>italic</strong></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>Convention</td>
<td>Meaning</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Who's Who

The WebCenter Portal documentation is organized so that the tasks in a particular guide address a specific user persona. Each persona is associated with a set of skills required to work with WebCenter Portal, from basic to advanced. For example, this guide is aimed at the System Administrator persona.

This preface introduces you to the WebCenter Portal personas and describes the ways in which they might interact with WebCenter Portal. Each persona is assigned a default role provided out-of-the-box with WebCenter Portal. The default roles are given a unique set of permissions appropriate for the work that each persona will typically do. Note that you can modify these default roles or configure new roles to meet the unique needs of your organization.

The people who interact with WebCenter Portal typically work together as a team that is comprised of the following personas:

- Knowledge Worker
- Application Specialist
- Web Developer
- Developer
- System Administrator

**Knowledge Worker**

Karen is a knowledge worker who typically uses WebCenter Portal to contribute and review content, participate in social interactions, and leverage the Home portal to manage her own documents and profile.
At the application level, Karen has permissions such as those granted to the default Authenticated-User role, which may be customized for the specific needs of the organization. At the portal level, the portal manager will likely assign Karen a role that includes View Pages and Customize Pages permissions.

For more information about roles and permissions, see About Roles and Permissions for a Portal in Building Portals with Oracle WebCenter Portal.

**Knowledge Worker Tasks in WebCenter Portal**

Tasks that are typical of a knowledge worker like Karen include:

- Editing and updating pages for which she has been assigned content contribution permissions
- Connecting to and collaborating with other WebCenter Portal users by sharing information, files, and links; and by interacting through instant messaging, mail, message boards, discussions, wikis, and blogs
- Uploading, sharing, and managing documents stored in Content Server
- Joining a team or project portal
- Keeping up with changes in WebCenter Portal by receiving notifications when content is updated, viewing the activities of the portals she is a member of and users she’s connected to, viewing announcements, participating in discussions, and monitoring WebCenter Portal RSS feeds
- Staying organized through the use of favorites, notes, calendars, lists, links to portal objects, and tags

As Karen becomes more familiar with the functionality available in WebCenter Portal, she may begin to perform more advanced tasks, such as creating portals. As a more advanced knowledge worker, her role may evolve to overlap with application specialist tasks.

Information targeted for knowledge workers like Karen is in Using Oracle WebCenter Portal. Advanced tasks that overlap with those of an application specialist are covered in Building Portals with Oracle WebCenter Portal.

**Application Specialist**

Ari is an application specialist who works in WebCenter Portal to create and administer portals, their structure (hierarchy of pages, navigation, security), and their content (components on a page, layout, behavior, and so on). In a typical project, Ari
coordinates the efforts of Karen (knowledge worker), Wendy (web developer), and Dave (developer).

At the application level, Ari has permissions such as those granted to the default Application Specialist role, which may be customized for the specific needs of the organization. In a portal that Ari creates, he performs actions available to the Portal Manager role to manage the portal.

For more information about roles and permissions, see About Roles and Permissions for a Portal in Building Portals with Oracle WebCenter Portal.

Application Specialist Tasks in WebCenter Portal

Tasks that are typical of an application specialist like Ari include:

- Planning and creating new portals
- Editing and administering the portals he owns
- Creating and building portal pages using the page editor (Composer) and the resource catalog to add and configure page components
- Creating and managing portal assets, tools, and services
- Managing shared assets and portal templates across all portals

Information targeted for application specialists like Ari is in Building Portals with Oracle WebCenter Portal. To work with his personal view of the Home portal, Ari will also refer to Using Oracle WebCenter Portal.

Web Developer

Wendy is a web developer who focuses on delivering a consistent, branded look and feel to all portals. Wendy provides graphics designs and HTML markup from which Ari (application specialist in WebCenter Portal) or Dave (developer in JDeveloper) can create content or page style templates, skins, and so on. Once these assets are created, Ari can leverage them to create portal pages. Wendy typically does not interact with WebCenter Portal directly.

Web Developer Tasks in WebCenter Portal

Tasks that are typical of a web developer like Wendy include:

- Developing a corporate portal look and feel
- Designing new portal page templates

Information targeted for web developers like Wendy is in the Creating a Look and Feel for Portals in Building Portals with Oracle WebCenter Portal.
Developer

Dave is a developer who is primarily responsible for developing components (such as task flows, page templates, and content templates), which are published and leveraged by Ari (the application specialist). Dave works with JDeveloper to develop and extend assets for use in WebCenter Portal.

Developer Tasks

Tasks that are typical of a developer like Dave include:

- Developing custom assets such as page templates and resource catalogs for portals in WebCenter Portal
- Developing Java portlets
- Developing and deploying task flows, managed beans, and other custom components
- Developing custom personalization components
- Maintaining the source control system
- Maintaining a build system

Information targeted for developers like Dave is in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

System Administrator

Syed is a system administrator who fields requests from IT employees and business users to set up new machines; clone or back up existing applications systems and databases; install patches, packages, and applications; and perform other administration-related tasks. As the system administrator, Syed works with other tools.
such as Fusion Middleware Control and command line tools. He leverages Enterprise Manager to configure portal settings, and also configures integrations such as WebCenter Content and other Fusion Middleware products and Oracle applications.

In WebCenter Portal, he has permissions such as those granted to the default Administrator role, which provides exclusive access to administer and set global options for all portals (including the Home portal).

For more information about application level roles and permissions, see About Application Roles and Permissions.

System Administrator Tasks

Tasks that are typical of a system administrator like Syed include:

• Uses WebCenter Portal administration to administer all portals (including import and export of portals) and security site-wide
• Uses WebCenter Portal administration to manage site-wide system pages, business role pages, and personal pages
• Leads security, taxonomy, metadata, workflow, governance
• Uses the management console for administrative functions
• Executes command line utilities for administrative functions
• Installs and configures production versions of developers' efforts
• Performs patching of the production versions and the operating system
• Creates clones and backups of the production versions
• Performs restores of production versions
• Monitors the operating system for issues with the production version
• Deploys and redeploy applications

Information targeted for system administrators like Syed is found in this manual and WebCenter WLST Command Reference.
Part I

Introduction to Oracle WebCenter Portal

This part of *Administering Oracle WebCenter Portal* provides introduction about the Oracle WebCenter Portal and its administration tools.

- Introduction to Administration for Oracle WebCenter Portal
Introduction to Administration for Oracle WebCenter Portal

This chapter provides a high-level overview of Oracle WebCenter Portal and its administrative tools.

This chapter includes the following topics:

- Introducing Oracle WebCenter Portal
- Oracle WebCenter Portal Architecture
- Oracle WebCenter Portal Topology
- Understanding the Oracle WebCenter Portal Installation
- Understanding Administrative Operations, Roles, and Tools
- Performance Monitoring and Diagnostics
- Understanding Security
- WebCenter Portal Application Deployment
- Data Migration, Backup, and Recovery
- Oracle WebCenter Portal Administration Tools

1.1 Introducing Oracle WebCenter Portal

Welcome to Oracle WebCenter Portal!

Companies use Oracle WebCenter Portal to build enterprise-scale intranet and extranet portals that provide a foundation for the next-generation user experience (UX) with Oracle Fusion Middleware and Oracle Fusion Applications. Portals built with Oracle WebCenter Portal commonly support thousands of users who create, update, and access content and data from multiple back-end sources. WebCenter Portal delivers intuitive user experiences by leveraging the best UX capabilities from a significant portfolio of leading portal products and related technologies. From the user's perspective, the integration is seamless.

For more overview information about WebCenter Portal, see What Is Oracle WebCenter Portal? in Using Oracle WebCenter Portal

This section describes WebCenter Portal components and architecture in the following topics:

- Oracle WebCenter Portal Architecture
- Oracle WebCenter Portal Topology
1.2 Oracle WebCenter Portal Architecture

Oracle WebCenter Portal comprises the following components:

- WebCenter Portal Framework
- Application Development Framework
- Portal Composer
- Tools and Services
- Discussion Server
- Analytics

1.2.1 WebCenter Portal Framework

Injects portal capabilities into ADF, including:

- Run-time application customization (you can make in-place changes to WebCenter Portal using Portal Composer without re-deploying the application)
- Support for JSR-168 and JSR-286 standards-based WSRP portlets
- Oracle JSF Portlet Bridge, which lets you expose JSF pages and Oracle ADF task flows as standards-based portlets

1.2.2 Application Development Framework

The Oracle Application Development Framework (ADF) is a productivity layer that sits on top of JSF and provides:

- Unified access to back ends such as databases, web services, XML, CSV, and BPEL
- Data binding (JSR 227) connecting the user interface with back-end data controls
- Over 100 data-aware JSF view components
- Native component model that includes task flows
- Fine grained JAAS security model

1.2.3 Portal Composer

Portal Composer comprises all the browser-based creating, editing, and administration areas of WebCenter Portal:

- A browser-based platform for creating and administering enterprise portals, multiple sites, and communities.
- A Home portal, where users have access to their profile, available portals, portal templates, and documents, and can customize certain elements of their own view of the Home portal.
- A browser-based portal editor, where users can perform runtime portal customization to modify portal settings and create portal pages and device-enabled page variants. An intuitive page editor enables users to modify page layout,
properties, wiring, and include components such as task flows, portlets, threaded discussions, blogs, wikis, announcements, RSS, activity stream, search, and more.

### 1.2.4 Tools and Services

Table 1-1 lists the tools and services available in WebCenter Portal.

<table>
<thead>
<tr>
<th>A Through I</th>
<th>L Through T</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Stream</td>
<td>Links</td>
</tr>
<tr>
<td>Analytics</td>
<td>Lists</td>
</tr>
<tr>
<td>Announcements</td>
<td>Mail</td>
</tr>
<tr>
<td>Discussions</td>
<td>Notes</td>
</tr>
<tr>
<td>Documents (includes Wikis and Blogs)</td>
<td>People Connections</td>
</tr>
<tr>
<td>Events</td>
<td>RSS</td>
</tr>
<tr>
<td>Instant Messaging and Presence (IMP)</td>
<td>Search</td>
</tr>
<tr>
<td></td>
<td>Tags</td>
</tr>
</tbody>
</table>

WebCenter Portal’s tools and services provide:

- Seamless integration with enterprise-level services
- Thin adapter layer to abstract back-end services. For example:
  - Content adapters: Content Server
  - Presence adapters: Microsoft Lync
- Back-end systems represented by a unified connection architecture
- User interface to services presented through rich task flow components

For more information, see Managing Tools and Services.

### 1.2.5 Discussion Server

A discussion server is provided with Oracle WebCenter Portal so you can integrate discussion forums and announcements into your portals. For information, see Managing Announcements and Discussions.

### 1.2.6 Analytics

WebCenter Portal’s analytics capability enables users to view various user activity reports, for example:

- Login data
- Page views
- Portlet views
• Search metrics
• Page response data
• Portal usage

For information, see Managing Analytics.

1.3 Oracle WebCenter Portal Topology

This section describes Oracle WebCenter Portal topology and configuration in the following topics:

• Oracle WebCenter Portal Topology Out-of-the-Box
• Oracle WebCenter Portal Managed Servers
• Oracle WebCenter Portal Startup Order
• Oracle WebCenter Portal Dependencies
• Oracle WebCenter Portal Configuration Considerations
• Discussions Server Configuration
• Oracle WebCenter Portal State and Configuration Persistence
• Analytics Considerations
• Oracle WebCenter Portal Log File Locations

1.3.1 Oracle WebCenter Portal Topology Out-of-the-Box

Oracle WebCenter Portal installation creates the WebCenter Portal product home directory (wcportal), under the Oracle Home directory, that contains WebCenter Portal binaries and supporting files (Figure 1-1).

![Figure 1-1 Directory Structure of an Oracle WebCenter Portal Installation](image)

The installation also creates a WebCenter Portal domain (default name base_domain), containing the administration server and several managed servers to host various WebCenter Portal components. In Figure 1-2, applications are shown in yellow, while the managed servers they run on are shown in brown.
Out-of-the-box managed servers host the following Oracle WebCenter Portal components:

- **WC_Portal** - Hosts WebCenter Portal, Oracle's out-of-the-box portal application, and analytics
- **WC_Portlet** - Hosts out-of-the-box portlets, pagelet producer, and WebCenter Portal tools
- **WC_Collaboration** - Hosts the discussions server and any additional services that you choose to integrate

For more information about managed servers, see Understanding Oracle Fusion Middleware Concepts in *Administering Oracle Fusion Middleware*.

### 1.3.2 Oracle WebCenter Portal Managed Servers

During Oracle WebCenter Portal installation, the managed servers are provisioned with system libraries and Oracle ADF libraries. Table 1-2 lists the managed servers and the applications that run on them.

#### Table 1-2 Oracle WebCenter Portal Managed Servers and Applications

<table>
<thead>
<tr>
<th>Managed Server</th>
<th>Installed Applications</th>
<th>Application Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>WC_Portal</td>
<td>WebCenter Portal</td>
<td>webcenter</td>
</tr>
<tr>

<td>WSRP tools</td>
<td>wsrp-tools</td>
</tr>
<tr>
<td></td>
<td>Pagelet producer</td>
<td>pagelet-producer</td>
</tr>
<tr>
<td>WC_Collaboration</td>
<td>Discussions Server</td>
<td>owc_discussions</td>
</tr>
</tbody>
</table>

### 1.3.3 Oracle WebCenter Portal Startup Order

When a managed server starts up, applications and libraries are started in the following order:

1. Oracle system libraries, known as the JRF libraries.
2. Oracle ADF libraries.

3. Instrumentation applications, such as Oracle DMS, and the Oracle Web Services Manager (wsm-pm) application.

4. Oracle WebCenter Portal applications shown in Table 1-2.

The startup order is also the order of dependency. If a dependent component does not deploy successfully, a later component may not function correctly.

Application startup is not dependent on the availability of external services such as the discussions server, or other back-end servers. For details, see Oracle WebCenter Portal Dependencies.

1.3.4 Oracle WebCenter Portal Dependencies

WebCenter Portal uses several external servers, tools, and services (Table 1-3). The Configuration column lists the type of information provided to WebCenter Portal to configure or initialize the connection. The Access column lists the protocol used in run-time access of the service.

<table>
<thead>
<tr>
<th>External Server, Tool or Service</th>
<th>Configuration</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics</td>
<td>UDP access to the analytics collector</td>
<td>UDP</td>
</tr>
<tr>
<td>Discussions server</td>
<td>HTTP access to discussions server administration</td>
<td>SOAP/HTTP</td>
</tr>
<tr>
<td>Content Server</td>
<td>Socket connection to the Administration Server. HTTP access is required only if the Content Server must be accessed outside WebCenter Portal.</td>
<td>Socket or HTTP</td>
</tr>
<tr>
<td>Instant messaging and presence server</td>
<td>HTTP access to instant messaging and presence server administration</td>
<td>SOAP/HTTP</td>
</tr>
<tr>
<td>Mail server</td>
<td>IMAP/SMTP server</td>
<td>IMAP/SMTP</td>
</tr>
<tr>
<td>Personal events server</td>
<td>HTTP access to calendar services</td>
<td>SOAP/HTTP</td>
</tr>
<tr>
<td>Portlets</td>
<td>HTTP location of provider WSDLs</td>
<td>SOAP/HTTP</td>
</tr>
<tr>
<td>Search server</td>
<td>HTTP access to search server</td>
<td>HTTP</td>
</tr>
<tr>
<td>SOA server connections</td>
<td>HTTP access to BPEL server</td>
<td>SOAP/HTTP</td>
</tr>
<tr>
<td>MDS and schemas</td>
<td>JDBC</td>
<td>JDBC</td>
</tr>
</tbody>
</table>

Server/service unavailability does not prevent WebCenter Portal from starting up, although errors may display while the application is running. The only exception is the Oracle Metadata Services Repository (MDS), as WebCenter Portal does not work without it.
1.3.5 Oracle WebCenter Portal Configuration Considerations

The main configuration files for WebCenter Portal are listed and described in Table 1-4. Both these files are supplied within the application deployment .EAR file.

<table>
<thead>
<tr>
<th>Artifact</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>adf-config.xml</td>
<td>Stores basic configuration for Application Development Framework (ADF) and application settings, such as which discussions server or mail server WebCenter Portal is currently using.</td>
</tr>
<tr>
<td>connections.xml</td>
<td>Stores basic configuration for connections to external services.</td>
</tr>
</tbody>
</table>

WebCenter Portal uses the Oracle Metadata Services (MDS) repository to store its configuration data; it accesses the MDS repository as a JDBC data source within the Oracle WebLogic framework.

The MDS repository stores post deployment configuration changes for WebCenter Portal as application customizations. MDS uses the original deployed versions of adf-config.xml and connections.xml as base documents and stores all subsequent application customizations separately into MDS using a single customization layer.

When WebCenter Portal starts up, application customizations stored in MDS are applied to the appropriate base documents and the application uses the merged documents (base documents with customizations) as the final set of configuration properties.

For applications that are deployed to a server cluster, all members of a cluster read from the same location in the MDS repository.

Typically, there is no need for administrators to examine or manually change the content of base documents (or MDS customization data) for files such as adf-config.xml and connections.xml, as Oracle provides several administration tools for post deployment configuration. If you must locate the base documents or review the information in MDS, read Oracle WebCenter Portal Configuration.

To find out more about the configuration tools available, see Oracle WebCenter Portal Administration Tools.

Note:

Oracle does not recommend that you edit adf-config.xml or connections.xml by hand as this can lead to misconfiguration.

While WebCenter Portal stores post deployment configuration information in MDS, configuration information for portlet producers and the discussion server is stored in the file system or the database (Table 1-5).
Table 1-5  (Cont.) WebCenter Portal Configuration Location

<table>
<thead>
<tr>
<th>Application</th>
<th>Configuration Stored in MDS</th>
<th>Configuration Stored in File System</th>
<th>Configuration Stored in Database</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebCenter Portal</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Portlet producers</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Discussions server</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

1.3.6 Discussions Server Configuration

Oracle WebCenter Portal’s discussions server stores configuration information in its database. Additionally, it stores startup configuration information in `DOMAIN_HOME/config/fmwconfig/servers/WC_COLLABORATION/owc_discussions`. This directory contains `jive_startup.xml`, `jive.license` files, and a `logs` directory containing log files for the discussions server instance.

1.3.7 Oracle WebCenter Portal State and Configuration Persistence

WebCenter Portal runs as a J2EE application with application state and configuration persisted to the MDS repository. User session information within the application is held locally in memory. In a cluster environment, this state is replicated to other members of the cluster.

Application customizations within a portlet or service environment are persisted by that service. Out-of-the-box, Oracle portlets, any custom portlets you build, and the discussions server, all have their own database persistence mechanisms.

1.3.8 Analytics Considerations

WebCenter Portal’s analytics capability is stateless. Requests received by analytics collectors are executed immediately. Any in-transit state, such as a request initiated by WebCenter Portal or a request processed by the analytics collector, is not guaranteed.

1.3.9 Oracle WebCenter Portal Log File Locations

Operations performed by WebCenter Portal, portlet producers, discussion servers, and so on, are logged directly to the WebLogic managed server where the application is running:

`DOMAIN_HOME/servers/Server_Name/logs/Server_Name-diagnostic.log`

For example, diagnostics for WebCenter Portal are logged to: `/base_domain/servers/WC_Portal/logs/WC_Portal-diagnostic.log`

You can view the log files for each WebLogic managed server from the Oracle WebLogic Server Administration Console. To view the logs, access the Oracle WebLogic Server Administration Console `http://<admin_server_host>:<port>/console`, and click **Diagnostics-Log Files**.

You can also view and configure diagnostic logs through Fusion Middleware Control, see **Viewing and Configuring Log Information**.
1.4 Understanding the Oracle WebCenter Portal Installation

Installing WebCenter Portal requires a little bit of planning. Some of the questions to consider are:

- What Oracle WebCenter Portal components will be used?
- How many users will access this deployment?
- How can I provide high availability for my enterprise deployment?
- How can I secure WebCenter Portal?

For more information about Oracle WebCenter Portal installation and post-installation administration tasks, see *Installing and Configuring Oracle WebCenter Portal*.

For post installation enterprise configuration, see *Enterprise Deployment Guide for Oracle WebCenter Portal*.

For post installation high availability configuration, see *High Availability Guide*.

For post-installation security configuration, see *Post-deployment Security Configuration Tasks*.

The out-of-the-box topology is briefly described in *Oracle WebCenter Portal Topology*. Specific areas of the topology are described in the corresponding chapters, for example, security-related aspects are described in *Managing Oracle WebCenter Portal Security*.

1.5 Understanding Administrative Operations, Roles, and Tools

Oracle WebCenter Portal provides several different tools with which to deploy, configure, start and stop, and maintain WebCenter Portal. All these tools are described in *Oracle WebCenter Portal Administration Tools*.

Your ability to perform administration tasks depends on which Oracle WebLogic Server role you are assigned—Admin, Operator, or Monitor. *Table 1-6* lists the Oracle WebLogic Server roles needed for common operations. These roles apply whether the operations are performed through Fusion Middleware Control, WLST commands, or the WebLogic Server Administration Console.

<table>
<thead>

1.6 Performance Monitoring and Diagnostics

Performance monitoring helps administrators identify issues and performance bottlenecks in their environment. Monitoring Oracle WebCenter Portal Performance describes the range of performance metrics available for WebCenter Portal and how to monitor them using Fusion Middleware Control. It also describes how to troubleshoot issues by analyzing information that is recorded in diagnostic log files.

1.7 Understanding Security

The recommended security model for Oracle WebCenter Portal is based on Oracle ADF Security, which implements the Java Authentication and Authorization Service (JAAS) model. The following chapters describe security configuration for WebCenter Portal applications:

- Managing Oracle WebCenter Portal Security
- Configuring the Identity Store
- Configuring the Policy and Credential Store
- Configuring Single Sign-On
- Configuring SSL
- Configuring Web Services Security
- Configuring Security for Portlet Producers
1.8 WebCenter Portal Application Deployment

Deploying Portlet Producer Applications provides instructions for deploying WSRP portlet producer applications.

Note:

1.9 Data Migration, Backup, and Recovery

Oracle WebCenter Portal stores data related to its configuration and content for the various feature areas in several locations. To facilitate disaster recovery and the full production lifecycle from development through staging and production, Oracle WebCenter Portal provides a set of utilities that enable you to back up this data, and move the data between staging and production environments.

Managing WebCenter Portal Backup, Recovery, and Cloning describes the backup, import, and export capabilities and tools available for these tasks.

1.10 Oracle WebCenter Portal Administration Tools

Oracle offers the following tools for managing Oracle WebCenter Portal:

- Oracle Enterprise Manager Fusion Middleware Control Console
- Oracle WebLogic Server Administration Console
- Oracle WebLogic Scripting Tool (WLST)
- System MBean Browser
- WebCenter Portal Administration Pages

Administrators should use these tools, rather than edit the configuration files, to perform administrative tasks. For help to decide which tool is best for you, see Configuration Tools.

1.10.1 Oracle Enterprise Manager Fusion Middleware Control Console

Oracle Enterprise Manager Fusion Middleware Control Console is a browser-based management application that is deployed when you install Oracle WebCenter Portal. From Fusion Middleware Control Console, you can monitor and administer a domain (such as one containing Oracle WebCenter Portal).

Fusion Middleware Control organizes a wide variety of performance data and administrative functions into distinct, web-based home pages. These home pages make it easy to locate the most important monitoring data and the most commonly used administrative functions for any WebCenter Portal component—all from your web browser. For general information about the Fusion Middleware Control Console, see Getting Started Using Oracle Enterprise Manager Fusion Middleware Control in Administering Oracle Fusion Middleware.
Fusion Middleware Control is the primary management tool for Oracle WebCenter Portal and can be used to:

- Configure back-end services and tools
- Configure security management
- Control process lifecycle
- Access log files and manage log configuration
- Manage data migration
- Monitor performance
- Diagnose run-time problems
- Manage related components, such as the parent Managed Server, MDS, and portlet producers

1.10.1.1 Displaying Fusion Middleware Control Console

For information about starting Fusion Middleware Control, see Displaying Fusion Middleware Control Console.

1.10.2 Oracle WebLogic Server Administration Console

The Oracle WebLogic Server Administration Console is a browser-based, graphical user interface that you use to manage a WebLogic Server domain.

The Administration Server hosts the Administration Console, which is a Web application accessible from any supported Web browser with network access to the Administration Server Managed Servers host applications.

Use the Administration Console to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters
- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy your applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

For more information about the Oracle WebLogic Server Administration Console, see Displaying the Oracle WebLogic Server Administration Console in Administering Oracle Fusion Middleware.
1.10.2.1 Locking Domain Configuration

You must lock configuration settings for a domain in the production mode before making any configuration changes. Navigate to the Administration Console’s Change Center (Figure 1-3), and click Lock & Edit.

Once configuration updates are complete, release the changes by clicking Release Configuration.

If the domain is in the development mode, the Lock & Edit option is not available, and changes are automatically committed.

**Figure 1-3 Change Center in Oracle WebLogic Server Administration Console**

1.10.3 Oracle WebLogic Scripting Tool (WLST)

Oracle provides the WebLogic Scripting Tool (WLST) to manage Oracle Fusion Middleware components, such as Oracle WebCenter Portal, from the command line.

WLST is a complete, command-line scripting environment for managing Oracle WebLogic Server domains, based on Jython. In addition to supporting standard Jython features such as local variables, conditional variables, and flow control statements, WLST provides a set of scripting functions (commands) that are specific to Oracle WebLogic Server. You can extend the WebLogic scripting language to suit your needs by following the Jython language syntax.

Oracle provides WLST commands for fully administering and monitoring WebCenter Portal and managing connections to content repositories, portlet producers, external applications, and other back-end services. All Oracle WebCenter Portal WLST commands are described in WebCenterPortal Custom WLST Commands in *WebCenter WLST Command Reference*.

1.10.3.1 Running Oracle WebLogic Scripting Tool (WLST) Commands

You must run all Oracle WebCenter Portal WLST commands from your Oracle home directory (ORACLE_HOME).

---

**Note:**

If you attempt to run WLST commands from the wrong directory, you will see a NameError. Always run the WLST commands from the Oracle home directory.

See also, Troubleshooting Oracle WebCenter Portal.

---

To run WLST from the command line:

1. Navigate to your Oracle home directory and invoke the WLST script:

   (UNIX) ORACLE_HOME/common/bin/wlst.sh
2. At the WLST command prompt, enter the following command to connect to the Administration Server for Oracle WebCenter Portal:

```
wlst:/offline>connect('user_name','password', 'protocol(optional):host_name:port_number')
```

where

- `user_name` is the username of the operator who is connecting to the Administration Server
- `password` is the password of the operator who is connecting to the Administration Server
- `protocol` is the protocol for connecting to the Administration Server and is optional
- `host_name` is the host name of the Administration Server
- `port_number` is the port number of the Administration Server

For example:

```python
connect(username='weblogic', password='mypassword', url='t3://myhost.example.com:7001')
```

If preferred, you can connect to the Administration Server in interactive mode without parameters:

```
wls:/offline> connect()
```

Please enter your username :weblogic
Please enter your password : 
Please enter your server URL [t3://localhost:7001]:t3://myhost.example.com:7001
Connecting to t3://myhost.example.com:7001 with userid weblogic ...
Successfully connected to Admin Server 'AdminServer' that belongs to domain 'wc_domain'.

For help with this command, type `help('connect')` at the WLST command prompt.

**Note:**

If SSL is enabled, you must edit the `wlst.sh` or `wlst.cmd` file and append the following to `JVM_ARGS`:

```
-Dweblogic.security.SSL.ignoreHostnameVerification=true
-Dweblogic.security.TrustKeyStore=DemoTrust
```

or setenv `CONFIG_JVM_ARGS`

```
-Dweblogic.security.SSL.ignoreHostnameVerification=true
-Dweblogic.security.TrustKeyStore=DemoTrust
```

3. Once connected to the Administration Server you can run Oracle WebCenter Portal WLST commands, and any other generic WLST command.

**1.10.3.1.1 Hints and Tips Running for Oracle WebCenter Portal WLST Commands**
• **To list Oracle WebCenter Portal WLST commands**, type: `help('webcenter')` at the WLST command prompt.

  If the message *No help for webcenter found...* displays, you are probably running the WLST script from the wrong directory, for example, you might be running `wlst.sh` or `wlst.cmd` from the `oracle_common` directory instead of `ORACLE_HOME/common/bin`.

• **For help on a particular command**, type: `help('WLST_command_name')` at the WLST command prompt.

• **Include argument names when running commands** and especially when writing WLST scripts. For example, it is good practice to enter:

  `createExtAppConnection(appName='webcenter', name='myXApp')`... rather than:

  `createExtAppConnection('webcenter', 'myXApp')`...

  Either syntax is valid but when you include the argument names, errors and misconfiguration is less likely. Also, if arguments are added in the future, the command does not fail or configure the wrong property.

• **In a clustered environment, remember to specify the "server" argument when running commands.** All Oracle WebCenter Portal WLST commands include a `server` argument which becomes mandatory when WebCenter Portal is deployed to cluster.

• **Online documentation for Oracle WebCenter Portal WLST commands** is available in WebCenter Portal Custom WLST Commands in *WebCenter WLST Command Reference*.

### 1.10.4 System MBean Browser

Fusion Middleware Control provides a set of MBean browsers that allow you to browse the MBeans for an Oracle WebLogic Server or for a selected application.

**Note:**

While you can monitor and configure WebCenter Portal MBeans from the System MBean browser, it is not the preferred tool for configuration. Oracle recommends that you configure WebCenter Portal settings from its home page using Fusion Middleware Control or by using WLST commands.

To access application MBeans:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see *Navigating to the Home Page for WebCenter Portal*.

2. From the **WebCenter Portal** menu, select **System MBean Browser**.

3. Under **Application Defined MBeans**, navigate to the MBean you want to view or configure.

   For example, you might want to navigate to MBeans for `adf-config.xml` and `connections.xml` as follows (*Figure 1-4*):
1. Navigate to the parent MBean (for example, ADFConfig or ADFConnections), select the Operations tab, and click save to save the changes.

6. Restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

1.10.5 WebCenter Portal Administration Pages

WebCenter Portal provides several administration pages, which appear only to users who have logged in to WebCenter Portal using an administrator user name and password.

WebCenter Portal administration pages allow you to:

- Customize WebCenter Portal
- Manage users and roles
- Manage tool and service settings
- Manage portlet producers and external applications
- Manage individual portals and portal templates
- Create and manage business role pages
- Manage personal pages
• Export and import individual portals and portal templates

For more information, see Accessing the Settings Pages in WebCenter Portal Administration.
Part II

Getting Started

This part of *Administering Oracle WebCenter Portal* provides checklists to help you get started with Oracle WebCenter Portal administration.

- Getting Started Administering WebCenter Portal
- Starting Enterprise Manager Fusion Middleware Control
- Starting and Stopping Managed Servers and Applications for Oracle WebCenter Portal
This chapter describes the roles and responsibilities of system administrators to get WebCenter Portal up and running.

This chapter includes the following topics:

- **Role of the System Administrator**
- **Installing WebCenter Portal**
- **Setting Up WebCenter Portal for the First Time (Roadmap)**
- **Customizing WebCenter Portal for the First Time (Roadmap)**
- **System Administration for WebCenter Portal – Fusion Middleware Admin Role (Roadmap)**
- **System Administration for WebCenter Portal – WebCenter Portal Admin Role (Roadmap)**

**Permissions:**

To perform the tasks in this chapter, you must be granted the following roles:

- **WebLogic Server:** `Admin` role granted through the Oracle WebLogic Server Administration Console.
  
  Users with this role are also known as *Fusion Middleware administrators*.

- **WebCenter Portal:** `Administrator` role granted through WebCenter Portal Administration.
  
  Users with this role are also known as *WebCenter Portal administrators*.

See also, **Understanding Administrative Operations, Roles, and Tools**.

### 2.1 Role of the System Administrator

Oracle Fusion Middleware provides a single administrative role with complete administrative capabilities—the `Admin` role. System administrators with this role can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks. This administrator is also responsible for setting up and configuring WebCenter Portal immediately after installation, and performing ongoing administrative tasks for WebCenter Portal and other Oracle WebCenter Portal components. This administrator is sometimes known as the *Fusion Middleware administrator*. 
During installation, a single default system administrator account is created named weblogic. You can choose to create the account by any other name. The password is the one provided during installation.

Use this administrator account to log in to the Fusion Middleware Control Console and WebCenter Portal, and assign administrative privileges to other users:

- **Fusion Middleware Control** - Add one more user to the Administrator group using the Oracle WebLogic Server Administration Console or Oracle WebLogic Scripting Tool (WLST). For more information, see Administrative Users and Roles in *Securing Applications with Oracle Platform Security Services*.

  Oracle WebLogic Server provides two other roles, in addition to the Admin role, namely Operator and Monitor. For more information about these role, see Table 1-6 in *Understanding Administrative Operations, Roles, and Tools*.

- **WebCenter Portal** - Assign one more users the Administrator role through WebCenter Portal Administration. For more information, see Assigning a User to a Different Application Role.

  WebCenter Portal administrators have the highest privileges within the WebCenter Portal application. This administrator can view and customize every aspect of the WebCenter Portal, manage users and roles, and delegate responsibilities to others.

To find out what other tasks system administrators must do to get WebCenter Portal up and running, follow the steps listed under Table 2-1.

To find out what system administrator can do to customize WebCenter Portal out-of-the-box, follow the Table 2-2.

---

**Note:**

System administrators are also responsible for all ongoing administrative and maintenance tasks. For more information, see *System Administration for WebCenter Portal – Fusion Middleware Admin Role (Roadmap)*.

---

### 2.2 Installing WebCenter Portal

WebCenter Portal installation is described in *Installing and Configuring Oracle WebCenter Portal*.

### 2.3 Setting Up WebCenter Portal for the First Time (Roadmap)

The flow chart depicted in Figure 2-1 and Table 2-1 in this section provide an overview of the tasks required to get WebCenter Portal up and running.
Figure 2-1   Setting Up WebCenter Portal for the First Time

1. Verify your WebCenter Portal installation
2. Add/Modify connections to back-end components:
   - Content repositories
   - BPEL servers
   - Analytics
   - Discussions server
   - Events server
3. Connect external applications and portlet producers:
   - WSRP producers
   - Pagelet Producer
   - External applications
4. Connect back-end servers to the same identity store as the WebCenter Portal application:
   - Content Server
   - Oracle Secure Enterprise Search
   - Presence server
5. Secure communication with the WebCenter Portal application
6. Optional: Configure application-level options for WebCenter Portal
7. Restart WC_Portal, the managed server on which WebCenter Portal is deployed
8. Log in to WebCenter Portal
9. Set global options and customize WebCenter Portal
10. Grant application roles

2.4 Customizing WebCenter Portal for the First Time (Roadmap)

The roadmap in Table 2-2 outlines the tasks that a WebCenter Portal administrator might perform to customize WebCenter Portal for a new target audience.

<table>
<thead>
<tr>
<th>Task</th>
<th>Documentation</th>
<th>Actor</th>
</tr>
</thead>
</table>
| 1. Log in to WebCenter Portal | Log in to WebCenter Portal with administrative privileges and access the administration pages:  
   • Accessing the WebCenter Portal Administration Page  
   Tips:  
   WebCenter Portal URL is `http://host:port/webcenter`  
   WebCenter Portal Administration URL is `http://host:port/webcenter/portal/admin/settings` | WebCenter Portal Admin |
| 2. Customize WebCenter Portal | Customize WebCenter Portal to suit your audience. Choose a name and logo for your application, apply a corporate brand, set language options, choose default portals, default assets, and more. For details, see:  
   • Working with WebCenter Portal Administration Settings  
   • Configuring Global Defaults Across Portals  
   • Customizing System Pages  
   • Managing Business Role Pages  
   • Managing Personal Pages | WebCenter Portal Admin |
| 3. Determine self-registration policy | Establish your policy regarding new user registration. Allow users outside of the WebCenter Portal community to self-register on an invitation-only basis or extend self-registration to the public:  
   • Enabling Self-Registration By Invitation-Only  
   • Enabling Anyone to Self-Register | WebCenter Portal Admin |
| 4. Plan the public user experience | First impressions are extremely important. Determine the content displayed on your Welcome page and the appearance of WebCenter Portal before users login:  
   • Customizing the Welcome Page  
   • Customizing the Login Page  
   • Customizing the Self-Registration Page  
   • Choosing a Default Display Language  
   • Default Application Roles | WebCenter Portal Admin |
| 5. Create roles and delegate responsibilities to other users | Create roles to characterize groups of users and determine what they can see and do in WebCenter Portal. Manage and assign roles for any user in the identity store:  
   • About WebCenter Portal Security  
   • Assigning Users (and Groups) to Application Roles  
   • Defining Application Roles  
   • Assigning a User to a Different Application Role  
   • Modifying Application Role Permissions | WebCenter Portal Admin |
### Table 2-2  (Cont.) Roadmap - Customizing WebCenter Portal for the First Time

<table>
<thead>

Starting Enterprise Manager Fusion Middleware Control

This chapter describes how to access Oracle Enterprise Manager Fusion Middleware Control Console, and display Oracle WebCenter Portal-related pages from where you can perform all necessary configuration, monitoring, and management tasks.

This chapter includes the following topics:

- Displaying Fusion Middleware Control Console
- Navigating to the Home Page for WebCenter Portal
- Navigating to Dependent Components

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin, Operator, or Monitor role through the Oracle WebLogic Server Administration Console.

See also, Understanding Administrative Operations, Roles, and Tools.

3.1 Displaying Fusion Middleware Control Console

System administrators can login to Fusion Middleware Control Console and access pages for managing Oracle WebCenter Portal. Your role determines what you can see and do after logging in. For more information, see Understanding Administrative Operations, Roles, and Tools.

To access the Fusion Middleware Control Console:

1. Start Fusion Middleware Control.

   Fusion Middleware Control is configured for a domain, and it is automatically started when you start the Oracle WebLogic Server Administration Server. See Starting and Stopping Fusion Middleware Control in Administering Oracle Fusion Middleware.

2. Enter the following URL in your browser: http://hostname.domain:port/em

   For example: http://myhost.mycompany.com:7001/em

   The port number is the port number of the Administration Server. By default, the port number is 7001. The port number is listed in config.xml:

   - On Windows: DOMAIN_HOME\config\config.xml
• On UNIX: `DOMAIN_HOME/config/config.xml`

See also, About Managing Ports in *Administering Oracle Fusion Middleware*.

3. Enter valid administrator **User Name** and **Password** details for the domain.

   The default user name for the administrator user is `weblogic`. This is the account you can use to log in to Fusion Middleware Control for the first time.

4. Click **Login**.

   The first page you see is the Domain home page (Figure 3-1). You can view this page at any time by selecting the name of the domain in the navigation pane.

   **Tip:**

   If you are unable to log in, try logging in to the WebLogic Administration Console to confirm your host/port/credentials. The Weblogic Admin Console is accessible at the same host/port as Fusion Middleware Control: `http://host.domain:port/console`.

   ![Figure 3-1 Domain Home Page](image)

From the navigation pane, you can drill down to view and manage all components in your domain, including WebCenter Portal. For detailed instructions, see **Navigating to the Home Page for WebCenter Portal**.

**3.2 Navigating to the Home Page for WebCenter Portal**

This section includes the following topics:

• **Home Page for WebCenter Portal**.

• **Navigating to the WebCenter Portal Home Page**.
3.2.1 Home Page for WebCenter Portal

The WebCenter Portal home page (Figure 3-2) is your starting place for managing WebCenter Portal. The page displays status, performance and availability of all the components and tools/services that make up WebCenter Portal.

**Figure 3-2  WebCenter Portal Home Page**

The metrics displayed on WebCenter Portal's home page enable you to:

- Check the status of the WebCenter Portal application and view key performance data.
- Quickly see whether the application is performing as expected through charts that immediately report:
  - availability and performance issues with pages, and portlets
  - general health of the WebLogic Server and the back-end LDAP server
- Hover over the links in the WebCenter Portal Metrics and WebLogic Server Metrics sections for a brief description about the information displayed and click the links to drill down to more detail.
- Monitor CPU and heap memory usage charts to detect whether system resources are running low.
• Track overall response time compared with the user access rate to see how the application performs under different loads and to diagnose system resource issues.

• Quickly see which portals are used the most, and then drill down to see the slowest performers, and determine which portals are recording the most errors.

• View status and key performance metrics for WebCenter Portal tools/services used in the application.

• Drill down to detailed performance information for individual portals, tools/services, external applications, portlets, and producers.

• Navigate to other key components, including the WebLogic Server managed server on which the WebCenter Portal application is running, and the MDS repository.

**Note:**
To find out more about the performance metrics displayed on the home page, what to look out for, and how to diagnose issues with your installation, see Using Key Performance Metric Data to Analyze and Diagnose System Health.

The home page for WebCenter Portal also displays a **WebCenter Portal** menu (Figure 3-3).

**Figure 3-3   Menu for the WebCenter Portal Application**

From the **WebCenter Portal** menu, you can:

• Drill down to detailed performance metrics for all components

• Select and chart live metrics
- Start and stop the WebCenter Portal application
- Analyze diagnostic information and configure logs
- Export and import the WebCenter Portal application
- Register and manage portlet producers
- Configure application settings
- Manage back-end services
- Manage external applications
- Configure security policies and roles
- Configure ADF and MDS options
- View web services-related information

Most tasks that you perform from WebCenter Portal’s home page are described in this guide. For more information, see Getting Started Administering WebCenter Portal.

### 3.2.2 Navigating to the WebCenter Portal Home Page

To navigate to the main home page for WebCenter Portal:

1. Log on to Fusion Middleware Control.
   
   See Displaying Fusion Middleware Control Console.

2. Click the Target Navigation icon at the top of the page.

3. In the Target Navigation (Figure 3-4), expand WebCenter > Portal > Server.

4. Select WebCenter Portal (WC_Portal) to navigate to the home page for your WebCenter Portal installation (Figure 3-4).

![Figure 3-4 Navigating to the WebCenter Portal Home Page](image)

Notice how the Navigator menu changes to WebCenter Portal (Figure 3-5).
Another way to access the context menu for a particular component is to right-click the node in the navigation tree. For example, if you right-click the **WebCenter Portal** (WC_Portal) node (under the **Server** node on the left in Figure 3-4), the same **WebCenter Portal** menu displays.

### 3.3 Navigating to Dependent Components

From WebCenter Portal pages it is easy to navigate to pages belonging to related components, such as WebLogic Server domains, servers, Java components, and MDS repository.

On the WebCenter Portal home page, click the links in the **Related Components** section to navigate to WebCenter Portal application itself, WebLogic Server installation pages, or MDS repository pages in Fusion Middleware Control. See also, *Navigating to the Home Page for WebCenter Portal*. 

---

**Figure 3-5  Displaying the WebCenter Portal Home Page and Menu**

![WebCenter Portal Home Page and Menu](image)
This chapter describes how to restart the managed server on which the application is deployed. Most configuration changes that you make to WebCenter Portal through Fusion Middleware Control or using WLST are not dynamic; you must restart the managed server for changes to take effect. For example, when you modify connection details to backend servers, you must restart the application's managed server. There are exceptions; portlet producer and external application registrations are dynamic. Any new portlet producers and external applications that you register are immediately available in your application and any changes that you make to existing connections take effect immediately too.

This chapter includes the following topics:

- Starting Node Manager
- Starting and Stopping Managed Servers for WebCenter Portal Application Deployments
- Starting and Stopping the WebCenter Portal Application

You perform all start and stop operations from the Oracle WebLogic Server Administration Console too. See also, Starting and Stopping Servers in Administering Server Startup and Shutdown for Oracle WebLogic Server.

Note:
Node Manager must be running before you can start and stop administration servers, managed servers, and WebCenter Portal through Fusion Middleware Control or Oracle WebLogic Server Administration Console.

Alternatively, you can start administration servers or managed servers from the command line using the startWeblogic.sh or startManagedWebLogic.sh scripts, respectively.

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin, or Operator role through the Oracle WebLogic Server Administration Console.

See also, Understanding Administrative Operations, Roles, and Tools.
4.1 Starting Node Manager

Node Manager *must* be running before you can start and stop administration servers, managed servers, and WebCenter Portal through Fusion Middleware Control or Oracle WebLogic Server Administration Console.

For information on how to start Node Manager with `startNodeManager.sh`, see Using Node Manager in *Administering Node Manager for Oracle WebLogic Server*.

4.2 Starting and Stopping Managed Servers for WebCenter Portal Application Deployments

This section includes the following sections:

- Oracle WebCenter Portal Managed Servers
- Starting and Stopping Managed Servers

4.2.1 Oracle WebCenter Portal Managed Servers

Most WebCenter Portal configuration changes that you make, through Fusion Middleware Control or using WLST, are not dynamic; you must restart the managed server on which the application is deployed for your changes to take effect.

When you start or restart a managed server, all applications deployed on the managed server start automatically, see also Table 4-1.

<table>
<thead>
<tr>
<th>Managed Server</th>

</tr>
<tr>
<td></td>
<td>pagelet-producer (Pagelet Producer)</td>
</tr>
<tr>
<td>WC_Collaboration</td>
<td>owc_discussions (Discussions Server)</td>
</tr>
</tbody>
</table>

**Note:**

This section describes how to start and stop WebCenter Portal managed servers listed in Table 4-1. To start and stop managed servers for other components, refer to:

- Oracle WebCenter Content managed server, see Installing and Configuring Oracle WebCenter Content
- Oracle SOA Server managed server, see Installing and Configuring Oracle SOA Suite and Business Process Management
While a specific order in which to start managed servers is not mandated, if you must start multiple managed servers, it is good practice to start the managed server on which WebCenter Portal is deployed last.

### 4.2.2 Starting and Stopping Managed Servers

To start, stop, or restart a WebCenter Portal managed server through Fusion Middleware Control:

1. Log in to Fusion Middleware Control.
2. Click the Target Navigation icon and expand **WebLogic Domain** in the Target Navigation pane.
3. Expand **wc_domain**, and select the managed server you want to start or stop (Figure 4-2).

The home page for the managed server displays.

#### Figure 4-1 Accessing Managed Server Home Page

4. From the **WebLogic Server** menu:
   - To start the managed server, select **Control > Start Up**.
   - To stop the managed server, select **Control > Shut Down**.
Alternatively, right-click the name of the managed server in the Target Navigation pane to access menu options for the managed server.

To start and stop WebCenter Portal managed servers using command line tools, see Starting and Stopping Oracle WebLogic Server Instances in *Administering Oracle Fusion Middleware*.

### 4.3 Starting and Stopping the WebCenter Portal Application

It's easy to start, restart, and shut down WebCenter Portal from Fusion Middleware Control:

- **Starting WebCenter Portal Using Fusion Middleware Control**
- **Stopping WebCenter Portal Using Fusion Middleware Control**

Alternatively, use WLST:

- **Starting WebCenter Portal Using WLST**
- **Stopping WebCenter Portal Using WLST**

You can also start WebCenter Portal through Oracle WebLogic Server Administration Console. For information, see Displaying the Oracle WebLogic Server Administration Console in *Administering Oracle Fusion Middleware*. 
Note:
Application configuration changes require you to restart the WC_Portal managed server on which WebCenter Portal is deployed. For details, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

4.3.1 Starting WebCenter Portal Using Fusion Middleware Control
Starting WebCenter Portal makes the application available to its users; stopping it makes it unavailable.

To start WebCenter Portal through Fusion Middleware Control:
1. In Fusion Middleware Control, navigate to the home page for the WebCenter Portal application.
   See Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select Control > Start Up.
   Alternatively, right-click WC_Portal in the Target Navigation pane to access this menu option.
   A progress message displays.
3. Click Close.
   Note how the application status changes to Up (Green arrow).

4.3.2 Starting WebCenter Portal Using WLST
Use the WLST command startApplication to start WebCenter Portal. For command syntax and detailed examples, see startApplication in WLST Command Reference for WebLogic Server.
For the WebCenter Portal application, the appName argument is always webcenter.
For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

4.3.3 Stopping WebCenter Portal Using Fusion Middleware Control
When you stop the WebCenter Portal application no one can use it. Stopping an application does not remove its source files from the server; you can later restart a stopped application to make it available again.

When you stop WebCenter Portal, the managed server on which the WebCenter Portal application is deployed (WC_Portal) remains available.

To stop a WebCenter Portal application through Fusion Middleware Control:
1. In Fusion Middleware Control, navigate to the home page for WebCenter Portal.
   See Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select Control > Shut Down.
   Alternatively, right-click WC_Portal in the Target Navigation pane to access this menu option.
3. Click OK to continue.
   A progress message displays.

4. Click Close.
   Note how the status changes to Down (Red arrow).

4.3.4 Stopping WebCenter Portal Using WLST

Use the WLST command `stopApplication` to stop the WebCenter Portal application. For command syntax and detailed examples, see `stopApplication` in the WLST Command Reference for WebLogic Server.

For the WebCenter Portal application, the `appName` argument is always `webcenter`.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
This part of *Administering Oracle WebCenter Portal* provides information about the administration tasks for tools, services, portlet producers, and external applications used by WebCenter Portal.

- Managing Tools and Services
- Managing Connections to Oracle WebCenter Content Server
- Managing Analytics
- Managing Announcements and Discussions
- Managing Calendar Events
- Integrating Other Oracle Applications
- Managing Instant Messaging and Presence
- Managing Mail
- Managing People Connections
- Managing RSS
- Managing Oracle Secure Enterprise Search in WebCenter Portal
- Managing Subscriptions and Notifications
- Managing the SOA Connection for WebCenter Portal Membership Workflows
- Managing Portlet Producers
- Managing Pagelet Producer
- Managing External Applications
- Managing REST Services
Managing Tools and Services

This chapter provides an overview of managing tools and services in WebCenter Portal. It also explains the back-end servers required and provides information on enabling tools and services in portals.

This chapter includes the following topics:

- Introduction to Managing Tools and Services
- Configuring Back-end Data Repositories for Tools and Services
- About Tools and Services in WebCenter Portal

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role in the deployed application:

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

The tasks described are performed by a system administrator at the application level. Working with tools and services at the portal level is an application specialist or portal manager task, as described in the Introduction to Portal Tools and Services in Building Portals with Oracle WebCenter Portal.

5.1 Introduction to Managing Tools and Services

WebCenter Portal exposes collaborative, social networking, and personal productivity features through tools and services, which, in turn, expose subsets of their features and functionality through task flows. Task flows provide reusable functionality that may expose all or a subset of the features available from a particular tool or service.

Some tools, like tags, are available and work out-of-the-box, but other tools require additional configuration (for example, a connection to an external back-end server). The following tools and services require a connection to an external data repository or server (such as a content server, a presence server, a discussions server, a mail server) where relevant information is stored:

- Analytics
- Announcements
Discussions
Documents, including wikis and blogs
Events
Instant Messaging and Presence (IMP)
Mail
RSS
Search (for Oracle SES adapter)

In addition, the following tools and services require a connection to a database schema where relevant information (such as relationship mapping) is stored:

Analytics
Documents (wikis and blogs that want to include the comments and Activity Stream)
Links
Lists
People Connections
Tags

Table 5-1 lists where data associated with the various tools and services is stored, that is, in MDS, a database, or an external repository or server. You may find it helpful to know which tools and services are impacted when any one of these repositories are unavailable.

MDS - Some tools and services store connection metadata in the Metadata Services Repository (MDS). Changes that you make to applications, post deployment, are stored in MDS as customizations. For more information, see Oracle WebCenter Portal Configuration Considerations.

For WebCenter Portal, MDS is installed and configured out-of-the-box, as described in Setting Up the MDS Repository.

Database - Some tools and services require a connection to a database schema where relevant information (such as relationship mapping) is stored.

For more information, see Setting Up Database Connections.

External repository or server - Some tools and services require a connection to an external data repository (such as a content server, a presence server, or a mail server) where relevant information is stored.

For more information on setting up those connections, refer to the relevant chapter in this guide (as indicated in Table 5-1). For example, for information on how to set up a connection to an external discussions server, refer to Managing Announcements and Discussions (as indicated in the For More Information column in Table 5-1).

5.2 Configuring Back-end Data Repositories for Tools and Services

For certain tools and services to work in WebCenter Portal, you must configure various back-end data repositories.

The following sections are included:

- Setting Up the MDS Repository
- Setting Up Database Connections
5.2.1 Setting Up the MDS Repository

Some tools and services store information in the Metadata Services Repository (MDS). For WebCenter Portal, MDS is installed and configured out-of-the-box.

See Also:
Managing the Metadata Repository and Purging Oracle WebCenter Portal Data in Administering Oracle Fusion Middleware.

5.2.2 Setting Up Database Connections

Many tools and services store information in the WebCenter Portal repository, which is a database with the WebCenter Portal schema (_WEBCENTER_) installed. Refer to Table 5-1 for a complete list of these tools and services. For example, with the Links service, relationship mapping information, such as what object is linked to what other object, is stored in this database. Some other tools, such as analytics, require the ACTIVITIES schema.

For WebCenter Portal, _WEBCENTER_ and _ACTIVITIES_ schemas are configured out-of-the-box, so no further configuration is required.

See Also:
- Setting Up a Database Connection in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper for information on creating the connection and installing the schema

Depending on the connection type used in an application, do one of the following:

- Create a global data source, if the application does not include an application-level data source with password indirection. For information on creating global data sources, see Creating and Managing JDBC Data Sources in Administering Oracle Fusion Middleware.

- Map the connection credentials, if the application uses an application-level data source with password indirection. The password is set through the Oracle WebLogic Administration Console on the Credential Mappings tab under Security. If you change the password for an indirect data source on the Connection Pool tab under Configuration, then it has no effect. For more information on credential mapping, see JDBC Data Sources: Security: Credential Mapping under the Creating a JDBC Data Source in Administering JDBC Data Sources for Oracle WebLogic Server.

- Merge the information stored in the application credential store with that of the global application store, if the application uses a JDBC URL connection. For more
information on credential migration behavior, see Configuring the Credential Store in *Securing Applications with Oracle Platform Security Services*.

In a typical business scenario, applications are deployed to different managed servers, and multiple databases are used as repositories for the applications.

When a repository connection is reconfigured, the local `datasource` file and the `*-jdbc.xml` file in the `WEB-INF` directory of the WAR file are updated with the new connection details. However, the JNDI Name and data source name remain the same. If you change the JNDI Name for any reason, then you must also update the `adf-config.xml` file. The JNDI name must be of the form `jdbc/connection-nameDS`. For example, if the application has a connection name `connection1`, then the JNDI name is `jdbc/connection1DS`.

### 5.2.3 Setting Up Back-end Server Connections

Some tools and services require a connection to an external data repository (such as a content server, a presence server, or a mail server) where relevant information is stored. Refer to Table 5-1 for a complete list of these tools and services, as well as links to the relevant chapter in this guide where connection configuration is described.

Administrators must always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end server connections for WebCenter Portal application deployments.

---

**Note:**

Most changes that you make to services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the application is deployed for your changes to take effect. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

---

### 5.2.4 Setting Up a Proxy Server

A proxy server is required if you want to enable external RSS news feeds and external links in activity stream task flows in WebCenter Portal. The RSS service and the activity stream service share the same proxy server settings.

You can set up a proxy server using Fusion Middleware Control or WLST.

This section includes the following subsections:

- Setting Up a Proxy Server Using Fusion Middleware Control
- Setting Up a Proxy Server Using WLST

#### 5.2.4.1 Setting Up a Proxy Server Using Fusion Middleware Control

To set up a proxy server using Fusion Middleware Control:

1. Log on to Fusion Middleware Control and navigate to the home page for your application.
   
   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the **WebCenter Portal** menu, select **Settings > Application Configuration**.
3. In the **Proxy Server** section, enter the host name and the port number of the proxy server. For details, see Table 5-2.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Enter the host name of the proxy server.</td>
</tr>
<tr>
<td>Proxy Port</td>
<td>Enter the port number on which the proxy server is running.</td>
</tr>
</tbody>
</table>

4. Click **Apply** to save this connection.

5. Restart the managed server to which your application is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 5.2.4.2 Setting Up a Proxy Server Using WLST

Use the WLST command `setWebCenterProxyConfig` to specify the proxy host and port number used by RSS news feeds and activity stream task flows. For example:

```
setWebCenterProxyConfig(appName='webcenter', proxyHost='www-proxy.example.com', proxyPort='80')
```

For command syntax and examples, see `setWebCenterProxyConfig` in *WebCenter WLST Command Reference*.

For information about how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

**Note:**

To start using new proxy details, you must restart the managed server in which your application is deployed. For more information, see Starting and Stopping Managed Servers Using WLST in *Administering Oracle Fusion Middleware*.

Use the `getWebCenterProxyConfig` command to find out the current proxy host and port used by RSS and activity stream task flows. For example:

```
getWebCenterProxyConfig(appName='webcenter')
```

If you want to delete the current proxy host and port settings, use the `unsetWebCenterProxyConfig` command. For example:

```
unsetWebCenterProxyConfig(appName='webcenter')
```

For more information, see Proxy Server in *WebCenter WLST Command Reference*.

### 5.2.5 Setting Up External Application Connections

When a tool or service interacts with an application that handles its own authentication, you can associate that application with an external application definition to allow for credential provisioning. For more information about working with external applications, see *Managing External Applications*. 
Tip:

If you are planning to use the same LDAP server and credentials for some of these tools and services (for example for IMP, Events, and Mail), consider creating a single connection for them, specifying the properties to use across the shared connections.

Creating a shared, single connection is especially useful in cases where the identity store imposes additional restrictions that passwords needs to be changed frequently. If you create only one external application connection, it would help minimize invalid login attempts after password changes, thus preventing chances of password lockout.

The following tools and services permit the use of an external application to connect with and define authentication for it:

- Documents
- Events
- Instant Messaging and Presence
- Mail
- RSS Viewer (when using a secured RSS feed)

5.3 About Tools and Services in WebCenter Portal

The system administrator is responsible for managing connections to external servers and also maintains the database schema and Metadata Service (MDS) repositories where application data, specific to WebCenter Portal, is stored. For details, see Getting Started Administering WebCenter Portal.

When a back-end server is not configured, intentionally or otherwise, WebCenter Portal cannot offer features or functionality related to that tool:

- Associated task flows are not available in the resource catalog.
- Existing task flows display a message indicating that the tool or service is unavailable.
- Tool or service is not listed as available to portal managers—through the portal's administration settings.

When a valid connection exists, the associated tool or service is available in WebCenter Portal. For more information, see Enabling and Disabling Tools and Services in WebCenter Portal.

The Administration Tools and Services page for WebCenter Portal allows you to perform some optional configurations, if necessary. For more information, see Configuring Tools and Services for WebCenter Portal.

Reporting Temporary Issues with Tools and Services

When a tool or service is temporarily unavailable, the system administrator can use Fusion Middleware Control to investigate, diagnose, and solve issues relating to services. See also, Navigating to the Home Page for WebCenter Portal.

Hiding Task Flows When Tools and Services are Unavailable
Most tools and services are optional. If you decide not to offer a particular tool or service in your application, temporarily or permanently, consider removing any associated task flows that display by default out-of-the-box.

**Enabling and Disabling Tools and Services for a Particular Portal**

Portal Managers can enable or disable available tools within their portal. See Enabling and Disabling Tools and Services Available to a Portal in *Building Portals with Oracle WebCenter Portal*.

For information about enabling and disabling, as well as configuring, tools and services in WebCenter Portal, see Enabling and Disabling Tools and Services in WebCenter Portal and Configuring Tools and Services for WebCenter Portal.

### 5.3.1 Enabling and Disabling Tools and Services in WebCenter Portal

WebCenter Portal offers tools and services that allow portal members to collaborate and communicate through various task flows that are associated with these tools and services. Some tools, such as personal notes, are ready to use out-of-the-box and require no further configuration. Other tools, such as discussions, and other services, such as mail, require connections to the back-end server and require additional configuration. See Introduction to Managing Tools and Services.

When a valid connection exists, the associated tool or service is available in WebCenter Portal. With the exception of the Mail service, if the tool or service is not part of a template, then portal managers or application specialists must enable the tool or service within a portal. The Mail service is enabled upon portal creation, and, if it is configured by the system administrator, then it cannot be disabled for individual portals. If a tool is included in a portal template, then it is enabled when it is first used. Portal Managers can manually disable a tool in the portal, with the exception of the Mail service.

If a portal manager manually enables a tool in a portal, WebCenter Portal handles any necessary configuration with the back-end server. For example, when the portal manager enables discussions in a portal, WebCenter Portal configures discussions storage for that portal on the discussions server and performs role-mapping based authorization, that is, WebCenter Portal roles that allow users to work with the discussions in the portal, are mapped to corresponding roles on the discussions server. See also Understanding Discussion Server Role Mapping. If role-mapping fails, the portal manager is notified by email, and users are unable to access discussions.

If a tool is enabled in the template used to create a new portal, WebCenter Portal handles the back-end server configuration when someone accesses that tool for the first time. For example, the first time someone navigates to the Discussions page in a portal at `/webcenter/portal/PortalName/Discussions`, WebCenter Portal configures discussions storage for that portal on the discussions server, performs role-mapping based authorization, and then the discussions page displays.

The following tools and services can be automatically enabled on first use, if the portal template includes it:

- Announcements
- Discussions
- Events
- Lists
- Documents
5.3.2 Configuring Tools and Services for WebCenter Portal

Tools and services are configured by the system administrator by setting up and connecting to the appropriate back-end applications, as described earlier in this chapter.

If the connection exists, the tool or service is available in the portal. Portal managers are responsible for managing tools and services in their individual portals. You, as the system administrator, can, however, use the Tools and Services page in WebCenter Portal Administration to set up some additional configurations for WebCenter Portal.

To configure options on the Tools and Services page in WebCenter Portal Administration:

1. On the Administration page (see Accessing the Settings Pages in WebCenter Portal Administration), click Tools and Services.

You can also enter the following URL in your browser to navigate directly to the Tools and Services page:

http://host:port/webcenter/portal/admin/settings/tools

See Also:

WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.
2. View the default configurations by clicking the available tabs. Click the online Help icon for more information about the tabs.

3. **Optionally**, perform some additional configuration for some of the tools and services.

   - **Discussions**—change the root category under which discussions are stored. For more information, see Configuring Discussion Forum Options for WebCenter Portal.
   - **Search**—if Oracle SES 11.2.2.2 is configured, you can additionally choose which types of search results to display and do some other customizations. For more information, see Managing Oracle Secure Enterprise Search in WebCenter Portal.
   - **External Applications**—Register new external applications, or edit and deregister the existing external applications. For more information, see Managing External Applications.
   - **Mail**—specify the default mail client for either the local mail client or WebCenter Portal's mail service. For more information, see Configuring Send Mail Notifications for WebCenter Portal.
   - **People Connections**—set options for people connection features. For more information, see Configuring People Connections for WebCenter Portal.
• Portlet Producers—register new portlet producers, or edit and deregister existing portlet producers. For more information, see Managing Portlet Producers.

• Portal Server Connections—register new portal servers for deploying WebCenter Portal. For more information, see Deploying Portals.
Managing Connections to Oracle WebCenter Content Server

You can create connections to Oracle WebCenter Content Server to enable content integration within Oracle WebCenter Portal.

This chapter includes the following topics:

- About Oracle WebCenter Content Server Connections
- Prerequisites for Configuring Oracle WebCenter Content Server
- Configuration Roadmap for Oracle WebCenter Content Server
- Configuring Oracle WebCenter Content Server
- Creating a Connection to Oracle WebCenter Content Server
- Changing the Default Oracle WebCenter Content Server Connection
- Modifying Oracle WebCenter Content Server Connection Details
- Deleting Oracle WebCenter Content Server Connections
- Changing the Maximum File Upload Size

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role in WebCenter Portal granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

6.1 About Oracle WebCenter Content Server Connections

By leveraging the functionality of Oracle WebCenter Content Server, Oracle WebCenter Portal provides content management and storage capabilities, including content upload, file and folder creation and management, file check out, versioning, and so on.

To provide content integration in WebCenter Portal, you must configure at least one WebCenter Content Server connection and mark it as the default connection (sometimes referred to as the active or primary connection).
Note:

WebCenter Portal supports multiple Content Server connections. However, iFraming is supported only for the default Content Server connection. Therefore, when portal managers set properties for the Content Manager task flow or Content Presenter, they cannot specify a non-default Content Server connection if these task flows will use iFrames to display file content, such as PDF files.

Prerequisite configuration for WebCenter Content Server is described in Prerequisites for Configuring Oracle WebCenter Content Server. Before creating a connection to WebCenter Content Server, ensure that you complete the configuration described.

WebCenter Portal provides content integration through:

- **Content Manager task flow**, which enable users to view and manage documents and other types of content in WebCenter Content Server.

- **Content Presenter task flow**, which enables end users to select content from WebCenter Content Server in a variety of ways and then display those items using available display templates.

- **Wiki and Blog pages**, which enable users to create collaborative portal pages.

- **Content Contribution and Publishing**, which enables end users to add text, images, and video to portal pages. A connection to WebCenter Content Server is not required for content contribution and publishing, however if a WebCenter Content Server connection does exist, images that are stored in WebCenter Content Server can be published in Image components and links to WebCenter Content Server items can be added to Image and Text components.

Any portal (including the Home portal) that enables content integration has its own document folder in the WebCenter Content Server repository identified by WebCenter Portal’s default WebCenter Content Server connection.

For information about setting the default connection, see Changing the Default Oracle WebCenter Content Server Connection. For information about setting additional properties for WebCenter Portal’s default WebCenter Content Server connection, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection.

The content repository identified by the default WebCenter Content Server connection must be connected to the same identity store that is used by WebCenter Portal.

Just like other service connections, post-deployment WebCenter Content Server connections are registered and managed through Oracle Enterprise Manager Fusion Middleware Control or using the WLST command-line tool. Connection information is stored in configuration files and in the Oracle Metadata Services Repository. For more information, see Oracle WebCenter Portal Configuration Considerations.

Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter Portal. All changes that you make, post deployment, are stored in the MDS Repository as customizations.
Note:
WebCenter Content Server connection changes that you make through Fusion Middleware Control or using WLST are not dynamic; you need to restart the managed server on which WebCenter Portal is deployed for your changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

Once connection details are defined, users can expose the content of the connected WebCenter Content Server repository through the Content Manager and Content Presenter task flows. For more information, see Working with Content in a Portal in Building Portals with Oracle WebCenter Portal and Adding Content to a Portal in Using Oracle WebCenter Portal.

Note:
Although Microsoft SharePoint is not directly supported as a back-end content store for WebCenter Portal, it is possible to use Content Server as a repository for SharePoint documents. For more information, see Administering the Oracle WebCenter Content Storage Connector for Microsoft SharePoint.

### 6.2 Prerequisites for Configuring Oracle WebCenter Content Server

Read this section to understand the prerequisites and other considerations before continuing with Oracle WebCenter Content Server.

This section includes the following topics:

- Installation Prerequisites for Oracle WebCenter Content Server
- Installation Prerequisites for Inbound Refinery
- Configuration Prerequisites for Oracle WebCenter Content Server and Inbound Refinery
- Security Prerequisites for Oracle WebCenter Content Server and Inbound Refinery

#### 6.2.1 Installation Prerequisites for Oracle WebCenter Content Server

Oracle WebCenter Content Server is installed as part of Oracle WebCenter Content, which is an Oracle Fusion Middleware component.

For more information about installing WebCenter Content, see Installing Oracle WebCenter Content in Installing and Configuring Oracle WebCenter Content.

If you already have an earlier version of WebCenter Content Server installed, upgrade your installation to WebCenter Content 12c prior to configuring it. For information about upgrading to WebCenter Content 12c, see Upgrading Your Oracle WebCenter Content Environment in Upgrading Oracle WebCenter.
6.2.2 Installation Prerequisites for Inbound Refinery

For content integration in Oracle WebCenter Portal, it is recommended that you also install Oracle WebCenter Content: Inbound Refinery as part of the installation of WebCenter Content.

Inbound Refinery is a conversion server that manages file conversions for electronic assets such as documents, digital images, and motion videos. It also provides thumbnail functionality for documents and images and storyboarding for videos. You can use Inbound Refinery to convert content items stored in WebCenter Content Server. Installing Inbound Refinery is described in Installing and Configuring Oracle WebCenter Content.

**Note:**

WebCenter Content Server and Inbound Refinery must be installed in the same domain. Oracle recommends that you install WebCenter Content Server and Inbound Refinery in the same domain as WebCenter Portal. When they are installed in the same domain, no additional configuration is required to use an external LDAP authentication provider.

6.2.3 Configuration Prerequisites for Oracle WebCenter Content Server and Inbound Refinery

After installing Oracle WebCenter Content Server and Inbound Refinery, you should configure the initial post-installation settings, including additional Oracle WebCenter Portal-specific instructions.

General post-installation settings are described in Configuring the Content Server Instance in *Installing and Configuring Oracle WebCenter Content*. WebCenter Portal-specific instructions are provided in the tables below. Be sure to restart the servers after updating the settings.

**Table 6-1  Configuration Prerequisites - WebCenter Content Server**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Socket Port</td>
<td>This is the intradoc port that WebCenter Portal connects to using RIDC (defaults to 4444). This value is stored in the <code>$MW_HOME/user_projects/domains/ucm_domain/ucm/ibr/config/config.cfg</code> configuration file for the WebCenter Content Server managed server as <code>IntradocServerPort</code>.</td>
</tr>
<tr>

<th>Description</th>
</tr>
</thead>
</table>
| Server Socket Port                   | This port is used for communication between WebCenter Content Server and Inbound Refinery. This value was entered on the post-installation configuration page, and can be found on the Inbound Refinery configuration information page under Server Port. You can also find it in the $MW_HOME/
|                                       | user_projects/domains/ucm_domain/ucm/ibr/config/config.cfg file as IntradocServerPort.                                                                                                 |
| Incoming Socket Connection Address   | Server filter specifying which machines can access Inbound Refinery through RIDC. This value is stored in the configuration file for the managed server as SocketHostAddressSecurityFilter. |
| Security Filter                      |                                                                                                                                                                                      |

6.2.4 Security Prerequisites for Oracle WebCenter Content Server and Inbound Refinery

Oracle WebCenter Content Server and Inbound Refinery must be installed in the same domain. Oracle recommends that you install WebCenter Content Server and Inbound Refinery in the same domain as Oracle WebCenter Portal. When they are installed in the same domain, no additional configuration is required to use an external LDAP authentication provider.

WebCenter Content Server must be configured to use the same identity store LDAP server as WebCenter Portal. For information on how to reassociate the identity store with an external LDAP server, see Reassociating the Identity Store with an External LDAP Server.

Oracle also recommends that you install and configure a single sign-on solution to avoid users having to log in twice when accessing WebCenter Content Server and other WebCenter Portal components. For more information about single sign-on solutions, see Configuring Single Sign-On.

6.3 Configuration Roadmap for Oracle WebCenter Content Server

The flow chart in this section provides an overview of the prerequisites and tasks required to get Oracle WebCenter Content Server working with Oracle WebCenter Portal to provide content integration.

The steps are shown in the in the flow chart (Figure 6-1). The steps are also described in Table 6-3 and further detail is provided the in the topics of Configuring Oracle WebCenter Content Server.
Figure 6-1  Configuring WebCenter Content Server for WebCenter Portal

| Configure the SES Crawler     | **Optional**  
You can override the default search adapters and use Oracle SES to get unified ranking results for WebCenter Portal resources such as documents, pages, people, and so on. | See Setting Up Oracle WebCenter Content Server for Oracle SES.  
See also Configuring the SES Crawler. |
| Configure Site Studio         | **Optional, but strongly recommended**  
Configuring Site Studio lets you use Site Studio to create and use Site Studio assets (region definitions and display templates) in Content Presenter. Unless you are absolutely sure you will not need Site Studio, Oracle strongly recommends installing and configuring it so you don’t have to come back to it later. | See Setting Up Site Studio.  
For information, see also Publishing Content Using Content Presenter in Building Portals with Oracle WebCenter Portal. See also Managing Oracle Site Studio. |
| Enable a Full-Text Search     | **Optional, but strongly recommended**  
Although configuring full-text searching and indexing capabilities is nominally optional, Oracle strongly recommends that you use the OracleTextSearch search option for full-text search. Note that this option should only be used in conjunction with an Oracle database. For MS-SQL, use the DATABASE.FULLTEXT option. | See Enabling Full-Text Search.  
For more information, also see Configuring OracleTextSearch for WebCenter Content in Installing and Configuring Oracle WebCenter Content and Site Studio Integration in Managing Oracle WebCenter Content in Managing Oracle WebCenter Content. |
| Create Content Profiles       | **Optional**  
Users have the option to upload content based on Content Profiles | See Creating Content Profiles in Oracle WebCenter Content Server.  
For more information about creating content profiles, see Managing Content Profiles in Managing Oracle WebCenter Content. |
### 6.4 Configuring Oracle WebCenter Content Server

After installing or upgrading to Oracle WebCenter Content 12c, there are several configuration tasks to perform to ensure that Oracle WebCenter Content Server works with Oracle WebCenter Portal.

The configuration tasks are listed in Table 6-3.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
</tr>
</thead>
</table>
| Enable Digital Asset Manager  | Optional  
If you want to use Content Presenter to use different renditions of images in your portal, you may want to enable Digital Asset Manager (DAM) in WebCenter Content Server. | See Enabling Digital Asset Manager.  
See also, Working with Image and Video Conversions in Managing Oracle WebCenter Content. |
| Additional Optional Configurations | Optional  
After completing the rest of your configuration, you can optionally configure desktop integration, configure the FileStore Provider component, and set up Node Manager. | See Additional Optional Configurations for Oracle WebCenter Content Server. |
| Register Content Server       | Mandatory  
Although in most cases the connection will be configured when WebCenter Portal first starts up, you should at least test it to make sure it has been configured correctly for your environment, and that data has been correctly seeded. | See Configuring the Default Oracle WebCenter Content Server Connection for Oracle WebCenter Portal.  
Be sure to also check the seeded data as described in Checking the Oracle WebCenter Portal Data Seeded in Oracle WebCenter Content Server. |

**Note:**

Prior to beginning the configuration you must have completed the installation and configuration steps described in Prerequisites for Configuring Oracle WebCenter Content Server, which define the starting point for the configuration steps in this section.
Caution:
To avoid conflicts and ensure you can migrate documents between multiple WebCenter Content Server instances, make sure that you have entered a unique Auto Number Prefix for your WebCenter Content Server instance. To check that the Auto Number Prefix is unique across WebCenter Content Server instances, log into WebCenter Content Server and navigate to Administration > Admin Server > General Configuration.

This section includes the following topics:

- Enabling Mandatory Components
- Configuring the Dynamic Converter Component
- Configuring the Inbound Refinery
- Setting Up SSL for Oracle WebCenter Content Server
- Configuring the SES Crawler
- Setting Up Site Studio
- Enabling Full-Text Search
- Creating Content Profiles in Oracle WebCenter Content Server
- Enabling Digital Asset Manager
- Additional Optional Configurations for Oracle WebCenter Content Server
- Registering the Default Oracle WebCenter Content Server Repository

6.4.1 Enabling Mandatory Components

A component is a functional unit that can be plugged into Oracle WebCenter Content Server to provide additional features or to modify existing functionality.

To prepare WebCenter Content Server for Oracle WebCenter Portal, you must:

- Enable FrameworkFolders
  For information, see Enabling the FrameworkFolders Component
- Enable WebCenterConfigure
  For information, see Enabling the WebCenterConfigure Component
- Enable AutoSuggestConfig
  AutoSuggestConfig sets the necessary AutoSuggest feature environment variables for Web UI. For enabling the component, follow the same procedure that you used for enabling other components, such as FrameworkFolders and WebCenterConfigure.

6.4.1.1 Enabling the FrameworkFolders Component

FrameworkFolders provides a hierarchical folder interface similar to a conventional file system, for organizing and locating some or all of the content in Oracle WebCenter
Content Server. In addition, it enables you to use WebCenter Content Server mobile applications to access content in portals and leverage the ADF content UI.

To enable the FrameworkFolders component:

1. Log on to WebCenter Content Server as an administrator.
2. From the Main menu, choose Administration, then Admin Server, then Component Manager.
3. On the Component Manager page, select the FrameworkFolders check box.
4. Click Update.
5. Click Advanced Component Manager.
6. On the Advanced Component Manager page, ensure that:
   - FrameworkFolders is listed in the Enabled Components section
   - Folders_g is listed in the Disabled Components section
7. Restart the WebCenter Content Server instance.

6.4.1.2 Enabling the WebCenterConfigure Component

You must enable the WebCenterConfigure component to configure Oracle WebCenter Content Server for Oracle WebCenter Portal.

Table 6-4 describes the tasks performed in WebCenter Content Server when you enable this component.

To enable the WebCenterConfigure component:

1. Log on to WebCenter Content Server as an administrator.
2. From the Main menu, choose Administration, then Admin Server, then Component Manager.
3. On the Component Manager page, select the WebCenterConfigure check box.

   Tip:
   On the Component Manager page, you can choose to select other components like Dynamic Converter if you plan to use them as you’ll otherwise need to enable them later.

4. Click Update.
5. Click Advanced Component Manager.
6. On the Advanced Component Manager page, ensure that WebCenter Configure is listed in the Enabled Components section.
7. Restart the WebCenter Content Server instance.

Enabling the WebCenterConfigure component performs certain tasks in WebCenter Content Server. Table 6-4 describes these tasks.

<table>
<thead>
<tr>
<th>Table 6-4</th>
<th>Tasks Associated with the WebCenterConfigure Component</th>
</tr>
</thead>
</table>
### Table 6-4 (Cont.) Tasks Associated with the WebCenterConfigure Component

<table>
<thead>
<tr>
<th>Tasks</th>
<th>Pointers to Verify the Completion of Tasks</th>
</tr>
</thead>
</table>
| Enables accounts | Content Server > Administration > Admin Server > General Configuration > Enable Accounts checkbox  
or  
MW_HOME/user_projects/domains/ucm_domain/ucm/cs/config/config.cfg file. The setting in this file is UseAccounts=1. |
| Allows updates to documents that are yet to be released | Content Server > Administration > Admin Server > General Configuration > Additional Configuration Variables  
or  
MW_HOME/user_projects/domains/ucm_domain/ucm/cs/config/config.cfg  
The setting is AllowUpdateForGenwww=1 |
| Adds metadata fields:  
  • xWCTags  
  • xWCPageId  
  • xWCWorkflowAssignment  
  • xWCWorkflowApproverUserList | You can view, edit, and add metadata fields here: Content Server > Administration > Admin Applets > Configuration Manager > Information Fields tab. |
| Sets Folder settings if the Folders_g component is enabled:  
  • System Default Information Field Configuration: Doc Type = Document  
  • Information Field Inherit Configuration  
    xWCWorkflowAssignment  
    xWCWorkflowApproverUserList | Content Server > Administration > Folder Configuration > System Default Information Field Configuration  
Content Server > Administration > Folder Configuration > Information Field Inherit Configuration |
| Adds the WCWorkflowApproverUserToken workflow token | Content Server > Administration > Admin Applets > Workflow Admin > Options > Tokens menu |
| Adds three DynamicConverter templates | If the DynamicConverter component is enabled, the DynamicConverter service is called to create the three DynamicConverter templates:  
  • SLIDE-PREVIEW  
  • SLIDE-PREVIEW-TEXT  
  • SLIDE-PREVIEW-LARGE |

</tr>
</tbody>
</table>

6.4.2 Configuring the Dynamic Converter Component

Configure the Dynamic Converter component to enable the Slide Previewer capability in Oracle WebCenter Portal.

The Slide Previewer makes use of the HTML renditions generated on the fly by the Dynamic Converter.

**Note:**
The Inbound Refinery must also be configured or any previews will fail. See Configuring the Inbound Refinery for the steps to configure the Inbound Refinery.

The configuration for the Dynamic Converter consists of two steps:

- Enabling the Dynamic Converter.
  
  For more information, see Enabling the Dynamic Converter Component.

**Tip:**
You may have already enabled the Dynamic Converter when you were enabling the mandatory components.

- Defining the file types for which the Dynamic Converter is available
  
  For more information, see Specifying the File Type, File Size, and Timeout Settings.
6.4.2.1 Enabling the Dynamic Converter Component

The Dynamic Converter generates HTML renditions on the fly that can be used by the Slide Previewer in Oracle WebCenter Portal.

To enable the Dynamic Converter component:

1. Log on to WebCenter Content Server as an administrator.

2. From the Main menu, choose Administration, then Admin Server, then Component Manager.

3. On the Component Manager page, select the DynamicConverter checkbox.

4. Click Update.

5. Restart the WebCenter Content Server instance.

6.4.2.2 Specifying the File Type, File Size, and Timeout Settings

After enabling the Dynamic Converter component, you must define the file types for which Dynamic Converter is available. You can also specify the maximum file size that can be processed by Dynamic Converter and amount of time after which conversion operations will fail.

To set the file types supported, the maximum file size allowed, and the timeout settings in Dynamic Converter:

1. Log on to WebCenter Content Server as an administrator.

2. From the Main menu, choose Administration, then Dynamic Converter Admin, then Configuration Settings.

   **Note:**
   
   The Dynamic Converter Admin menu option is not visible until after you restart the WebCenter Content Server instance after enabling the Dynamic Converter component.

3. In the Conversion Formats section, select the file formats from the drop-down list for which the Dynamic Converter will be enabled. Choose all the document formats for which you want to be able to generate HTML renditions, such as Word, Excel, PowerPoint, and PDF.

4. In the Maximum File Size field, specify the maximum size of files that Dynamic Converter will process.

   **Note:** For information about specifying the maximum upload size for files uploaded using Content Manager or through features such as a wiki, blog, or activity stream, see Oracle WebCenter Portal Configuration.

5. In the Time Out field, specify the amount of time after which dynamic conversions that take longer will fail.

   **Note:** For information about setting the timeout settings on the Inbound Refinery server, see Specifying the Timeout Setting for File Conversions.
6.4.3 Configuring the Inbound Refinery

The Inbound Refinery is a conversion server that manages file conversions for electronic assets such as documents, digital images, and motion videos. It also provides thumbnail functionality for documents and images and storyboarding for videos.

Optional, but strongly recommended

You can use Inbound Refinery to convert content items stored in Oracle WebCenter Content Server. Note that if you enabled the DynamicConverter component (used to generate slide previews), you must also configure the IBR.

To configure Inbound Refinery, you must set up an outgoing provider from WebCenter Content Server to Inbound Refinery, and specify the file types that will be converted. Although optional, you may also want to enable the conversion of wikis and blogs to PDF.

Prior to configuring Inbound Refinery, you should have:

- Installed Inbound Refinery, as described in Installation Prerequisites for Oracle WebCenter Content Server
- Completed the initial post-install configuration as described in Configuration Prerequisites for Oracle WebCenter Content Server and Inbound Refinery

This section contains the following subsections:

- Creating an Outbound Provider
- Selecting the File Formats To Be Converted
- Enabling the Conversion of Wikis and Blogs into PDFs
- Specifying the Timeout Setting for File Conversions

6.4.3.1 Creating an Outbound Provider

Before Oracle WebCenter Content Server can send files to Inbound Refinery for conversion, you must set up an outgoing provider from WebCenter Content Server to the Inbound Refinery with the Handles Inbound Refinery Conversion Jobs option checked.

To create an outbound provider:

1. From the WebCenter Content Server Administration menu, select Providers.

2. In the Create a New Provider section of the Providers page, click Add in the outgoing row.

3. Enter values for these fields:

   - **Provider Name**: Any short name with no spaces describing the Inbound Refinery instance the outgoing provider is for. It is a good idea to use the same name as the Inbound Refinery Instance Name.

   - **Provider Description**: A description of the outgoing provider.

   - **Server Host Name**: The name of the host machine where the Inbound Refinery instance is running (for example, myhost.example.com).
• **HTTP Server Address:** The address of the Inbound Refinery instance (for example, http://myhost.example.com:16250 where 16250 is the web port).

• **Server Port:** The IntradocServerPort value for the Inbound Refinery instance. This value was entered on the post-installation configuration page, and can be found on the Inbound Refinery configuration information page under **Server Port.** You can also find it in the MW_HOME/user_projects/domains/ucm_domain/ucm/ibr/config/config.cfg file as IntradocServerPort.

To display the Inbound Refinery configuration information page:

a. Log in to WebCenter Content Server and choose **Administration > Configuration for instanceName.**

b. Click **Server Configurations** to display the server configurations.

Or log into the IBR at **Administration > Admin Server > General Configuration.**

• **Instance Name:** The instance name for Inbound Refinery (the IDC_Name value in the config.cfg file). This value was entered on the post-installation configuration page as **Server Instance Name.** To find the instance name, log into the Inbound Refinery, and navigate to **Administration -> Configuration for instanceName.**

• **Relative Web Root:** The web root of the Inbound Refinery instance (for example, /ibr/).

4. Under Conversion Options, check **Handles Inbound Refinery Conversion Jobs.** Do not check **Inbound Refinery Read Only Mode.**

5. Click **Add.**

6. Restart WebCenter Content Server.

7. Go back to the Providers page, and check that the Connection State value is **good** for the provider.

   If the value is not good, double-check that you entered all the preceding entries correctly, and check that the WebCenter Content Server and Inbound Refinery instances can ping each other.

**6.4.3.2 Selecting the File Formats To Be Converted**

To tell Oracle WebCenter Content Server which files to send to Inbound Refinery to be converted, you need to select the file formats.

To select the file formats to be converted:

1. From the WebCenter Content Server Administration menu, select **Refinery Administration** and then **File Formats Wizard.**

---

**Note:**

**Refinery Administration** is not listed when there is no valid outgoing provider to an Inbound Refinery instance.
WebCenter Content Server displays the File Formats Wizard page. This page configures which file formats will be sent to Inbound Refinery for conversion when they are checked into WebCenter Content Server.

2. Select the file formats that you want to be converted.

Make sure you check all the file types you want sent to Inbound Refinery for conversion. Do not check HTML, and also do not check wiki and blog unless you have enabled their conversion through the WebCenterConversions component as described in Enabling the Conversion of Wikis and Blogs into PDFs.

3. Click Update.

6.4.3.3 Enabling the Conversion of Wikis and Blogs into PDFs

Enabling the conversion of wikis and blogs into PDFs requires you to first install the WebCenterConversions component, then configure OpenOffice, which converts HTML to PDF, in the Inbound Refinery server and Oracle WebCenter Content Server respectively.

Optional

The WebCenterConversions component adds the HtmToPDFOpenOffice conversion option, which makes use of OpenOffice conversion in Inbound Refinery (and therefore requires OpenOffice to be configured for that Inbound Refinery).

Note that you must complete the steps below in sequence. If you enable Wiki and Blogs by selecting them in the file Formats Wizard without first installing and enabling the Inbound Refinery, the Wiki and Blogs documents will be stuck in the Inbound Refinery conversion queues.

---

**Note:**

Only images that have been added through the Rich Text Editor (RTE) using the Embed Image feature are visible in the generated PDF. Images referenced with an external URL do not display in the PDF. For information on the RTE, see Using the Rich Text Editor (RTE) in Using Oracle WebCenter Portal.

---

**Tip:**

See also, File Formats Converted to PDF by Open Office in Managing Oracle WebCenter Content.

Before you can enable the conversion of wikis and blogs into PDFs in WebCenter Portal, you must first:

- Set up the OpenOffice integration with Inbound Refinery. For information, see Configuring Inbound Refinery to Use OpenOffice in Managing Oracle WebCenter Content.

- Perform the steps described in Setting Classpath to OpenOffice Class Files in Managing Oracle WebCenter Content (see also, Using OpenOffice Without Logging In to Host).

1. Install the WebCenterConversion component:

   a. Log in to the Inbound Refinery server.
b. Click Administration and then select Admin Server.  
The Inbound Refinery Admin Server page displays.

c. In the Component Manager, click the advanced component manager link.  
The Advanced Component Manager page displays.

d. In the Install New Component section, select the path to the  
WebCenterConversions.zip, then click Install.  
The WebCenterConversions.zip can be found under $MW_HOME$/wcportal/install/.  
The WebCenterConversion component displays in the Disabled Components box.

e. Select WebCenterConversion and click Enable.  
f. Restart the Inbound Refinery server.

2. Enable Inbound Refinery to integrate with OpenOffice:

a. Log in to the Inbound Refinery server again.

b. Click Administration and then select Admin Server.  
The Inbound Refinery Admin Server page displays.

c. In the Component Manager, select the OpenOfficeConversion check box.

d. Restart the Inbound Refinery server.

3. Enable the WebCenterConversion component:

a. In the Inbound Refinery server, under Conversion Settings, click the  
Conversion Listing link.  
This displays the Conversion Listing page.

b. In the Conversions table, select the Accept check box for  
HtmToPDFOpenOffice, and click Update.  
The Wiki and Blog options will now appear in WebCenter Content Server’s File  
Formats Wizard in the associated WebCenter Content Server instance.

4. Enable Wikis and Blogs to be converted to PDFs in WebCenter Content Server:

a. Log in to WebCenter Content Server.

b. Expand the Administration node, then Refinery Administration, and then click  
File Formats Wizard.

c. Under Select File Types, select the Wiki and Blogs check boxes and click  
Update.

5. Enable the PDF conversion in Inbound Refinery:

a. Log in to the Inbound Refinery server again.

b. Select Conversion Settings, and then select Primary Web Rendition.
c. Check the Convert to PDF using Open Office option.

d. Click Update.

6.4.3.4 Specifying the Timeout Setting for File Conversions

You can optionally set the maximum and minimum amount of time for which Inbound Refinery will process the different conversion operations.

To set the timeout settings for conversion operations:

1. Log on to the Inbound Refinery server.

2. Under Settings, select Timeouts.

3. Specify the minimum and maximum timeout settings for the various conversion operations as required.

4. Click Update.

**Note:** For information about setting the timeout settings in Dynamic Converter, see Specifying the File Type, File Size, and Timeout Settings.

6.4.4 Setting Up SSL for Oracle WebCenter Content Server

If Oracle WebCenter Portal and the Oracle WebCenter Content Server you intend to use for your content repository are not on the same system or the same trusted private network, then identity propagation is not secure.

To ensure secure identity propagation you must also configure SSL for WebCenter Content Server.

6.4.5 Configuring the SES Crawler

You can override the default search adapters and use Oracle SES to get unified ranking results for Oracle WebCenter Portal resources such as documents, pages, people, and so on.

**Optional**

Follow the steps in Setting Up Oracle WebCenter Content Server for Oracle SES to configure the SES crawler.

6.4.6 Setting Up Site Studio

Configuring Site Studio lets you use Site Studio to create and use Site Studio assets (region definitions and display templates) in Content Presenter.

**Optional, but strongly recommended**

Although configuring Site Studio is strictly speaking optional, without it you will not be able to create and use Site Studio-related assets in Content Presenter. Unless you are absolutely sure you will not need Site Studio, we strongly recommend installing and configuring it now rather than having to come back to it later.

To enable Site Studio:

1. Log in to WebCenter Content Server and open the Admin Server Page.

The Component Manager Page displays.
2. Click All Features.

   All components from the Document Management, Folders, Inbound Refinery, Integration, and Web Content Management categories are displayed.

3. Select the checkbox for each component you want to enable. The following components should be enabled:

   • LinkManager
   • SiteStudio
   • DBSearchContainsOpSupport (required for Full Text Search)
   • PortalVCRHelper

4. Click Update.

5. Restart the WebCenter Content Server instance.

6. Log back into WebCenter Content Server and open the Administration page.

7. Select Site Studio Administration, and then Set Default Project Document Information.

8. Accept the defaults and click Update.

9. Select Site Studio Administration, and then Set Default Web Asset Document Information.

10. Accept the defaults and click Update.

11. To use the Site Studio Designer, log into the WebCenter Content Server console, navigate to My Content Server > My Downloads, then download and install Site Studio Designer.

After setting up Site Studio, start (or restart) Oracle WebCenter Portal to seed the WebCenter Content Server instance with the appropriate assets, such as the RD_ARTICLE region definition.

6.4.6.1 Enabling the iFraming UI

If you want Site Studio to be displayed in Content Presenter using inline frames rather than in separate windows, and Oracle WebCenter Portal and Oracle WebCenter Content Server are not in the same domain (in terms of their web address), you must configure the Oracle HTTP Server (OHS).

Notes:

• Before enabling support for iFraming, you should already have installed and configured OHS as described in Installing and Configuring the Oracle HTTP Server.

• While Content Presenter allows specifying a different Content Server connection, iFraming is supported only for the default Content Server connection.

To enable the iFraming UI:
1. Open the *mod_wl_ohs.conf* file and make sure it points to the right WebCenter Content Server instance.

   The default location of this file is: `OHS_HOME/Oracle_WT1/instances/instance1/config/OHS/ohs1/mod_wl_ohs.conf`

2. Update the connection property of the Content Server to `webContextRoot="/cs"`.

   **Note:**
   This setting should never be set if OHS is not set up or is not working correctly.

3. Configure OHS by updating the *mod_wl_ohs.conf* file with the WebCenter Content Server and adfAuthentication protected URI information.

   For example:
   ```
   <Location /cs>
   SetHandler weblogic-handler
   WeblogicHost example.com
   WeblogicPort 9400
   </Location>
   
   <Location /adfAuthentication>
   SetHandler weblogic-handler
   WeblogicHost example.com
   WeblogicPort 9400
   </Location>
   
   If your WebCenter Content Server is configured with the Oracle AutoVue VueLink servlet, include the additional entry:
   ```
   <Location /vuelink>
   SetHandler weblogic-handler
   WeblogicHost example.com  # Same as /cs entry
   WeblogicPort 9400    # Same as /cs entry
   </Location>
   
   For more information about configuring OHS through the *mod_wl_ohs.conf* file, see [Oracle HTTP Server Configuration](#).

   Note that since WebCenter Portal is now front-ended by OHS, when you access WebCenter Portal you need to do so through OHS. Consequently, you would access your application using the following URL:

   `http://host:OHSPort/webcenter`

   For example:
   ```
   http://my.example.com:7777/webcenter
   ```

### 6.4.7 Enabling Full-Text Search

By default, the database used by Oracle WebCenter Content Server is set up to provide metadata-only searching and indexing capabilities. However, you can modify the
default configuration of the database to additionally support full-text searching and indexing.

Optional, but strongly recommended
Although nominally optional, Oracle recommends that you implement full-text search using the OracleTextSearch option.

For more information, see Configuring OracleTextSearch for Content Server in Installing and Configuring Oracle WebCenter Content, and Site Studio Integration in Managing Oracle WebCenter Content.

6.4.8 Creating Content Profiles in Oracle WebCenter Content Server

Users have the option to upload content using Content Server Profiles.

Optional
For more information on WebCenter Content Server Profiles, see Managing Content Profiles in Managing Oracle WebCenter Content.

You can use the content check-in page to check files into WebCenter Content Server. Required fields are indicated by an asterisk (*). All content profiles must include the mandatory fields, otherwise the check-in will fail.

In addition to the mandatory fields needed to upload files to WebCenter Content Server, for the upload profiles to work correctly in Document Library and Oracle WebCenter Portal, the WebCenter Content Server profiles should also contain the following fields:

- **xCollectionID** - for the folder name to be persisted
- **xIdcProfile** - for the profile value to be persisted
- **dRevLabel** - required by the CHECKIN_SEL_FORM API to enable a new version to be checked in

These fields can be added as hidden fields to the profile.

6.4.9 Enabling Digital Asset Manager

For full image rendition support, the Oracle WebCenter Content Server where your images are checked in must have Digital Asset Manager (DAM) enabled.

Optional
For example, you may want to use a large, high resolution image when the page containing the image is displayed using a desktop browser; a smaller, lower resolution image for display on a mobile phone; and a medium-sized, but still low resolution image for display on a tablet.

When DAM is enabled, different renditions are automatically created when an image is checked in, determined by the rendition set specified during check in. DAM provides some built-in rendition sets but the Content Server administrator can also create new rendition sets. The individual renditions can then be referenced by name in Content Presenter display templates by using the appropriate EL expression.

If DAM is not enabled, there is limited support only for image renditions through Inbound Refinery with web and thumbnail renditions.

For more information about enabling DAM and creating rendition sets, see Working with Image and Video Conversions in Managing Oracle WebCenter Content.
6.4.10 Additional Optional Configurations for Oracle WebCenter Content Server

This section describes additional optional configurations that are not required for Oracle WebCenter Content Server to function correctly, but nonetheless offer value and comprise best practices for a WebCenter Content Server enterprise installation.

This section includes the following topics:

- Configuring Oracle WebCenter Content Server for Desktop
- Configuring the File Store Provider
- Setting Up Node Manager
- Configuring Localization Properties
- Showing and Hiding the Wiki Markup Tab in the Rich Text Editor
- Disabling Text Wrapping in the Rich Text Editor

6.4.10.1 Configuring Oracle WebCenter Content Server for Desktop

Oracle WebCenter Content: Desktop provides convenient access to Oracle WebCenter Content Server files from a number of familiar desktop applications, such as Windows Explorer, Microsoft Office applications (Word, Excel, and Powerpoint), email clients (Microsoft Outlook and Lotus Notes), and web browsers (Internet Explorer, Mozilla Firefox, and Google Chrome).

For the Desktop client software to connect to WebCenter Content Server, the following system component must be enabled on the server:

- coreWebdav, which provides core WebDAV capabilities for the content management integrations.

In addition, you must also enable the following components:

- DesktopIntegrationSuite, which handles core content management integration functions on the server.
- DesktopTag, which manages custom properties in Microsoft Office files that are used for content tracking purposes, and also provides the workflow processing functionality in Microsoft Office applications.
- Framework Folders, which enables the content folders in the integration hierarchy.

You can also enable the following component:

- EmailMetadata, which maps email message fields to email metadata fields and is also required for dragging and dropping emails into content folders in Microsoft Outlook and Lotus Notes.

To configure WebCenter Content Server for Desktop:

1. Log in to WebCenter Content Server.
2. In the WebCenter Content Server Administration tray or menu, choose an Admin Server, then Component Manager.

3. On the Component Manager page, select Folders to display the Folders category of components.

5. Select the DesktopIntegrationSuite, DesktopTag, and, optionally, the EmailMetadata components.

6. Click the Update button, and then click OK to confirm your selections.

7. In the first paragraph of the Component Manager page, click advanced component manager.

8. In the Disabled Components box on the Advanced Component Manager page, select FolderStructureArchive, and click the Enable button.

9. Make sure that the CoreWebdav component is enabled:
   a. Under Category Filters on the Advanced Component Manager page, select Show System Components.
   b. If CoreWebdav is not in the Enabled Components box, select CoreWebdav in the Disabled Components box, and click the Enable button.

10. Restart WebCenter Content Server.

    For additional configuration information for Desktop, see Managing Desktop in Managing Oracle WebCenter Content.

    The Desktop client software must be installed on the computers of users wishing to use desktop integration. For more information, see Setting Up the Desktop Client Software on Your Computer in Using Oracle WebCenter Content: Desktop.

6.4.10.2 Configuring the File Store Provider

A file store for data management is used in Oracle WebCenter Content Server instead of the traditional file system for storing and organizing content.

The File Store Provider component is installed, enabled, and upgraded by default for a new WebCenter Content Server instance (with no documents in it). The File Store Provider component automatically upgrades the default file store (DefaultFileStore) to make use of functionality exposed by the component, including modifying the web, vault, and web URL path expressions.

The File Store Provider component exposes the file store functionality in the WebCenter Content Server interface and allows additional configuration options. For example, you can configure the WebCenter Content Server instance to use binary large object (BLOB) data types to store content in a database, instead of using a file system.

With File Store Provider, checked-in content and associated metadata are examined and assigned a storage rule based on criteria established by a system administrator. Criteria can include metadata, profiles, or other considerations. The storage rule determines how vault and web files are stored by the WebCenter Content Server system and how they are accessed by a web server.

The File Store Provider component enables you to define data-driven rules to store and access content managed by the WebCenter Content Server system. The
configuration steps below create a storage rule that ensures content is stored in the database rather than on the file system.

To create a storage rule:

1. Log in to the WebCenter Content Server instance as system administrator.
2. Select Administration, then Providers.
   
The Providers Page displays.
3. Click Info in the Action column next to the DefaultFileStore provider.
   
The File Store Provider Information Page displays.
4. Specify a name for the rule (for example, DBStorage) and select JDBC Storage.
5. Click OK.
   
The Edit File Store Provider Page displays.
6. Click Update.
7. Restart the WebCenter Content Server instance.

6.4.10.3 Setting Up Node Manager

As an additional step to configuring and managing Oracle WebCenter Content Server and the other servers in the domain in which it resides, you may want to consider using Oracle WebLogic Server Node Manager. Node Manager lets you start and stop WebLogic Server instances remotely, monitor them, and automatically restart them after an unexpected failure.

You can configure WebCenter Content Server, the Administration Server, and Node Manager to work together in a WebLogic Server domain. Node Manager is installed on all the machines that host any server instance. For more information about using Node Manager, see Using Node Manager with Oracle WebCenter Content in Installing and Configuring Oracle WebCenter Content.

6.4.10.4 Configuring Localization Properties

To ensure the Content Manager task flow works and displays proper translations on non-English locales, you need to configure Content Server for localization.

To configure enable or disable locales on Content Server:

1. Log on to WebCenter Content as an administrator.
2. From the Main menu, choose Administration, and then Localization.
3. Select the check boxes for the required locales.
4. Click Update.

6.4.10.5 Showing and Hiding the Wiki Markup Tab in the Rich Text Editor

When creating or editing a wiki document in the Rich Text Editor (RTE), the Wiki Markup tab is hidden by default. To show and hide the Wiki Markup tab, you can edit the configuration file blog-wiki-config.xml.xml.

Optional
Warning:
Switching between the Wiki Markup tab and other tabs in the RTE may cause data loss. For this reason, the Wiki Markup tab is disabled by default. Before you enable the Wiki Markup tab, consider potential issues that may result.

To show and hide the Wiki Markup tab for portals:

1. Export the latest configuration file blog-wiki-config.xml.xml from MDS:

   exportMetadata(application='webcenter', server='WC_Portal', toLocation='/scratch/aime1', docs='/oracle/webcenter/doclib/config/mdssys/cust/site/webcenter/blog-wiki-config.xml.xml')

2. If the configuration file is not found, create it at the path specified in Step 1, then edit the file to add the following code:

   ```xml
   ```

3. Edit the configuration file to change the value of element wiki.markup.enabled:

   ```xml
   <mds:modify element="/mds_ns1:adf-blogwiki-config/mds_ns1:properties/mds_ns1:property[@name='wiki.markup.enabled']"><mds:attribute name="value" value="[true|false]"/></mds:modify>
   ```

   where:
   - true: show the Wiki Markup tab
   - false (default): hide the Wiki Markup tab

4. Import the updated file to MDS:

   importMetadata(application='webcenter', server='WC_Portal', fromLocation='/scratch/aime1', docs='/oracle/webcenter/doclib/config/mdssys/cust/site/webcenter/blog-wiki-config.xml.xml')

6.4.10.6 Disabling Text Wrapping in the Rich Text Editor
By default, the Rich Text Editor wraps HTML source at 68 characters. This may cause some multibyte symbols to wrap incorrectly. If you encounter this problem, you can disable text wrapping in the Rich Text Editor.

Optional
To disable text wrapping in the Rich Text Editor:

1. Export the latest configuration file blog-wiki-config.xml.xml from MDS:
2. If the configuration file is not found, create it at the path specified in Step 1, then edit the file to add the following code:

```xml
<?xml version='1.0' encoding='UTF-8'?>
<mds:customization version="11.1.1.64.86" xmlns:mds="http://xmlns.oracle.com/mds"
  motype_local_name="adf-blogwiki-config" motype_nsuri="http://xmlns.oracle.com/webcenter/blogwiki/config">
  <mds:modify element="(xmlns(mds_ns1=http://xmlns.oracle.com/webcenter/blogwiki/config))/mds_ns1:adf-blogwiki-config/mds_ns1:properties/
    mds_ns1:property[@name='wiki.markup.enabled']/">
    <mds:attribute name="value" value="false"/>
  </mds:modify>
</mds:customization>
```

3. Edit the configuration file to change the value of element `text.wrap.length` to 0:

```xml
<mds:modify element="(xmlns(mds_ns1=http://xmlns.oracle.com/webcenter/blogwiki/config))/mds_ns1:adf-blogwiki-config/mds_ns1:properties/
  mds_ns1:property[@name='text.wrap.length']/">
  <mds:attribute name="value" value="0"/>
</mds:modify>
```

4. Import the updated file to MDS:

```xml
importMetadata(application='webcenter', server='WC_Portal', fromLocation='/', location=scratch/aime1', docs=oracle/webcenter/doclib/config/mdssys/cust/site/webcenter/blog-wiki-config.xml.xml')
```

### 6.4.11 Registering the Default Oracle WebCenter Content Server Repository

The default connection between Oracle WebCenter Portal and Oracle WebCenter Content Server may be configured for you when WebCenter Portal first starts up, but Oracle strongly recommends that you test the connection and check that the expected data has been properly seeded.

**Optional, but strongly recommended**

This section includes the following topics:

- Configuring the Default Oracle WebCenter Content Server Connection for Oracle WebCenter Portal
- Checking the Oracle WebCenter Portal Data Seeded in Oracle WebCenter Content Server

#### 6.4.11.1 Configuring the Default Oracle WebCenter Content Server Connection for Oracle WebCenter Portal

A default connection between Oracle WebCenter Portal and Oracle WebCenter Content Server may be automatically configured when WebCenter Portal first starts up, however, you should test the connection and check that it has been appropriately configured for your environment.

For high availability environments, or for single sign-on environments, you may have to modify the WebCenter Portal host and port settings.
After installing and configuring WebCenter Content Server, and restarting WebCenter Portal, check the connection between WebCenter Portal and WebCenter Content Server is properly configured. If your connection was not properly configured, then configure it as shown in Setting Connection Properties for the Default Oracle WebCenter Content Server Connection.

Some WebCenter Portal components rely on the data seeded in WebCenter Content Server when WebCenter Portal first starts up. Before configuring other components with WebCenter Portal, check that the expected data has been properly seeded as described in Checking the Oracle WebCenter Portal Data Seeded in Oracle WebCenter Content Server.

6.4.11.2 Checking the Oracle WebCenter Portal Data Seeded in Oracle WebCenter Content Server

When Oracle WebCenter Portal first starts up, a set of default data is seeded in the default Oracle WebCenter Content Server. The data seeded in WebCenter Content Server for a WebCenter Portal instance is based on several properties that are set on the default WebCenter Content Server connection.

For example:

Portal Server Identifier = /WebCenter1
Security Group = WC1

If the data is not correct, or has only been partially seeded, check the WebCenter Portal log and your WebCenter Content Server configuration, make the necessary corrections to these properties, and then restart the WebCenter Portal instance to reseed the data. For information about setting the default WebCenter Content Server connection, and setting additional properties required for WebCenter Portal's content repository, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection.

Table 6-5 illustrates the WebCenter Portal data that is seeded (Seeded Data), the naming for the data seeded (Naming) and how to check that the data is created in WebCenter Content Server (Verify).

<table>
<thead>
<tr>
<th>Seeded Data</th>
<th>Naming</th>
<th>Verify</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Group</td>
<td>One security group is seeded: securityGroup</td>
<td>In WebCenter Content Server, go to Administration</td>
</tr>
<tr>
<td></td>
<td>For example: WC1</td>
<td>&gt; Admin Applets &gt; User</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Admin &gt; Security &gt; Permission by Group</td>
</tr>
<tr>
<td>Roles</td>
<td>Two roles are seeded:</td>
<td>In WebCenter Content Server, go to Administration</td>
</tr>
<tr>
<td></td>
<td>• securityGroupUser (with R permission on</td>
<td>&gt; Admin Applets &gt; User</td>
</tr>
<tr>
<td></td>
<td>the security group)</td>
<td>Admin &gt; Security &gt; Permission by Role</td>
</tr>
<tr>
<td></td>
<td>• securityGroupAuthenUser (with RWD</td>
<td></td>
</tr>
<tr>
<td></td>
<td>permission on the security group)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For example: WC1User and</td>
<td></td>
</tr>
<tr>
<td></td>
<td>WC1AuthenUser</td>
<td></td>
</tr>
</tbody>
</table>
Table 6-5  (Cont.) Data Seeded in WebCenter Portal

<table>
<thead>
<tr>
<th>Seeded Data</th>
<th>Naming</th>
<th>Verify</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root Folder name</td>
<td>portalServerIdentifier (with Security Group = securityGroup)</td>
<td>Browse content (folder will be listed as a top-level folder)</td>
</tr>
<tr>
<td></td>
<td>For example: /WebCenter1</td>
<td></td>
</tr>
<tr>
<td>Default Attributes - Public users</td>
<td>All public users have:</td>
<td>Query the ExtendedConfigProperties table, or after logging into WebCenter Content Server, click on the user name to view the user's profile page listing their roles and accounts, including the account PUBLIC and WCILS and the role securityGroupUser</td>
</tr>
<tr>
<td></td>
<td>• Read on the account prefix PUBLIC</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Read on the account prefix WCILS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The securityGroup role</td>
<td></td>
</tr>
<tr>
<td>Default Attributes - Authenticated users</td>
<td>All Authenticated users have:</td>
<td>Query the ExtendedConfigProperties table, or after logging into WebCenter Content Server, click on the user name to view the user's profile page listing their roles and accounts, including the account AUTHEN and WCILS and the role securityGroupAuthenUser</td>
</tr>
<tr>
<td></td>
<td>• Read permission on the account prefix AUTHEN</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Read, Write, Delete, Admin permission on the account prefix WCILS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The securityGroupAuthenUser role</td>
<td></td>
</tr>
</tbody>
</table>

Table 6-6 illustrates the data that is seeded for the Home portal (Seeded Data), the naming for the data seeded (Naming) and how to check that the data is created in WebCenter Content Server (Verify). Note that the Home portal data is seeded only once in a WebCenter Content Server instance, regardless of how many WebCenter Portal instances are using the same WebCenter Content Server. Therefore, if you have multiple WebCenter Portal instances using the same WebCenter Content Server, they will all share the same Home portal data.

Table 6-6  Data Seeded for the Home Portal

<table>
<thead>
<tr>
<th>Seeded Data</th>
<th>Naming</th>
<th>Verify</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Group</td>
<td>One security group is seeded:</td>
<td>In WebCenter Content Server, go to Administration &gt; Admin Applets &gt; User Admin &gt; Security &gt; Permission by Group</td>
</tr>
<tr>

<td>• The PersonalSpacesAutothnRole</td>
<td></td>
</tr>
</tbody>
</table>

6.5 Creating a Connection to Oracle WebCenter Content Server

A default connection to Oracle WebCenter Content Server may be automatically created and configured when Oracle WebCenter Portal first starts up, but you may want to change the default settings or register other WebCenter Content Server repositories.

This section contains the following topics:

- About Creating a Connection to Oracle WebCenter Content Server
- Creating a Connection to Oracle WebCenter Content Server Using Fusion Middleware Control
6.5.1 About Creating a Connection to Oracle WebCenter Content Server

When creating a connection to Oracle WebCenter Content Server, there are several things to think about.

Consider the following:

- Oracle WebCenter Portal communicates with WebCenter Content Server over the Remote Intradoc Client (RIDC). RIDC provides the ability for WebCenter Portal to remotely execute WebCenter Content Server services. It also handles things like connection pooling, security, and protocol specifics. RIDC supports socket-based communication and the HTTP and JAX-WS protocols.

  - **Socket** — The socket protocol communicates to WebCenter Content Server over the Intradoc socket port. This protocol requires a trusted connection between WebCenter Portal and WebCenter Content Server and does not perform any password validation.

    The socket-based communication can also be configured to run over SSL to provide extra security.

  - **HTTP** — Using the HTTPClient package, RIDC communicates with the web server attached to WebCenter Content Server. Unlike the socket protocol, this protocol requires authentication credentials for each request.

    The HTTP protocol can also be load-balanced using an HTTP load balancer such as Oracle Traffic Director.

  - **JAX-WS** — With JAX-WS, WebCenter Portal must authenticate with WebCenter Content Server for each connection rather than assuming any connection from WebCenter Portal is automatically a trusted connection. The JAX-WS protocol is only supported in Oracle WebCenter Content with a properly configured WebCenter Content Server instance and the RIDC client installed.

- Additional configuration is required for the default WebCenter Content Server connection:

  - A user name with administrative rights for the WebCenter Content Server instance is required (Content Administrator). This user is used to create and maintain folders for portal content, security groups and roles, and manage content access rights. The default content administrator is sysadmin.

    Administrative privileges are required for this connection so that operations can be performed on behalf of WebCenter Portal users.

  - The Portal Server Identifier value is used as the name for the root folder within the WebCenter Content Server repository under which all WebCenter Portal content is stored. For the Portal Server Identifier value, you must specify a WebCenter Content Server folder that does not yet exist. Use the format: /foldername. For example: /MyWebCenterPortal. The Portal Server Identifier cannot be /, the WebCenter Content Server root itself, and it must be unique across different portals. The folder specified is created for you when WebCenter Portal starts up. Invalid entries include: /, /foldername/, /foldername/subfolder.
The Security Group, identifies a WebCenter Portal instance within this WebCenter Content Server repository and must have a unique value (for example: MyWCPApp). The name must be 14 characters or less, begin with an alphabetical character, followed by any combination of alphanumeric characters or the underscore character.

The Security Group value is used for the following:

◆ To separate data when multiple WebCenter Portal instances share the same WebCenter Content Server instance and should be unique across applications.

◆ As the name of the security group in which all data created in that WebCenter Portal instance is stored.

◆ As the prefix for the role (the name format is securityGroupUser and securityGroupAuthenUser).

◆ To stripe users permissions on accounts for the particular WebCenter Portal instance.

◆ To stripe default attributes for the particular WebCenter Portal instance.

For information about security groups and roles, see Advanced Administration: Security in Administering Oracle WebCenter Content. For information about folders, see Organizing Content in Managing Oracle WebCenter Content.

- Portal Server Identifier and Security Group values:

  - For the default connection in WebCenter Portal, the Portal Server Identifier and Security Group values are used to create the seed data in WebCenter Content Server to enable storage of portal-related data.

  Warning:

  You should never change the Portal Server Identifier or Security Group values separately; you should always change both. That is, if you change the Portal Server Identifier value after configuring and running WebCenter Portal, then you must also change the Security Group value, and vice versa. That is, you must change both values (Portal Server Identifier and Security Group) to unique values if WebCenter Portal already contains the seed data.

When you change these values, the existing seed data is not renamed in WebCenter Content Server. Instead, new seed data is created using the new values when you start the application. Once the application is started, new WebCenter Portal data is created under the new Portal Server Identifier folder and existing data under the old folder is no longer available. This means that the Documents tools will now be disabled in WebCenter Portal where the Documents tools were previously enabled, prior to changing the Portal Server Identifier.
Although the Portal Server Identifier and Security Group values change, the old folder still appears in search results, like any other folder in WebCenter Content Server.

- At start up, WebCenter Portal creates seed data (if it does not already exist) in the default WebCenter Content Server repository for WebCenter Portal.

6.5.2 Creating a Connection to Oracle WebCenter Content Server Using Fusion Middleware Control

You can register Oracle WebCenter Content Server as a content repository for Oracle WebCenter Portal using Fusion Middleware Control.

This section includes the following topics:

- Connecting to Oracle WebCenter Content Server Using Socket-Based Communication
- Connecting to Oracle WebCenter Content Server Using Secure Socket-Based Communication
- Connecting to Oracle WebCenter Content Server Using JAX-WS
- Connecting to Oracle WebCenter Content Server Using HTTP

6.5.2.1 Connecting to Oracle WebCenter Content Server Using Socket-Based Communication

The socket protocol communicates to Oracle WebCenter Content Server over the Intradoc socket port.

Note:
Some additional configuration is required for the default WebCenter Content Server connection. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

To connect to WebCenter Content Server using socket-based communication:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Click Add.

5. In the Connection Name field, enter a unique name for the WebCenter Content Server connection.
Tip:
The name must be unique (across all connection types) within WebCenter Portal.

6. The Repository Type is Oracle Content Server.

7. Select Active Connection to make this the default WebCenter Content Server connection for WebCenter Portal.

You can create connections to multiple WebCenter Content Server instances; all connections are used. One connection must be the default connection. The default connection is the one used by WebCenter Portal to store portal-related documents.

If this is the default connection for WebCenter Portal, some additional configuration is required. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

Note:
Deselecting this option does not disable the connection. If a connection is no longer required, you must delete the connection. For more information, see Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control.

8. From the RIDC Socket Type dropdown list, select Socket.

9. In the Server Host field, enter the host name of the machine where WebCenter Content Server is running.

For example: mycontentserver.example.com.

10. In the Server Port field, enter the port specified for the WebCenter Content Server’s incoming provider.

This property corresponds to the IntradocServerPort setting in the WebCenter Content Server configuration file, which defaults to 4444.

Tip:
You can find the current value by logging into WebCenter Content Server and navigating to Administration > Admin Server > General Configuration > Additional Configuration Variables > IntradocServerPort.

11. In the Connection Timeout field, enter the length of time (in milliseconds) to attempt to log in to WebCenter Content Server before issuing a connection timeout message.

This value is also used as the socket timeout for the underlying RIDC connection for all service requests.

If the Connection Timeout is not set, the following values are used:

- Login timeout — the default concurrency timeout configured for the oracle.webcenter.content resource (30 seconds or 30000 milliseconds). See Configuring Concurrency Management in Tuning Performance.
• **RIDC socket timeout** — the default RIDC socket timeout (60 seconds or 60000 milliseconds).

  **Tip:**
  It is recommended that you do not specify a value less than 60000 milliseconds for the *Connection Timeout*, as this would reduce the RIDC socket timeout and increase the likelihood that long running requests time out. For example, timeouts may occur during long running searches, long file uploads, or long copy operations.

12. From the **Authentication Method** dropdown list, select:

• **Identity Propagation** if WebCenter Content Server uses the same identity store as WebCenter Portal to authenticate users. If you select this option, you must also specify the appropriate **Web Server context root for Content Server**.

• **External Application** if WebCenter Content Server uses an external application to authenticate users. Select this option if you want to use public, shared, or mapped credentials. If you select this option, you must also specify the appropriate **Associated External Application**.

13. (Only if **Authentication Method** is **Identity Propagation**) In the **Web Server context root for Content Server** field, enter the web server context root for WebCenter Content Server if WebCenter Content Server is front-ended with Oracle HTTP Server (OHS).

  Use the format `/contextRoot`. For example, `/cs`.

Oracle recommends that you access WebCenter Portal through Oracle HTTP Server (OHS) if you want to use Content Presenter to create or edit Site Studio content. Without Oracle HTTP Server (and WebContextRoot configuration), it is still possible to create or edit Site Studio content from within Content Presenter, but the create and edit actions launch new browser windows (or tabs) rather than opening within the Content Presenter task flow. For more information, see Creating or Editing Site Studio Content in the Content Presenter Configuration Dialog in *Building Portals with Oracle WebCenter Portal*.

14. (Only if **Authentication Method** is **External Application**) From the **Associated External Application** dropdown list, select the application to use to authenticate users with WebCenter Content Server.

  **Tip:**
  If the application has not yet been registered with WebCenter Portal, select **Create New** to register it now. For more information, see Registering External Applications Using Fusion Middleware Control.

15. In the **Administrator User Name** field, enter the user name of a user with administrative rights for this WebCenter Content Server instance.

  This user is used to fetch content type information based on profiles and track document changes for cache invalidation purposes.

  The default value is *sysadmin*.
16. In the **Administrator Password** field, enter the password for the user specified in the **Administrator User Name** field.

17. In the **Cache Invalidation Interval** field, enter the time (in minutes) to allow between checks for external WebCenter Content Server content changes.

WebCenter Portal automatically clears items that have changed from the cache. The minimum interval is 2 minutes.

By default, cache invalidation is disabled so no periodic check is made for content changes (shown as 0).

18. In the **Maximum Cached Document Size**, enter a maximum cacheable size (in bytes) for WebCenter Content Server binary documents.

Documents larger than this size are not cached by WebCenter Portal. The default is 102400 bytes (100KB).

**Tip:**

Tune this value based on your machine’s memory configuration and the types of binary documents that you expect to cache. Be aware that, unless Coherence is enabled, there is no maximum total size for the cache.

If you are using Coherence, you can additionally specify the total amount of memory to be used for binary caches. For this reason, using Coherence for any type of production environment is strongly recommended, and is a requirement for High Availability (HA) environments. For more information, see **Modifying Cache Settings for Content Presenter**.

**Note:**

Most documents stored in WebCenter Content Server are considered binary content, that is, images, plain text, Word documents, and so on. The only exception is Site Studio content, which is stored in CDF data files and cached separately in a Virtual Content Repository (VCR) cache (or node cache).

19. Click **Test** to verify if the connection you created works.

20. Click **OK** to save the connection.

The registered connection is now available to the Content Manager and Content Presenter task flows, which you can add to pages in WebCenter Portal. See also, **Working with the Content Manager Task Flow in Building Portals with Oracle WebCenter Portal**.

To start using the connection, you must restart the managed server on which WebCenter Portal is deployed (WC_Portal by default). For more information, see **Starting and Stopping Managed Servers**.
6.5.2.2 Connecting to Oracle WebCenter Content Server Using Secure Socket-Based Communication

The socket protocol communicates to Oracle WebCenter Content Server over the Intradoc socket port. The socket-based communication can also be configured to run over SSL to provide extra security.

Before you can connect to WebCenter Content Server using secure socket-based communication, you must:

- Configure SSL on WebCenter Content Server.

**Note:**

Some additional configuration is required for the default WebCenter Content Server connection. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

To connect to WebCenter Content Server using secure socket-based communication:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.

   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select **Settings** and then **Service Configuration**.

3. On the WebCenter Portal Services Configuration page, from the list of services select **Content Repository**.

4. Click **Add**.

5. In the **Connection Name** field, enter a unique name for the WebCenter Content Server connection.

   **Tip:**
   
   The name must be unique (across all connection types) within WebCenter Portal.

6. The **Repository Type** is **Oracle Content Server**.

7. Select **Active Connection** to make this the default WebCenter Content Server connection for WebCenter Portal.

   You can create connections to multiple WebCenter Content Server instances; all connections are used. One connection must be the default connection. The default connection is the one used by WebCenter Portal to store portal-related documents.

   If this is the default WebCenter Content Server connection for WebCenter Portal, some additional configuration is required. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.
**Note:**

Deselecting this option does not disable the connection. If a connection is no longer required, you must delete the connection. For more information, see [Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control](#).

8. From the **RIDC Socket Type** dropdown list, select **Socket SSL**.

9. In the **Server Host** field, enter the host name of the machine where WebCenter Content Server is running.

   For example: `mycontentserver.example.com`.

10. In the **Server Port** field, enter the port specified for the WebCenter Content Server’s `sslincoming` provider.

    This property corresponds to the `IntradocServerPort` setting in the WebCenter Content Server configuration file, which defaults to `4444`.

    **Tip:**

    You can find the current value by logging into WebCenter Content Server and navigating to **Administration > Admin Server > General Configuration > Additional Configuration Variables > IntradocServerPort**.

11. In the **Connection Timeout** field, enter the length of time (in milliseconds) to attempt to log in to WebCenter Content Server before issuing a connection timeout message.

    This value is also used as the socket timeout for the underlying RIDC connection for all service requests.

    If the **Connection Timeout** is not set, the following values are used:

    • **Login timeout** — the default concurrency timeout configured for the `oracle.webcenter.content` resource (30 seconds or 30000 milliseconds). See Configuring Concurrency Management in [Tuning Performance](#).

    • **RIDC socket timeout** — the default RIDC socket timeout (60 seconds or 60000 milliseconds).

    **Tip:**

    It is recommended that you do not specify a value less than 60000 milliseconds for the **Connection Timeout**, as this would reduce the RIDC socket timeout and increase the likelihood that long running requests time out. For example, timeouts may occur during long running searches, long file uploads, or long copy operations.

12. From the **Authentication Method** dropdown list, select:

    • **Identity Propagation** if WebCenter Content Server uses the same identity store as WebCenter Portal to authenticate users.

    If you select this option, you must also specify the appropriate **Web Server context root for Content Server**.
• **External Application** if WebCenter Content Server uses an external application to authenticate users. Select this option if you want to use public, shared, or mapped credentials.

  If you select this option, you must also specify the appropriate **Associated External Application**.

13. **(Only if Authentication Method is Identity Propagation)** In the **Web Server context root for Content Server** field, enter the web server context root for WebCenter Content Server if WebCenter Content Server is front-ended with Oracle HTTP Server (OHS).

  Use the format `/contextRoot`. For example, `/cs`.

  Oracle recommends that you access WebCenter Portal through Oracle HTTP Server (OHS) if you want to use Content Presenter to create or edit Site Studio content. Without Oracle HTTP Server (and WebContextRoot configuration), it is still possible to create or edit Site Studio content from within Content Presenter, but the create and edit actions launch new browser windows (or tabs) rather than opening within the Content Presenter task flow. For more information, see Creating or Editing Site Studio Content in the Content Presenter Configuration Dialog in *Building Portals with Oracle WebCenter Portal*.

14. **(Only if Authentication Method is External Application)** From the **Associated External Application** dropdown list, select the application to use to authenticate users with WebCenter Content Server.

  **Tip:**

  If the application has not yet been registered with WebCenter Portal, select **Create New** to register it now. For more information, see Registering External Applications Using Fusion Middleware Control.

15. In the **Administrator User Name** field, enter a user name with administrative rights for this WebCenter Content Server instance.

  This user is used to fetch content type information based on profiles and track document changes for cache invalidation purposes.

  Defaults to `sysadmin`.

16. In the **Administrator Password** field, enter the password for the user specified in the **Administrator User Name** field.

17. In the **Key Store Location** field, enter the location of the keystore that contains the private key used to sign the security assertions.

  The keystore location must be an absolute path.

  For example, `D:\keys\keystore.xyz`.

18. In the **Key Store Password** field, enter the password required to access the keystore.

  For example, `TOPS3CR3T`.

19. In the **Private Key Alias** field, enter the client private key alias in the keystore.

  The public key corresponding to this private key must be imported in the server keystore.
Ensure that the alias does not contain special characters or white space.

For example, enigma.

20. In the **Private Key Password** field, enter the password to use with the private key alias in the keystore.

For example, c0d3bR3ak3R.

21. In the **Cache Invalidation Interval** field, enter the time (in minutes) to allow between checks for external WebCenter Content Server content changes.

WebCenter Portal automatically clears items that have changed from the cache. The minimum interval is 2 minutes.

By default, cache invalidation is disabled so no periodic check is made for content changes (shown as 0).

22. In the **Maximum Cached Document Size**, enter a maximum cacheable size (in bytes) for WebCenter Content Server binary documents.

Documents larger than this size are not cached by WebCenter Portal.

The default is 102400 bytes (100KB).

**Tip:**

Tune this value based on your machine’s memory configuration and the types of binary documents that you expect to cache. Be aware that, unless Coherence is enabled, there is no maximum total size for the cache.

If you are using Coherence, you can additionally specify the total amount of memory to be used for binary caches. For this reason, using Coherence for any type of production environment is strongly recommended, and is a requirement for High Availability (HA) environments. For more information, see [Modifying Cache Settings for Content Presenter](#).

**Note:**

Most documents stored in WebCenter Content Server are considered binary content, that is, images, plain text, Word documents, and so on. The only exception is Site Studio content, which is stored in CDF data files and cached separately in a Virtual Content Repository (VCR) cache (or node cache).

23. Click **Test** to verify if the connection you created works.

24. Click **OK** to save the connection.

The registered connection is now available to the Content Manager and Content Presenter task flows, which you can add to pages in WebCenter Portal. See also, Working with Content Manager Task Flow in *Building Portals with Oracle WebCenter Portal*.

To start using the connection, you must restart the managed server on which WebCenter Portal is deployed (WC_Portal by default). For more information, see [Starting and Stopping Managed Servers](#).
6.5.2.3 Connecting to Oracle WebCenter Content Server Using JAX-WS

With JAX-WS, Oracle WebCenter Portal must authenticate with Oracle WebCenter Content Server for each connection rather than assuming any connection from WebCenter Portal is automatically a trusted connection.

---

**Note:**

Some additional configuration is required for the default WebCenter Content Server connection. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

---

To connect to WebCenter Content Server using JAX-WS:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select **Settings** and then **Service Configuration**.

3. On the WebCenter Portal Services Configuration page, from the list of services select **Content Repository**.

4. Click **Add**.

5. In the **Connection Name** field, enter a unique name for the WebCenter Content Server connection.
   
   **Tip:**
   
   The name must be unique (across all connection types) within WebCenter Portal.

6. The **Repository Type** is **Oracle Content Server**.

7. Select **Active Connection** to make this the default WebCenter Content Server connection for WebCenter Portal.

   You can create connections to multiple WebCenter Content Server instances; all connections are used. One connection must be the default connection. The default connection is the one used by WebCenter Portal to store portal-related documents.

   If this is the default content repository for WebCenter Portal, some additional configuration is required. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

---

**Note:**

Deselecting this option does not disable the connection. If a connection is no longer required, you must delete the connection. For more information, see Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control.

---
8. From the RIDC Socket Type dropdown list, select JAX-WS.

9. In the Web Service URL field, enter the web service URL required to connect to WebCenter Content Server when using the JAX-WS protocol.
   
   Use the format http://host:port/webRoot
   
   For example, http://myhost.com:9044/idcnativews

10. In the Client Security Policy field, enter the client security policy to use.
    
    For example, oracle/wss11_saml_token_with_message_protection_service_policy
    
    The JAX-WS client security policy can be any valid OWSM policy, but must match the security policy configured for WebCenter Content Server’s Native Web Services IdcWebLogin service. For more information about the IdcWebLogin service, see WebCenter Content Web Services in Developing with Oracle WebCenter Content.
    
    **Tip:**
    
    Leave this field blank if your environment supports Global Policy Attachments (GPA).

11. In the Connection Timeout field, specify the length of time (in milliseconds) to attempt to log in to WebCenter Content Server before issuing a connection timeout message.
    
    If the Connection Timeout is not set, the default concurrency timeout configured for the oracle.webcenter.content resource is used (30 seconds or 30000 milliseconds). See Configuring Concurrency Management in Tuning Performance.

12. In the Administrator User Name field, enter a user name with administrative rights for this WebCenter Content Server instance.
    
    This user is used to fetch content type information based on profiles and track document changes for cache invalidation purposes.
    
    Defaults to sysadmin.

13. In the Administrator Password field, enter the password for the user specified in the Administrator User Name field.

14. In the Cache Invalidation Interval field, enter the time (in minutes) to allow between checks for external WebCenter Content Server content changes.
    
    WebCenter Portal automatically clears items that have changed from the cache. The minimum interval is 2 minutes.
    
    By default, cache invalidation is disabled so no periodic check is made for content changes (shown as 0).

15. In the Maximum Cached Document Size, enter a maximum cacheable size (in bytes) for WebCenter Content Server binary documents.
    
    Documents larger than this size are not cached by WebCenter Portal.
    
    The default is 102400 bytes (100KB).
Tip:
Tune this value based on your machine’s memory configuration and the types of binary documents that you expect to cache. Be aware that, unless Coherence is enabled, there is no maximum total size for the cache.

If you are using Coherence, you can additionally specify the total amount of memory to be used for binary caches. For this reason, using Coherence for any type of production environment is strongly recommended, and is a requirement for High Availability (HA) environments. For more information, see Modifying Cache Settings for Content Presenter.

Note:
Most documents stored in WebCenter Content Server are considered binary content, that is, images, plain text, Word documents, and so on. The only exception is Site Studio content, which is stored in CDF data files and cached separately in a Virtual Content Repository (VCR) cache (or node cache).

16. Click Test to verify if the connection you created works.
17. Click OK to save the connection.

The registered connection is now available to the Content Manager and Content Presenter task flows, which you can add to pages in WebCenter Portal. See also, Working with the Content Manager Task Flow in Building Portals with Oracle WebCenter Portal.

To start using the connection, you must restart the managed server on which WebCenter Portal is deployed (WC_Portal by default). For more information, see Starting and Stopping Managed Servers.

6.5.2.4 Connecting to Oracle WebCenter Content Server Using HTTP
Using the HTTPClient package, RIDC communicates with the web server attached to Oracle WebCenter Content Server.

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.

See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Click Add.

5. In the Connection Name field, enter a unique name for the WebCenter Content Server connection.

Tip:
The name must be unique (across all connection types) within WebCenter Portal.

6. The Repository Type is Oracle Content Server.
7. Do not select **Active Connection**.

The HTTP protocol does not allow identity propagation, therefore it is not suitable to use for the default WebCenter Content Server connection for WebCenter Portal. That is, you should not use this protocol to connect to the back-end WebCenter Content Server repository that is being used to store portal-related documents.

8. From the **RIDC Socket Type** dropdown list, select **Web**.

9. In the **Web URL** field, enter the web server URL for WebCenter Content Server.

   Use the format `http://host:port/webRoot/pluginRoot`.

   For example, `http://mycontentserver/cms/idcplug`.

10. In the **Connection Timeout** field, specify the length of time (in milliseconds) to attempt to log in to WebCenter Content Server before issuing a connection timeout message.

    This value is also used as the socket timeout for the underlying RIDC connection for all service requests.

    If the **Connection Timeout** is not set, the following values are used:

    - **Login timeout** — the default concurrency timeout configured for the `oracle.webcenter.content` resource (30 seconds or 30000 milliseconds). See Configuring Concurrency Management in Tuning Performance.
    - **RIDC socket timeout** — the default RIDC socket timeout (60 seconds or 60000 milliseconds).

    **Tip:**

    It is recommended that you do not specify a value less than 60000 milliseconds for the **Connection Timeout**, as this would reduce the RIDC socket timeout and increase the likelihood that long running requests time out. For example, timeouts may occur during long running searches, long file uploads, or long copy operations.

11. From the **Associated External Application** dropdown list, select the application to use to authenticate users with WebCenter Content Server.

    **Tip:**

    If the application has not yet been registered with WebCenter Portal, select **Create New** to register it now. For more information, see Registering External Applications Using Fusion Middleware Control.

12. In the **Administrator User Name** field, enter a user name with administrative rights for this WebCenter Content Server instance.

    This user is used to fetch content type information based on profiles and track document changes for cache invalidation purposes.

    Defaults to `sysadmin`.

13. In the **Administrator Password** field, enter the password for the user specified in the **Administrator User Name** field.
14. In the **Cache Invalidation Interval** field, enter the time (in minutes) to allow between checks for external WebCenter Content Server content changes.

WebCenter Portal automatically clears items that have changed from the cache. The minimum interval is 2 minutes.

By default, cache invalidation is disabled so no periodic check is made for content changes (shown as 0).

15. In the **Maximum Cached Document Size**, enter a maximum cacheable size (in bytes) for WebCenter Content Server binary documents.

Documents larger than this size are not cached by WebCenter Portal.

The default is 102400 bytes (100KB).

**Tip:**

Tune this value based on your machine’s memory configuration and the types of binary documents that you expect to cache. Be aware that, unless Coherence is enabled, there is no maximum total size for the cache.

If you are using Coherence, you can additionally specify the total amount of memory to be used for binary caches. For this reason, using Coherence for any type of production environment is strongly recommended, and is a requirement for High Availability (HA) environments. For more information, see **Modifying Cache Settings for Content Presenter**.

**Note:**

Most documents stored in WebCenter Content Server are considered binary content, that is, images, plain text, Word documents, and so on. The only exception is Site Studio content, which is stored in CDF data files and cached separately in a Virtual Content Repository (VCR) cache (or node cache).

16. Click **OK** to save the connection.

17. Click **Test** to verify if the connection you created works.

The registered connection is now available to the Content Manager and Content Presenter task flows, which you can add to pages in WebCenter Portal. See also, **Managing Connections to Oracle WebCenter Content Server**.

To start using the connection, you must restart the managed server on which WebCenter Portal is deployed (WC_Portal by default). For more information, see **Starting and Stopping Managed Servers**.

### 6.5.3 Registering Oracle WebCenter Content Server Using WLST

Use the WLST command `createContentServerConnection` to register Oracle WebCenter Content Server with Oracle WebCenter Portal.

For command syntax and examples, see `createContentServerConnection` in **WebCenter WLST Command Reference**.

To configure the connection as the default connection for WebCenter Portal, set `isPrimary='true'`. If you mark a connection as primary, you must run the `setContentServerProperties` WLST command to specify certain additional
properties required for the primary WebCenter Content Server connection. See Changing the Default Oracle WebCenter Content Server Connection.

**Note:**
You must set additional connection properties for the default WebCenter Content Server connection. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using WLST.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

To start using the new connection you must restart the managed server on which WebCenter Portal is deployed. See Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

Note that if you are using the Content Manager or Content Presenter task flows, WebCenter Content Server should be started first to allow for initial provisioning to take place.

### 6.5.4 Oracle WebCenter Content Server Connection Parameters for RIDC Socket Types

The configuration parameters you need to set for your Oracle WebCenter Content Server connection depend on the RIDC socket type.

<table>
<thead>
<tr>
<th>Connection Parameter (WLST Command Argument)</th>

### 6.6 Changing the Default Oracle WebCenter Content Server Connection

Oracle WebCenter Portal supports multiple Oracle WebCenter Content Server connections, but only one connection can be designated the default connection.

The default WebCenter Content Server connection becomes the default back-end repository for portal documents (including the Home portal). The default connection is also used as the default connection for the Documents tools and Content Manager and Content Presenter task flows.

This section contains the following topics:

- Changing the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control
- Changing the Default Oracle WebCenter Content Server Connection Using WLST
- Setting Connection Properties for the Default Oracle WebCenter Content Server Connection

#### 6.6.1 Changing the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control

You can use Fusion Middleware Control to change the default Oracle WebCenter Content Server connection.

To change the active (or default) content repository connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. See Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select **Settings** and then **Service Configuration**.

3. On the WebCenter Portal Services Configuration page, from the list of services select **Content Repository**.

   The Manage Content Repository Connections table indicates the current default connection (if any).

4. Select the connection you want to become the default connection, and then click **Edit**.

5. Select the **Active Connection** check box.

   Before saving your changes, be sure to provide values for the **Content Administrator**, **Portal Server Identifier** and **Security Group** fields. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control.

6. Click **Test** to verify if the connection you activated works.

7. Click **OK** to update the connection.

8. To start using the updated connection you must restart the managed server on which WebCenter Portal is deployed.

**6.6.2 Changing the Default Oracle WebCenter Content Server Connection Using WLST**

Use the WLST command `setContentServerConnection` with `isPrimary='true'` to designate an existing Oracle WebCenter Content Server connection as the default connection.

For command syntax and examples, see `setContentServerConnection` in WebCenter WLST Command Reference.

---

**Note:**

You must set additional connection properties for the default WebCenter Content Server connection. For more information, see Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using WLST.

---

To subsequently disable a default WebCenter Content Server connection, run the same WLST command with `isPrimary='false'`. Connection details are retained but the connection is no longer named as the default connection in `adf-config.xml`.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

To start using the new default connection you must restart the managed server on which WebCenter Portal is deployed. See, Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.
6.6.3 Setting Connection Properties for the Default Oracle WebCenter Content Server Connection

The default content repository is the one used by WebCenter Portal to store portal-related documents. Some additional configuration is required for the default repository.

This section contains the following topics:

- Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control
- Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using WLST

6.6.3.1 Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using Fusion Middleware Control

You can view, modify, and delete connection information for the Oracle WebCenter Content Server connection that is being used by Oracle WebCenter Portal to store portal documents.

**Warning:**

You should never change the Portal Server Identifier or Security Group values separately; you should always change both. That is, if you change the Portal Server Identifier value after configuring and running WebCenter Portal, then you must also change the Security Group value, and vice versa. That is, you must change both values (Portal Server Identifier and Security Group) to unique values if WebCenter Portal already contains the seed data.

To set connection properties for the default WebCenter Content Server connection using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Select the default connection, and click Edit.

5. In the Portal Server Identifier field, enter a name for the folder in WebCenter Content Server under which WebCenter Portal content is stored.

   Use the format `/folderName`.

   For example `/WebCenter` or `/WCPMain`.

   The folder cannot be the WebCenter Content Server root folder (`/`) and it must be unique across applications. If the folder does not exist it will be created for you.
Note:
When you change this value, the existing seed data is not renamed in WebCenter Content Server. Instead, new seed data is created using the new value when you start WebCenter Portal. Once WebCenter Portal is started, new data is created under the new folder and existing data under the old folder is no longer available. This means that the Documents tools will now be disabled in WebCenter Portal where the Documents tools were previously enabled, prior to changing the Portal Server Identifier. The old folder still appears in search results, like any other root folder in WebCenter Content Server.

Warning:
If you change the Portal Server Identifier you must also provide a new value for Security Group.

6. In the Content Administrator field, enter a user name with administrative rights for the WebCenter Content Server instance.

   For example, sysadmin.

   This user will be used to create and maintain folders for WebCenter Portal content and manage content access rights. Administrative privileges are required for the default connection so that operations can be performed on behalf of WebCenter Portal users.

7. In the Security Group field, enter a unique identifier to use as the value for the security group assigned to files in WebCenter Content Server created in WebCenter Portal.

   This name is used to separate data when multiple WebCenter Portal instances share the same WebCenter Content Server instance.

   The application name must be:

   • Unique across all WebCenter Portal applications.
   • Must begin with an alphabetical character, followed by any combination of alphanumeric characters or the underscore character.
   • Must be less than or equal to 30 characters.

   Warning:
   If you change the Security Group you must also provide a new value for Portal Server Identifier.

8. Click OK to save your changes.

   To start using the updated connection properties, you must restart the managed server on which WebCenter Portal is deployed (WC_Portal by default).
6.6.3.2 Setting Connection Properties for the Default Oracle WebCenter Content Server Connection Using WLST

Use WLST commands to view, set, and delete properties for the Oracle WebCenter Content Server connection that is being used by Oracle WebCenter Portal to identify where to store portal documents.

The following values must be set for the default WebCenter Content Server connection:

- `portalServerIdentifier`—specify a name for the folder in WebCenter Content Server under which WebCenter Portal content is stored.

- `adminUserName`—specify a user name with administrative rights for the WebCenter Content Server instance.

- `securityGroup`—specify a unique identifier to use as the value for the security group assigned to files in WebCenter Content Server created in WebCenter Portal.

**Warning:**
You should never change the `portalServerIdentifier` or `securityGroup` values separately; you should always change both. That is, if you change the `portalServerIdentifier` value after configuring and running WebCenter Portal, then you must also change the `securityGroup` value, and vice versa. That is, you must change both values (`portalServerIdentifier` and `securityGroup`) to unique values if WebCenter Portal already contains the seed data.

Use the following commands (for command syntax and detailed examples, see the linked section in WebCenter WLST Command Reference):

- `listContentServerProperties`
- `setContentServerProperties`
- `deleteContentServerProperties`

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

6.7 Modifying Oracle WebCenter Content Server Connection Details

This section contains the following topics:

- Modifying Oracle WebCenter Content Server Connection Details Using Fusion Middleware Control
- Modifying Oracle WebCenter Content Server Connection Details Using WLST
- Modifying Cache Settings for Content Presenter
- Configuring the Cache to Check for External Oracle WebCenter Content Server Changes
6.7.1 Modifying Oracle WebCenter Content Server Connection Details Using Fusion Middleware Control

You can modify Oracle WebCenter Content Server connection details using Fusion Middleware Control.

To update WebCenter Content Server connection details using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for Oracle WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Select the connection name, and click Edit.

5. Edit connection details, as required.

   For detailed parameter information, see Creating a Connection to Oracle WebCenter Content Server Using Fusion Middleware Control.

6. Click Test to verify if the updated connection works.

7. Click OK to save your changes.

8. To start using the updated connection, you must restart the managed server on which WebCenter Portal is deployed.

6.7.2 Modifying Oracle WebCenter Content Server Connection Details Using WLST

Use the WLST command `setContentServerConnection` to edit Oracle WebCenter Content Server connection details.

For command syntax and examples, see `setContentServerConnection` in WebCenter WLST Command Reference.

To configure a particular connection as the default connection, set `isPrimary='true'`. See Changing the Default Oracle WebCenter Content Server Connection.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Note:

To start using the updated connection details, you must restart the managed server on which WebCenter Portal is deployed. See Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.
6.7.3 Modifying Cache Settings for Content Presenter

Content Presenter, by default, is configured to use a local (in-memory) cache. Using Coherence for any type of production environment, however, is strongly recommended, and is a requirement for High Availability (HA) environments. You can enable content caching with Coherence by modifying the Coherence configuration file.

---

**Note:**

Your Coherence license may or may not support multi-node environments depending on the license option you have purchased.

---

To enable and test Coherence as the caching mechanism:

1. Open the `ORACLE_HOME/wcportal/webcenter/modules/oracle.webcenter.framework/content-app-lib.ear` file and copy the `sample-content-coherence-cache-config.xml` file from `ORACLE_HOME/webcenter/modules/oracle.webcenter.content.integration_11.1.1/content-app-lib.ear`.

   You’ll find the `sample-content-coherence-cache-config.xml` file under `/content-app-lib.ear/APP-INF/classes/sample-content-coherence-cache-config.xml`.

3. Modify the Coherence configuration file for your local environment based on the example file (Example 6-1) and entry descriptions (Table 6-8).

---

<table>
<thead>
<tr>
<th>Cache Entry Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repo.ucm.nodeUidCache.*</td>
<td>Stores a list of nodes for a repository based on an ID. The size of this cache entry depends upon the number of nodes in the active repository. This cache expires based on when the node data is refreshed and how many times the data is modified from another application.</td>
</tr>
</tbody>
</table>

Key - Node UID - String

Value - An Oracle WebCenter Content Server Node object
<table>
<thead>
<tr>
<th>Cache Entry Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repo.ucm.nodePathToUidCache.*</td>
<td>Stores a list of nodes for a repository based on a path. The size of this cache depends upon the number of nodes in the default repository. This cache entry expires based on when the node data is refreshed and how many times the data is modified from another application. The size and expiration time must be the same as that of nodeUidCache.</td>
</tr>
<tr>
<td>Key - Node path - String</td>
<td>Value - Node UID - String</td>
</tr>
<tr>
<td>repo.ucm.securityInfoCache.*</td>
<td>Stores cached security information for a node. The size of this cache depends upon the number of nodes in the repository. This cache expires based on the frequency of node security data updates.</td>
</tr>
<tr>
<td>Key - Node UID - String</td>
<td>Value - Security information for a node</td>
</tr>
<tr>
<td>repo.ucm.typeNameCache.*</td>
<td>Caches Content Type information. The size of this cache depends upon the number of types in the repository. This cache expires based on when the type information is refreshed and how many times the types are modified from another application.</td>
</tr>
<tr>
<td>Key - Content Type UID - String</td>
<td>Value - A ContentType object</td>
</tr>
<tr>
<td>repo.ucm.typeNamesCache.*</td>
<td>Caches all the type names known to WebCenter Content Server. All type names are cached together (one key), and thus all expire at the same time. This cache expires based on the frequency of new types being created or removed.</td>
</tr>
<tr>
<td>Key - There is only one key to this cache: typeNames</td>
<td>Value - An ArrayList&lt;String&gt; of the type names</td>
</tr>
</tbody>
</table>
### Table 6-8  (Cont.) Cache Entries in content-coherence-cache-config.xml

<table>
<thead>
<tr>
<th>Cache Entry Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| binaryCache.*        | Caches binary property data. Only binaries that are smaller than the repository configuration property binaryCacheMaxEntrySize are cached. The size of this cache either depends on the number and frequency of the smaller binary properties (smaller than the binaryCacheMaxEntrySize setting) usage, or it is based on the total amount of memory to be used for binary caches. This cache expires based on when the binary data is refreshed and how many times this data is modified from another application.  
  **Key** - The Node UID and binary Property UID (nodeUid.propUid) - String  
  **Value** - The binary stream data - byte[]  
  **Note:** Most documents stored in WebCenter Content Server are considered binary content, that is, images, plain text, Word documents, and so on. The only exception is Site Studio content which is stored in CDF data files and cached separately in a Virtual Content Repository (VCR) cache (or node cache). |
| repo.ucm.searchCriteriaCache.* | Caches a set of search query to parameters based on the WebCenter Content Server search grammar. The size of this cache depends upon the number of unique searches expected to be repeatedly performed. The expiration must be set to eventually expire unused searches and save on the cache memory.  
  **Key** - A set of search query parameters.  
  **Value** - A set of search query parameters, in Content Server terms. |
<table>
<thead>
<tr>
<th>Cache Entry Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repo.ucmindexedFieldsCache.*</td>
<td>Holds the indexed (searchable) system properties for the repository. There are three keys in this cache:&lt;br&gt;• indexedFields holds all WebCenter Content Server indexed fields.&lt;br&gt;• indexedFolderProps holds indexed system properties for folders.&lt;br&gt;• indexedDocProps holds indexed system properties for documents.&lt;br&gt;This cache expires based on the frequency of the indexed fields changes.</td>
</tr>
<tr>
<td>Key - String</td>
<td>Value - Map&lt;String,Boolean&gt; holds a key for each indexed property name, and a Boolean indicating if that property is also sortable.</td>
</tr>
<tr>
<td>repo.ucm.securityUserCache.*</td>
<td>Caches the mapping between local user names (current application) and the name of the same user in WebCenter Content Server. The size of this cache depends upon the number of simultaneous and/or frequent users.&lt;br&gt;This cache expires based on the frequency of user identity mapping updates.</td>
</tr>
<tr>
<td>Key - Local user Id - String</td>
<td>Value - WebCenter Content Server user Id - String</td>
</tr>
<tr>
<td>repo.ucm.profileTriggerValueCache.*</td>
<td>Caches the profile trigger value for a given profile, so it is available when documents are created. The maximum number of entries in this cache is implicitly limited to the maximum number of profiles on the WebCenter Content Server instance. The cache entry size is small. The primary entry to vary is the expiration, which depends upon how often the profile trigger field values are modified in WebCenter Content Server. These values change rarely once a profile is configured on the WebCenter Content Server system. Therefore, the expiration should be set appropriately.</td>
</tr>
</tbody>
</table>
5. Restart the WC_Portal server and connect to it by entering `jconsole` from the command line and choosing the process corresponding to WC_Portal to open JConsole.

**Note:**

- There must be something in the cache for the MBeans to appear in JConsole. That is, you must have created and accessed a Content Presenter page for the MBeans to exist.

- Once a Content Presenter page exists, thus populating the cache, in JConsole connected to the WC_Portal server, you can open Coherence > Cache > LocalCache and see multiple entries for `repo.ucm.*.{ucm-connection-name}`. For example, `repo.ucm.typeNameCache.{ucm-connection-name}`

**Example 6-1 Sample Coherence Configuration File**

```xml
<!DOCTYPE cache-config SYSTEM "cache-config.dtd">
<cache-config>
  <caching-scheme-mapping>

6.7.4 Configuring the Cache to Check for External Oracle WebCenter Content Server Changes

This section describes how you can change the Content Server's Cache Invalidation Interval so that changes are picked up.

This section includes the following topics:

- Modifying Oracle WebCenter Content Server's Contributor Data Files
- Modifying Oracle WebCenter Content Server's Cache Invalidation Interval
- Testing the Cache Settings

6.7.4.1 Modifying Oracle WebCenter Content Server's Contributor Data Files

The Content Presenter task flow enables Oracle WebCenter Portal users with Page-Edit permissions to customize the selection and presentation of content. In Content Presenter you can select a single item of content, contents under a folder, a list of items, or a query for content and then select a Content Presenter template with which to render that content on a page in WebCenter Portal.

As well as displaying Oracle WebCenter Content Server folders and files, Content Presenter also integrates with Oracle Site Studio to let you to create, access, edit, and display Site Studio contributor data files (that is, a WebCenter Content Server document) in either a Site Studio region template, or in a custom Content Presenter display template. For more information about creating Content Presenter display templates, see Developing Content Presenter Display Templates in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

In some cases you may want to modify WebCenter Content Server's contributor data files directly through WebCenter Content Server. This operation is completely supported. However, if a contributor data file is being modified through a method other than using WebCenter Portal, a running WebCenter Portal page that also uses the same data file will not immediately see those updates. This is due to the WebCenter Portal page using Content Presenter to display the contents of the data file while WebCenter Portal is using the cached version of the data file. Fortunately, there is a way to configure the cache so that changes like this are picked up quickly and automatically.

6.7.4.2 Modifying Oracle WebCenter Content Server's Cache Invalidation Interval

By changing the Oracle WebCenter Content Server's Cache Invalidation Interval, you can enable the cache to be monitored by the cache sweeper utility.

The cache sweeper queries for changes in WebCenter Content Server, flagging the cache as "dirty" if there have been any changes. This causes the application to retrieve a new copy of the document from WebCenter Content Server that replaces the cached version.

By default, the initial value for the Cache Invalidation Interval is set to 0 (minutes). This means that the sweeper has been turned off. To turn the sweeper on, you need to set a value (in minutes). The minimum value that can be set is 2 (minutes). You can do this from the Cache Details page in Fusion Middleware Control or using a WLST command.

This section includes the following topics:

- Modifying the Cache Invalidation Interval Using Fusion Middleware Control
• Modifying the Cache Invalidation Interval Using WLST

6.7.4.2.1 Modifying the Cache Invalidation Interval Using Fusion Middleware Control
You can change the Cache Invalidation Interval using Fusion Middleware Control.

To change the Cache Invalidation Interval using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for Oracle WebCenter Portal.

   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Select the connection name and click Edit.

5. In the Cache Details section, set the Cache Invalidation Interval to 2 (the shortest time allowed) or a similarly low value.

   Note:
   In some instances, once the value of the Cache Invalidation Interval has been set (and saved) in Fusion Middleware Control, it becomes sticky and the interval value can only be set back to 0 using the setContentServerConnection WLST command. For more information, see Modifying the Cache Invalidation Interval Using WLST.

6.7.4.2.2 Modifying the Cache Invalidation Interval Using WLST
You can update the value for the Cache Invalidation Interval using the setContentServerConnection WLST command.

Run the command as follows:

```
setContentServerConnection(appName, name, [socketType, url, serverHost, serverPort, 
keystoreLocation, keystorePassword, privateKeyAlias, privateKeyPassword, 
webContextRoot, clientSecurityPolicy, cacheInvalidationInterval, 
binaryCacheMaxEntrySize, adminUsername, adminPassword, extAppId, timeout, isPrimary, 
service, applicationVersion])
```

For example:

```
setContentServerConnection(appName='webcenter',name='UCM', socketType='socket', 
serverHost='webcenter.oracle.local', serverPort='4444', webContextRoot='/cs', 
cacheInvalidationInterval='2', 
binaryCacheMaxEntrySize='1024',adminUsername='sysadmin',isPrimary=1)
```

   Tip:
   To get the other parameter values required to execute the command, you can use the 
   listContentServerConnections(appName='webcenter',verbose=true) command.
Note:
You must restart the Oracle WebCenter Portal managed server (WC_Portal) for the change to take effect.

6.7.4.3 Testing the Cache Settings

Once the sweeper is turned on, only cache objects that have been changed will be invalidated.

To test this out, configure Oracle WebCenter Content Server so that it monitors and reports on events.

To configure Oracle WebCenter Content Server to monitor and report on events:

1. Log in to the WebCenter Content Server console application, and under the Administration menu item, select System Audit Information.
   
   If your console is using the left menu display option, the Administration link will be located there.

2. Under the Tracing Sections Information, add in only `system` and `requestaudit` in the Active Sections. Check Full Verbose Tracing, check Save, then click the Update button. Once this is done, select the View Server Output menu option. This will change the browser view to display the log. This is all that is needed to configure WebCenter Content Server.

   For example, the following is the View Server Output with the cache invalidation interval set to 2 (minutes)

   Note the time stamp:

   ```
   requestaudit/6 08.30 09:52:26.001 IdcServer-68 GET_FOLDER_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.01693399995654144(secs)
   requestaudit/6 08.30 09:52:26.010 IdcServer-69 GET_FOLDER_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.006134999915957451(secs)
   requestaudit/6 08.30 09:52:26.014 IdcServer-70 GET_DOCUMENT_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.004271999932825565(secs)
   ... other trace info ...
   requestaudit/6 08.30 09:54:26.002 IdcServer-71 GET_FOLDER_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.020323999226093292(secs)
   requestaudit/6 08.30 09:54:26.101 IdcServer-72 GET_FOLDER_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.017928000539541245(secs)
   requestaudit/6 08.30 09:54:26.017 IdcServer-73 GET_DOCUMENT_HISTORY_REPORT
   [dUser=sysadmin][IsJava=1] 0.010185999795794487(secs)
   ```

3. Once the tracing logs are reporting correctly, the next step is set up Oracle WebCenter Portal to test the sweeper. You can do this by setting up two pages with Content Presenter task flows, with each task flow using a different custom Content Presenter display template, and assigning each page a different contributor data file (document in the cache).

   When the WebCenter Portal pages containing the content is loaded in the browser for the first time, you can see the tracing information in the Content Server output viewer. For example:

   ```
   requestaudit/6 08.30 11:51:12.030 IdcServer-129 CLEAR_SERVER_OUTPUT
   [dUser=weblogic] 0.02917199954395258(secs)
   requestaudit/6 08.30 11:51:12.101 IdcServer-130 GET_SERVER_OUTPUT
   [dUser=weblogic] 0.02572100507473946(secs)
   ```
The highlighted sections show where the two example data files DF_UCMCACHETESTER and 113_ES were called by the WebCenter Portal VCR connection to WebCenter Content Server. Note the VCR_GET_DOCUMENT_BY_NAME invocation.

On subsequent refreshes of these two pages, you will notice (after you refresh WebCenter Content Server's View Server Output) that there are no further traces of the same VCR_GET_DOCUMENT_BY_NAME invocations. This is because the pages are getting the documents from the cache.

4. The next step is to go through the back door and change one of the documents through the Content Server console. To do this, locate the data file document, and from the Content Information page, select **Edit Data File**. This invokes the Site Studio Contributor, where you can make some modifications. When you refresh the Content Server View Server Output, the tracing displays the operations performed on the document.
After refreshing the first page, you should see that the updates have been applied. Note that the refresh time may vary since the Cache Invalidation Interval (set to 2 minutes) is not determined by when changes occur. The sweeper just runs every two minutes.

When you refresh the WebCenter Content Server View Server Output, for this example, the tracing displays the following information:

```
requestaudit/6 08.30 11:57:10.187 IdcServer-265 GET_DOCUMENT_HISTORY_REPORT [dUser=sysadmin][IsJava=1] 0.0186839997848021(secs)
```

After refreshing the first page, you should see that the updates have been applied. Note that the refresh time may vary since the Cache Invalidation Interval (set to 2 minutes) is not determined by when changes occur. The sweeper just runs every two minutes.

When you refresh the WebCenter Content Server View Server Output, for this example, the tracing displays the following information:

```
After the specified Cache Invalidation Interval time, the sweeper is invoked (tracked by the GET calls). Since a change has been noted, the next call is to the VCR_GET_DOCUMENT_BY_NAME to retrieve a new version of the modified data file.

Navigating back to the second page and viewing the server output, there are no further VCR_GET_DOCUMENT_BY_NAME to retrieve the data file. This simply means that the data file was just retrieved from the cache. Looking at the example server output, we can see that there was only one request for the VCR_GET_DOCUMENT_BY_NAME:

```
requestaudit/6 08.30 11:59:16.885 IdcServer-273 VCR_GET_DOCUMENT_BY_NAME [dID=923] [dDocName=DF_UCMCACHETESTER] [dDocTitle=DF_UCMCacheTester] [dUser=weblogic] [RevisionSelectionMethod=LatestReleased][IsJava=1] 0.0786449983716011(secs)
```

After the specified Cache Invalidation Interval time, the sweeper is invoked (tracked by the GET calls). Since a change has been noted, the next call is to the VCR_GET_DOCUMENT_BY_NAME to retrieve a new version of the modified data file.
6.8 Deleting Oracle WebCenter Content Server Connections

This section includes the following topics:

- Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control
- Deleting Oracle WebCenter Content Server Connections Using WLST

Note:
Delete a WebCenter Content Server connection only if it is not in use. If a connection is marked as the default connection, it should first be removed from the active list, and then deleted.

6.8.1 Deleting Oracle WebCenter Content Server Connections Using Fusion Middleware Control

You can delete an Oracle WebCenter Content Server connection using Fusion Middleware Control.

To delete a content repository connection:

1. Log in to Fusion Middleware Control and navigate to the home page for Oracle WebCenter Portal.

   See Navigating to the Home Page for WebCenter Portal

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. On the WebCenter Portal Services Configuration page, from the list of services select Content Repository.

4. Select the connection name, and click Delete.

5. To effect this change you must restart the managed server on which WebCenter Portal is deployed.
6.8.2 Deleting Oracle WebCenter Content Server Connections Using WLST

Use the WLST command `deleteContentServerConnection` to remove a content repository connection.

For command syntax and examples, see `deleteContentServerConnection` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

---

**Note:**

To effect this change you must restart the managed server on which Oracle WebCenter Portal is deployed. See Starting and Stopping Managed Servers Using WLST in *Administering Oracle Fusion Middleware*.

---

6.9 Changing the Maximum File Upload Size

By default, the maximum upload size for files is 2GB.

You can customize the maximum file upload size. For more information, see *Modifying the File Upload Size in Content Manager*. 
This chapter describes how to configure and manage Analytics for WebCenter Portal. Analytics enables you to display usage and performance metrics for a portal.

Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter Portal. Any configuration changes that you make post-deployment are stored in the MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations. Any changes that you make to Analytics Collector configuration are stored in the Analytics database.

**Note:**

Changes that you make to Analytics configuration through Fusion Middleware Control or using WLST are not dynamic so you must restart the managed server on which the Analytics Collector or portal application is deployed for your changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

This chapter includes the following topics:

- About Analytics in WebCenter Portal
- Configuration Roadmap for Analytics
- Analytics Prerequisites
- Configuring Analytics Collector Settings
- Registering an Analytics Collector for Your Application
- Validating Analytic Event Collection
- Viewing the Current WebCenter Portal’s Analytic Event List
- Purging Analytics Data
- Partitioning Analytics Data
Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

7.1 About Analytics in WebCenter Portal

Analytics allows WebCenter Portal administrators and business users to track and analyze portal usage. Analytics provides the following basic functionality:

- **Usage Tracking Metrics**: Analytics collects and reports metrics for common portal functions, including community, page, and portlet visits.

- **Behavior Tracking**: Users can analyze portal metrics to determine usage patterns, such as portal visit duration and usage over time.

- **User Profile Correlation**: Users can correlate metric information with user profile information. Usage tracking reports can be viewed and filtered by user profile data such as country, company, or state. For more information, see Query Options in Building Portals with Oracle WebCenter Portal.

An overview of Analytics components and ready-to-use task flows are described in the following sections:

- Analytics Components

- Analytics Task Flows

7.1.1 Analytics Components

Figure 7-1 illustrates components for Analytics in WebCenter Portal:

- **WC_Portal** – The managed server on which Oracle WebCenter Portal and the Analytics Collector is deployed are deployed.

- **Event Data** – Analytics tracks and collects a defined set of events. A comprehensive set of the most common events are provided out-of-the-box.

- **Open Usage API** – The OpenUsage API sends metrics to the Analytics Collector using UDP (User Datagram Protocol).

- **Analytics Collector** – The Analytics Collector component gathers event data. Analytics Collectors can be clustered to provide increased scalability and reliability.

- **Analytics Database** – The Analytics database (ACTIVITIES) stores metrics gathered from portal and non-portal events.

- **Analytics Task Flows** – Analytics provides a series of task flows to report metrics for common portal functions.
• MDS – The Metadata Service (MDS) repository that stores task flow customizations.

**Figure 7-1 Analytics Components**

![Analytic Components Diagram]

### 7.1.2 Analytics Task Flows

Table 7-1 lists the Analytics task flows available with WebCenter Portal. For detailed information about these task flows and how to use them, see About Analytics in *Building Portals with Oracle WebCenter Portal*.

**Table 7-1 Analytics Task Flows in WebCenter Portal**

</tr>
</tbody>
</table>
### 7.3 Analytics Prerequisites

This section includes the following topics:

- Analytics – Installation
- Analytics – Configuration
- Analytics – Security Considerations
- Analytics – Limitations

#### 7.3.1 Analytics – Installation

The Analytics Collector is an optional installation option for Oracle WebCenter Portal. To install this product, select **Oracle WebCenter Portal Analytics Collector** in the Fusion Middleware Configuration Wizard. For detailed installation instructions, see *Installing and Configuring Oracle WebCenter Portal*.

The Analytics schema (ACTIVITIES) and the WebCenter Portal schema (WEBCENTER) can be installed on the same database or on separate databases.

#### 7.3.2 Analytics – Configuration

The Analytics Collector is configured to receive events out-of-the-box, using installation defaults. If the default values are not suitable for your installation or you have a cluster, you may configure different values using WLST or MBeans Browser. For more information, see [Configuring Analytics Collector Settings](#).

Out-of-the-box, WebCenter Portal is not configured to *send events* to the Analytics Collector. If you want to collect usage and performance metrics for WebCenter Portal you must register the Analytics Collector and enable event collection. For more information, see [Registering an Analytics Collector for Your Application](#). Once connected, analytics data is collected and displays in your application (through Analytics task flows) without further configuration.

#### 7.3.3 Analytics – Security Considerations

In WebCenter Portal, resource catalogs display Analytics task flows only to users with appropriate permissions:

- Administrators – Users with the **Administrator** role have access to all Analytics task flows
• Portal Managers – Within a particular portal, members with the Portal Manager role have access to Analytics task flows that display usage data for that portal only.

Analytics usage data is valuable for portal analysis but might be regarded as private or sensitive to portal users. To protect security and privacy interests associated with usage metrics WebCenter Portal administrators and individual portal managers must manage page security such that only appropriate, specified users have access to pages that expose analytics data. See About Analytics in Building Portals with Oracle WebCenter Portal.

7.3.4 Analytics – Limitations
Analytics task flows do not display custom event information.

7.4 Configuring Analytics Collector Settings
During installation, the Analytics Collector is configured to receive events using the following default values:

• Collector Host Name - localhost
• Default Port - 31314
• Maximum Port Number - 31314
• Broadcast Type - Unicast
• Clustering - The clustering settings do not apply. Clustering is not supported in this version.

Note:
If the database used by WebCenter Portal uses a National Character Set set to something other than AL16UTF16, the Analytics startup listener may fail to start. The National Character Set option is configure through the Database Configuration Assistant when the database is created. Oracle recommends that you keep the National Character Set set to its default value of AL16UTF16 to avoid potential issues.

If these default values are not suitable for your installation or you have a cluster, you can configure suitable values using WLST or the MBeans Browser in Fusion Middleware Control:

• Setting Analytics Collector Properties Using WLST
• Setting Analytics Collector Properties Using Fusion Middleware Control

These Analytics Collector configuration settings are stored in the Analytics database (ACTIVITIES).

7.4.1 Setting Analytics Collector Properties Using WLST
Use the WLST command setAnalyticsCollectorConfig to set event collection properties for the Analytics Collector. For command syntax and examples, see setAnalyticsCollectorConfig in WebCenter WLST Command Reference.
For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Note:
To start using the property values you must restart the managed server on which the Analytics Collector application is deployed (WC_Portal). For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

7.4.2 Setting Analytics Collector Properties Using Fusion Middleware Control

Use the Systems MBeans Browser in Fusion Middleware Control to set event collection properties for the Analytics Collector:

To configure the Analytics Collector (deployed on the WC_Portal managed server):

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see:
   - Navigating to the Home Page for WebCenter Portal

2. Open the System MBean Browser. From the WebCenter Portal menu, select System MBean Browser.

   Alternatively, search for CollectorConfiguration or filter the System MBean Browser tree using the MBean pattern: oracle.webcenter.analytics:*
4. Modify configuration properties for the Analytics Collector. For more information, see Table 7-3.

**Table 7-3  Analytics Collector - Configuration Properties**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| BroadcastType          | Specify the network channel on which the Analytics Collector broadcasts a 'heartbeat' to advertise its location to event producers. Valid values are Broadcast and Multicast:  
  Broadcast - use the standard network broadcast channel.  
  Multicast - use a special fixed multicast address. |
<p>| ClusterEnabled         | The clustering settings do not apply. Clustering is not supported in this version. |
| ClusterName            | The clustering settings do not apply. Clustering is not supported in this version. |
| CollectorHeartbeatFrequency | The clustering settings do not apply. Clustering is not supported in this version. |
| CollectorDefaultPort   | Enter the default port number on which the Analytics Collector listens. The default value is 31314. |
| CollectorHostName      | Enter the name of the host on which the Analytics Collector is running. The default setting is localhost. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CollectorMaximumPort</td>
<td>Enter the highest port number that an Analytics Collector can use when allocating a listener. This property is mostly used in a clustered environment where multiple collectors run in the same box. Each collector listens for incoming UDP messages on a free port within a given port range. The range is from the default port number to the maxPort number.</td>
</tr>
</tbody>
</table>

5. To start using the new settings you must restart the managed server on which the Analytics Collector application is deployed (WC_Portal). For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 7.5 Registering an Analytics Collector for Your Application

Events raised in WebCenter Portal using OpenUsage APIs can be sent to an Analytics Collector for use by Analytics. If you intend to use any of the features or task flows provided by these tools you must connect WebCenter Portal to an Analytics Collector.

While you can register multiple Analytics Collector connections for WebCenter Portal, only one Analytics Collector is used (i.e., the default (or active) connection).

To start using a new configuration you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Registering an Analytics Collector Using Fusion Middleware Control
- Registering an Analytics Collector Using WLST
- Disabling WebCenter Portal Event Collection

#### 7.5.1 Registering an Analytics Collector Using Fusion Middleware Control

To register an Analytics Collector for WebCenter Portal:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. Open the Service Configuration page. From the WebCenter Portal menu, select Settings > Service Configuration.

3. From the list of services on the WebCenter Portal Service Configuration page, select Analytics.

4. To connect to an Analytics Collector, click Add (Figure 7-4).
5. Enter a unique name for this connection.

The name must be unique (across all connection types) within WebCenter Portal.

6. Select Active Connection to use this connection for Analytics.

While you can register multiple Analytics Collector connections for WebCenter Portal, only one connection is used—the default (or active) connection.

7. Select Enable WebCenter Portal Event Collection to send analytics events raised using OpenUsage APIs to the Analytics Collector.

Deselect this option if you do not want to collect analytics data.

8. Enter connection details for the Analytics Collector. For details, see Table 7-4.

Table 7-4  Analytics Collector Connection - Connection Details
Table 7-4  (Cont.) Analytics Collector Connection - Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messaging Mode</td>
<td>This property specifies whether to send events to a clustered Analytics Collector in multicast mode or a single Analytics Collector using unicast communication. Clustering the Analytics Collector is not supported in the current release, so the only valid value for this release is <strong>Unicast</strong>.</td>
</tr>
<tr>
<td>Collector Host Name</td>
<td>If the messaging mode is set to <strong>Unicast</strong>, enter the host name where the Analytics Collector is running. The default setting is <strong>localhost</strong>.</td>
</tr>
<tr>
<td>Collector Port</td>
<td>Enter the port on which the Analytics Collector listens for events. The default value is <strong>31314</strong>.</td>
</tr>
</tbody>
</table>

9. Click OK to save.

10. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

7.5.2 Registering an Analytics Collector Using WLST

Use the WLST command `createAnalyticsCollectorConnection` to create an Analytics Collector connection for WebCenter Portal. To update an existing connection, use `setAnalyticsCollectorConnection`. For command syntax and examples, see `createAnalyticsCollectorConnection` and `setAnalyticsCollectorConnection` in WLST Command Reference for WebLogic Server.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

To start using the new connection, ensure that `isEnabled=1` and `default=1`, and then restart the managed server on which WebCenter Portal is deployed. See Starting and Stopping Managed Servers Using WLST in WLST Command Reference for WebLogic Server.

7.5.3 Disabling WebCenter Portal Event Collection

If you do not want to collect events raised using OpenUsage APIs, you can stop event transmission temporarily or permanently.

This section includes the following subsections:

- Disabling WebCenter Portal Event Collection Using Fusion Middleware Control
- Disabling WebCenter Portal Event Collection Using WLST

7.5.3.1 Disabling WebCenter Portal Event Collection Using Fusion Middleware Control

To disable event collection for WebCenter Portal:
1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. Open the Service Configuration page. From the WebCenter Portal menu, select Settings > Service Configuration.

3. From the list of services on the WebCenter Portal Service Configuration page, select Analytics.

4. Select the connection in the table, and then click Edit.

5. Deselect Enable WebCenter Portal Event Collection (Figure 7-6).

![Figure 7-6 Disabling Analytics Event Collection](image)

6. To effect this change you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

7.5.3.2 Disabling WebCenter Portal Event Collection Using WLST

To disable event collection using WLST, run the `setAnalyticsCollectorConnection` command with the `isEnabled` argument set to 0 (false). For command syntax and examples, see `setAnalyticsCollectorConnection` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

7.6 Validating Analytic Event Collection

You can check whether events reach the Analytics Collector by checking the trace log at:

`<base_domain_name>/servers/WC_Portal/logs/analytics-collector/collector.trc`

Event messages are similar to the following:

```
[2015-09-16T07:13:56.906-07:00] [WC_Utilities] [TRACE] []
[SRC_METHOD: OnMessageReceived] Event = [{
    EVENT_TYPE: (http://www.myorg.com/videoapp) VIDEOVIEWS
    VERSION: 3.0.XXXX
    AS_DIMENSION_USER.USERID: testuser01
    VIDEO.RESOURCEID: video8736
```
To display analytics collector configuration information, enter the following URL:

http://hostname:WC_Portal_port/collector

This page lists the following:

- Collector Default Port
- Collector Max Port
- Collector Server Name
- Broadcast Type
- Cluster Enabled
- Cluster Name
- Partitioning Enabled
- Time Dimension for This Year
- Space Dimension Exists (for WebCenter Portal)

### 7.7 Viewing the Current WebCenter Portal's Analytic Event List

Use the Systems MBeans Browser in Fusion Middleware Control to see which events an Analytics Collector is configured to collect.

To display the current list of analytics events:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. Open the System MBean Browser. From the WebCenter Portal menu, select System MBean Browser.

   Alternatively, search for CollectorServices or filter the System MBean Browser tree using the MBean pattern: oracle.webcenter.analytics:*

4. Select the Operations tab.
5. Click `listRegisteredEventTypes`.

6. Click `Invoke`.

Alternatively, use the WLST command `listAnalyticsEventTypes`. For command syntax and examples, see `listAnalyticsEventTypes` in *WebCenter WLST Command Reference*.

**7.8 Purging Analytics Data**

For information about purging analytics data, see Purging Oracle WebCenter Portal’s Analytics Data in *Administering Oracle Fusion Middleware*.

**7.9 Partitioning Analytics Data**

For information about partitioning analytics data, see Partitioning Oracle WebCenter Portal’s Analytics Data in *Administering Oracle Fusion Middleware*.
Managing Announcements and Discussions

This chapter describes how to configure and manage announcements and discussions for WebCenter Portal. Both announcements and discussions use the same connection to WebCenter Portal’s Discussion Server.

Unless otherwise documented, do not make configuration changes within WebCenter Portal’s Discussion Server. Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter Portal. For troubleshooting tips with WebCenter Portal’s Discussion Server, see Troubleshooting Issues with Announcements and Discussions.

Any configuration changes that you make postdeployment are stored in the MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

Note:
Configuration changes for discussions and announcements, through Fusion Middleware Control or using WLST, are not dynamic, so you must restart the managed server on which your application is deployed for changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

For troubleshooting issues, see Troubleshooting Issues with Announcements and Discussions.

This chapter includes the following topics:

• About Discussions Server Connections
• Discussions Server Prerequisites
• Registering Discussions Servers
• Choosing the Active Connection for Discussions and Announcements
• Modifying Discussions Server Connection Details
• Deleting Discussions Server Connections
• Setting Up Discussions Defaults
• Setting Up Announcements Defaults
• Testing Discussions Server Connections
8.1 About Discussions Server Connections

Announcements and discussions let users start, publish, and store discussions in WebCenter Portal. Users can create and expose announcements and discussions on the portal pages.

Discussions and announcements require a single connection to WebCenter Portal’s Discussion Server. WebCenter Portal’s discussion server can be installed with Oracle Fusion Middleware.

You can register additional discussion server connections through the Fusion Middleware Control Console or using WLST, but only one connection is active at a single time. See the following:

- Registering Discussions Servers Using Fusion Middleware Control
- Registering Discussions Servers Using WLST

Some additional configuration is required to use discussions and announcements in WebCenter Portal. This includes choosing the category (on the discussions server) under which all WebCenter Portal discussions and announcements are stored, and more. This configuration takes place inside WebCenter Portal. For more information, see Configuring Discussion Forum Options for WebCenter Portal.

8.2 Discussions Server Prerequisites

This section includes the following subsections:
8.2.1 Discussions Server - Installation

While installing WebCenter Portal, select to install WebCenter Portal’s Discussion Server. Use the Repository Creation Utility (RCU) to create the `DISCUSSIONS` schema. The Oracle Fusion Middleware Configuration Wizard automatically creates managed servers in the domain to host the selected WebCenter Portal components.

See Also:

Note:
Updates to discussion content do not refresh immediately when clustered caching is enabled. Users can click the Refresh icon to force a manual refresh at any time.

Discussions Server - High Availability Installation

To set up WebCenter Portal’s Discussion Server for high availability:

1. Install the `WC_Collaboration` domain in a clustered environment.
2. Log on to the discussions server admin console as an administrator by using the following URL format: `http://host:port/owc_discussions/admin`.
3. Go to the Cache Settings page (click the System link at the top of the page and select Cache Settings), then scroll down to the Cache Features section, and select to enable clustering (Figure 8-1).

Figure 8-1 Cache Features - Clustering

<table>
<thead>
<tr>
<th>Feature</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short-term</td>
<td>Disabled</td>
<td>Prevents cache evictions of the short-term cache from happening more than once every 5 or 10 seconds. This is useful for sites with extreme amounts of traffic. The default is using the short-term cache when new content will appear for 5 to 10 seconds after it is posted.</td>
</tr>
<tr>
<td>Short-term</td>

</tbody>
</table>

Managing Announcements and Discussions 8-3
8.2.2 Discussions Server - Configuration

Note:
In a new or patched WebCenter Portal instance, the assigned security policy configuration is set to “no security policy.” You must attach Oracle Web Services Manager (OWSM) security policies for the WebCenter Portal web service endpoint and the discussions authenticated web service endpoint.

For detailed information, see Attaching Security Policies for WebCenter Portal and Discussions Web Service Endpoints.

There are numerous WLST commands for configuring the discussions server. You can view, set, and remove WebCenter Portal’s discussion server system properties with the following WLST commands, as described in Table 8-1:

Note:
To execute discussions server WLST commands, such as syncDiscussionServerPermissions, the same user who connected to the admin server must also have administrative privileges on the discussions server.

For more information about WLST commands, see Discussions and Announcements in WLST Command Reference for WebLogic Server.

<table>

<td>addDiscussionsServerAdmin</td>
<td>Grant system administrator permissions on the discussions server to a user or a group. This command is useful when you connect the discussions server to a new identity store that does not contain any of the current administrators.</td>
<td>See addDiscussionsServerAdmin in WLST Command Reference for WebLogic Server.</td>
</tr>
</tbody>
</table>

8.2.3 Discussions Server - Security Considerations

- WS-Security establishes a trust relationship between WebCenter Portal and WebCenter Portal’s Discussion Server so that WebCenter Portal can pass the user identity information to the discussions server without knowing the user’s credentials.

Configure OWSM WS-Security for WebCenter Portal’s Discussion Server by following any of the following the steps in Configuring Web Services Security.

- WebCenter Portal’s Discussion Server-specific web services messages sent by WebCenter Portal to the discussions server are not encrypted. For message confidentiality, access the discussions server URL over Secure Socket Layer (SSL) or protect the Web service end points with an OWSM policy. For more information, see Configuring SSL and Configuring Web Services Security.

- By default, WebCenter Portal’s Discussion Server is configured to use the embedded LDAP identity store: All users in the embedded LDAP store can log on to the discussions server, and all users in the Administrators group have administrative privileges on the discussions server.

For your production environment, you must reassociate the identity store with an external LDAP server, as described in Reassociating the Identity Store with an External LDAP Server. In addition, you must either move the system administrator account to the external LDAP (as described in Moving the Administrator Account to an External LDAP Server), or if you choose not to move the administrator account, you must perform some additional steps to identify the new administrator account for the discussions server as described in Migrating the Discussions Server to Use an External LDAP.

- Oracle recommends that you install and configure a single sign-on solution to avoid users having to log in twice when accessing WebCenter Portal’s Discussion Server and other WebCenter Portal components. You can configure the discussions server to leverage single sign-on security using Oracle Access Manager, Oracle Single Sign-On, or SAML-based single sign-on.

Note:

Direct login to the discussions server is not supported after SSO is configured. Log in through the Oracle HTTP Server URL.
For more information about single sign-on solutions, see Configuring Single Sign-On. For additional discussions-specific configuration instructions for Oracle Access Manager (OAM), see Configuring the Discussions Server for SSO.

Note:
If you set up SAML single sign-on, with WebCenter Portal as the source application and WebCenter Portal’s Discussion Server as the destination application, then you can access WebCenter Portal's Discussion Server administration pages from WebCenter Portal as follows:

- Administration > Tools and Services
  See Accessing the Discussions Server Admin Console.

- Portal_Name > Settings > Tools and Services
  However, because the administration pages of WebCenter Portal’s Discussion Server do not participate in single sign-on, if you access the administration pages directly, you are required to log in to the discussions server again.

- If WebCenter Portal is not integrated with a single sign-on solution, then different login sessions are required for the owc_discussion user (/owc_discussions) and the owc_discussion admin user (/owc_discussions/admin).

- User Identity: User identity management is handled by authentication providers settings specified in Oracle WebLogic Server using custom JPS Auth Factory. To check that the correct auth factory is running, go to WebCenter Portal’s Discussions Server admin console System Properties page and confirm the following property values:
  - owc_discussions.setup.complete_11.1.1.2.0=true
  - AuthFactory.className=oracle.jive.security.JpsAuthFactory
    If the AuthFactory.className is set to this value, then set the owc_discussions.setup.complete_11.1.1.2.0 property to false and restart WebCenter Portal’s Discussion Server. This ensures that proper initialization is done for the application.

8.2.4 Discussions Server - Limitations

WebCenter Portal's Discussion Server URL supports only English and Spanish languages for displaying labels; however, data can be entered in UTF-8 format. Oracle recommends using WebCenter Portal (with all supported languages) for user operations in the discussions server. All WebCenter Portal-supported languages are supported for data, such as discussion topics or announcements, and they are displayed in the discussions server also.

Discussions and announcements do not support non-ASCII user names if the WebCenter Portal instance is running in a native encoding on Microsoft Windows. In a Linux environment, to allow support for non-ASCII user names in discussions and announcements, the server on which WebCenter Portal is deployed must have the environment variable LC_ALL set to utf-8.
8.3 Registering Discussions Servers

You can register multiple discussions server connections for WebCenter Portal, but only one is active at a single time.

To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following topics:

- Registering Discussions Servers Using Fusion Middleware Control
- Registering Discussions Servers Using WLST

8.3.1 Registering Discussions Servers Using Fusion Middleware Control

To register a discussions server:

1. Log in to Fusion Middleware Control and navigate to the home page for the application.

   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. To connect to a new discussions server, click Add (Table 8-3).

   Figure 8-2 Configuring Discussion and Announcement Connections

5. Enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for WebCenter Portal (Table 8-2).

   Table 8-2 Discussion and Announcement Connection - Name

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name for the connection. The name must be unique (across all connection types) within WebCenter Portal.</td>
</tr>
<tr>
<td>Active Connection</td>
<td>Select to use this connection for Discussions and Announcements in WebCenter Portal. While you can register multiple discussions server connections for an application, only one connection is used for discussion and announcement—the default (or active) connection.</td>
</tr>
</tbody>
</table>

6. Enter connection details for the discussions server. For details, see Table 8-3.
### Table 8-3 Discussion and Announcement Connection - Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server URL</td>
<td>Enter the URL of the discussions server hosting discussion forums and announcements. For example: <a href="http://discuss-server.com:8890/owc_discussions">http://discuss-server.com:8890/owc_discussions</a></td>
</tr>
<tr>
<td>Administrator User Name</td>
<td>Enter the user name of the discussions server administrator. This account is used by the Discussions and Announcements tool to perform administrative operations on behalf of WebCenter Portal users. In the WebCenter Portal application, this account is mostly used for managing portal-related discussions and announcements. It is not necessary for this user to be a super admin. However, the user must have administrative privileges on the current root category for WebCenter Portal, that is, the category (on the discussions server) under which all portal-related discussions and announcements are stored. Note: If your application does not include portal-related functionality, then the administrator's user name is not required.</td>
</tr>
<tr>
<td>Authenticated User Web Service Policy URI</td>
<td>Select the policy this connection uses for authenticated access to the discussions server Web service. SAML (Security Assertion Markup Language) is an XML-based standard for passing security tokens defining authentication and authorization rights. An attesting entity (that already has a trust relationship with the receiver) vouches for the verification of the subject by a method called sender-vouches. The client policy specified must be compatible with the service policy that is configured for the OWCDiscussionsServiceAuthenticated endpoint in the discussions server. Out-of-the-box, the default service policy is WSS 1.0 SAML Token Service Policy (oracle/wss10_saml_token_service_policy). Options available are:   - WSS 1.0 SAML Token Client Policy (oracle/wss10_saml_token_client_policy)   - WSS 1.1 SAML Token With Message Protection Client Policy (oracle/wss11_saml_token_with_message_protection_client_policy)   - Global Policy Attachment If your environment supports Global Policy Attachments, you must ensure that the default policy attached to the OWCDiscussionsServiceAuthenticated endpoint in the discussions server is set to oracle/no_authentication_client_policy using the WLST command detachWebServicePolicy or Enterprise Manager.</td>
</tr>
</tbody>
</table>
7. Configure advanced options for the discussion and announcement connection (Table 8-4).

### Table 8-4 Discussion and Announcement Connection - Advanced Configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Timeout (seconds)</td>
<td>Specify a suitable timeout for the connection. This is the length of time (in seconds) WebCenter Portal waits for a response from the discussions server before issuing a connection timeout message. The default is -1, which means that the service default is 10 seconds.</td>
</tr>
</tbody>
</table>

8. Sometimes, additional parameters are required to connect to the discussions server, for example, those listed in Table 8-5.

### Table 8-5 Additional Discussion Connection Properties

<table>

</table>

8. Sometimes, additional parameters are required to connect to the discussions server, for example, those listed in Table 8-5.

### Table 8-5 Additional Discussion Connection Properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public User Web Service</td>
<td>Select the client policy this connection uses to enforce message security and integrity for public access to the discussions server Web service. The client policy specified must be compatible with the service policy that is configured for the OWCDiscussionsServicePublic endpoint in the discussions server. Out-of-the-box, a service policy is not configured for public access (None). Options available are: • None - This is the default setting. • WSS 1.1 Message Protection Client Policy (oracle/wss11_with_message_protection_client_policy) • Global Policy Attachment If your environment supports Global Policy Attachments, you must ensure that the default policy attached to the OWCDiscussionsServicePublic endpoint in the discussions server is set to oracle/no_authentication_client_policy using the WLST command detachWebServicePolicy or Enterprise Manager.</td>
</tr>
<tr>
<td>Policy URI</td>
<td></td>
</tr>
<tr>
<td>Recipient Key Alias</td>
<td>Enter the recipient key alias to be used for message protected policies (applicable to the OWCDiscussionsServicePublic and OWCDiscussionsServiceAuthenticated endpoints). This is the alias to the certificate that contains the public key of the discussions server in the configured keystore. See also Configuring Web Services Security.</td>
</tr>
</tbody>
</table>
Table 8-5  (Cont.) Additional Discussion Connection Properties

<table>
<thead>
<tr>
<th>Additional Connection Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application.root.category.id</td>
<td>(WebCenter Portal only) Application root category ID on the discussions server under which all discussion forums are stored. For example, if set to 3, then all forums are stored in the category with ID 3.</td>
</tr>
</tbody>
</table>

linkURL  
URL used to link users to the discussions server’s Admin Console. Only required if it is different to the Server URL property; for example, when SSO or HTTPS is configured. Use the following format to specify an alternative public external URL: protocol://host:port  
For example: http://example.com:7777

If additional parameters are required to connect to the discussions server, expand Additional Properties and enter details as required (Table 8-6).

Table 8-6  Discussion and Announcement Connection - Additional Properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add   | Click Add to specify an additional connection parameter:  
  • Property Name - Enter the name of the connection property.  
  • Property Value - Enter the default value for the property.  
  • Is Property Secured - Indicate whether encryption is required. When selected, the property value is stored securely using encryption.  
  For example, select this option to secure the admin.password property where the value is the actual password. |
| Delete| Click Delete to remove a selected property.  
Select the correct row before clicking Delete.  
Note: Deleted rows appear disabled until you click OK. |

9. Click OK to save this connection.

10. To start using the new (active) connection, you must restart the managed server on which WebCenter Portal is deployed.

For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

For WebCenter Portal, some additional configuration is recommended for the discussions. For details, see Configuring Discussion Forum Options for WebCenter Portal.

8.3.2 Registering Discussions Servers Using WLST

Use the WLST command createDiscussionForumConnection to create a discussions server connection. For command syntax and examples, see createDiscussionForumConnection in WLST Command Reference for WebLogic Server.
To configure discussions and announcements to actively use the new connection, set `default=true`.

Make sure to set additional properties for WS-Security. See Modifying Discussions Server Connection Details Using WLST.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

To start using the new (active) connection, you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

---

### 8.4 Choosing the Active Connection for Discussions and Announcements

You can register multiple discussions server connections for WebCenter Portal, but only one connection is active at a single time. The *active connection* becomes the back-end discussions server for:

- Discussions task flows (Discussion Forum Manager, Discussions, Popular Topics, Recent Topics, Watched Forums, Watched Topics)
- Announcements task flows (Announcements Manager, Announcements)

This section includes the following subsections:

- Choosing the Active Connection for Discussions and Announcements Using Fusion Middleware Control
- Choosing the Active Discussion for Discussions and Announcements Using WLST

#### 8.4.1 Choosing the Active Connection for Discussions and Announcements Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for the application.
   
   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select **Settings > Service Configuration**.

3. On the WebCenter Portal Services Configuration page, select **Discussions and Announcements**.

   The Manage Discussion and Announcement Connections table indicates the current active connection (if any).

4. Select the connection you want to make the active (or default) connection, and then click **Edit**.

5. Select the **Active Connection** check box.
6. Click OK to update the connection.

7. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

8.4.2 Choosing the Active Discussion for Discussions and Announcements Using WLST

Use the WLST command `setDiscussionForumConnection` with `default=true` to activate an existing connection. For command syntax and examples, see `setDiscussionForumConnection` in WebCenter WLST Command Reference.

To disable a Discussions and Announcements connection, either delete it, make another connection the 'active connection', or use the `removeDiscussionForumServiceProperty` command:

`removeDiscussionForumServiceProperty('appName=webcenter', property='selected.connection')`

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see `removeDiscussionForumServiceProperty` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

---

8.5 Modifying Discussions Server Connection Details

You can modify discussions server connection details at any time.

To start using the modified (active) connection you must restart the managed server on which the application is deployed.

This section includes the following subsections:

- Modifying Discussions Server Connection Details Using Fusion Middleware Control
- Modifying Discussions Server Connection Details Using WLST

8.5.1 Modifying Discussions Server Connection Details Using Fusion Middleware Control

To update connection details for a discussions server:
1. Log in to Fusion Middleware Control and navigate to the home page for the application.
   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Edit.

5. Edit connection details, as required. For detailed parameter information, see Table 8-3 and Table 8-5.

6. Click OK to save your changes.

7. To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

8.5.2 Modifying Discussions Server Connection Details Using WLST

Use the WLST command setDiscussionForumConnection to edit connection details. For command syntax and examples, see setDiscussionForumConnection in WebCenter WLST Command Reference.

To set additional parameters, use the setDiscussionForumConnectionProperty command. For more information, see setDiscussionForumConnectionProperty in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Note:
To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

8.6 Deleting Discussions Server Connections

You can delete discussions server connections at any time, but be careful when deleting the active connection. If you delete the active connection, none of the Discussions or Announcements task flows work, as they all require a back-end discussions server.

This section includes the following subsections:

- Deleting a Discussions Server Connection Using Fusion Middleware Control
- Deleting a Discussions Server Connection Using WLST

8.6.1 Deleting a Discussions Server Connection Using Fusion Middleware Control

To delete a discussions server connection:
1. Log in to Fusion Middleware Control and navigate to the home page for the application.

   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Delete.

   **Note:**

   Before restarting the managed server, select another connection as active; otherwise, the discussions and announcements features are disabled.

5. To make this change you must restart the managed server on which WebCenter Portal is deployed.

   For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 8.6.2 Deleting a Discussions Server Connection Using WLST

Use the WLST command `deleteConnection` to remove a connection. For command syntax and examples, see `deleteConnection` in WebCenter WLST Command Reference.

Ensure that another connection is marked active; otherwise, the tool is disabled.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

   **Note:**

   To effect this change you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

### 8.7 Setting Up Discussions Defaults

Use the WLST command `setDiscussionForumServiceProperty` to set defaults for discussions in your application:

- `topics.fetch.size`: Maximum number of topics fetched by discussions and displayed in the topics view.

- `forums.fetch.size`: Maximum number of forums fetched by discussions and displayed in the forums view.

- `recentTopics.fetch.size`: Maximum number of topics fetched by discussions and displayed in the recent topics view.
• **watchedTopics.fetch.size**: Maximum number of topics fetched by discussions and displayed in the watched topics view.

• **watchedForums.fetch.size**: Maximum number of forums fetched by discussions and displayed in the watched forums view.

• **application.root.category.id**: Application root category ID on the discussions server under which all discussion forums are stored. For example, if set to 3, then all forums are stored in the category with ID 3.

• **ForumGatewayManager.AUTO_START**: Communication through mail distribution lists can be published as discussion forum posts on a Discussions server, as described in Publishing Portal Mail in a Discussion Forum in *Building Portals with Oracle WebCenter Portal*. This parameter starts or stops the gateway for this communication.

  For WebCenter Portal, the default value is 1 (true), which means that as soon as you configure mail server settings through administration, the gateway starts. Set this to 0 (false), and restart the managed server, to stop the gateway and disable this feature.

  For command syntax and examples, see `setDiscussionForumServiceProperty` in *WebCenter WLST Command Reference*.

  For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 8.8 Setting Up Announcements Defaults

Use the WLST command `setAnnouncementServiceProperty` to set defaults for announcements:

• **miniview.page_size**: Maximum number of announcements displayed in the Announcements quick view.

• **mainview.page_size**: Maximum number of announcements displayed in the Announcements main view.

• **linksview.page_size**: Maximum number of announcements displayed in the Announcements links view.

• **announcements.expiration.days**: Number of days that announcements display and remain editable.

  For command syntax and examples, see Discussions and Announcements in *WLST Command Reference for WebLogic Server*.

  For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 8.9 Testing Discussions Server Connections

Try accessing the discussions server with the following URL:

http://host:port/owc_discussions

You should see a page listing all public information.
8.10 Granting Administrator Permissions on the Discussions Server

The WLST command `addDiscussionsServerAdmin` grants system administrator permissions on the discussions server to a user or a group. The WLST command `addDiscussionsCategoryAdmin` grants category administrator permissions on the discussions server to a user or a group for a specific category ID.

These commands are useful when you connect the discussions server to a new identity store that does not contain any of the current administrators.

For command syntax and examples, see `addDiscussionsServerAdmin` and `addDiscussionsCategoryAdmin` in WebCenter WLST Command Reference.

8.11 Granting Administrator Role on the Discussions Server

The default domain administrator created for WebCenter Portal is also the administrator for WebCenter Portal's Discussion Server. You can make a nondefault user the administrator for the discussions server too.

While creating a domain, if you specify any other user as the domain administrator, that user is granted all the domain administrative rights. However, after creating the domain, you must manually grant the administrator role to that nondefault user in both WebCenter Portal and the discussions server. For information on how to grant administrator privileges to a nondefault user for WebCenter Portal, see Granting the WebCenter Portal Administrator Role.

For WebCenter Portal's Discussion Server, the default user is the super administrator. This section describes how to grant administrator privileges to a nondefault user.

8.11.1 Granting the Discussions Server Administrator Role using WLST

The WLST command `addDiscussionsServerAdmin` lets you grant system administrator permissions on the discussions server to a user or a group. This is useful when you connect the discussions server to a new identity store. For command syntax and examples, see `addDiscussionsServerAdmin` in WebCenter WLST Command Reference.

8.11.2 Granting the Discussions Server Administrator Role using the Admin Console

To grant the administrator role for WebCenter Portal’s Discussion Server to a nondefault user:

1. Log on to the discussions server admin console as an administrator by using the following URL format: http://host:port/owc_discussions/admin.
2. Click the Settings link in the list of links across the top of the page.
3. Click the Admins/Moderators link, if not selected, in the navigation panel on the left.
4. On the Admins & Moderators page, click the Grant New Permissions tab.
5. Select the System Admin check box.
6. Select the A Specific User check box and specify the user to whom you want to grant administrative privilege for WebCenter Portal’s Discussion Server.
7. Click Grant New Permission.
You can now log on to WebCenter Portal’s Discussion Server as the user whom you have assigned the administrative privilege.

**Figure 8-3 Granting the Administrator Role on WebCenter Portal’s Discussion Server**

8.11.3 Revoking the Discussions Server Administrator Role

After assigning the discussions server administrator role to the required nondefault user, you may want to revoke the administrator role from the default user.

To revoke the administrator role:

1. Log on to discussions server admin console as the nondefault user whom you have assigned the administrator role.

   See also Accessing the Discussions Server Admin Console.

2. Click the **Settings** link in the list of links across the top of the page.

3. Click the **Admins/Moderators** link, if not selected, in the navigation panel on the left.

4. On the Admins & Moderators page, under the **Permission Summary** tab, uncheck the **System Admin** check box for the required user, for example, `weblogic`. (Figure 8-4)
5. Click **Save Changes**.

The administrative privileges for managing WebCenter Portal’s Discussion Server are now revoked from the default user.

### 8.12 Configuring Discussion Forum Options for WebCenter Portal

Discussion forums allow members to capture, share, and preserve content that is relevant to their project or community goals.

**Note:**

To perform the tasks described in this section, you need WebCenter Portal Administrator (Portal Server – Manage All) permissions.

As an administrator, you are responsible for setting discussion forum options for the entire application through WebCenter Portal Administration pages (Figure 8-5).
Figure 8-5  Setting Discussion Forum Options

From the Discussions page you configure discussions-related setting, as well as access the discussions server administration pages:

- **Accessing the Discussions Server Admin Console**
- **Specifying Where Discussions and Announcements are Stored on the Discussions Server**
- **Choosing How Many Discussion Topics to Save In Portal Templates**

**Note:**
The system administrator maintains the connection between WebCenter Portal and the discussions server. If you are experiencing issues with this connection, report the problem to the system administrator. See also **Registering Discussions Servers**.

### 8.12.1 Accessing the Discussions Server Admin Console

For convenience, you can access the discussions server’s Admin Console, a web-based tool for configuring and managing discussion forums, from WebCenter Portal’s Administration pages. In the discussions server’s Admin Console, you can navigate all categories and forums and edit their properties, create new categories and forums, as well as set cache, security, and various other properties for the discussions server.

   For details, see **Accessing the Settings Pages in WebCenter Portal Administration**.
2. Click Tools and Services, and then select Discussions.

3. Click Administer Forums (Figure 8-6).

Figure 8-6   Administer Forums Link on the Discussion Forum Settings

4. Enter your discussions server administrator login credentials in the login page that appears.

Note:
If the Forum Administration link does not work, it could be because single sign-on or HTTPS is configured. Your system administrator must specify a public external URL (using the linkURL property).

8.12.2 Specifying Where Discussions and Announcements are Stored on the Discussions Server

WebCenter Portal administrators can change the root category (on the discussions server) under which all WebCenter Portal discussions and announcements are stored.

The default system root category is suitable in most cases but you can choose a different location. This might be useful when WebCenter Portal is connected to a discussions server that is hosting discussion forums for multiple applications.

Oracle recommends the following:

- Choose a category that is dedicated to WebCenter Portal. There may be conflicts when multiple Oracle WebCenter Portals share the same root category.

- Do not switch the root category after WebCenter Portal is up and running. If you change the root category, then all the discussion forums under the old root
continue to work, but you cannot create links to discussions or announcements stored in the old category.

You can retain existing discussions in a portal template saved with the data copy option. For example, in the WebCenter Portal Administration Tools and Services - Discussions page, enter the number (between 1 and 25) of most recent topics and replies to be copied over to the template.

Portal templates support single or multiple forums under the root category that you specify. With some templates, one forum is created automatically under the root category for each new portal based on that template.

To specify where discussion forums are stored:

1. Open WebCenter Portal Administration.
   For details, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select Discussions (Figure 8-7).

   Figure 8-7    Specifying Where Discussions and Announcements are Stored

3. Specify an appropriate Root Category for storing discussions.
   Click the Find icon to view the categories available and then select the most appropriate location.
   To create a new category, click Create Category. You must have system administrator permissions on the discussions server to create new categories.

4. Click Apply to save the settings.

8.12.3 Choosing How Many Discussion Topics to Save In Portal Templates

WebCenter Portal administrators can limit how many recent topics and replies are copied to portal templates. Because copying large amounts of data has performance
implications, there is an upper limit of 25 topic or replies. If you prefer not to include any recent topics or replies in portal templates, specify zero.

1. Open WebCenter Portal Administration.
   For details, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select Discussions (Figure 8-8).

   **Figure 8-8 Specifying the Number of Topics and Replies in a Portal**

3. Specify an appropriate number of Topics and Replies to save in portal templates.

4. Click Apply to save the settings.
Managing Calendar Events

This chapter describes how to configure and manage events to expose personal Microsoft Exchange calendars in WebCenter Portal.

Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter Portal. Any configuration changes that you make, post deployment, are stored in the MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

Note:

Configuration changes for events, through Fusion Middleware Control or using WLST, are not dynamic, so you must restart the managed server on which WebCenter Portal is deployed for your changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

This chapter includes the following topics:

- About Events Connections
- Configuring Personal Events for WebCenter Portal
- Events Prerequisites for Personal Events
- Registering Events Servers
- Choosing the Active Events Server Connection
- Modifying Events Server Connection Details
- Deleting Event Server Connections
- Testing Event Server Connections

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

For troubleshooting, see Troubleshooting Issues with Events.
9.1 About Events Connections

In WebCenter Portal, events provides portal calendars that you can use to schedule meetings, appointments, and any other type of team, project, or group occasion. Events also enables you to access your personal Microsoft Exchange calendar, where you can schedule events that are not related to a particular portal.

Personal calendars are available through a Microsoft Exchange Server; therefore, a connection to that server is required. You can register the Microsoft Exchange Server connection through the Fusion Middleware Control Console or using WLST.

You must mark a connection as active for events to work. You can register additional Microsoft Exchange Server connections, but only one connection is active at a time.

To view personal events in WebCenter Portal, users must have an account on the Microsoft Exchange Server.

9.2 Configuring Personal Events for WebCenter Portal

Use the roadmaps in this section as a guide through the configuration process for providing access to personal events:

The flow chart (Figure 9-1) and table (Table 9-1) in this section provide an overview of the prerequisites and tasks required for personal events to work in WebCenter Portal.

![Figure 9-1 Configuring Personal Events for WebCenter Portal](image)

9.3 Events Prerequisites for Personal Events

This section includes the following subsections:

- Microsoft Exchange Server 2013 Prerequisites
- Microsoft Exchange Server 2010 Prerequisites
- Microsoft Exchange Server 2007 Prerequisites

9.3.1 Microsoft Exchange Server 2013 Prerequisites

This section describes the Microsoft Exchange Server 2013 prerequisites when used as the server for personal events.

This section includes the following subsections:

- Microsoft Exchange Server 2013 - Installation
- Microsoft Exchange Server 2013 - Configuration
- Microsoft Exchange Server 2013 - Security Considerations
- Microsoft Exchange Server 2013 - Limitations

9.3.1.1 Microsoft Exchange Server 2013 - Installation

Refer to the Microsoft Exchange Server 2013 documentation for installation information.

9.3.1.2 Microsoft Exchange Server 2013 - Configuration

To use Microsoft Exchange Server 2013 as the server for personal events, you must edit the Microsoft Exchange Server 2013 web service WSDL to specify the location of the web service.

To specify the location of the Microsoft Exchange Server 2013 web service:

1. Open the WSDL file for the Microsoft Exchange Server web service.
   
   For example:
   
   C:\Program Files\Microsoft\Exchange Server\ClientAccess\exchweb\ews\Services.wsdl

2. Add a service section that points to your Microsoft Exchange Server web service.
   
   For example:
<wsdl:definitions>
...
<wsdl:service name="ExchangeServices">
  <wsdl:port name="ExchangeServicePort" binding="tns:ExchangeServiceBinding">
    <soap:address location="https://server.example.com/EWS/Exchange.asmx"/>
  </wsdl:port>
</wsdl:service>
</wsdl:definitions>

9.3.1.3 Microsoft Exchange Server 2013 - Security Considerations

Events includes a Microsoft Exchange Server 2013 adapter that communicates with the Microsoft Exchange Server 2013 generic web service through a JAX-WS proxy. To set up the communication between the adapter and the web service, you must edit the Microsoft Exchange Server security settings. You must enable Basic authentication. Further, you must enable anonymous access to Services.wsdl, Messages.xsd, and Types.xsd so that JAX-WS can access them to create the service port before committing any web service call. This involves creating a virtual directory and enabling anonymous authentication and disabling Windows authentication.

To edit Microsoft Exchange Server security settings:

1. On Microsoft Exchange Server, open Internet Information Services (IIS) Manager.
2. Under Node computer_name > Sites > Default Web Site > EWS, double-click Authentication under IIS.
3. Right-click Basic Authentication and select Enable to enable Basic Authentication for the EWS application.
4. Under Sites, right-click Default Web Site and select Add Virtual Directory to create a virtual directory that will be used to provide anonymous access to Services.wsdl, Messages.xsd, and Types.xsd.
5. In the Add Virtual Directory dialog, in the Alias field, specify the name of the virtual directory, for example ExchWS.
6. In the Physical Path field, specify the path to the virtual directory. For example (Figure 9-2):
   
   C:\Program Files\Microsoft\Exchange Server\V14\ClientAccess\exchweb\ews

   ![Figure 9-2 Creating a Virtual Directory]

   Add Virtual Directory
   
   Site name: Default Web Site
   Path: /
   
   Alias: ExchWS
   Example: Images
   Physical path: \Exchange Server\V14\ClientAccess\exchweb\ews
   Pass-through authentication
   
   Connect as... Test Settings...
   
   OK Cancel
7. Click **Connect as**.

8. In the Connect As dialog, ensure **Application user (pass-through authentication)** is selected.

9. Click **OK**.

10. Under **Default Web Site > ExchWS**, double-click **Authentication** under IIS.

11. Right-click **Anonymous Authentication** and select **Enable** (Figure 9-3).

![Figure 9-3 Enabling Anonymous Authentication](image)

12. Right-click **Anonymous Authentication** and select **Edit**.

13. In the Edit Anonymous Authentication Credentials dialog, ensure **Application pool identity** is selected.

14. Right-click **Windows Authentication** and select **Disable**.

Events uses Basic Authentication to communicate with the Microsoft Exchange Server. To secure the communication, ensure that SSL is enabled. For more information, see: [http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/56bd1f977-14e8-4867-9c51-34c346d48b04.mspx?mfr=true](http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/56bd1f977-14e8-4867-9c51-34c346d48b04.mspx?mfr=true)

You must also ensure that the **SSLAlwaysNegoClientCert** property is set to **true** in IIS. The **SSLAlwaysNegoClientCert** property controls SSL client connection negotiations.

For example, use the following command to set the **SSLAlwaysNegoClientCert** property:

```
CScript.exe adsutil.vbs SET w3svc/1/SSLAlwaysNegoClientCert true
```

For information about setting the **SSLAlwaysNegoClientCert** property, see: [https://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/d3df4bc9-0954-459a-b5e6-7a8bc462960c.mspx?mfr=true](https://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/d3df4bc9-0954-459a-b5e6-7a8bc462960c.mspx?mfr=true)
9.3.1.4 Microsoft Exchange Server 2013 - Limitations

There are currently no known limitations.

9.3.2 Microsoft Exchange Server 2010 Prerequisites

This section describes the Microsoft Exchange Server 2010 prerequisites when used as the server for personal events.

This section includes the following subsections:

- Microsoft Exchange Server 2010 - Installation
- Microsoft Exchange Server 2010 - Configuration
- Microsoft Exchange Server 2010 - Security Considerations
- Microsoft Exchange Server 2010 - Limitations

9.3.2.1 Microsoft Exchange Server 2010 - Installation

Refer to the Microsoft Exchange Server 2010 documentation for installation information.

9.3.2.2 Microsoft Exchange Server 2010 - Configuration

To use Microsoft Exchange Server 2010 as the server for personal events, you must edit the Microsoft Exchange Server 2010 web service WSDL to specify the location of the web service.

To specify the location of the Microsoft Exchange Server 2010 web service:

1. Open the WSDL file for the Microsoft Exchange Server web service.
   
   For example:
   
   C:\Program Files\Microsoft\Exchange Server\ClientAccess\exchweb\ews\Services.wsdl

2. Add a service section that points to your Microsoft Exchange Server web service.
   
   For example:
   
   <wsdl:definitions>
   ...
   <wsdl:service name="ExchangeServices">
   <wsdl:port name="ExchangeServicePort" binding="tns:ExchangeServiceBinding">
   <soap:address location="https://server.example.com/EWS/Exchange.asmx"/>
   </wsdl:port>
   </wsdl:service>
   </wsdl:definitions>

9.3.2.3 Microsoft Exchange Server 2010 - Security Considerations

Events includes a Microsoft Exchange Server 2010 adapter that communicates with the Microsoft Exchange Server 2010 generic web service through a JAX-WS proxy. To set up the communication between the adapter and the web service, you must edit the Microsoft Exchange Server security settings. You must enable Basic authentication. Further, you must enable anonymous access to Services.wsdl, Messages.xsd, and Types.xsd so that JAX-WS can access them to create the service port before committing any web service call. This involves creating a virtual directory and enabling anonymous authentication and disabling Windows authentication.
To edit Microsoft Exchange Server security settings:

1. On Microsoft Exchange Server, open Internet Information Services (IIS) Manager.

2. Under Node `computer_name` > Sites > Default Web Site > EWS, double-click **Authentication** under IIS.

3. Right-click **Basic Authentication** and select **Enable** to enable Basic Authentication for the EWS application.

4. Under Sites, right-click **Default Web Site** and select **Add Virtual Directory** to create a virtual directory that will be used to provide anonymous access to **Services.wsdl**, **Messages.xsd**, and **Types.xsd**.

5. In the Add Virtual Directory dialog, in the Alias field, specify the name of the virtual directory, for example **ExchWS**.

6. In the Physical Path field, specify the path to the virtual directory. For example (Figure 9-4):

   `C:\Program Files\Microsoft\Exchange Server\V14\ClientAccess\exchweb\ews`

**Figure 9-4 Creating a Virtual Directory**

7. Click **Connect as**.

8. In the Connect As dialog, ensure **Application user (pass-thorough authentication)** is selected.

9. Click **OK**.

10. Under Default Web Site > ExchWS, double-click **Authentication** under IIS.

11. Right-click **Anonymous Authentication** and select **Enable** (Figure 9-5).
12. Right-click **Anonymous Authentication** and select **Edit**.

13. In the Edit Anonymous Authentication Credentials dialog, ensure **Application pool identity** is selected.

14. Right-click **Windows Authentication** and select **Disable**.

Events uses Basic Authentication to communicate with the Microsoft Exchange Server. To secure the communication, you must enable SSL. For more information, see:

You must also ensure that the **SSLAlwaysNegoClientCert** property is set to **true** in IIS. The **SSLAlwaysNegoClientCert** property controls SSL client connection negotiations.

For example, use the following command to set the **SSLAlwaysNegoClientCert** property:

CScript.exe adsutil.vbs SET w3svc/1/SSLAlwaysNegoClientCert true

For more information about the **SSLAlwaysNegoClientCert** property, see:

### 9.3.2.4 Microsoft Exchange Server 2010 - Limitations

There are currently no known limitations.

### 9.3.3 Microsoft Exchange Server 2007 Prerequisites

This section describes the Microsoft Exchange Server 2007 prerequisites when used as the server for personal events.

This section includes the following subsections:

- **Microsoft Exchange Server 2007 - Installation**
- **Microsoft Exchange Server 2007 - Configuration**
- **Microsoft Exchange Server 2007 - Security Considerations**
9.3.3.1 Microsoft Exchange Server 2007 - Installation

Refer to the Microsoft Exchange Server 2007 documentation for installation information.

9.3.3.2 Microsoft Exchange Server 2007 - Configuration

To use Microsoft Exchange Server 2007 as the server for personal events, you must edit the Microsoft Exchange Server 2007 web service WSDL to specify the location of the web service.

To specify the location of the Microsoft Exchange Server 2007 web service:

1. Open the WSDL file for the Microsoft Exchange Server web service.
   
   For example:
   
   C:\Program Files\Microsoft\Exchange Server\ClientAccess\exchweb\ews\Services.wsdl

2. Add a service section that points to your Microsoft Exchange Server web service.
   
   For example:
   
   ```xml
   <wsdl:definitions>
   ...
   <wsdl:service name="ExchangeServices">
   <wsdl:port name="ExchangeServicePort" binding="tns:ExchangeServiceBinding">
   <soap:address location="https://server.example.com/EWS/Exchange.asmx"/>
   </wsdl:port>
   </wsdl:service>
   </wsdl:definitions>
   ```

9.3.3.3 Microsoft Exchange Server 2007 - Security Considerations

Events includes a Microsoft Exchange Server 2007 adapter that communicates with the Microsoft Exchange Server 2007 generic web service through a JAX-WS proxy. To set up the communication between the adapter and the web service, you must edit the Microsoft Exchange Server security settings.

To edit security settings:

1. On the Microsoft Exchange Server, open Internet Information Services (IIS) Manager.

2. Under Node `computer_name` > Web Sites > Default Web Site > EWS, click Properties.

4. Select Basic authentication.

5. Click OK.

   You must enable anonymous access to `Services.wsdl`, `Messages.vsd`, and `Types.vsd` so that JAX-WS can access them to create the service port before committing any web service call.

6. Right-click `Services.wsdl` and select Edit.

8. Select Enable anonymous access.

9. Click OK.

10. Repeat steps 6 through 9 for Messages.xsd and Types.xsd.

Events uses Basic Authentication to communicate with the Microsoft Exchange Server. To secure the communication, ensure that SSL is enabled. For more information, see: http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/56bdf977-14f8-4867-9c51-34c346d48b04.mspx?mfr=true

You must also ensure that the SSLAlwaysNegoClientCert property is set to true in IIS. The SSLAlwaysNegoClientCert property controls SSL client connection negotiations.

For example, use the following command to set the SSLAlwaysNegoClientCert property:

CScript.exe adsutil.vbs SET w3svc/1/SSLAlwaysNegoClientCert true

For information about setting the SSLAlwaysNegoClientCert property, see: https://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/d3df4bc9-0954-459a-b5e6-7a8bc462960c.mspx?mfr=true
to understand how to use adsutil.vbs

9.3.3.4 Microsoft Exchange Server 2007 - Limitations

There are currently no known limitations.

9.4 Registering Events Servers

You can register multiple events servers for WebCenter Portal, but only one is active at a single time.

To start using a new (active) connection you must restart the managed server on which the application is deployed.

This section includes the following topics:

- Registering Events Servers Using Fusion Middleware Control
- Registering Event Servers Using WLST

9.4.1 Registering Events Servers Using Fusion Middleware Control

To register an events server:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.

   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.
3. On the WebCenter Portal Service Configuration page, select **Personal Events**.

4. To connect to a new events server instance, click **Add**.

The Add Personal Events Connection page appears (Figure 9-6).

**Figure 9-6 Configuring Events Connections**

![Add Personal Events Connection](image)

5. Enter a unique name for this connection, specify the version of Microsoft Exchange Server, and indicate whether this connection is the active (or default) connection for WebCenter Portal (see Figure 9-6).

**Table 9-2 Personal Events Connection - Name**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name for the connection. The name must be unique (across all connection types) within WebCenter Portal.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>Select the Microsoft Exchange Server you want to connect to:</td>
</tr>
<tr>
<td></td>
<td>• Microsoft Exchange Server 2007</td>
</tr>
<tr>
<td></td>
<td>• Microsoft Exchange Server 2010</td>
</tr>
<tr>
<td></td>
<td>• Microsoft Exchange Server 2013</td>
</tr>
<tr>
<td>Active Connection</td>
<td>Select to use this connection for events in WebCenter Portal. While you can register multiple events server connections, only one connection is used by events—the default (or active) connection.</td>
</tr>
</tbody>
</table>

6. Enter connection details for the events server (Table 9-3).

**Table 9-3 Personal Events - Connection Details**

...
### Table 9-3 (Cont.) Personal Events - Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Service URL</td>
<td>Enter the URL of the web service exposing the event application. Use the format: protocol://host:port/appWebServiceInterface/WSName</td>
</tr>
<tr>
<td></td>
<td>For example <a href="http://myexchange.com:80/ExchangeWS/PersonalEventsWebService.asmx">http://myexchange.com:80/ExchangeWS/PersonalEventsWebService.asmx</a> <a href="http://myexchange.com:80/EWS/Services.wsd1">http://myexchange.com:80/EWS/Services.wsd1</a></td>
</tr>
<tr>
<td>Associated External Application</td>
<td>Associate events with an external application. External application credential information is used to authenticate users against the Microsoft Exchange Server hosting events.</td>
</tr>
</tbody>
</table>

7. Click OK to save this connection.

8. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 9.4.2 Registering Event Servers Using WLST

Use the WLST command `createPersonalEventConnection` to create an events server connection. Use `setPersonalEventConnection` to alter an existing connection. For command syntax and examples, see `createPersonalEventConnection` and `setPersonalEventConnection` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

**Note:**

To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed. See Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

### 9.5 Choosing the Active Events Server Connection

You can register multiple events server connections with WebCenter Portal, but only one connection is active at a time.

This section includes the following topics:

- Choosing the Active Events Server Using Fusion Middleware Control
- Choosing the Active Events Server Connection Using WLST
9.5.1 Choosing the Active Events Server Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

3. On the WebCenter Portal Services Configuration page, select Personal Events.
   
   The Manage Personal Events Connections table indicates the current active connection, if any (Figure 9-7).

4. Select the connection you want to make the active (or default) connection, and then click Edit.

5. Select the Active Connection check box.

6. Click OK to update the connection.

7. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

   For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

9.5.2 Choosing the Active Events Server Connection Using WLST

Use the WLST command `setPersonalEventConnection` with `default=true` to activate an existing events server connection. For command syntax and examples, see `setPersonalEventConnection` in WLST Command Reference for WebLogic Server.

To subsequently disable an events connection, run the same WLST command with `default=false`. Connection details are retained but the connection is no longer named as an active connection.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
Note:
To start using the active connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

9.6 Modifying Events Server Connection Details

You can modify events server connection details at any time. To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Modifying Events Server Connection Details Using Fusion Middleware Control
- Modifying Events Server Connection Details Using WLST

9.6.1 Modifying Events Server Connection Details Using Fusion Middleware Control

To update connection details for an events server:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select Settings > Service Configuration.
3. On the WebCenter Portal Service Configuration page, select Personal Events.
4. Select the connection name, and click Edit.
5. Edit connection details, as required.
   For detailed parameter information, see Table 9-3
6. Click OK to save your changes.
7. To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed.
   For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

9.6.2 Modifying Events Server Connection Details Using WLST

Use the WLST command `setPersonalEventConnection` to edit an existing events server connection. For command syntax and examples, see `setPersonalEventConnection` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
9.7 Deleting Event Server Connections

You can delete events server connections at any time, but use caution when deleting the active connection. If you delete the active connection, users cannot create events in their personal calendar.

This section includes the following subsections:

- Deleting Event Server Connections Using Fusion Middleware Control
- Deleting Event Server Connections Using WLST

9.7.1 Deleting Event Server Connections Using Fusion Middleware Control

To delete an events server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

3. From the list on the WebCenter Portal Service Configuration page, select Personal Events.

4. Select the connection name, and click Delete.

   **Note:**
   
   Before restarting the managed server, select another connection as active; otherwise, the service is disabled.

5. To make this change you must restart the managed server on which WebCenter Portal is deployed.

   For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

9.7.2 Deleting Event Server Connections Using WLST

Use the WLST command deleteConnection to remove an events server connection. For command syntax and examples, see deleteConnection in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
Note:
To effect this change you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers in *Administering Oracle Fusion Middleware*.

9.8 Testing Event Server Connections

To confirm the connection to the events server:

1. Add the Events task flow to a page in WebCenter Portal.
   
   **Tip:**
   
   In WebCenter Portal, add the task flow to a page in your Home portal. See Adding an Events Task Flow to a Page in *Building Portals with Oracle WebCenter Portal*.

2. Click **Personal Events**, then click **Login to Personal Calendar**.

3. Enter your Microsoft Exchange Server login credentials.

   The personal events from your Microsoft Exchange Server should display in the task flow.
This chapter describes how you can integrate other Oracle applications, such as Siebel, E-Business Suite, JD Edwards, PeopleSoft, and Oracle Business Intelligence, with WebCenter Portal.

This chapter includes the following topics:

- About Integrating Other Oracle Applications
- Integrating Siebel Applications
- Integrating E-Business Suite Applications
- Integrating JD Edwards Applications
- Integrating PeopleSoft Applications
- Integrating Oracle Business Intelligence Presentation Services

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration. Aside from these permissions for WebCenter Portal, you may also need additional permissions for the other Oracle applications being integrated.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

10.1 About Integrating Other Oracle Applications

Oracle WebCenter Portal is an integrated suite of technology designed to deliver a unified, context-aware user experience. WebCenter Portal integrates structured and unstructured content, business intelligence, business processes, communication, and collaboration services, and removes the boundaries between enterprise applications. By integrating other applications available within the enterprise with WebCenter Portal, you can create context-centric, composite applications that leverage the capabilities of these applications, extending WebCenter Portal and changing the way people work.

WebCenter Portal uses industry-standard technologies to integrate (primarily as WSRP portlets) other application components. Figure 10-1 shows the technologies involved in WebCenter Portal integration with other Oracle applications.
Although not all applications support the same integration mechanisms, the integration process is generally quite simple, consisting of exposing the application object to be integrated as a portlet, registering the portlet with WebCenter Portal, adding the portlet to a page, and then running and testing the results.

In Figure 10-1 we show the applications that can be integrated as Siebel, E-Business Suite, JD Edwards, PeopleSoft, and Oracle Business Intelligence. These Oracle applications are fully supported and documented within this chapter. However, you can integrate virtually any application that can expose objects as WSRP portlets. The process for integrating them is the same as for the Oracle applications documented here: expose the object as a portlet, register the portlet in WebCenter Portal, and add the portlet to a page. Refer to the documentation for one of the supported Oracle applications for a description of how to consume an exposed portlet in WebCenter Portal.

10.2 Integrating Siebel Applications

This section describes how to integrate a Siebel Web service in WebCenter Portal. It also describes how to integrate Siebel objects using the Siebel Web Engine (SWE). Siebel and WebCenter can work together to include Siebel's CRM capabilities as portlets within WebCenter Portal. You can integrate Siebel applications as Web services, or using the Siebel Web Engine (SWE) as described in the following subsections:

- How to Integrate Siebel Applications as Web Services
- How to Integrate Siebel Applications Using the Siebel Web Engine

10.2.1 How to Integrate Siebel Applications as Web Services

This section describes how to integrate Siebel applications as Web services in WebCenter Portal.

This section contains the following subsections:
• How to Prepare the Siebel Application
• How to Consume a Siebel Web Service Data Control

10.2.1.1 How to Prepare the Siebel Application

This section describes how to create an inbound Web service, set up operations for the inbound service, and generate a WSDL that you will later use to create a data control in WebCenter Portal.

This section contains the following subsections:
• How to Create an Inbound Web Service
• How to Create Operations for the Inbound Web Service

10.2.1.1.1 How to Create an Inbound Web Service

To create an inbound Web service:

1. Log into the Siebel application as an administrator.
2. Navigate to the Administration - Web Services page.
3. Click Inbound Web Services.

   The Inbound Web Services page shows the out-of-the-box Web services and any other Web services that are currently exposed.
4. Click Menu and select New Record from the drop-down list.
5. Enter the values for Namespace, Name, Status and Comment as appropriate for the Web service you want to set up. For example:

   - **Namespace**: http://xmlns.oracle.com
   - **Name**: Siebel Customer Account
   - **Status**: Active
   - **Comment**: For Fusion Middleware

6. Scroll to the Service Ports pane and select New Record from the Menu drop-down list.
7. Enter CustAccount as the Name and click Type.
8. In the Inbound Web Service Port Type pick applet, open the New tab.
9. Select Business Service as the Implementation Type.
10. From the Service Name list, select Siebel Account.
11. In the Inbound Web Service Port Type pick applet, click OK to create the inbound Web service.
12. From the Service Ports dialog’s Transport drop-down list, select HTTP.
13. In the **Address** field, set the URL to your Siebel instance. For example:

   http://xmlns.oracle.com/eai_enu/start.swe?
   SWEEExtSource=WebService&SWEEExtCmd=Execute&UserName=SADMIN&Password=SADMIN

14. From the **Menu** drop-down list, select **Save Record**.

### 10.2.1.1.2 How to Create Operations for the Inbound Web Service

After creating the inbound Web service (see **How to Create an Inbound Web Service**), continue by adding operations to the inbound Web service and then create a WSDL file, follow these steps:

1. Scroll to the Operations section and select **New** from the **Menu** drop-down list.
2. In the **Operation Name** field, enter **AccountInsert**.
3. Click **Method Display Name** to open the Business Service Method dialog.
4. Select **Insert** as the **Method**, and click **OK**.
5. From the **Authentication Type** drop-down list, select an appropriate authentication type:

<table>
<thead>
<tr>
<th>Authentication Type</th>
<th>Session Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>A single request is sent with an anonymous user login, and the session is closed after the response is sent out. In order for the anonymous session to be identified by the SWSE Plug-in, UsernameToken and PasswordText must be excluded in the SOAP headers.</td>
</tr>
<tr>
<td>Username and password</td>
<td>None</td>
<td>A single request is sent with the username and password used to log in, and the session is closed after the response is sent out.</td>
</tr>
<tr>
<td>Username and password</td>
<td>Stateless</td>
<td>The initial request to log in establishes a session that is to remain open and available for subsequent requests. Username/password are used to log in and a session token is returned in a SOAP header included in the outbound response. The session remains open.</td>
</tr>
<tr>
<td>Session token (stateless)</td>
<td>Stateless</td>
<td>Request to reconnect to an established session, using the information contained in the session token. If the session has been closed, automatic re-login occurs. The Siebel servers include the session token in the SOAP header of the response. The session remains open.</td>
</tr>
<tr>
<td>Session token (stateless)</td>
<td>None</td>
<td>When a SOAP header carries a session token and has the session type set to None, then the Session Manager on the SWSE closes (logs out) of this session, and invalidates the session token. The session token is not used after the session is invalidated.</td>
</tr>
</tbody>
</table>
6. Click **New** to create a new operation.
7. In the **Operation Name** field, enter a name for the new operation (for example, **AccountQueryByExample**).
8. Click **Method Display Name** for the new operation.

9. In the Business Service Method dialog, select the query method (for example, **Query By Example**) and click **OK**.

10. Continue by adding any additional operations you may need as described in steps 6 to 9 above.

11. In the Service Ports pane, select **Save Record** from the **Menu** drop-down list.

12. In the Inbound Web Services pane, select **Save Record** from the **Menu** drop-down list.

13. Select **Clear Cache** from the **Menu** drop-down list.

14. Click the **Generate WSDL**.

15. On the File Download dialog, click **Open**.

16. Select **File --> Save As**...

17. Locate the directory where you want to save the WSDL file, enter a name for the file and click **Save**.

### 10.2.1.2 How to Consume a Siebel Web Service Data Control

This section describes how you can create a Web Service data control and add it to a portal page. The steps in this section assume that you have prepared the application and generated a WSDL as described in **How to Prepare the Siebel Application**.

---

**Note:**

Before you can add a data control or task flow containing a data control to a portal page you must first have configured WS-Security for WebCenter Portal. For more information about configuring WS-Security, see Configuring Web Services Security login credentials in *Administering Oracle WebCenter Portal*.

For more information about creating a Web service data control, see Creating Data Controls in *Building Portals with Oracle WebCenter Portal*. For information about Web service data controls, see also Web Service Data Controls in *Building Portals with Oracle WebCenter Portal*.

To create a Web service data control:

1. In WebCenter Portal or the portal in which you want to create the data control, go to either the **Shared Assets** or **Assets** page.

2. Select **Data Controls** and click **Create**.

The Create New Data Control dialog displays (see **Figure 10-31**).
3. In the Create New Data Control dialog, enter a Name and Description for the data control, select Web Service as the Data Control Type, and then click Continue.

4. Enter the WSDL URL that you generated in How to Generate the WSDL and other details for the data control and click Continue.

5. Click Show Methods.

6. Select the method(s) to make available and click Next.

7. Enter the parameter default values, if any, and click Create.

8. To make the data control available, from the Shared Assets or Assets page, select Task Flows. The Create New Task Flow dialog displays (see Figure 10-33).

9. Enter the task flow Name and Description, select the Mashup Style to use, and then click Create to create the task flow.

10. Select the task flow and click the Edit icon.

11. Add the data control (with parameter form) as a table onto the task flow and verify the data.

12. To make the task flow available, navigate to Administration > Business Role Pages.

13. Select Business Role Page and click the Create icon.

14. Edit the page and save the changes.

15. Drop the task flow onto the page and verify the data.

10.2.2 How to Integrate Siebel Applications Using the Siebel Web Engine

As well as integrating Siebel applications using Web services, you can also integrate Siebel applications in WebCenter Portal using the Siebel Web Engine (SWE).
Siebel Web Engine (SWE) is responsible for rendering the Siebel User Interface. Siebel Web Templates provide this HTML layout information (markup information) to the Siebel Web Engine when rendering Siebel objects in the repository definition of the application. The markup that SWE returns can also be XML for rendering within XML-aware applications or WML (wireless markup language) for rendering on wireless devices. This lets you request the SWE to return a Siebel View as XML, parse the data elements, and display the result in a WebCenter Portal application.

For more information, refer to the Siebel Bookshelf Guides: Siebel Portal Framework Guide (specifically, the section on delivering content to external Web applications), and Configuring Siebel Business Applications Guide for details on SWE and Web Templates.

### 10.3 Integrating E-Business Suite Applications

This section describes how to integrate E-Business Suite applications in WebCenter Portal.

This section contains the following subsections:

- About Integrating EBS Applications
- Required Configurations for Integrating EBS
- How to Integrate EBS Applications as WSRP Portlets
- How to Integrate EBS Applications as Data Controls

#### 10.3.1 About Integrating EBS Applications

This section describes the integration points and requirements integrating Oracle E-Business Suite portlets in WebCenter Portal.

This section includes the following subsections:

- Understanding EBS Integration
- Requirements for Integrating EBS Applications

##### 10.3.1.1 Understanding EBS Integration

Out of the box, Oracle E-Business Suite OA Framework-based portlets, such as Applications Navigator, and Favorites are WSRP and JSR 168-compliant. That means that you can access these Oracle E-Business Suite portlets from WSRP-compliant portal servers, such as WebCenter Portal, by simply adding the portlet onto a page. Follow the instructions in How to Add the EBS Portlet to a Portal Page to add them to a WebCenter Portal or portal page.

You can also create new E-Business Suite portlets that are WSRP and JSR 168-compliant that can similarly be added to WebCenter Portal. Creating and consuming WSRP and JSR 168 compliant portals in WebCenter Portal is described in How to Integrate EBS Applications.

##### 10.3.1.2 Requirements for Integrating EBS Applications

The following requirements apply for integrating Oracle E-Business Suite portals in WebCenter Portal:

- Regions to be exposed as portlets must be created using Oracle E-Business Suite OA Framework Release 12 as previous versions are not WSRP/JSR 168-compliant.
• Oracle E-Business Suite can be configured to use Oracle Internet Directory (OID) and one of following single sign-on solutions:

  **Caution:**
  Both WebCenter Portal and Oracle E-Business Suite must share the same OID instance and user IDs.

  – Oracle Single Sign-On (OSSO)
  – Oracle Access Manager (OAM)

  If you are using OSSO, follow the steps in My Oracle Support document 376811.1 to integrate E-Business Suite Release 12 with OID and OSSO.

  If you are using OAM, follow the steps in My Oracle Support document 975182.1 to integrate E-Business Suite Release 12 with OAM.

  E-Business Suite can also be configured to OID without OAM or OSSO. For more information, see [How to Prepare OID for Use Without Single Sign-On](#).

  **Note:**
  Although Oracle E-Business Suite can be configured to use Oracle Internet Directory (OID) without single sign-on, this is not a recommended approach as users will be prompted for credentials each time they move to or from the integrated portal or data control.

  • You must have granted WebCenter Portal access to the E-Business Suite Portlet Producer and added and configured the appropriate users.

  **Note:**
  To complete some steps, you may need system administrator permissions.

### 10.3.2 Required Configurations for Integrating EBS

This section contains configurations that should be undertaken prior to attempting to integrate portal or data controls in WebCenter Portal.

This section contains the following subsections:

• How to Prepare OID for Use Without Single Sign-On
• How to Create a User in EBS and Assign a Responsibility
• How to Configure the EBS Applications Profile Options
• How to Add the WebCenter Host as a Trusted Portal Using AutoConfig

#### 10.3.2.1 How to Prepare OID for Use Without Single Sign-On

This section describes the steps to configure OID as an optional standalone environment without using either OAM or OSSO. Note that this is not a recommended approach as users will be prompted for credentials each time they move to or from an
integrated portal or data control. If you have installed an SSO solution, continue with How to Create a User in EBS and Assign a Responsibility.

**Caution:**
Both WebCenter Portal and Oracle E-Business Suite must share the same OID instance and the same user IDs.

1. Register the OID instance on the host server by following the steps below:
   a. Run the following command:
      
      ```
      $FND_TOP/bin/txrun.pl -script=SetSSOReg -registerinstance=yes
      ```
   
   b. Supply the required information at the following prompts:
      
      Enter the host name where the Oracle iAS Infrastructure database is installed ? `<Enter the OID Host>`
      Enter the LDAP Port of the Oracle Internet Directory server ? `<Enter the LDAP Port>`
      Enter SSL LDAP Port of the Oracle Internet Directory server ? `<Enter the LDAP SSL Port>`
      Enter the Oracle Internet Directory Administrator (orcladmin) Bind password ? `<Password>`
      Enter Oracle E-Business apps database user password ? `<Password>`
   
   c. Restart all the services by navigating to `$ADMIN_SCRIPTS_HOME` and running:
      
      ```
      ./adstpall.sh apps/<apps to stop>
      ```
      and then:
      
      ```
      ./adstrtal.sh apps/<apps to start>
      ```

2. Register OID by following the steps below:
   a. Run the following command:
      
      ```
      $FND_TOP/bin/txrun.pl -script=SetSSOReg -registeroid=yes
      ```
   
   b. Supply the required information at the following prompts:
      
      Enter LDAP Host name ? `<Enter the OID Host>`
      Enter the LDAP Port on Oracle Internet Directory server ? `<Enter the LDAP Port>`
      Enter the Oracle Internet Directory Administrator (orcladmin) Bind password ? `<Password>`
      Enter the instance password that you would like to register this application instance with ? `<Password>`
      Enter Oracle E-Business apps database user password ? `<Password>`
   
   c. Restart all the services by navigating to `$ADMIN_SCRIPTS_HOME` and running:
      
      ```
      ./adstpall.sh apps/<apps to stop>
      ```
      and then:
      
      ```
      ./adstrtal.sh apps/<apps to start>
      ```
3. Continue by configuring EBS profile options as shown in How to Configure the EBS Applications Profile Options.

10.3.2.2 How to Create a User in EBS and Assign a Responsibility

For integration with EBS to work, WebCenter Portal and EBS must have a common OID identity store. With a common OID, you can either create a new user in EBS, or use an existing user in OID, and then assign a responsibility to that user. This will ensure that the user has access to the portlets in WebCenter Portal.

To create a new user and assign a responsibility:

1. Log into EBS as a system administrator if not already logged in.

2. In the Navigation pane, expand the System Administrator node, expand Security, expand User, and then click Define.

The Users window displays (Figure 10-4).

Figure 10-4 Users Window

3. Enter the User Name, and Password. The Password Expiration options should be set to None.

4. Open the Direct Responsibilities tab, and search for the Responsibility to add and assign the Application to associate with it (for example, search for Preferences SSWA and assign Oracle iProcurement to it), and then click Save (see Figure 10-5).
5. To confirm, log in with the newly created user and check that the application associated with the Responsibility is listed.

6. Continue by configuring the EBS Application Profile Options as described in How to Configure the EBS Applications Profile Options.

### 10.3.2.3 How to Configure the EBS Applications Profile Options

This section describes how to configure EBS Applications Profile Options and is a requirement for both SSO and non-SSO configurations.

To configure the EBS profile options:

1. Log into EBS as a system administrator.

2. In the Navigation pane, expand the System Administrator node, and then click **Define Profile Options**.

3. Close the Profiles window.

4. In the Navigator, select **Profile System Values** and click **Open**.

   The Find System Profile Values window displays (see Figure 10-6)
5. Enter the **Profile** name to update and click **Find**.

The System Profile Values window displays (see Figure 10-7).

![Figure 10-7 System Profile Values Window](image)

Update the values for the following profiles, saving your entries after each update:

- **Applications SSO Enable OID Identity Add Event** = **Enabled**
- **Applications SSO Login Types** = **Both**
- Application SSO LDAP Synchronization = **Enabled**
- **Applications SSO Type** = **SSWA w/ SSO**
- Link Applications user with OID user with same username = **Enabled**

6. Restart all the services by navigating to `$ADMIN_SCRIPTS_HOME` and running:

```
./adstpall.sh apps/<apps to stop>
```

and then:

```
./adstrtal.sh apps/<apps to start>
```
7. Continue by adding the WebCenter host as a trusted host as described in **How to Add the WebCenter Host as a Trusted Portal Using AutoConfig**.

**10.3.2.4 How to Add the WebCenter Host as a Trusted Portal Using AutoConfig**

The EBS WSDL is protected and before you can access it you must first add an entry for the consuming WebCenter Portal instance's host using the EBS AutoConfig tool. Note that without this configuration step you will get a "403 Forbidden" error if you try to access the WSDL.

To add the WebCenter Portal host as a trusted portal:

1. Log into EBS as a system administrator if you are not already logged in.

2. In the Navigation pane, expand the System Administrator node, expand Oracle Applications Manager, and then click **Workflow**.

3. Open the Sitemap tab and click **AutoConfig**.

4. In the Edit Parameter column, click the **Edit** icon in the Applications Tier row.

5. Open the System tab and expand the **oa_web_server** node.

6. In the list of nodes, look for any that have access to Portlet Producer URLs, add the WebCenter Host and click **Save**. If you need to add multiple host name, add them separated by space.

7. Run the autoconfig script entering **apps** as the password when prompted:

```
cd $ADMIN_SCRIPTS_HOME
./adautocfg.sh
```

8. Restart all the services by running the following commands from $ADMIN_SCRIPTS_HOME:

```
./adstpall.sh apps/<apps to stop>
```

and then:

```
./adstrtal.sh apps/<apps to start>
```

**10.3.3 How to Integrate EBS Applications as WSRP Portlets**

This section describes how to integrate EBS regions as WSRP portlets in WebCenter Portal. To start, you'll need to generate the portlet for the region using the Portlet Generator, and then continue by registering the producer and integrating it in WebCenter Portal.

This section contains the following subsections:

- **How to Prepare the EBS Portlet for Remote Access**
- **How to Integrate EBS Applications**

**10.3.3.1 How to Prepare the EBS Portlet for Remote Access**

Oracle E-Business Suite provides a tool called Portlet Generator to convert existing standalone Oracle Application Framework regions into portlets. To be available for portletization, a region must have the following properties.
- Regions must have an Application Module (AM) defined and must have its standalone property set to true.
- Inline regions must have an AM defined and have its standalone property set to true.
- Content regions must have an AM defined (content regions do not have a standalone property)

To expose EBS functionality as a portlet using Portlet Generator:

1. Log into EBS as a system administrator.
2. In the Navigation pane, expand the Functional Administrator node, and then click Home.

The Application Administration page displays (see Figure 10-8).

*Figure 10-8  Application Administration Page*

3. Open the Portletization tab and click the Search icon for the Application Short Name field (or enter the Application Short Name if you know it).
4. Select the Search By criteria (for example, select **Application Name** and enter **Oracle iProcurement**) and search for the functionality to portletize.

5. Select the row returned in the search results and click **Select**.

6. Click **Go** to list the EBS functionality that can be portletized.

7. Click the **Portletize** icon for the functionality you want to expose (for example, **AdvisoryWarningRN**).

   The Create Portlet dialog displays (see Figure 10-10).

8. Enter the **Responsibility** to associate the region with (for example, **Preferences SSWA**) or use the **Search** function.

9. Click **Apply**.

10. Continue by registering the EBS producer and integrating it in a portal (see How to Integrate EBS Applications).
10.3.3.2 How to Integrate EBS Applications

This section contains the following subsections:

- How to Prepare the EBS Portlet for Remote Access
- How to Register the EBS WSRP Producer in WebCenter Portal
- How to Add the EBS Portlet to a Portal Page
- How to Test the Portlet Connection

10.3.3.2.1 How to Prepare the EBS Portlet for Remote Access

Prepare the standalone regions to be portletized as described in the section on How to Prepare the EBS Portlet for Remote Access.

Before adding the portlets in WebCenter Portal, be sure to bounce the Apache listener as the menu and function definitions are cached.

10.3.3.2.2 How to Register the EBS WSRP Producer in WebCenter Portal

You can register the EBS WSRP producer directly in WebCenter Portal using Fusion Middleware Control.

To register the EBS WSRP producer using Fusion Middleware Control:

1. Prepare the EBS page that you want to consume in WebCenter Portal for remote access as described in How to Prepare the EBS Portlet for Remote Access.

2. Log into Fusion Middleware Control for the WebCenter Portal domain (wc_domain by default).

   The Add Portlet Producer page displays.

4. Enter a Connection Name, set the Producer Type to WSRP Producer, and paste the WSDL endpoint URL that you copied in step 1 into the URL End Point field.

5. Click OK and verify that the producer connection was created successfully.

6. Continue by adding the portlet to a portal page as described in How to Add the EBS Portlet to a Portal Page.

10.3.3.2.3 How to Add the EBS Portlet to a Portal Page

Follow the steps below to consume the EBS remote producer in a WebCenter Portal page:

1. Log into WebCenter Portal and, optionally, open the target portal.

2. Go to the page, or create a new page, where you want to add the EBS portal.

3. Click Add Content and in the resource catalog, select UI Components and then Portlets.

   Note that if you’ve created a custom resource catalog, Portlets may not appear. In this case, you will need to add it to the resource catalog. For information about
managing resource catalogs, see Working with Resource Catalogs in Building Portals with Oracle WebCenter Portal.

4. Click the portlet you added in Fusion Middleware Control.

5. Click Add for the EBS portlet you want to add to your portal page.

6. On the portal page, click the portlet’s View Actions menu, and select Display Options.

7. In the Display Options dialog, set Render Portlet in IFrame to True and click OK.

8. Continue by checking the portlet connection as described in How to Test the Portlet Connection.

10.3.3.2.4 How to Test the Portlet Connection

Follow these steps to test the portlet connection by modifying content and checking that the modification shows up in the EBS application.

1. On the WebCenter Portal or portal page to which you added the EBS portlet, modify some information that you can verify the changes for in the EBS application.

2. Save your changes and confirm that the changes also appear in the EBS application.

10.3.4 How to Integrate EBS Applications as Data Controls

This section describes how to add EBS applications as Web service data controls on a WebCenter Portal page.

This section contains the following topics:

- How to Generate the WSDL
- How to Add a Web Service Data Control to a Portal Page

10.3.4.1 How to Generate the WSDL

This section describes how to create the WSDL.

1. Log into E-Business Suite as the SYSADMIN user.

2. In the Navigation pane, expand the Integrated SOA Gateway node and under the Integrated SOA Gateway sub-node click Integration Repository.

3. From the Integration Repository tab, navigate to the part of the EBS application to expose. For example, for the price request interface, you would go to Order Management Suite > Advanced Pricing > Price List, and then selecting Price Request from the list of integration points.

4. Click Generate WSDL to expose the integration point (for our example, a PL/SQL API integration point) as a Web service.

5. Right-click the View WSDL link and open the link in a new tab or new window (be sure to keep the tab or window open as you'll need it later).

6. On the Integration Repository page under Procedures and Functions (see Figure 10-11), check the box for the object to grant access to, and then click Grant Access.
7. Select the Grantee Type and Grantee Name (the user you want to grant access to the exposed object), or use the Search tool. For our example, we will grant access to ASADMIN.

10.3.4.2 How to Add a Web Service Data Control to a Portal Page

Once you have the WSDL, you can continue by using it to create a web service data control.

Note:

Before you can add a data control or task flow containing a data control to a portal page you must first have configured WS-security for WebCenter Portal. For more information about configuring WS-security, see Configuring Web Services Security.
For more information about creating a web service data control, see Creating a Web Service Data Control in *Building Portals with Oracle WebCenter Portal*. For information about web service data controls, see About Web Services Data Controls in *Building Portals with Oracle WebCenter Portal*.

To create a web service data control:

1. In WebCenter Portal or the portal in which you want to create the data control, go to either the **Shared Assets** or **Assets** page.

2. Select **Data Controls** and click **Create**.

   The Create New Data Control dialog displays (see Figure 10-31).

3. In the Create New Data Control dialog, enter a **Name** and **Description** for the data control, select **Web Service** as the **Data Control Type**, and then click **Continue**.

4. Enter the WSDL URL that you generated in *How to Generate the WSDL* and other details for the data control and click **Continue**.

5. Click **Show Methods**.

6. Select the method(s) to make available and click **Next**.

7. Enter the parameter default values, if any, and click **Create**.

8. To make the data control available, from the **Shared Assets** or **Assets** page, select **Task Flows**. The Create New Task Flow dialog displays (see Figure 10-33).

9. Enter the task flow **Name** and **Description**, select the **Mashup Style** to use, click **Create** to create the task flow.

10. Select the task flow and click the **Edit** icon.

11. Add the data control (with parameter form) as a table onto the task flow and verify the data.
12. To make the task flow available, navigate to Administration > Business Role Pages.

13. Select Business Role Page and click the Create icon.

14. Edit the page and save the changes.

15. Drop the task flow onto the page and verify the data.

10.4 Integrating JD Edwards Applications

This section describes how to integrate JD Edwards applications into WebCenter Portal.

This section contains the following subsections:

- How to Prepare the JD Edwards Application for Remote Access
- How to Register the Producer
- How to Add the JD Edwards Portlet to a WebCenter Portal Page
- How to Test the Portlet Connection

10.4.1 How to Prepare the JD Edwards Application for Remote Access

Before you can add JD Edwards standalone regions to WebCenter Portal, you must first prepare them to be portletized within JD Edwards by making them available externally as portlets and locating the pre-configured WSDL in the `webclient.war/wsdl` directory. The WSDL URL is needed so that you can register the JD Edwards WSRP producer and consume it from a WebCenter Portal or portal page. To view the XML content of the JDE WSDL in the browser, open the Page source of the page in the browser. For more information, see Administering WSRP with Oracle WebCenter.

10.4.2 How to Register the Producer

You can register the JD Edwards WSRP producer directly in WebCenter Portal, as described in the Registering Portlet Producers with the Administration Console in Administering Oracle WebCenter Portal. You can also register the JD Edwards WSRP producer using Fusion Middleware Control as described in the steps below.

To register the JD Edwards WSRP producer using Fusion Middleware Control:

1. Prepare the JD Edwards page that you want to consume in WebCenter Portal for remote access as described in How to Prepare the JD Edwards Application for Remote Access.

2. Log into Fusion Middleware Control for the WebCenter Portal domain (`wc_domain` by default).

   The Add Portlet Producer page displays.

4. Enter JDE as the Connection Name, set the Producer Type to WSRP Producer, and paste the WSDL endpoint URL that you copied in step 1 into the URL End Point field.
5. Click OK and verify that the producer connection was created successfully.

6. Continue by adding the portlet to a portal page as described in How to Add the JD Edwards Portlet to a WebCenter Portal Page.

10.4.3 How to Add the JD Edwards Portlet to a WebCenter Portal Page

Follow the steps below to consume the JD Edwards remote producer in WebCenter Portal:

1. Log into WebCenter Portal.

2. Go to the page, or create a new page, where you want to add the JD Edwards portal.

3. Click Add Content and in the resource catalog, select UI Components and then Portlets.

Note that if you've created a custom catalog, Portlets may not appear. In this case, you will need to add it to the resource catalog. For information about managing resource catalogs, see Working with Resource Catalogs in Building Portals with Oracle WebCenter Portal.

4. Click the portlet you added in Fusion Middleware Control.

5. Click Add for the JD Edwards portlet you want to add to your portal page.

6. On the portal page, click the portlet’s View Actions menu, and select Display Options.

7. In the Display Options dialog, set Render Portlet in IFrame to True and click OK.

8. Continue by checking the portlet connection as described in How to Test the Portlet Connection.

10.4.4 How to Test the Portlet Connection

Follow these steps to test the portlet connection by modifying content and checking that the modification shows up in the JD Edwards application.

1. On the WebCenter Portal or portal page that you added the JD Edwards portlet to, modify some information that you can verify the changes for in the JD Edwards application.

2. Save your changes and confirm that the changes also appear in the JD Edwards application.

10.5 Integrating PeopleSoft Applications

This section describes how to integrate PeopleSoft applications in WebCenter Portal. This section contains the following subsections:

- About Integrating PeopleSoft Applications
- How to Integrate PeopleSoft Applications as WSRP Portlets
- How to Integrate PeopleSoft Applications as Data Controls in WebCenter Portal
10.5.1 About Integrating PeopleSoft Applications

This section describes the benefits and methods involved in integrating PeopleSoft applications in WebCenter Portal.

This section includes the following subsections:

- Understanding PeopleSoft Integration
- Requirements for Integrating PeopleSoft Applications

10.5.1.1 Understanding PeopleSoft Integration

PeopleTools 8.51 and later lets you expose PeopleSoft applications as WSRP portlets in remote applications such as WebCenter Portal. This allows people who only need access to a small portion of PeopleSoft's functionality to access it through WebCenter Portal without needing to open or learn the entire PeopleSoft application.

10.5.1.2 Requirements for Integrating PeopleSoft Applications

This section the prerequisites for integrating PeopleSoft objects in WebCenter Portal.

- PeopleSoft 9.0 or later.
- PeopleTools 8.51 or later.
- When using WS-Security for automatic sign on to PeopleSoft, in order for the SAML assertion to be valid, the date/time on the PeopleSoft and Oracle WebCenter Portal servers must be synchronized. If this is problematic, then the PeopleSoft web server's time may be set to be slightly ahead of the Oracle WebCenter Portal server.
- For PeopleTools 8.51, you may need to create and configure a custom OWSM policy in order to fully support WS-Security. For more information, see How to Configure WS-Security for PeopleTools 8.51.
- For PeopleTools 8.51, only upper case subject names are supported, requiring that only fully upper case user IDs can be used in WebCenter for the integration to work.

10.5.2 How to Integrate PeopleSoft Applications as WSRP Portlets

This section describes how to expose PeopleSoft applications as WSRP portlets in WebCenter Portal.

This section includes the following subsections:

- How to Prepare the PeopleSoft Application for Remote Access
- How to Configure WS-Security for PeopleTools 8.52 and Later
- How to Attach a WS-Security Policy to WebCenter Portal
- How to Integrate PeopleSoft Applications in WebCenter Portal
- How to Configure WS-Security for PeopleTools 8.51

10.5.2.1 How to Prepare the PeopleSoft Application for Remote Access

This section describes how to prepare the PeopleSoft application so that it can be consumed by WebCenter Portal.
To prepare the PeopleSoft application:

1. Log into PeopleSoft as an administrator.

2. Select PeopleTools from the main menu.

3. From the PeopleTools main menu, expand Portal.

4. Select **Structure and Content**.

   The Structure and Content page displays a list of folders containing PeopleSoft objects that could be exposed as a WSRP Portlet (see **Figure 10-15**).

![Structure and Content Page](image)

**Figure 10-15  Structure and Content Page**

5. Navigate to the folder and subfolder (if required) containing the service that you want to expose as portlet in WebCenter Portal and click **Edit** to open it. For example, you could select **Self Service, Personal Information**, and then **Personal Information Summary**.

   The Content Ref Administration page displays (see **Figure 10-16**).
6. On the General tab, select the **WSRP Producible** checkbox.

7. Save the page.

8. In the PeopleSoft Application Designer, open the component object to the Request Details page that gets displayed in PeopleSoft, and in the Component Properties section, check the **WSRP Compliant** check box.

9. From the main menu, expand PeopleTools and then Portal and select **WSRP Production**.

   The Producer Offered Portlets page displays (see **Figure 10-17**).
10. Verify that the service is exposed, and then expand Web Service Endpoint URL and copy the URL (the WSDL).

11. Open a new tab in your browser, and paste the copied URL into the Navigation Bar to access the WSDL page.

12. Copy the URL to the clipboard.

13. Continue by integrating the PeopleSoft WSRP producer in WebCenter Portal as described in How to Integrate PeopleSoft Applications in WebCenter Portal.

### 10.5.2.2 How to Configure WS-Security for PeopleTools 8.52 and Later

This section describes how to create a keystore for both WebCenter Portal and PeopleSoft, and exchange the private key between them. This step is required prior to adding WS-Security policies for WebCenter Portal.

1. First, we will create the WebCenter keystore as *webcenter.jks* with *orakey* as the private key, and PeopleSoft's public key *rootCA* and the certificate that PeopleSoft will use as the WS-Security recipient using the following *keytool* commands:
2. Next, we will create PeopleSoft keystore as `peoplesoft.jks` with `rootCA` as the private key and WebCenter’s public key `orakey` and the certificate that WebCenter will use as the WS-Security recipient.

   ```bash
./keytool -genkeypair -keyalg RSA -dname "cn=rootCA,dc=us,dc=oracle,dc=com" -
   alias rootCA -keypass password -keystore peoplesoft.jks -storepass password -
   validity 720

./keytool -exportcert -v -alias rootCA -keystore peoplesoft.jks -storepass
   password -rfc -file rootca.cer

./keytool -importcert -trustcacerts -alias rootCA -file rootca.cer -keystore
   peoplesoft.jks -storepass password
```

3. After creating the key stores for WebCenter Portal and PeopleSoft, copy the `peoplesoft.jks` to the PeopleSoft host and `webcenter.jks` to the WebCenter host:

   - Copy `peoplesoft.jks` to `<Domain_Home>/config/fmwconfig/
   - Copy `webcenter.jks` to `/home/psadm2/psft/pt/8.52/webserv/ `<Domain_Name>/applications/peoplesoft/pspc.war/WEB-INF/ classes

4. Install the certificate in PeopleSoft as shown below:

   The Digital Certificates page displays (see Figure 10-18).
b. Click + to add a new entry.

We need to add digital certificates for Remote and RootCA as shown in Figure 10-19.
c. Enter the **Type** as `RootCA`, **Alias** as `orakey`, **Issuer Allias** as `orakey`, and then click the **Search** icon (magnifying glass).

d. Click **Import** and in the popup, enter the entire text of `orakey.cer` created earlier and click **OK**.

e. Click + to add another new entry, and enter the **Type** as `Remote`, **Alias** as `orakey`, **Issuer Allias** as `orakey` and then click the **Search** icon.

f. Click **Import** and in the popup, enter the entire text of `orakey.cer` created earlier and click **OK**.

6. Use **PSCipher.sh** to create an Encrypted Password and update the KeyStore password as shown in **Figure 10-20**.
7. Check the local node definition in PeopleSoft:
      The Nodes page displays.
   b. Click Search and click PSFT-HR.
c. Select Password from the Authentication Option drop-down list and click Save.

10.5.2.3 How to Attach a WS-Security Policy to WebCenter Portal

This section describes how to attach a WS-Security policy to WebCenter Portal.

Note:

Before continuing with the steps below you must have configured the WebCenter and PeopleSoft key stores as described in How to Configure WS-Security for PeopleTools 8.52 and Later.

- How to Configure WSS 1.0 SAML Token with Message Integrity
- How to Configure WSS 1.0 Username Token Without Password
- How to Configure WSS 1.0 SAML Token with Message Protection
- How to Configure WSS 1.0 Username Token with Password
10.5.2.3.1 How to Configure WSS 1.0 SAML Token with Message Integrity

Follow the steps below to configure the WSS1.0 SAML Token with Message Integrity policy for WebCenter Portal:

1. Navigate to the following directory on the PeopleSoft server:
   
   `/home/psadm2/psft/pt/8.53/webserv/peoplesoft/piabin`

   and run the following command:
   
   `./redeployWSRP.sh 6`

   This will update the PeopleSoft WSRP security options to use WSRPBaseService with SAMLToken Full Security.

2. In PeopleSoft, navigate to PeopleTools > Security > SAML Administration Setup > SAML Inbound Setup.

   The SAML Inbound Setup page displays (see Figure 10-22).

   **Figure 10-22   SAML Inbound Setup Page**

3. Open the Add a New Value tab and map the WebCenter Portal user with the PeopleSoft user if they use a different OID (example settings are shown below), and then click **Save**.

   Example:

   - **Certificate Alias** - orakey
   - **Issuer** - WWW.ORACLE.COM
   - **SubjectName** - pat
   - **QualifierName** - WWW.ORACLE.COM
   - **Mapping PeopleSoft UserID** - PS
4. Continue by registering the WSRP producer and adding the portlet to a portal page as shown in How to Integrate PeopleSoft Applications in WebCenter Portal.

10.5.2.3.2 How to Configure WSS 1.0 Username Token Without Password

Follow the steps below to attach a WSS 1.0 Username Token without Password policy to WebCenter Portal.

1. Create a WebCenter user in PeopleSoft:
      The Copy User Profiles page displays (see Figure 10-23).

   

   

   

   

   Figure 10-23   Copy User Profiles Page - Search Criteria

   b. Search for the user to add (e.g., for example).
      The search results display (see Figure 10-24).
c. Enter the **New User ID** (for example, *Pat*), a **Description**, the **New Password**, check the **Copy ID Type Information** option and click **Save**.

2. Log into Fusion Middleware Control, select the domain and navigate to **Security > Security Provider Configuration**.

   The Security Provider Configuration page displays.

3. Open the Keystore section and click **Configure**.

   The Keystore Configuration page displays.

4. Enter `.webcenter.jks` for the **KeyStore Path**, `orakey` for the **Key Alias**, `orakey` for the **Crypt Alias**. Enter the associated passwords and click **OK**.

   Note that you must restart the entire domain for the configuration changes to take effect.

5. Navigate to `/home/psadm2/psft/pt/8.53/webserv/peoplesoft/piabin` and run the following command:

   ```
   ./redeployWSRP.sh 8
   ```

   This will update the PeopleSoft WSRP security options to use WSRPBaseService with UsernameToken, No Password Full Security Option With WSS Response.

6. Continue by registering the WSRP producer and adding the portlet to a WebCenter Portal or portal page as shown in **How to Integrate PeopleSoft Applications in WebCenter Portal**.

10.5.2.3.3 How to Configure WSS 1.0 SAML Token with Message Protection

Follow the steps below to attach the WSS1.0 SAML Token with Message Protection policy to WebCenter Portal.
1. Navigate to /home/psadm2/psft/pt/8.53/webserv/peoplesoft/piabin and run the following command:

   ```bash
   ./redeployWSRP.sh 10
   ```

   This will update the PeopleSoft WSRP security options to use WSRPBaseService with SAMLToken Full Security Option With WSS Response.

2. Continue by registering the WSRP producer and adding the portlet to a portal page as shown in How to Integrate PeopleSoft Applications in WebCenter Portal.

### 10.5.2.3.4 How to Configure WSS 1.0 Username Token with Password

Follow the steps below to attach the WSS1.0 SAML Token with Message Protection policy to WebCenter Portal.

1. Navigate to /home/psadm2/psft/pt/8.53/webserv/peoplesoft/piabin and run the following command:

   ```bash
   ./redeployWSRP.sh 7
   ```

   This will update the PeopleSoft WSRP security options to use WSRPBaseService with UsernameToken Full Security Option With WSS Response.

2. Continue by registering the WSRP producer and adding the portlet to a WebCenter Portal or portal page as shown in How to Integrate PeopleSoft Applications in WebCenter Portal.

### 10.5.2.4 How to Integrate PeopleSoft Applications in WebCenter Portal

This section describes how to integrate a PeopleSoft application in WebCenter Portal. This section contains the following subsections:

- How to Register the PeopleSoft WSRP Producer for WebCenter Portal
- How to Add the PeopleSoft Portlet to a WebCenter Portal Page
- How to Test the Portal Portlet Connection

### 10.5.2.4.1 How to Register the PeopleSoft WSRP Producer for WebCenter Portal

You can register the PeopleSoft WSRP producer directly in WebCenter Portal, as described in Registering Portlet Producers with the Administration Console in Administering Oracle WebCenter Portal. You can also register the PeopleSoft WSRP producer using Fusion Middleware Control as described in the steps below.

To register the PeopleSoft WSRP producer using Fusion Middleware Control:

1. Prepare the PeopleSoft page that you want to consume in WebCenter Portal for remote access as described in How to Prepare the PeopleSoft Application for Remote Access.

2. Log into Fusion Middleware Control for the WebCenter Portal domain (wc_domain by default).

   
   The Add Portlet Producer page displays.

4. Set the Producer Type to WSRP Producer, enter a Connection Name, and paste the WSDL endpoint URL that you copied in step 1 into the URL End Point field.
5. If required, configure WS-Security in WebCenter Portal as described in \textit{How to Configure WS-Security for PeopleTools 8.51}.

6. Click \textbf{OK} and verify that the producer connection was created successfully.

7. Continue by adding the portlet to a WebCenter Portal or portal page as described in \textit{How to Add the PeopleSoft Portlet to a WebCenter Portal Page}.

10.5.2.4.2 How to Add the PeopleSoft Portlet to a WebCenter Portal Page

Follow the steps below to add the PeopleSoft portlet to a WebCenter Portal or portal page:

1. Log into WebCenter Portal.
   
   If you configured WS-Security, be sure to use the user account that was used in the SAML Inbound Setup page in PeopleSoft (see \textit{How to Attach a WS-Security Policy to WebCenter Portal}).

2. Go to the page, or create a new page, where you want to add the PeopleSoft portal.

3. Click \textbf{Add Content} and in the resource catalog, select \textit{UI Components} and then \textit{Portlets}.
   
   Note that if you’ve created a custom catalog, \textit{Portlets} may not appear. In this case, you will need to add it to the resource catalog. For information about managing resource catalogs, see \textit{Working with Resource Catalog Components on a Page in Building Portals with Oracle WebCenter Portal}.

4. Click the portlet you added in Fusion Middleware Control.

5. Click \textbf{Add} for the PeopleSoft page you want to add to your portal page.

6. On the portal page, click the portlet’s \textbf{View Actions} menu, and select \textbf{Display Options}.

7. In the Display Options dialog, set \textbf{Render Portlet in IFrame} to \textbf{True} and click \textbf{OK}.

8. Continue by checking the portlet connection as described in \textit{How to Test the Portal Portlet Connection}.

10.5.2.4.3 How to Test the Portal Portlet Connection

Follow these steps to test the portlet connection by modifying content and checking that the modification shows up in the PeopleSoft application.

1. On the WebCenter Portal or portal page that you added the PeopleSoft portlet to, modify some information that you can verify the changes for in the PeopleSoft application.

2. Save your changes and confirm that the changes also appear in the PeopleSoft application.

10.5.2.5 How to Configure WS-Security for PeopleTools 8.51

This section describes the supported OWSM policies for PeopleTools 8.51. It is important to note that PeopleTools release 8.51 does not support outgoing WS-Security headers in its messages. However, some out-of-the-box Oracle WebCenter Portal/OWSM policies require that both outgoing and incoming messages be secured.
To bridge this gap you may need to create custom OWSM policies. The different integration scenarios that would require you to create custom WS-Security policies, and the steps required on the WebCenter Portal side to configure them are also described in this section.

For integration scenarios with PeopleTools 8.51, you can use WSS10 SAML Token with Message Integrity, WSS10 SAML Token with Message Protection, or WSS10 Username Token with Password as the OWSM policy.

This section includes the following subsections:

- How to Configure WS-Security for WSS10 SAML Token with Message Integrity
- How to Configure WS-Security for WSS10 SAML Token with Message Protection
- How to Configure WS-Security for WSS10 Username Token with Password

10.5.2.5.1 How to Configure WS-Security for WSS10 SAML Token with Message Integrity

(PeopleSoft policy: WSRPBaseService with SAMLToken Full Security Option (timestamp))

This section describes how to configure WS-Security for the WSS10 SAML Token with Message Integrity (oracle/wss10_saml_token_with_message_integrity_client_policy) policy.

To configure WS-Security:

2. Generate a certificate containing the public key of the Oracle WebCenter Portal domain and send it to the PeopleTools administrator so it can be imported in the PeopleTools configuration.

3. When you register the producer, choose wss10_saml_token_with_message_integrity_client_policy.

4. Continue by adding the WSRP portlet to WebCenter Portal or a Framework application page.

10.5.2.5.2 How to Configure WS-Security for WSS10 SAML Token with Message Protection

(PeopleSoft policy: WSRPBaseService with SAMLToken Full Security Option (timestamp) With WSS Response)

The default WSS10 SAML Token with Message Protection (oracle/wss10_saml_token_with_message_protection_client_policy) policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.51 and earlier cannot send WS-Security headers in response (only the initial cookie/get portlet handle call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the oracle/wss10_saml_token_with_message_protection_client_policy policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the Oracle WebCenter Portal domain (wc_domain by default).

2. From the WebLogic Domain menu, select Web Services > Policies.
3. Select the `wss10_saml_token_with_message_protection_client_policy` and click `Create Like`.

4. Give the policy a new name (for example, `oracle/wss10_saml_token_with_message_protection_plaintext_response_client_policy`).

5. Open the Response tab, uncheck the `Include Entire Body` check boxes under Message Signing Setting and Message Encrypt Setting, and save the policy.

6. Check that the public certificate of the PeopleSoft keystore is imported into the keystore used in the WebCenter Portal domain.

7. Use WLST to register the producer using the newly created policy as shown in the following example:

   ```
   registerWSRPProducer('webcenter', 'wc-pt851-saml_msg-protection', 'http://xmlns.oracle.com/pspc/pswsdl/ps/EMPLOYEE', timeout=100, tokenType='oracle/wss10_saml_token_with_message_protection_plaintext_response_client_policy', enforcePolicyURI='false', issuer='www.oracle.com', sigKeyAlias='webcenter', sigKeyPswd='welcome1', encKeyAlias='webcenter', encKeyPswd='welcome1', recptAlias='peoplesft_public')
   ```

   Use the alias for the imported peoplesft public key as the value for the `recptAlias` parameter.

   **Note:**

   You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in `enforcePolicyURI='false'`.

---

### 10.5.2.5.3 How to Configure WS-Security for WSS10 Username Token with Password

(PeopleSoft policy: WSRPBaseService with UsernameToken Full Security Option With WSS Response)

The default WSS10 Username Token with Password (oracle/wss10_username_token_with_message_protection_client_policy) policy that ships with OWSM requires that response also be signed and encrypted. However, PeopleTools release 8.51 and earlier cannot send WS-Security headers in response (only the initial cookie/get portlet handle call contains security headers; subsequent calls do not) and we therefore need to create and attach a custom policy based on the oracle/wss10_username_token_with_message_protection_client_policy policy.

To create a custom policy:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal domain (`wc_domain` by default).

2. From the WebLogic Domain menu, select `Web Services > Policies`.

3. Select the `wss10_username_token_with_message_protection_client_policy` and click `Create Like`. 

---

Integrating Other Oracle Applications 10-37
4. Give the policy a new name (for example, oracle/wss10_username_token_with_message_protection_plaintext_response_client_policy).

5. Open the Response tab, uncheck the Include Entire Body check boxes under Message Signing Setting and Message Encrypt Setting, and save the policy.

6. Check that the public certificate of the PeopleSoft keystore is imported into the keystore used in the Oracle WebCenter Portal domain.

7. Use WLST to register the producer using the newly created policy as shown in the following example:

   ```
   registerWSRPProducer('webcenter', '<Producer_Name>', '<URL>', timeout=100,
   tokenType='oracle/wss10_username_token_with_message_protection_plaintext_response_client_policy',
   extApp='<Ext_App_Name>',
   enforcePolicyURI='false', issuer='www.oracle.com',
   sigKeyAlias='webcenter', sigKeyPswd='welcome1', encKeyAlias='webcenter',
   encKeyPswd='welcome1', recptAlias='peoplesft_public')
   ```

   Use the alias for the imported peoplesft public key as the value for the recptAlias parameter.

   **Note:**

   You must use WLST to register the producer. Fusion Middleware Control can only accept fixed policy names and therefore you must register the producer with this policy using WLST by passing in enforcePolicyURI='false'.

---

### 10.5.3 How to Integrate PeopleSoft Applications as Data Controls in WebCenter Portal

This section describes how to add PeopleSoft applications as Web service data controls in WebCenter Portal.

This section includes the following subsections:

- How to Prepare the WSDL
- How to Create a Web Service Data Control

#### 10.5.3.1 How to Prepare the WSDL

Follow the steps below to prepare a the WSDL.

1. Log into the PeopleSoft Console as an administrator.

2. Navigate to PeopleTools > Web Profile > Web Profile Configuration.

3. Click Search and select DEV from the results list.
4. Open the General tab and enter the Authentication Domain for your host.
   For example, if your host name is ps.example.com, enter .example.com in the Authentication Domain field.

5. Save your changes and close the application.

6. Open the C:\Windows\System32\drivers\etc\hosts file for editing.

7. On a new line enter the IP address and the full host name with the authentication domain.
   For example:
   193.128.1.113 ps.example.com

8. Save the file and reboot the server.

9. Log into the PeopleSoft application using the following URL:
   http://<host_name>:8000/ps/signon.html
   For example:
   http://ps.example.com:8000/ps/signon.html
10. From the Main Menu, navigate to PeopleTools > Integration Broker > Configuration > Gateways.

11. Search for the GatewayID LOCAL. The Local Gateway URL is set to http://<host_name>:8000/PSIGW/PeopleSoftListeningConnector.

12. Using the Local Gateway URL, ping the gateway to make sure it’s active.

13. Open the Gateway Setup Properties and log in as an administrator.

14. On the PeopleSoft Node Configuration page, check that the node being used is PSFT_HR.

15. Ping the node

16. From the Main Menu, navigate to PeopleTools > Integration Broker > Configuration > Service Configuration.

17. Open Setup Target Locations and check that the Target Location is set to <Local Gateway URL>/PSFT_HR.

18. From the Main Menu, navigate to PeopleTools > Integration Broker > Integration Setup > Nodes.

19. Click Search.

20. Click the Default Local Node PSFT_HR.

21. On the Nodes tab, check that the Default UserID is set correctly as in the example in Figure 10-26.
22. Click **Return to Search**.

23. Click the **ANONYMOUS** node.

24. Change the **Default UserID** to the PeopleSoft Login ID (for example, **PS**) as in the example in **Figure 10-27**.
25. Save the changes and navigate to Main Menu > PeopleTools > Integration Broker > Web Services > CI-Based Services.

26. Search for and select the Component Interface Name (for example, CURRENCY) as in the example in Figure 10-28.
27. Click **Review CI Status**.

The CI-Based Services - Review Status page displays (see Figure 10-29).

**Figure 10-29  Review CI-Based Status - Review Status Page**

![Review CI-Based Status - Review Status Page](image)

28. Select the available methods (Get and Find, in this case) and click **Display Selected Actions**.

29. On the Confirm Actions dialog, click **Perform Selected** actions.

30. Click **View Service Definition**.

31. Click **Provide Web Service**.

The Select Service Operations page displays (see Figure 10-30).
32. Select the Select All check box and click Next until you reach the last page.

33. Click Finish to generate the WSDL.

   You should now be able to access the WSDL URL. For this example, the URL would be:

   http://ps.example.com:8000/PSIGW/
   PeopleSoftServiceListeningConnector/PSFT_HR/CI_CURRENCY.
   1.wsdl\\

34. Continue by creating a Web service data control as shown in How to Create a Web Service Data Control.

### 10.5.3.2 How to Create a Web Service Data Control

Once you have the WSDL, you can continue by using it to create a Web service data control. In this section we'll continue with the example we started in How to Prepare the WSDL.

**Note:**

Before you can add a data control or task flow containing a data control to a portal page you must first have configured WS-Security for WebCenter Portal. For more information about configuring WS-Security, see Configuring Web Services Security in Administering Oracle WebCenter Portal.

For more information about creating a Web service data control, see Creating a Web Service Data Control in Building Portals with Oracle WebCenter Portal. For information about Web service data controls, see also Web Service Data Controls in Building Portals with Oracle WebCenter Portal.

To create a Web service data control:

1. In WebCenter Portal or the portal in which you want to create the data control, go to either the Shared Assets or Assets page.
2. Select **Data Controls** and click **Create**.

The Create New Data Control dialog displays (see Figure 10-31).

![Create New Data Control Dialog](image1)

3. In the Create New Data Control dialog, enter a **Name** and **Description** for the data control, select **Web Service** as the **Data Control Type**, and then click **Continue**.

4. Enter the WSDL URL and other details for the data control and click **Continue**. For our example, the URL would be:

   http://ps.example.com:8000/PSIGW/PeopleSoftServiceListeningConnector/PSFT_HR/CI_CURRENCY.1.wsdl

5. For our example, enter the Default Value for **CURRENCY_CD** as **USD** and click **Create** (see Figure 10-32).

![Create New Data Control Dialog - CI_Currency_G Method Parameters](image2)

6. To make the data control available, from the **Shared Assets** or **Assets** page, select **Task Flows**. The Create New Task Flow dialog displays (see Figure 10-33).

![Create New Task Flow Dialog](image3)

7. Click **Create** to create the task flow.

8. Select the task flow and click the **Edit** icon.

9. Add the data control (with parameter form) as a table onto the task flow and verify the data.
10. To make the task flow available, navigate to Administration > Business Role Pages.

11. Select Business Role Page and click the Create icon.

12. Edit the page and save the changes.

13. Drop the task flow onto the page and verify the data.

10.6 Integrating Oracle Business Intelligence Presentation Services

This section explains how to configure WebCenter Portal to integrate with the Oracle Business Intelligence Presentation Services catalog. At runtime, users can add business intelligence objects to their WebCenter Portal pages.

This section includes the following subsections:

- About Integrating Oracle Business Intelligence Presentation Services
- How to Configure Credentials for Connecting to the Oracle BI Presentation Catalog
- How to Integrate Oracle Business Intelligence Objects in WebCenter Portal

10.6.1 About Integrating Oracle Business Intelligence Presentation Services

This section explains how to configure WebCenter Portal to integrate with the Oracle Business Intelligence Presentation Services catalog.

This section includes the following subsections:

- Understanding Oracle Business Intelligence Presentation Services Integration
- Requirements for Integrating Oracle Business Intelligence Presentation Services
- Advanced Integration Options

10.6.1.1 Understanding Oracle Business Intelligence Presentation Services Integration

Oracle WebCenter Portal users can expand and browse the Presentation Services catalog's folders to view an analysis' views. The following view types display in the Presentation Services catalog: table, pivot table, chart, funnel chart, gauge, narrative, ticker and title. The following view types do not display in the Presentation Services catalog: view selector, column selector, logical SQL, and no-results view.

Users can also browse the dashboard folder for the pages associated with the dashboard; however, users cannot browse within the dashboard pages to see their components (for example, any analyses embedded in the dashboard).

10.6.1.2 Requirements for Integrating Oracle Business Intelligence Presentation Services

You must also set up a connection to the BI application as well as configuring security as described in Creating an Oracle BI EE Presentation Services Connection in Developer's Guide for Oracle Business Intelligence Enterprise Edition. You will also need to specify the credentials for the connection, as described in How to Configure Credentials for Connecting to the Oracle BI Presentation Catalog.

The following prerequisites apply:
Oracle WebCenter Portal

- The WC_Portal server has been installed and configured, including the database connection, Content Server connection, and Fusion Middleware Control

OBIEE

- Oracle Business Intelligence Applications
- OBI Enterprise Edition version 11.1.1.7.0
- OBI Applications version 7.9.6.3 (Optional)
- OBIEE is already installed, configured, and up and running (Database –OBI Enterprise Edition)
- OBI Applications is installed and set up and all content is available from the OBIEE environment (Optional)

Security

The OBIEE integration requires that the identity store user name population be the same across WebCenter and OBIEE. This can be done by either:

- Having WebCenter and OBIEE share the same identity store (recommended)
- Maintaining identical user names across separate WC and OBIEE identity stores

10.6.1.3 Advanced Integration Options

As well as the approaches to adding resources described in the subsections in Integrating Oracle Business Intelligence Presentation Services, such as adding business intelligence analyses, dashboards, and scorecard components that can be easily dropped onto a page, there are also options for using Web services and BI EE Logical SQL view objects to embed business intelligence data into a Framework application. For more information about using Web services, see Introduction to Oracle Business Intelligence Web Services in Integrator’s Guide for Oracle Business Intelligence Enterprise Edition. For more information about using the BI EE Logical SQL view object, see Using the Oracle BI EE Logical SQL View Object in Developer’s Guide for Oracle Business Intelligence Enterprise Edition.

10.6.2 How to Configure Credentials for Connecting to the Oracle BI Presentation Catalog

At design time, you need to specify credentials to connect to the Oracle BI Presentation Catalog. These credentials are used to retrieve the list of business intelligence objects (for example, analyses, dashboards, and scorecard components) from the Oracle BI Presentation Catalog.

This process ensures that the login to the Presentation Server is the same as the current user of the application and any access checks are performed as the current user, and data is fetched as the current user. If the ADF page contains business intelligence objects to which the user does not have access, the ADF page returns a message stating that the user does not have the proper permissions to access these objects.

Note that the Perform impersonation parameter should be set to true when security is enabled.

This section contains the following subsections:
10.6.2.1 How to Check for the BIImpersonatorUser

Use the following steps to check if a BIImpersonatorUser user already exists, and that the roles assigned to it are correct:

1. Open WLS Administration Console for your Oracle BI EE instance using an Administrator account.

2. Locate the Domain Structure pane and select Security Realm.

   The Realms pane displays.

3. In the Realms pane, select <myrealm>.

   The Settings dialog displays.

4. In the Settings dialog, open the Users and Groups tab.

5. Check that BIImpersonatorUser appears in the list of users.

   If the BIImpersonatorUser does not appear in the list, continue by creating the BIImpersonatorUser as shown in How to Create the BIImpersonatorUser.

6. Log into Fusion Middleware Control with an administrator account.

7. In the Navigation panel, expand the Weblogic Domain node and select bifoundation_domain.

9. On the Application Policies page under Search, choose obi from the Application Stripe dropdown list.

10. From the Principal Type drop down list, select User.

11. In the Name field, enter BIImpersonatorUser and start the search (Figure 10-34).
12. If found, check that:

- **Resource Name** = oracle.bi.server.impersonatorUser
- **Resource Type** = oracle.bi.server.permission
- **Permission Actions** = _all_
- **Permission Class** = oracle.security.jsp.ResourcePermission

13. If the BIImpersonatorUser is not found, continue by adding permissions for the BIImpersonatorUser as shown in How to Grant Permissions to BIImpersonatorUser.

**10.6.2.2 How to Create the BIImpersonatorUser**

Use the following procedures to create a BIImpersonatorUser user to secure an application that uses an Oracle BI EE Presentation Services connection and includes Oracle BI EE objects. ADF security must be enabled for your application before you can apply the impersonator user credentials to the Oracle BI EE Presentation Services connection.

The Impersonate User feature secures applications that contain Oracle BI EE objects when Oracle BI EE and ADF are not sharing an Oracle Internet Directory (OID). Before you begin the process of creating and using Impersonate User, you must confirm that this capability is configured in your environment.

Before you perform this procedure, make sure that either you or the Administrator have created users in the WebLogic Server's Oracle BI EE realm and assigned the BIConsumer group to each user in this realm. For more information, see How to Create and Use Impersonate User in *Developer’s Guide for Oracle Business Intelligence Enterprise Edition*. 

---

**Figure 10-34 Application Policies Pane - bifoundation_domain**

- **Resource Name** = oracle.bi.server.impersonatorUser
- **Resource Type** = oracle.bi.server.permission
- **Permission Actions** = _all_
- **Permission Class** = oracle.security.jsp.ResourcePermission
Follow the steps below to create the BIImpersonatorUser user:

1. Open WLS Administration Console for your Oracle BI EE instance using an Administrator account.

2. Locate the Domain Structure pane and select Security Realm.
   
The Realms pane displays.

3. In the Realms pane, select `<myrealm>`.
   
The Settings dialog displays.

4. In the Settings dialog, open the Users and Groups tab.

5. Confirm that the Users tab is displaying and click New.

6. Enter BIImpersonatorUser for the user name and enter a password.

7. Click OK.

**10.6.2.3 How to Grant Permissions to BIImpersonatorUser**

Follow the steps below to use Fusion Middleware Control to grant permissions to BIImpersonatorUser:

1. Open Fusion Middleware Control for your Oracle BI EE instance.

2. In the Navigation panel, expand the Weblogic Domain node and select bifoundation_domain.
   
The bifoundation_domain pane displays.

3. In the bifoundation_domain pane, open the WebLogic Domain menu and select Security > Application Policies.
   
The Search pane displays.

4. On the Application Policies page under Search, choose obi from the Application Stripe dropdown list.

5. Click Create.

   The Create Application Grant pane displays (Figure 10-35).
   The Add User dialog displays.

7. From the Type drop down list, select User.

8. In the Principal Name field, enter `oracle.bi.server.impersonatorUser` and click OK.

   The Add Permission dialog displays (Figure 10-36).

10. Select Permissions and in the Permission Class field, enter `oracle.security.jps.ResourcePermission`.

11. In the Resource Name field, enter `oracle.bi.server.impersonatorUser`, start the search and then click Continue.
12. If the search did not return anything, in the **Permission Class** field enter `oracle.security.jps.REsourcePermission`, and in the **Resource Name** field enter `oracle.bi.server.impersonatorUser`.

13. Click **Select**.

14. On the Application Grant page, click **OK**.

15. If the changes that you made do not display, stop and restart the following servers:
   - Oracle BI EE Server
   - Oracle BI EE Presentation Server
   - WebLogic Server

### 10.6.3 How to Integrate Oracle Business Intelligence Objects in WebCenter Portal

Use the following procedures to configure portal integration with the BI objects.

- **How to Add or Modify a Presentation Services Connection After Deployment**
- **How to Add Oracle BI Objects to a WebCenter Portal Resource Catalog**
- **How to Add Oracle BI Content at Runtime**
- **How to Modify a Business Intelligence Object's Prompt Values**
- **How to Modify a Business Intelligence Task Flow's Initialization Parameters**

#### 10.6.3.1 How to Add or Modify a Presentation Services Connection After Deployment

Before you can begin integrating BI objects in WebCenter Portal, you must first configure a connection from WebCenter Portal to the BI server. Oracle BI EE provides an ADF MBean that lets you add a new connection to a deployed portal or BI ADF application. You can also modify a deployed application's existing connection. MBeans are deployed with the application and can be accessed post-deployment using Fusion Middleware Control.

Prior to following the steps below, you should already have followed the steps in **How to Configure Credentials for Connecting to the Oracle BI Presentation Catalog** to specify credentials to connect to the Oracle BI Presentation Catalog.

---

**Note:**

If the portal and the Oracle Business Intelligence application do not share the same identity store, you must create the relevant users in both systems.

---

Follow the steps below to configure the connection after the application was deployed.

1. Open Fusion Middleware Control and select your WebLogic domain by doing one of the following:
   - If your application is deployed in the BI ADF domain, select the **Application Deployments <your domain>** tree node.
   - If your application is deployed in the WebCenter Portal domain, select the **WebCenter** tree node, and then the **WebCenter Portal** tree node, and then the
webcenter(11.1.1.4.0) (WC_Portal) tree node. Note that the WC_Portal server must be running in order to perform this step.

2. From the list, select **System MBean Browser**.
The System MBean Browser pane displays.

3. In the System MBean Browser pane, navigate to the ADF Connections tree node by following the below path:
   a. Select the **Application Defined MBeans** tree node.
   b. Select the **oracle.adf.share.connections** tree node.
   c. Select the **Server: <my server name>** tree node.
      For example, **Server: DefaultServer** or **Server: WC_Portal**.
   d. Select the **Application: <your application's name>** tree node.
      For example, **Application: Application2** or **Application: webcenter**.
   e. Open the ADF Connections tree node.
   f. Open the child ADF Connections tree node.
      The corresponding MBean information displays in the Application Defined MBean pane.

4. In the Application Defined MBean pane, open the Operations tab and then click **createConnection** to create a Presentation Services connection.
The Operation:createConnection dialog displays.

5. Specify the required values for the connection.
   In the connection type **Value** field, enter **BISoapConnection**, enter a name in the connection name **Value** field and click **Invoke** to create the connection.

6. In the System MBean Browser pane, click **Refresh** to refresh the tree so that the new connection displays.

7. To modify the connection, locate it in the System MBean Browser pane and click it.
The connection’s information displays in the Application Defined MBean pane.

8. Navigate to ADF Connections from the System MBean Browser pane and open the Attributes tab.

9. Enter the **BISoap** connection information as shown below, and then click **Apply** to apply your changes.
   • From the OBIEE URL to the login page you need:
     ```
     context =analytics
     host =<host name>
     port =7001 or the local value
     protocol =HTTP
     ```
   • From **BIImpersonatorUser** you need:
username =BIImpersonatorUser
password =<password>

10. Click on the ADFConnections folder in the Navigation pane, open the Operations tab, and then click Save to save the connection.

11. When you click Invoke, you should get the following message:
   "Confirmation Operation executed successfully."

10.6.3.2 How to Add Oracle BI Objects to a WebCenter Portal Resource Catalog

Before you can add Oracle BI content to a portal page, you must add objects stored in the Oracle BI Presentation Catalog to a WebCenter Portal resource catalog:

1. Log into WebCenter Portal as an administrator or application specialist.
2. In the portal browser, click the Administration tile.
3. Click Shared Assets, then Resource Catalogs.
4. Click Create.
5. In the Name field, enter the name of the resource catalog you are creating. Complete the other fields, as necessary.
6. Make the resource catalog available by selecting its Available check box.
7. Select the new resource catalog and click Edit.
8. From the Add menu, select Add From Library.
   The BI Presentation Services folder displays.
10. Open this folder to display the Oracle BI objects and browse to and select the objects that you want to add.
11. Click Add to add the selected objects to the catalog.

For more information about managing resource catalogs at runtime, see Working with Resource Catalogs in Building Portals with Oracle WebCenter Portal.

10.6.3.3 How to Add Oracle BI Content at Runtime

Use this procedure to create a portal page and add Oracle BI objects to it. Before you perform this procedure, you must have added Oracle BI objects to a WebCenter Portal resource catalog (see How to Add Oracle BI Objects to a WebCenter Portal Resource Catalog):

1. Log into WebCenter Portal and create a new portal or access an existing portal.
2. Make the resource catalog containing the Oracle BI objects the default resource catalog for portal pages. See Choosing Default Resource Catalogs
3. In the portal editor, create a new page.
4. In the page editor, click Add Content to open the resource catalog, and browse to the folder containing the Oracle BI objects.
5. Select an analysis or dashboard and click Add.
   The object that you selected is added to the page.

10.6.3.4 How to Modify a Business Intelligence Object’s Prompt Values
Use this procedure to test the portal page by changing an analysis or dashboard’s filter or prompt values.

1. Open the page that you created.
2. In the running page, click Page Actions and then click the Edit link to enter edit mode.
3. Add an analysis or dashboard that contains a filter or prompt. For more information about adding Oracle BI objects to the page, see How to Add Oracle BI Content at Runtime.
4. Without exiting the edit mode of the page, save the portal page.
5. In the portal page, modify the prompt values and click OK.
6. Exit edit mode, save the page and confirm that the application correctly applied the prompt values.

10.6.3.5 How to Modify a Business Intelligence Task Flow’s Initialization Parameters
Use the following procedure to test the business intelligence task flow’s initialization parameters.

1. Open the page that you created.
2. In the running page, click Page Actions and then click the Edit link to enter the edit mode.
3. Add an analysis or dashboard that is part of a task flow. For more information about adding business intelligence content to the .jspx page, see How to Add Oracle BI Content at Runtime.
4. Without exiting the edit mode for the page, save the portal page.
5. Locate the business intelligence object and click the Edit (wrench) icon.
   The Component Properties dialog displays.
6. On the portal page, open the Parameters tab and modify the object’s parameters and click OK.
7. Open the Parameters tab, modify the object’s parameters, and click OK.
8. Exit edit mode, save the page and confirm that the application correctly applied the modified parameter values.
Managing Instant Messaging and Presence

This chapter describes how to configure and manage instant messaging and presence (IMP) for WebCenter Portal.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end tools and services for WebCenter Portal. Any changes that you make to these applications, postdeployment, are stored in MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

**Note:**
Configuration changes for instant messaging and presence, through Fusion Middleware Control or using WLST, are not dynamic, so you must restart the managed server on which WebCenter Portal is deployed for changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

This chapter includes the following topics:

- About Instant Messaging and Presence Connections
- Instant Messaging and Presence Server Prerequisites
- Registering Instant Messaging and Presence Servers
- Choosing the Active Connection for Instant Messaging and Presence
- Modifying Instant Messaging and Presence Connection Details
- Deleting Instant Messaging and Presence Connections
- Setting Up Instant Messaging and Presence Defaults
- Testing Instant Messaging and Presence Connections

**Permissions:**

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.
11.1 About Instant Messaging and Presence Connections

Instant Messaging and Presence (IMP) lets you see the presence status of other authenticated application users (online, offline, busy, or away), and it provides quick access to interaction options, such as instant messages (IM) and mail.

A single connection to a back-end presence server is required. WebCenter Portal is certified with Microsoft Lync 2010.

**Note:**

Oracle Beehive Server connections are not supported in this release.

You can register the presence server connection for your application through the Fusion Middleware Control Console or using WLST. You must mark a connection as active for IMP to work. You can register additional presence server connections, but only one connection is active at a time.

11.2 Instant Messaging and Presence Server Prerequisites

This section describes the Microsoft Lync 2010 prerequisites as the presence server for instant messaging and presence.

This section includes the following subsections:

- **Microsoft Lync - Installation**
- **Microsoft Lync - Configuration**
- **Microsoft Lync - Security Considerations**

11.2.1 Microsoft Lync - Installation

Refer to the Microsoft Lync 2010 documentation for installation information.

11.2.2 Microsoft Lync - Configuration

This section includes the following subsections:

- **Simple Deployment**
- **Remote Deployment**
- **Building Application Provisioner**
- **Provisioning WebCenter Portal’s Proxy Application on Lync Server**
- **Adding AllowedDomains Using WBemTest**
- **Migrating Trusted Service Entries Using Topology Builder or PowerShell Cmdlets**
- **IIS Server Configuration**
- **Installing UCMA v2.0**
- **Installing WebCenter Portal’s Proxy Application**
To use Microsoft Lync 2010 as the presence server for IMP, you must deploy WebCenter Portal’s Proxy application for Microsoft Lync 2010 in one of two topologies:

- **Simple Deployment** – All components reside on the same box
- **Remote Deployment** – The proxy application and Microsoft Lync reside on separate boxes

### 11.2.2.1 Simple Deployment

In this topology, WebCenter Portal’s Proxy application is deployed in the Internet Information Services (IIS) server hosted on the Lync box.

1. Install Microsoft Unified Communications Managed API (UCMA) 2.0 on the Lync box.
   
   For detailed information, see [Installing UCMA v2.0](http://msdn.microsoft.com/en-us/library/dd253360%28office.13%29.aspx).
2. Deploy WebCenter Portal’s Proxy application on the IIS server.
   
   This proxy application provides web services for interacting with the Lync server, and for sending and receiving information. WebCenter Portal talks to these web services and presents the data. For detailed information, see [Installing WebCenter Portal’s Proxy Application](http://msdn.microsoft.com/en-us/library/dd253360%28office.13%29.aspx).

### 11.2.2.2 Remote Deployment

In this topology, WebCenter Portal’s Proxy application is deployed on an IIS server remote to the Lync box. That is, the IIS server and the Lync server are hosted on separate machines.

Because this proxy application is hosted on a remote box, you must set up a trust between the application and the Lync server. This is known as *provisioning* an application. Provisioning is done through the Application Provisioner utility shipped with Microsoft UCMA v2.0.

See Also:

**Figure 11-1** provides an overview of the steps (including installing UCMA v2.0) to be performed on different deployment entities.
The details of these steps are described in the following sections.

### 11.2.2.2.1 Building Application Provisioner

This section lists the steps Microsoft provides for provisioning other IIS servers to access Lync.

1. Install Visual Studio 2008 on any developer box (not necessarily IIS/Lync).
2. Install UCMA version 2.0 on the same box following the steps in *Installing UCMA v2.0*.

The Application Provisioner application comes with the UCMA SDK.
3. Go to the directory `Sample Applications\Collaboration\ApplicationProvisioner` under the location where you installed UCMA Core (for example, `C:\Program Files\Microsoft Lync 2010 R2\UCMA SDK 2.0\UCMACore\Sample Applications\Collaboration\ApplicationProvisioner`).

5. Build the application using Visual Studio 2008. This generates the `ApplicationProvisioner.exe` file.

6. Copy the executable file to the Lync box.

7. See the next step Provisioning WebCenter Portal’s Proxy Application on Lync Server.

11.2.2.2 Provisioning WebCenter Portal’s Proxy Application on Lync Server

1. Run the `OCSWMIBC.msi` file that comes with the Lync setup package.

   When a UCMA 2.0 application is deployed directly against Lync Server 2010, the SIP domains used in the Lync Server 2010 environment must be added to the Office Communications Server 2007 R2 SIP domain list before you run the `Merge-CsLegacyTopology` cmdlet. The application is deployed as if it were being deployed against OCS 2007 R2, then migrated to run against Lync Server 2010. To add the domains, see Adding AllowedDomains Using WBemTest.

2. Run the `ApplicationProvisioner.exe` file, generated in the previous section.

   The Application Provisioner dialog appears.

3. In the Application Provisioner dialog, enter `WebCenterProxyApplication` as the name of your application for the Application name, and then click Find or Create.

4. In the Create Application Pool dialog, select the pool for your application in the Lync Pool Fqdn list.
   
   • For Listening port, enter the listening port for your application (for example, 6001).
   
   • For Application server Fqdn, enter the fully qualified domain name (FQDN) of the computer on which the application is deployed. (This is the IIS box.)
   
   • If the application is deployed on two or more computers, then select the Load balanced application checkbox, and for Load balancer Fqdn, enter the FQDN of the load balancer.

   The application pool now appears in the Application Provisioner dialog.

5. Double-click the server entry.

   The View Server dialog appears. Note the information shown there; that is, Server FQDN, port, and GRUU.

See Migrating Trusted Service Entries Using Topology Builder or PowerShell Cmdlets.

7. Create a certificate on the Lync server with the subject name as the Server FQDN noted in the previous step using the Lync Certificate Wizard.

This certificate is used to authorize the requests coming from the IIS server.

8. After the certificate is created, view the certificate.

The Certificate Export Wizard appears.

10. Export the certificate with the private key to a file.

A .pfx (Personal Information Exchange) file with the certificate name is created.

11. See the next step Adding AllowedDomains Using WBemTest.

11.2.2.2.3 Adding AllowedDomains Using WBemTest

1. To start WBemTest.exe, type WBemTest in a command prompt window and press Enter.

2. In the Windows Management Instrumentation Tester dialog, click Connect.

3. In the Connect dialog, click Connect.

4. In the Windows Management Instrumentation Tester dialog, click Enum Classes.

5. In the Superclass Info dialog, click OK.

6. In the Query Result dialog, scroll down to MSFT_SIPDomainData(), and double-click this entry.

7. In the Object editor for MSFT_SIPDomainData dialog, click Instances.

The Query Result dialog appears, displaying the InstanceIDs for any instances of the MSFT_SIPDomainData WMI class. These entries are the AllowedDomain entries.

8. To add AllowedDomain entries, click Add.

9. In the Instance of MSFT_SIPDomainData dialog, in the Properties listbox, double-click Address.

10. In the Property Editor dialog, select the Not NULL radio button.

11. In the Value text input pane, enter the Lync server domain; for example, contoso.com, and click Save Property.

12. In the Instance of MSFT_SIPDomainData dialog, in the Properties listbox, double-click Authoritative, make sure that the Authoritative property is not Null and is set to False, and then click Save Property.

13. In the Instance of MSFT_SIPDomainData dialog, in the Properties listbox, double-click Default Domain, make sure that the Default Domain property is not Null and is set to True, then click Save Property.
14. In the Instance of MSFT_SIPDomainData dialog, click **Save Object**.

15. Go to the next step **Migrating Trusted Service Entries Using Topology Builder or PowerShell Cmdlets**.

### 11.2.2.4 Migrating Trusted Service Entries Using Topology Builder or PowerShell Cmdlets

To migrate trusted service entries using Microsoft Lync Server 2010 Topology Builder:

2. After the existing topology is loaded, under Action, select Merge 2007 or 2007 R2 Topology.
3. Go through the resulting wizard, keeping the default options.
4. Select Publish Topology and complete the wizard, as in the previous step.
5. After the wizard has finished, check that it completed successfully.
   There should be no errors in the user interface.

To migrate trusted service entries using Microsoft Lync Server 2010 PowerShell Cmdlets:

1. From the Start menu, in the Microsoft Lync Server 2010 program group, open Lync Server Management Shell.
2. Run the following PowerShell cmdlet:
   
   ```
   Merge-CsLegacyTopology -TopologyXmlFileName D:\output.xml
   ```
3. Run the following PowerShell cmdlet:
   
   ```
   Publish-CsTopology -FileName D:\output.xml
   ```

See **IIS Server Configuration**.

### 11.2.2.5 IIS Server Configuration

Because the IIS server hosts WebCenter Portal’s Proxy application in the remote deployment scenario, use the information from the previous section to make it a trusted authority.

1. Install the certificate issued by the Lync server with the private key: Copy the .pfx file generated in step 7 in **Provisioning WebCenter Portal’s Proxy Application on Lync Server** to the IIS box, and double-click it.
   
   The Certificate Import wizard appears.

2. Import the certificate in Personal Folder under LOCAL_MACHINE

3. Make an entry in `C:/WINDOWS/system32/drivers/etc/hosts` for the pool name of the Lync server as follows:
   
   ```
   <ip-address-of-lync-box> <poolname-of-lync-box>
   ```
   
   For example:

   ```
   10.177.252.146 pool01.example.com
   ```
4. Because the IIS server hosts WebCenter Portal’s Proxy application, install Microsoft UCMA v2.0 on it. For detailed information, see Installing UCMA v2.0.

5. After UCMA is installed, deploy this proxy application on the IIS server. WebCenter Portal’s Proxy application provides web services for interacting with Lync, and for sending and receiving information. WebCenter Portal talks to these web services and presents the data. For detailed information, see Installing WebCenter Portal’s Proxy Application.

6. Go to the location where WebCenter Portal’s Proxy application was extracted, and open Web.config and edit the appSettings XML node to add the values noted in Step 7 in the previous section (Section 12.2.2.2.5, “IIS Server Configuration”).

Make sure to set the value for RemoteDeployment to true. For example, the appsettings XML node should look somewhat like this.

```xml
<appSettings>
    <add key="ApplicationName" value="WebCenterProxyApplication"/>
    <add key="RemoteDeployment" value="true"/>
    <add key="ApplicationFQDN" value="iis.server.com"/>
    <add key="ApplicationGRUU" value="sip:iis.server.com@EXAMPLE.COM;gruu;opaque=srvr:WebCenterProxyApplication:7mhSo94P1UK-5Q2bKFLyM8AAA"/>
    <add key="ApplicationPort" value="6001"/>
</appSettings>
```

Note:
If you see the following exception in the log file:

```
ErrorCode = -2146893039
FailureReason = NoAuthenticatingAuthority
e.Message = "Unable to perform authentication of credentials."
base {Microsoft.Rtc.Signaling.FailureResponseException} = {"Unable to perform authentication of credentials."}
InnerException = {"NegotiateSecurityAssociation failed, error: -2146893039"}
```

then add the following entry to Web.config:

```xml
<identity impersonate="true" userName="Administrator" password="MyPassword*"/>
```

where username is the administrator's user name, and password is the administrator's password.

The trust is established, and WebCenter Portal's Proxy application can talk to the Lync server.

11.2.2.2.6 Installing UCMA v2.0

Microsoft Unified Communications Managed API v2.0 (UCMA) is an endpoint API that allows advanced developers to build server applications that can interact with the Lync environment.
In a simple deployment, the UCMA is installed on the same box as Lync. In a remote deployment, the Lync core libraries are installed on the Lync box, and the UCMA is installed on the IIS (proxy) box.

1. Download UCMA v2.0 installation from the following location: http://www.microsoft.com/downloads/details.aspx?FamilyID=b20967b1-6cf5-4a4b-b7ae-622653ac929f&displaylang=en

2. Download and run the UcmaSDKWebDownload.msi file.
   - Setup files are extracted to the folder C:\Microsoft Unified Communications Managed API 2.0 SDK Installer package\amd64

3. Go to the directory (where the files from the previous step were extracted) and run vcredist_x86.exe.
   - Run-time components of Visual C++ Libraries, required for UCMA APIs, are installed.

4. Go to the directory called Setup and run UcmaRedist.msi.
   - UCMA 2.0 assemblies in the GAC are installed.

### 11.2.2.2.7 Installing WebCenter Portal's Proxy Application

1. Extract owc_ocs2007.zip from the companion CD.
   - A directory named OCSWebServices is created.

2. Open the Internet Information Services (IIS) Manager.

3. Expand the server node and then Sites in the IIS Manager.

4. Right-click Lync Internal Web Site, and then select Add Application.

5. In the Add Application wizard, enter an alias for the virtual directory in the Alias field, for example RTC.

6. Enter the path to the directory extracted from the owc_ocs2007.zip file, and then click OK.
   - For example, if you extracted the zip file in C:\, then enter C:\OCSWebServices. Alternatively, use the Browse button to navigate to that directory. Click OK.

7. Right-click the newly created application and select Edit Permissions to open the Properties dialog.

8. In the Security tab, edit permissions to grant user Everyone read permission.

9. Test the Web service by accessing the website using the following URL format: http://localhost/lync_internal_web_site/OCSWebService.asmx.
   - where lync_internal_web_site is the virtual directory you created for the Oracle RTC Web service.
   - For example: http://localhost/RTC/OCSWebService.asmx
11.2.3 Microsoft Lync - Security Considerations

You must configure an external application for Microsoft Lync connections so that users can supply credentials to authenticate themselves on the Lync server.

With a secured application, users get presence status. With Lync, if security is required, then Lync should be on a private trusted network.

Lync provides an option for changing external credentials, which works as an alternative to using an external application. A logged-in user can click any Presence tag and select **Change Credentials** from the menu.

For more information, see Registering Instant Messaging and Presence Servers Using Fusion Middleware Control.

11.3 Registering Instant Messaging and Presence Servers

You can register multiple presence server connections with WebCenter Portal, but only one of them is active at a time.

To start using the new (active) presence server you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Registering Instant Messaging and Presence Servers Using Fusion Middleware Control
- Registering Instant Messaging and Presence Servers Using WLST

11.3.1 Registering Instant Messaging and Presence Servers Using Fusion Middleware Control

To register a presence server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the **WebCenter Portal** menu, select **Settings > Service Configuration**.

3. On the WebCenter Portal Service Configuration page, select **Instant Messaging and Presence**.

4. To connect to a new presence server, click **Add** (Figure 11-2).

   ![Figure 11-2 Configuring Instant Messaging and Presence](image-url)
5. Enter a unique name for this connection, specify the presence server type, and indicate whether this connection is the active (or default) connection for the application (Table 11-1).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name for the connection. The name must be unique (across all connection types) within WebCenter Portal.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>Specify the type of presence server:</td>
</tr>
<tr>
<td></td>
<td>Note: Microsoft Lync connections use the Microsoft Office Communications Server 2010 connection type. (Oracle Beehive Server connections are not supported in this release.)</td>
</tr>
<tr>
<td>Active Connection</td>
<td>Select to use this connection in WebCenter Portal for instant messaging and presence. While you can register multiple presence server connections for an application, only one connection is used by IMP—the default (or active) connection.</td>
</tr>
</tbody>
</table>

6. Enter connection details for the server hosting instant messaging and presence (Table 11-2).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server URL</td>
<td>Enter the URL of the server hosting instant messaging and presence. For example: <a href="http://mylynchost.com:8888">http://mylynchost.com:8888</a></td>
</tr>
<tr>
<td>User Domain</td>
<td>Enter the name of the Active Directory domain (on the Microsoft Office Communications Server) that is associated with this connection. The user domain is mandatory for Lync connections. Refer to Microsoft documentation for details on the user domain.</td>
</tr>
<tr>
<td>Pool Name</td>
<td>Enter the name of the pool that is associated with this connection. The pool name is mandatory. Refer to Microsoft documentation for details on the pool name.</td>
</tr>
</tbody>
</table>
Table 11-2 (Cont.) Instant Messaging and Presence Connection - Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Associated External Application | Associate the instant messaging and presence server with an external application. External application credential information is used to authenticate users against the instant messaging and presence server.  
An external application is mandatory.  
You can select an existing external application from the list, or click Create New to configure a new external application.  
The external application you configure for instant messaging and presence must use the POST authentication method, and specify an additional field named Account (Name property) that is configured to Display to User (checked). For more information, see Managing External Applications. |

7. Enter a timeout in the Advanced Configuration field (Table 11-4).

Table 11-3 Instant Messaging and Presence Connection - Advanced Configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Connection Timeout (seconds) | Specify a suitable timeout for the connection.  
This is the length of time (in seconds) WebCenter Portal waits for a response from the presence server before issuing a connection timeout message.  
The default is -1 which means that the default is used. The default is 10 seconds. |

8. Sometimes, additional parameters are required to connect to the presence server.

If additional parameters are required to connect to the presence server, expand Additional Properties and enter details as required (Table 11-4).

Table 11-4 Instant Messaging and Presence Connection - Additional Properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add   | Click Add to specify an additional connection parameter:  
• Property Name - Enter the name of the connection property.  
• Property Value - Enter the default value for the property.  
• Is Property Secured - Indicate whether encryption is required. When selected, the property value is stored securely using encryption.  
For example, select this option to secure the admin.password property where the value is the actual password. |
| Delete| Click Delete to remove a selected property.  
Select the correct row before clicking Delete.  
Note: Deleted rows appear disabled until you click OK. |

9. Click OK to save this connection.
10. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

11.3.2 Registering Instant Messaging and Presence Servers Using WLST

Use the WLST command `createIMPConnection` to create a presence server connection. For command syntax and examples, see `createIMPConnection` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

To configure instant messaging and presence to actively use a new IMP connection, set `default=true`. For more information, see Choosing the Active Connection for Instant Messaging and Presence Using WLST.

---

**Note:**

To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using the Command Line in Administering Oracle Fusion Middleware.

---

11.4 Choosing the Active Connection for Instant Messaging and Presence

You can register multiple instant messaging and presence server connections with WebCenter Portal, but only one connection is active at a time. The *active connection* becomes the back-end presence server for WebCenter Portal.

This section includes the following subsections:

- Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control
- Choosing the Active Connection for Instant Messaging and Presence Using WLST

11.4.1 Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

The Manage Instant Messaging and Presence Connections table indicates the current active connection, if any.
4. Select the connection you want to make the active (or default) connection, and then click Edit.

5. Select the Active Connection check box.

6. Click OK to update the connection.

7. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

11.4.2 Choosing the Active Connection for Instant Messaging and Presence Using WLST

Use the WLST command setIMPConnection with default=true to activate an existing presence server connection. For command syntax and examples, see setIMPConnection in WebCenter WLST Command Reference.

To disable a presence server connection, either delete it, make another connection the 'active connection,' or use the removeIMPServiceProperty command:

removeIMPServiceProperty('appName=webcenter', property='selected.connection')

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see removeIMPServiceProperty in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Note:

To start using this active connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using the Command Line in Administering Oracle Fusion Middleware.

11.5 Modifying Instant Messaging and Presence Connection Details

You can modify instant messaging and presence server connection details at any time. To start using an updated (active) connection you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control
- Modifying Instant Messaging and Presence Connections Details Using WLST

11.5.1 Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control

To update connection details for an instant messaging and presence server:
1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Edit.

5. Edit connection details, as required.
   For detailed parameter information, see Table 11-2.

6. Click OK to save your changes.

7. To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed.
   For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

11.5.2 Modifying Instant Messaging and Presence Connections Details Using WLST

Use the WLST command setIMPConnection to edit presence server connection details. For command syntax and examples, see setIMPConnection in WebCenter WLST Command Reference.

If additional parameters are required to connect to your presence server, then use the setIMPConnectionProperty command. For more information, see setIMPConnectionProperty in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

Note:
To start using the updated (active) connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers in Administering Oracle Fusion Middleware.

11.6 Deleting Instant Messaging and Presence Connections

You can delete instant messaging and presence connections at any time, but use caution when deleting the active connection. When you delete the active connection, user presence options are not available, as these require a back-end instant messaging and presence server.

When you delete a connection, consider deleting the external application associated with instant messaging and presence if the application’s sole purpose was to support it. For more information, see Deleting External Application Connections.

This section includes the following subsections:

- Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control
• Deleting Instant Messaging and Presence Connections Using WLST

11.6.1 Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control

To delete an instant messaging and presence server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Delete.

5. To make this change you must restart the managed server on which WebCenter Portal is deployed.

For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

Note:

Before restarting the managed server, mark another connection as active; otherwise, Instant Messaging and Presence is disabled.

11.6.2 Deleting Instant Messaging and Presence Connections Using WLST

Use the WLST command deleteConnection to remove a presence server connection. For command syntax and examples, see deleteConnection in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

11.7 Setting Up Instant Messaging and Presence Defaults

Use the WLST command setIMPServiceProperty to set defaults for IMP:

• selected.connection: Connection used by instant messaging and presence.

• rtc.cache.time: Cache timeout for instant messaging and presence data.

• resolve.display.name.from.user.profile: Determines what to display if user display names are missing. When set to 0, and display name information is unavailable, only the user name displays in the application. When set to 1, and display name information is unavailable, display names are read from user profile data. Setting this option to 1 impacts performance. The default setting is 0.

Display names are not mandatory in presence data. If the application does not always provide display names by default and you consider this information important, set resolve.display.name.from.user.profile to 1 so that display names always display.
- `im.address.resolver.class`: Resolver implementation used to map user names to IM addresses and IM addresses to user names. The default setting is `oracle.webcenter.collab.rtc.IMAddressResolverImpl`. This implementation looks for IM addresses in the following places and order:
  - User Preferences
  - User Credentials
  - User Profiles

- `im.address.profile.attribute`: User profile attribute used to determine a user's IM address. The default setting is `BUSINESS_EMAIL`. Users can change this default with `im.address.profile.attribute`.

For command syntax and detailed examples, see `setIMPServiceProperty` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 11.8 Testing Instant Messaging and Presence Connections

Oracle RTC web services expose a set of web methods that you can invoke to test validity. To verify a connection, try accessing the web service endpoints. The following examples assume the application context path is `/RTC`:

- `protocol://host/RTC/ApplicationConfigurationService.asmx`
- `protocol://host/RTC/RTCService.asmx`
- `protocol://host/RTC/OCSWebService.asmx`
Managing Mail

This chapter describes how to configure and manage mail for WebCenter Portal. It also describes how to configure the "Send Mail" feature, which allows application assets to send mail directly from them. The Send Mail feature does not require mail. That is, even if the Mail component has not been configured in WebCenter Portal, users can send mail notifications.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end servers for WebCenter Portal. Any changes that you make to post-deployment, are stored in MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

Note:
Configuration changes for mail, through Fusion Middleware Control or using WLST, are not dynamic, so you must restart the managed server on which WebCenter Portal is deployed for your changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

This chapter includes the following topics:

- About Mail Server Connections
- Configuration Roadmap for Mail
- Mail Server Prerequisites
- Registering Mail Servers
- Choosing the Active (or Default) Mail Server Connection
- Modifying Mail Server Connection Details
- Deleting Mail Server Connections
- Setting Up Mail Defaults
- Testing Mail Server Connections
- Configuring Send Mail Notifications for WebCenter Portal
Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

For troubleshooting issues with mail, see Troubleshooting Issues with Mail.

12.1 About Mail Server Connections

Oracle WebCenter Portal supports the Microsoft Exchange Server or any mail server that supports IMAP4 and SMTP. To enable users to access mail and perform basic operations such as read, reply, and forward within WebCenter Portal, you must first register the appropriate mail server. Mail is not configured out-of-the-box.

You can register multiple mail server connections.

WebCenter Portal supports multiple mail connections. The mail connection marked active is the default connection for mail in WebCenter Portal. All additional connections are offered as alternatives; users can choose which one they want to use through user preferences.

12.2 Configuration Roadmap for Mail

Use the roadmap in this section as an administrator’s guide through the configuration process:

Figure 12-1 and Figure 12-1 provide an overview of the prerequisites and tasks required for mail to work in WebCenter Portal.

Figure 12-1 Configuring Mail
Table 12-1 Configuring Mail for WebCenter Portal

<table>
<thead>
<tr>
<th>Actor</th>
<th>Task</th>
<th>Subtask</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>1. Install WebCenter Portal and the back-end components for the mail server (see Mail Server - Installation)</td>
<td>1.a For Microsoft Exchange 2007, 2010, or 2013, follow additional configuration steps (see Configuring Microsoft Exchange Server 2007, 2010, or 2013 for WebCenter Portal)</td>
</tr>
<tr>
<td></td>
<td>2. Configure a connection between WebCenter Portal and your mail server -- associating the mail server with an external application -- using one of the following tools:</td>
<td></td>
</tr>
<tr>

</table>

12.3 Mail Server Prerequisites

This section includes the following subsections:

- Mail Server - Installation
- Mail Server - Configuration
- Mail Server - Security Considerations
- Mail Server - Limitations

12.3.1 Mail Server - Installation

See your mail server documentation for installation information.

12.3.2 Mail Server - Configuration

You can allow WebCenter Portal to create and manage portal distribution lists. This feature is supported only with Microsoft Exchange.

If enabled, a portal distribution list is created automatically whenever a portal is created. Users added or removed from the portal are implicitly added or removed from the corresponding portal distribution list, provided that the LDAP Base DN does not change (only one LDAP Base DN is supported) and that users created on Microsoft Exchange Active Directory correspond with users created in the identity store used by
WebCenter Portal. To disable this feature, do not enter the LDAP (Active Directory) server details in the mail connection.

For more information, see step 7 of Registering Mail Servers Using Fusion Middleware Control.

For information about adding users on a mail server, see the mail server’s product documentation. For information about adding users to WebCenter Portal’s identity store, see Adding Users to the Embedded LDAP Identity Store.

Microsoft Exchange 2007, Microsoft Exchange 2010, and Microsoft Exchange 2013 are the only mail servers for which there are configuration prerequisites. If you are working with a different mail server, then you can bypass the rest of this section.

### 12.3.2.1 Configuring Microsoft Exchange Server 2007, 2010, or 2013 for WebCenter Portal

The Microsoft Exchange Server 2007, 2010, or 2013 certificate must be added to the WebCenter Portal keystore. This requires the following steps.

1. Obtain the Certificate from the Microsoft Exchange Server
2. Add the Certificate to the WebCenter Portal Keystore
3. Restart the server after the certificate is imported.

#### 12.3.2.1.1 Obtain the Certificate from the Microsoft Exchange Server

Obtain the certificate from your mail server installation administrator. This section describes one way to get the certificate from the Microsoft Exchange Server.

Follow these steps to obtain the certificate from a Microsoft Exchange Server 2007, 2010, or 2013:

1. Open a browser and connect to your IMAP server with the following command:

   ```
   https://host_name/owa
   ```

   Where `host_name` is the name of the Microsoft Exchange Server.

2. Place your cursor on the page, right-click, and select **Properties**, then click **Certificate**.

3. In the popup window, click the **Details** tab, and click **Copy to File...**

   Be sure to use the DER encoded binary (X.509) format, and copy to a file.

4. Convert the .DER format certificate to .PEM format.

---

**Note:**

WebLogic only recognizes .PEM format.

---

Use Firefox 3.0 or later to download the certificate directly to .PEM format. For other browsers, use the WebLogic Server `der2pem` tool to convert to .PEM format. For more information about `der2pem`, see [Command Reference for Oracle WebLogic Server](#).
12.3.2.1.1.1 Add the Certificate to the WebCenter Portal Keystore

1. Import the downloaded certificate into the keystore, which is generally the file named cacerts in the JAVA_HOME. For example:

   keytool -import -alias imap_cer -file cert_file.cer -keystore cacerts -storepass changeit

   Where cert_file is the name of the certificate file you downloaded. In a standard installation, the JAVA_HOME is in the following location:

   /scratch/wcinstall/ps2/1225/wlshome/jrockit_160_17_R28.0.0-616

   See Configuring and Exporting the Certificates, for information about adding the certificate to the keystore.

2. Restart the server.

12.3.2.1.1.1.1 Microsoft Exchange Server Considerations

- The IMAP port is 993 and secured true. SMTP port is 587 and secured true.
- If you see the following error, then you must change the trust store entry in the domain startup file setDomainEnv.sh:

  Caused by: java.io.IOException: Keystore was tampered with, or password was incorrect
  at sun.security.provider.JavaKeyStore.engineLoad(JavaKeyStore.java:771)
  at sun.security.provider.JavaKeyStore$JKS.engineLoad(JavaKeyStore.java:38)
  at java.security.KeyStore.load(KeyStore.java:1185)
  at com.sun.net.ssl.internal.ssl.TrustManagerFactoryImpl.getCacertsKeyStore
     (TrustManagerFactoryImpl.java:202)
  at com.sun.net.ssl.internal.ssl.DefaultSSLContextImpl.getDefaultTrustManager
     (DefaultSSLContextImpl.java:70)

  To change the entry:

  1. Shutdown the managed server on which WebCenter Portal is deployed.
  2. Edit the domain startup script setDomainEnv located at:

     UNIX: DOMAIN_HOME/bin/setDomainEnv.sh
     Windows: DOMAIN_HOME\bin\setDomainEnv.cmd

  3. Add the Java property, as follows:

     -Djavax.net.ssl.trustStore=<path to truststore> -Djavax.net.ssl.trustStorePassword=<truststore password>

     For example:

     set JAVA_PROPERTIES=
     -Dplatform.home=%WL_HOME% -Dwls.home=%WLS_HOME% -Dweblogic.home=%WLS_HOME% -Djavax.net.ssl.trustStore=C:\jive\mailtool\jssecacerts
     -Djavax.net.ssl.trustStorePassword=changeit

  4. Restart the managed server.
12.3.3 Mail Server - Security Considerations

For more information, see Securing the WebCenter Portal Connection to IMAP and SMTP with SSL.

Note:
If LDAP is configured to run in secure mode, then add the LDAP Secured property (set to true/false) to use LDAP while creating distribution lists. For more information, see Table 12-4.

12.3.4 Mail Server - Limitations

In WebCenter Portal, mail requires a Microsoft Exchange mail server connection to enable automatic WebCenter Portal distribution list management.

12.4 Registering Mail Servers

You can register multiple mail server connections. To start using the new mail connections you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Registering Mail Servers Using Fusion Middleware Control
- Registering Mail Servers Using WLST

12.4.1 Registering Mail Servers Using Fusion Middleware Control

To register a mail server with WebCenter Portal:

1. Log in to Fusion Middleware Control and navigate to the home page for the WebCenter Portal.
   For more information, see Navigating to the Home Page for WebCenter Portal

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. To connect to a new mail server, click Add (Figure 12-2).

   **Figure 12-2 Configuring Mail Servers**

   Manage Mail Server Connections

   ![Add, Edit, Delete buttons]

<table>
<thead>
<tr>
<th>Name</th>
<th>IMAP Host</th>
<th>SMTP Host</th>
<th>Active Connection</th>
</tr>
</thead>
</table>

5. Enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for the application (Table 12-2).

   **Table 12-2 Mail Server Connection - Name**
### Table 12-2 (Cont.) Mail Server Connection - Name

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name for the connection. The name must be unique (across all connection types) within WebCenter Portal.</td>
</tr>
<tr>
<td>Active Connection</td>
<td>Select to indicate whether this connection is the default (or active) connection for mail. You can register multiple mail server connections: WebCenter Portal supports multiple mail connections. The mail connection marked active is the default connection for mail. All additional connections are offered as alternatives; users can choose which one they want to use through user preferences.</td>
</tr>
</tbody>
</table>

6. Enter connection details for the mail server (Table 12-3).

### Table 12-3 Mail Server Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMAP Host</td>
<td>Enter the host name of the computer where IMAP (Internet Message Access Protocol) is running.</td>
</tr>
<tr>
<td>IMAP Port</td>
<td>Enter the port on which IMAP listens.</td>
</tr>
<tr>
<td>IMAP Secured</td>
<td>Indicate whether a secured connection (SSL) is required for incoming mail over IMAP.</td>
</tr>
<tr>
<td>SMTP Host</td>
<td>Enter the host name of the computer where SMTP (Simple Mail Transfer Protocol) is running.</td>
</tr>
<tr>
<td>SMTP Port</td>
<td>Enter the port on which SMTP listens.</td>
</tr>
<tr>
<td>SMTP Secured</td>
<td>Indicate whether a secured connection (SSL) is required for outgoing mail over SMTP.</td>
</tr>
</tbody>
</table>
Table 12-3  (Cont.) Mail Server Connection Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associated External Application</td>
<td>Associate the mail server with an external application. External application credential information is used to authenticate users against the IMAP and SMTP servers. Mail uses the same credentials to authenticate the user on both IMAP and SMTP. You can select an existing external application from the list, or click Create New to configure a new external application. For more information, see Managing External Applications. The external application for mail must use Authentication Method=POST, and you can customize some mail header fields (with Display to User enabled):</td>
</tr>
<tr>
<td></td>
<td>• Property: mail.user.emailAddress (who the mail is from)</td>
</tr>
<tr>
<td></td>
<td>• Property: mail.user.displayName (display name from the mail)</td>
</tr>
<tr>
<td></td>
<td>• Property: mail.user.replyToAddress (address used to reply to the mail)</td>
</tr>
<tr>
<td></td>
<td>These properties ensure that a specific mail address is the same in the external application and in the mail server. They are added to the mail connection and are used by mail for the From, Display Name and Reply To fields (Figure 12-3). See Table 12-7 for Additional Properties configuration. If your application offers a self-registration page with the facility to mail user ID information on request, then you must ensure that public credentials are configured for the external application selected here. If public credentials are not defined, then mail cannot be sent to users on their request. WebCenter Portal, for example, offers this feature on its default self-registration page.</td>
</tr>
</tbody>
</table>

7. Specify LDAP connection details for the Active Directory server managing WebCenter Portal distribution lists (Table 12-4).

WebCenter Portal supports Microsoft Exchange where distribution lists are managed on an Active Directory server.

Note:

Active Directory server details must be provided as part of the mail connection for distribution lists to work in WebCenter Portal.

Table 12-4  LDAP Directory Server Configuration Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Host</td>
<td>Enter the host name of the computer where the LDAP directory server (Lightweight Directory Access Protocol) is running.</td>
</tr>
<tr>
<td>LDAP Port</td>
<td>Enter the port on which the LDAP directory server listens.</td>
</tr>
<tr>
<td>LDAP Base DN</td>
<td>Enter the base distinguished name for the LDAP schema. For example, CN=Users, DC=oracle, DC=com.</td>
</tr>
</tbody>
</table>
Table 12-4  (Cont.) LDAP Directory Server Configuration Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Domain</td>
<td>Enter the domain appended to distribution list names. For example, if the domain value is set to example.com, then a portal named Finance Project maintains a distribution list named <a href="mailto:FinanceProject@example.com">FinanceProject@example.com</a>.</td>
</tr>
<tr>
<td>LDAP Administrator User Name</td>
<td>Enter the user name of the LDAP directory server administrator. A valid user with privileges to make entries into the LDAP schema.</td>
</tr>
<tr>
<td>LDAP Administrator Password</td>
<td>Enter the password for the LDAP directory server administrator. The password is stored in a secured store.</td>
</tr>
<tr>
<td>LDAP Default User</td>
<td>Enter a comma-delimited list of user names to whom you want to grant moderation capabilities. These users become members of every portal distribution list that is created. The users specified must exist in the base LDAP schema (specified in the LDAP Base DN field).</td>
</tr>
<tr>
<td>LDAP Secured</td>
<td>Indicate whether a secured connection (SSL) is required between WebCenter Portal and the LDAP directory server.</td>
</tr>
</tbody>
</table>

8. Configure advanced options for the mail server connection (Table 12-5).

Table 12-5  Mail Server Connection - Advanced Configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Timeout (seconds)</td>
<td>Specify a suitable timeout for the connection. This is the length of time (in seconds) WebCenter Portal waits for a response from the mail server before issuing a connection timeout message. The default is -1, which means that the default is used. The default is 10 seconds.</td>
</tr>
</tbody>
</table>

9. Optionally, you can add more parameters to the mail server connection (Table 12-6).

Table 12-6  Additional Mail Connection Properties

<table>
<thead>
<tr>
<th>Additional Connection Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Characterset used on the connection. The default charset is UTF-8. To use a different characterset, such as ISO-8859-1, set the charset connection property.</td>
</tr>
</tbody>
</table>
Table 12-6  (Cont.) Additional Mail Connection Properties

<table>
<thead>
<tr>
<th>Additional Connection Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Various IMAP properties</td>
<td>Any valid IMAP connection property. For example, mail.imap.connectionpoolsize. For a list of valid protocol properties, see your mail server documentation. For a list of standard IMAP properties, see the Java Mail APIs: <a href="https://javamail.java.net/nonav/docs/api/com/sun/mail/imap/package-summary.html">https://javamail.java.net/nonav/docs/api/com/sun/mail/imap/package-summary.html</a></td>
</tr>
<tr>
<td>Various SMTP properties</td>
<td>Any valid SMTP connection property. For example, mail.smtp.timeout. For a list of valid protocol properties, see your mail server documentation. For a list of standard SMTP properties, see the Java Mail APIs: <a href="https://javamail.java.net/nonav/docs/api/com/sun/mail/smtp/package-summary.html">https://javamail.java.net/nonav/docs/api/com/sun/mail/smtp/package-summary.html</a></td>
</tr>
</tbody>
</table>

If additional parameters are required to connect to the mail server, expand Additional Properties and enter details as required (see Table 12-7).

Table 12-7  Mail Connection - Additional Properties

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add          | Click **Add** to specify an additional connection parameter:  
|              | • **Property Name** - Enter the name of the connection property.  
|              | • **Property Value** - Enter the default value for the property.  
|              | • **Is Property Secured** - Indicate whether encryption is required. When selected, the property value is stored securely using encryption.  
|              | For example, select this option to secure the admin.password property where the value is the actual password.  
| Delete       | Click **Delete** to remove a selected property.  
|              | Select the correct row before clicking **Delete**.  
|              | **Note:** Deleted rows appear disabled until you click **OK**. |

Figure 12-3  Additional Properties for Mail Connection

[Diagram showing additional properties with columns for Property Name, Property Value, and Is Property Secured]

10. Click **OK** to save this connection.
11. To start using the new (active) connection you must restart the managed server on which WebCenter Portal is deployed.

For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

12.4.2 Registering Mail Servers Using WLST

Use the WLST command createMailConnection to create a mail server connection. For command syntax and examples, see createMailConnection in WebCenter WLST Command Reference.

Use the WLST command setMailConnectionProperty to add additional required properties through your external application. The external application for mail must use Authentication Method=POST, and you can customize some mail header fields (with Display to User enabled). For example:

```
setMailConnectionProperty(appName='webcenter', name='NotificationSharedConn', key='mail.user.emailAddress', value='john.doe@example.com')
```

```
setMailConnectionProperty(appName='webcenter', name='NotificationSharedConn', key='mail.user.displayName', value='John Doe')
```

```
setMailConnectionProperty(appName='webcenter', name='NotificationSharedConn', key='mail.user.replyToAddress', value='feedback@example.com')
```

where:

- mail.user.emailAddress = Email Address ('From' from the mail)
- mail.user.displayName = Your Name (display name from the mail)
- mail.user.replyToAddress = Reply-To Address (address when replying to the mail)

These properties ensure that a specific mail address is the same in the external application and in the mail server. These properties are added to the Mail connection and are used by mail for the From, Display Name and Reply To fields.

**For Exchange 2007 only**, create an universal distribution list which means that the default property value of 2 should be updated to 8. Specify a value of 8 for the mail property mail.exchange.dl.group.type, as follows:

```
setMailServiceProperty(appName='webcenter', property='mail.exchange.dl.group.type', value='8')
```

If your application offers a self-registration page with the facility to mail user ID information on request, then you must ensure that public credentials are configured for the external application selected here. If public credentials are not defined, then mail cannot be sent to users on their request. WebCenter Portal offers this feature on its default self-registration page.

For command syntax and examples, see setMailConnectionProperty in WebCenter WLST Command Reference.

To configure mail to use the new mail server connection as its default connection, set default=true. For more information, see Choosing the Active (or Default) Mail Server Connection Using WLST.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
12.5 Choosing the Active (or Default) Mail Server Connection

You can register multiple mail server connections with WebCenter Portal, but only one connection can be designated as the default connection. The default connection becomes the back-end mail server for:

- Mail task flows
- WebCenter Portal distribution lists
- Anywhere there is a Send Mail icon

This section includes the following subsections:

- Choosing the Active (or Default) Mail Server Connection Using Fusion Middleware Control
- Choosing the Active (or Default) Mail Server Connection Using WLST

12.5.1 Choosing the Active (or Default) Mail Server Connection Using Fusion Middleware Control

To change the default connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   For more information, see Navigating to the Home Page for WebCenter Portal
2. From the WebCenter Portal menu, select Settings > Service Configuration.
   The Manage Mail Server Connections table indicates the current active connection, if any (Figure 12-4).

Figure 12-4 Mail Server - Active Connection

WebCenter Portal Service Configuration
Use this page to configure services for the WebCenter Portal application. Choose a service to view or modify the current configuration, and to configure new service connections.
4. Select the connection you want to make the active (or default) connection, and then click Edit.

5. Select the Active Connection check box.

6. Click OK to update the connection.

7. To start using the new default connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

12.5.2 Choosing the Active (or Default) Mail Server Connection Using WLST

Use the WLST command setMailConnection with default=true to make an existing mail server connection the default connection for mail. For command syntax and examples, see setMailConnection in WebCenter WLST Command Reference.

A connection does not cease to be the default connection for mail if you change the default argument from true to false.

To disable a mail connection, either delete it, make another connection the ‘active connection’, or use the removeMailServiceProperty command:

```
removeMailServiceProperty(appName='webcenter', property='selected.connection')
```

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see removeMailServiceProperty in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

To start using the active connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers Using the Command Line in Administering Oracle Fusion Middleware.

---

12.6 Modifying Mail Server Connection Details

You can modify mail server connection details at any time.

To start using updated mail connections you must restart the managed server on which WebCenter Portal is deployed.

This section includes the following subsections:

- Modifying Mail Server Connection Details Using Fusion Middleware Control
- Modifying Mail Server Connection Details Using WLST

12.6.1 Modifying Mail Server Connection Details Using Fusion Middleware Control

To update mail server connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Edit.

5. Edit connection details, as required.

   For detailed parameter information, see Table 12-3.

6. Click OK to save your changes.

7. To start using updated connection details you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 12.6.2 Modifying Mail Server Connection Details Using WLST

Use the WLST command setMailConnection to edit existing mail server connection details. For command syntax and examples, see setMailConnection in WebCenter WLST Command Reference.

If additional parameters are required to connect to your mail server, use the setMailConnectionProperty command. For more information, see setMailConnectionProperty in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

**Note:**

To start using the updated connections you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers in Administering Oracle Fusion Middleware.

### 12.7 Deleting Mail Server Connections

You can delete mail server connections at any time, but use caution when deleting the active (or default) connection. If you delete the active connection, Mail task flows do not work, as they all require a back-end mail server.

When you delete a connection, consider deleting the external application associated with the mail server connection if the application's sole purpose was to support this connection. For more information, see Deleting External Application Connections.

This section includes the following subsections:

- Deleting a Mail Connection Using Fusion Middleware Control
- Deleting a Mail Connection Using WLST

#### 12.7.1 Deleting a Mail Connection Using Fusion Middleware Control

To delete a mail server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
For more information, see Navigating to the Home Page for WebCenter Portal

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Delete.

5. To make this change you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

Note:
Before restarting the managed server, mark another connection as active; otherwise, mail is disabled.

12.7.2 Deleting a Mail Connection Using WLST

Use the WLST command deleteConnection to remove a mail server connection. For command syntax and examples, see deleteConnection in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

12.8 Setting Up Mail Defaults

Use the WLST command setMailServiceProperty to set defaults for mail:

- address.delimiter: Defines the delimiter that is used to separate multiple mail addresses. A comma is used by default.
  
  Some mail servers require mail addresses in the form lastname, firstname and, in such cases, a semicolon is required.

- mail.emailgateway.polling.frequency: Frequency, in seconds, that portal distribution lists are checked for new incoming mail messages. The default is 1800 seconds (30 minutes).

  Email communication through WebCenter Portal distribution lists can be published as discussion forum posts on a discussions server. For details, see Publishing Portal Mail in a Discussion Forum in Building Portals with Oracle WebCenter Portal.

- mail.messages.fetch.size: Maximum number of messages displayed in mail inboxes

- resolve.email.address.to.name: Determines whether user email addresses are resolved to WebCenter Portal user names when LDAP is configured. Valid values are 1 (true) and 0 (false). The default value is 0.

  When set to 1, WebCenter Portal user names display instead of email addresses in Mail task flows.

  Set this property to 1 if instant messaging and presence requires user names to obtain presence status because presence information cannot be obtained when mail
provides email addresses. Setting this value to 1 does impact application performance so you must take this into consideration when setting this property.

- `mail.recipient.limit`: Restricts the number of recipients to a message. For example, setting this value to '500' limits the number of recipients to 500.

For command syntax and examples, see `setMailServiceProperty` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 12.9 Testing Mail Server Connections

Confirm that the mail server is running by connecting to the server using any client, such as Thunderbird or Outlook.

For Microsoft Exchange, go to **Administrative Tools - Services** to confirm that the following components are running (Status: Started):

- Microsoft Exchange IMAP4
- Simple Mail Transfer Protocol (SMTP)

### 12.10 Configuring Send Mail Notifications for WebCenter Portal

System administrators are responsible for setting mail options through WebCenter Portal administration settings (Figure 12-5). For more information about using Send Mail notifications, see About the Send Mail Feature in *Using Oracle WebCenter Portal*.

*Figure 12-5  Setting Mail Options*

From this page, you can assign the mail client for the Send Mail feature. This feature allows application assets to send mail directly from their task flows, using the **Send Mail** icon (Figure 12-6).

*Figure 12-6  Send Mail Icon*

For example, from an announcement, users can click the **Send Mail** icon to open a mail window prepopulated with information including the announcement text,
author, date created, and location. They can edit and add to the mail, as necessary. The way the mail window is prepopulated depends on the resource sending it. For example, from an announcement, Send Mail opens a mail window prepopulated with the title of the announcement.

Within a portal, the mail can be addressed to all members of the portal, which is the default distribution list that is created when the portal is created. Portal Managers (and anyone granted the Manage Security and Configuration permission on the portal) set this through the Tools and Services page in the portal's administration settings. See Configuring the Mail Distribution List for a Portal in Building Portals with Oracle WebCenter Portal.

For all Send Mail notifications throughout WebCenter Portal, you can choose to use the local mail client, such as Microsoft Outlook or Mozilla Thunderbird, or WebCenter Portal's own Mail service. The local mail client is the default. The Send Mail feature does not require the Mail service, that is, if the Mail service is not yet configured, you can still use the Send Mail feature with WebCenter Portal's Mail service. Application specialists or portal managers can specify whether portal members can override the default mail client setting.

### Note:

With some browsers, Send Mail notifications are garbled for many non-English languages. When multibyte characters are encoded (required for the "mailto:" protocol), the URL length exceeds the browser limit. As a workaround, configure the Send Mail feature to use WebCenter Portal's Mail service instead of the local mail client.

As the system administrator, you can also specify whether users can override the default mail client setting.

Registering Mail Servers

#### 12.10.1 Enabling Shared Mail Connections for Send Mail Notifications

Users do not need to specify credentials when sending mail using WebCenter Portal's Mail service when *shared credentials* are configured for the external application that is associated with the mail server connection.

To enable shared mail connections:

1. Confirm that your portal is using WebCenter Portal’s Mail service to send mail.
   a. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Tools and Services.
   b. Select Mail.
   c. Ensure that Default Mail Client for 'Send Mail' is set to WebCenter Portal’s Mail Service.

See also Configuring Send Mail Notifications for WebCenter Portal.
2. Set up a mail connection that uses an external application configured with the shared credentials and record the mail connection name.

3. Open the portal where shared mail credentials are required and specify the name of the shared mail connection.
   For details, see Configuring a Shared Mail Connection for a Portal in *Building Portals with Oracle WebCenter Portal*. 
This chapter describes back-end configuration requirements for the People Connections service.

This chapter includes the following topics:

- About the People Connections Service
- People Connections Prerequisites
- Configuring People Connections for WebCenter Portal
- Archiving the Activity Stream Schema
- Specifying a Management Chain for Organization View
- Setting Profile Configuration Properties
- Synchronizing Profiles with the Identity Store

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

13.1 About the People Connections Service

The People Connections service provides social networking tools for creating, interacting with, and tracking the activities of one's connections. Its features enable users to manage their personal profiles, access the profiles of other users, provide ad hoc feedback, post messages, track activities, and connect with others.

People Connections features include:

- **Activity Stream** for viewing user activities generated through application or social networking actions.

- **Connections** for connecting to other application users to share information, comment on performance, exchange messages, and track activity

- **Feedback** for giving ad hoc performance feedback to other users

- **Message Board** for posting messages to other users
- **Profile** for entering information about yourself and viewing the information of other users
- **Publisher** for publishing status messages and posting files and links

The People Connections service provides task flows for using its features.

---

**See Also:**

For information on adding People Connections functionality to a portal, see Adding Connections to a Portal in *Building Portals with Oracle WebCenter Portal*.

---

Always use the Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter Portal. Any changes you make to WebCenter Portal, post deployment, are stored in MDS metadata store as customizations. See *Oracle WebCenter Portal Configuration Considerations*.

---

**Note:**

Most changes you make to WebCenter Portal tools and services configuration through Fusion Middleware Control or using WLST are not dynamic. For your changes to take effect, you must restart the managed server where the application is deployed. See *Starting and Stopping Managed Servers for WebCenter Portal Application Deployments*.

---

For additional information about configuring People Connections, refer to *Configuring People Connections for WebCenter Portal*.

### 13.2 People Connections Prerequisites

To use the People Connections service, you must have the WEBCENTER schema installed in your database.

In a production environment, an enterprise can leverage its back-end identity store as a means of providing People Connections with a population of potential connections. In a development environment, developers can add test-users to the `jazn-data.xml` file.

For example, Profile takes the bulk of its information from the back-end identity store that provides WebCenter Portal with its users. Additionally, Profile may offer opportunities for altering some of this information and for providing additional data not included in the identity store.

For information about connecting to a back-end (LDAP) identity store for the production version of your application, see *Configuring the Identity Store*.

### 13.3 Configuring People Connections for WebCenter Portal

This section steps you through the process of setting application-wide values for People Connections features. It includes the following subsections:

- **Accessing People Connections Administrative Settings**
- **Configuring Activity Stream**
13.3.1 Accessing People Connections Administrative Settings

To access People Connections administrative settings:

1. Open WebCenter Portal Administration.
   
   For details, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select People Connections.
   
   Alternatively, use the following URL, and then select People Connections:
   
   http://host:port/webcenter/portal/admin/tools

   Tabs with the names of People Connections features appear to the right.

13.3.2 Configuring Activity Stream

Activity Stream is for publishing and tracking users’ application activity. Activity Stream configuration settings specify the users and activities that are streamed, who can see a user’s streamed activities, and whether liking and commenting is available on each streamed activity (Figure 13-1).

Figure 13-1    Administration Settings for People Connections
Who can view a user's activities and the types of activities tracked depend on Activity Stream configuration. Table 13-1 lists the types of activities that may be tracked by Activity Stream.

**Table 13-1  Activities Tracked by Activity Stream**

<td>• Home portal</td>
<td>• Activities in a Home portal are shared with whomever is permitted to view such activities. (For more information, see Configuring Activity Stream and Setting Activity Stream Preferences in Using Oracle WebCenter Portal.)</td>
</tr>
</tbody>
</table>

Configure Activity Stream to show or hide actions from these categories:

- **People**—For determining whose activities to show, either the current user’s or both the current user and the user’s connections.

- **WebCenter Portal**—For determining whether to show activities from all available portals or just the Home portal.

- **Service Categories**—For selecting the services from which to report activities and enabling users to override these default selections in their personal preferences or preventing users from overriding.

- **Privacy**—For selecting who may see the current user’s activities.

- **Comments and Likes**—For enabling users to comment on a posted activity and like a posted activity

To configure Activity Stream for all users:

1. Open WebCenter Portal Administration.
   
   For details, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click **Tools and Services**, and then select **People Connections**.

   Alternatively, use the following URL, and then select **People Connections**:

   `http://host:port/webcenter/portal/admin/tools`

   Tabs with the names of People Connections features appear to the right.

3. Click the **Activity Stream** tab to bring it forward.

4. Under **People**, select whose activities to show:

   - **Only Me**—Show only the current user’s activities in his or her view of the Activity Stream.

   - **Me and My Connections**—Show the current user’s activities and the activities of that user’s connections in his or her view of the Activity Stream.
• No Personal—Omit all activities streamed from the Home portal in the current user’s view of his or her Activity Stream.

5. Under Portals, select to show activities from:

• All Portals—All portals the user has access to
• My Portals—All portals the user manages
• No Portals—Only the Home portal

6. Under Service Categories, select the services from which to publish activity.

   Note:
   The activities of services that are not selected are still tracked, but they do not appear in the Activity Stream. If you select to show the activities at some later point, then all of the activities that occurred when it was not selected will appear in the Activity Stream.

Table 13-1 lists the activities tracked by the Activity Stream.

7. Optionally, select Allow Owner Override to enable users to override a setting for a given service through their personal preferences.

   Deselect this check box to prevent users from overriding the application defaults you set here.

8. Under Privacy, specify who can view the current user’s activities and whether users can override this setting in their personal preferences.

   Table 13-2 lists and describes each option.

   **Table 13-2 Activity Stream Privacy Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow all of my activities to be viewed by</td>
<td>Specify who can view another user’s activities. Choose from:</td>
</tr>
<tr>
<td></td>
<td>• Everyone—Any user, whether logged in or not, can view other users’ activities.</td>
</tr>
<tr>
<td></td>
<td>• Authenticated Users—Users who have logged in can view other users’ activities.</td>
</tr>
<tr>
<td></td>
<td>• My Connections—User A can view user B’s activities if user B has accepted user A as a connection. User A can also view user A’s activities.</td>
</tr>
<tr>
<td></td>
<td>• Myself—Only user A can view user A’s activities.</td>
</tr>
<tr>
<td>Allow Owner Override</td>
<td>Enable users to override the application default settings using their own People Connections Preferences (for more information, see Setting Activity Stream Preferences in Using Oracle WebCenter Portal).</td>
</tr>
</tbody>
</table>

9. Expand the Likes and Comments node, and specify whether liking and commenting are allowed:
• Select **Enable comments on objects in the Activity Stream** to enable users to comment on a given Activity Stream item. Deselect the check box to prevent users from commenting.

• Select **Enable others to like objects in the Activity Stream** to enable users to like an Activity Stream item. Deselect the check box to prevent users from liking.

**Tip:**
Users can like and comment on streamed items that include objects. For example, users can like or comment on “Jack posted a message.” Users cannot like or comment on system messages, such as “Jack and Jill are now connected.”

For more information, see Liking, Commenting On, and Sharing Items in WebCenter Portal in *Using Oracle WebCenter Portal*.

10. Click **Apply** to save your configuration settings.

### 13.3.3 Configuring Connections

Connections configuration involves selecting who can view another user's connections and whether users accept invitations to connect automatically (Figure 13-2).

**Figure 13-2  Configuration Settings for Connections**

To configure Connections:

1. Open WebCenter Portal Administration.
   
   For details, see Accessing the Settings Pages in WebCenter Portal Administration

2. Click **Tools and Services**, and then select **People Connections**.
   
   Alternatively, use the following URL, and then select **People Connections**: http://host:port/webcenter/portal/admin/tools

   Tabs with the names of People Connections features appear to the right.

3. Click the **Connections** tab to bring it forward.
   
   **Table 13-3** lists and describes each option.
### Table 13-3 Connections Configuration Options

<table>

</tr>
<tr>
<td></td>
<td>• Select to allow users to override the administrative View access setting specified here using their personal Preferences (for more information, see the Setting Connections Preferences in Using Oracle WebCenter Portal).</td>
</tr>
<tr>
<td></td>
<td>• Deselect to prohibit users from overriding the administrative View access setting.</td>
</tr>
<tr>
<td>Accept Invitations</td>
<td>• Select to specify that, by default, all invitations to connect are accepted automatically.</td>
</tr>
<tr>
<td>Automatically</td>
<td>• Deselect to specify that, by default, a user must explicitly accept or reject invitations to connect.</td>
</tr>
</tbody>
</table>

4. Click **Apply** to save your configuration settings.

### 13.3.4 Configuring Profile

Every authenticated user has a profile that displays personal information, such as the user’s email address, phone number, office location, department, manager, direct reports, and so on. All but three attributes are stored and read from the LDAP identity store that is configured for WebCenter Portal. The three exceptions include the Profile photo and expertise and Publisher status messages.

Use administrative configuration settings for Profile to specify whether users are allowed to change their application passwords, which profile sections display, whether users are allowed to update their profile details, and the profile attributes that users may update (Figure 13-3).
Personal profiles are presented in these sections: **Summary, Employee, Business Contact, Personal Information**. Each section provides information related to the section heading. For example, **Summary** includes a collection of basic details, such as the user’s name, email address, and office location.

In configuration settings, the access setting for the **Summary** section controls who can search for the user (for example, through global search, people pickers, and the searches one uses to find and invite other users to connect). For example, if Everyone is allowed to view the **Summary** section, then the user can be searched for by unauthenticated (public) users. If only Authenticated Users can view another user's **Summary** section, then only logged in users can search for the user. If **None** is the selected value for **Who can view this section**, then the user will not appear in search results.

Users cannot change the privacy settings on the **Summary** section through their Preferences (for more information, see Setting Profile Preferences in *Using Oracle WebCenter Portal*). Privacy on the **Summary** section is controlled at a global level for all users through the settings described in this section.

It is the administrator’s job to select the information to show in each section and determine whether users are allowed to edit their profile data and their application password in WebCenter Portal.

To configure Profile:

1. Open WebCenter Portal Administration. For details, see Accessing the Settings Pages in WebCenter Portal Administration

2. Click **Tools and Services**, and then select **People Connections**.

   Alternatively, use the following URL, and then select **People Connections**: 

---

**Figure 13-3  Configuration Settings for Profile**

![Image of configuration settings for profile](image-url)
Tabs with the names of People Connections features appear to the right.

3. Click the **Profile** tab to bring it forward.

Table 13-4 lists and describes each option.

</tr>
</tbody>
</table>

4. Click **Apply** to save your configuration settings.
### 13.3.5 Configuring Message Board

Message Boards provide a way for users to view and post messages to their connections. Configuration settings for Message Board provide controls for who can view and post messages, who can edit and delete the messages they leave, who can delete and change the visibility of messages they receive, and whether commenting and liking are available on each message (Figure 13-4).

**Figure 13-4  Configuration Settings for Message Board**

![Configuration Settings for Message Board](image)

**See Also:**

For information about likes and comments, see Liking, Commenting On, and Sharing Items in *Using Oracle WebCenter Portal*.

To configure Message Board:

1. Open WebCenter Portal Administration.
   
   For details, see *Accessing the Settings Pages in WebCenter Portal Administration*

2. Click **Tools and Services**, and then select **People Connections**.

   Alternatively, use the following URL, and then select **People Connections**:
   
   `http://host:port/webcenter/portal/admin/tools`

   Tabs with the names of People Connections features appear to the right.

3. Click the **Message Board** tab to bring it forward.

   **Table 13-5** lists and describes each option.
### Table 13-5  Message Board Configuration Options

<td></td>
</tr>
<tr>
<td>• Deselect to prohibit liking.</td>
<td></td>
</tr>
</tbody>
</table>

4. Click **Apply** to save your configuration settings.
13.3.6 Configuring Feedback

Feedback provides a way for users to view and post feedback for other application users. Configuration settings for Feedback provide controls for granting view and post access for feedback a user receives, granting view access for feedback a user gives, allowing users to override administrative default settings, enabling users to delete the feedback they post, and enabling a user to show or hide feedback left by others (Figure 13-5).

**Figure 13-5  Configuration Settings for Feedback**

Feedback configuration settings offer controls for identifying who can view, post, and delete feedback.

To configure Feedback:

1. Open WebCenter Portal Administration.
   
   For details, see Accessing the Settings Pages in WebCenter Portal Administration

2. Click Tools and Services, and then select People Connections.
   
   Alternatively, use the following URL, and then select People Connections:

   http://host:port/webcenter/portal/admin/tools

   Tabs with the names of People Connections features appear to the right.

3. Click the Feedback tab to bring it forward.

   Table 13-6 lists and describes each option.

**Table 13-6  Feedback Configuration Options**

<tr>
<td>• Deselect</td>
<td>Prevents users from hiding or showing Feedback left by others.</td>
</tr>
</tbody>
</table>

4. Click **Apply** to save your configuration settings.

### 13.4 Archiving the Activity Stream Schema

Administrators can use these WLST commands to archive and restore data in the Activity Stream schema:

- **archiveASByDate**—Archive activity stream data that is older than a specified date.
• archiveASByDeletedObjects—Archive activity stream data associated with deleted objects.
• archiveASByClosedSpaces—Archive activity stream data associated with portals that are currently closed.
• archiveASByInactiveSpaces—Archive activity stream data associated with portals that have been inactive since a specified date.
• restoreASByDate—Restore archived activity stream data from a specified date into production tables.
• truncateASArchive—Truncate activity stream archive data.
• archiveASBySpace—Archive activity stream data associated with a portal.
• archiveASAllSpaces—Archive activity stream data associated with all portals.
• archiveASByUser—Archive activity stream data associated with a user.
• archiveASAllUsers—Archive activity stream data associated with all users.
• archiveASByDeletedActors—Archive activity stream data associated with deleted actors.
• showASStatistics—Report activity stream statistics.

For more information, see Activity Stream in WebCenter WLST Command Reference.

13.5 Specifying a Management Chain for Organization View

The Organization View task flow and the Organization tab on a Profile page can provide a visualization of your management chain, for example, they can render a view of a manager and the manager's direct reports (Figure 13-6).

Figure 13-6  Organization View of a Manager and the Manager’s Direct Reports

By default, the values that define the management chain for these organization views are blank. This means that managers are not automatically specified for users in the back-end identity store that provides user details.
Tip:
The value for Manager on the Profile page’s About tab is also defined by the methods suggested in this section.

For the management chain to be rendered in organization views, the back-end identity store that is used for WebCenter Portal authentication must be set up in such a way that direct report users have a manager attribute. And the manager attribute must be defined as the Distinguished Name (DN) of their manager user (see Example Embedded LDAP Configuration).

Tip:
In an LDAP environment, a user can be managed by only one person; in the same environment, a user can manage many people.

13.5.1 Example Embedded LDAP Configuration

You can specify a management chain within the Oracle WebLogic Server (WLS) embedded LDAP or within an external LDAP, such as Oracle Internet Directory (OID). However, the management chain you define through the embedded LDAP is for testing or proof of concept and not for production. For production, you must use an external LDAP, such as OID, for the identity store for WebCenter Portal authentication.

See Also:
For more information, see Configuring the Identity Store, or refer to the documentation provided with your LDAP implementation.

This example describes how to define a management chain within the embedded LDAP in WebLogic Server for testing or proof of concept.

Note:
The steps provided in this example are similar to those you take for an external LDAP. That is, you create an attribute (manager) and set a value on the attribute for each user. For this value, enter the DN of the selected user’s manager.

In this example, there are three users:

- user1
- user2
- manager_user

To define a management chain with these users:

1. Enable browsing of the embedded LDAP using an external viewer, such as Apache Directory Studio:
   a. Go to the WLS Administration Console, and log in as the administrator user.
b. Click your domain (for example, \textit{wc\_domain}), then open the \textbf{Security} tab and then the \textbf{Embedded LDAP} subtab (Figure 13-7).

\textbf{Figure 13-7 Oracle WebLogic Server Administration Console}

![Oracle WebLogic Server Administration Console](image)

- Configuration
- Monitoring
- Control
- Security
- Web Service Security
- Notes

Settings for \textit{wc\_domain}

- General
- Filter
- Users
- Embedded LDAP
- Policy

Save

This page allows you to configure the embedded LDAP server for this WebLogic Server domain.

- Credential:
- Confirm Credential:
- Backup Hour:
- Backup Minute:
- Backup Copies:
- Cache Enabled
- Cache Size:
- Cache TTL:

**Tip:**

The default credential is a randomly generated password. Set it to something memorable.

d. Restart your administration and managed servers.

2. Start up the LDAP viewer you selected in Step 1, and create a connection using the following details:
   - hostname (for example, example.com)
   - port (the WLS administration port, for example 7001)
   - Bind DN (cn=Admin)
   - Password (that is, the credential you set in Step 1c)

3. Navigate to user1 by finding the users within the DIT tree (Figure 13-8). For example, click in succession:
   - dc=wc\_domain
4. In the **Attribute Description** column, add a new attribute of type *manager*.

**Tip:**
Press Ctrl-Shift-+ to open the New Attribute dialog.

5. For the attribute value, select the DN for *manager_user* (Figure 13-9).

For example, under the root, select in succession:

- dc=wc_domain
- ou=myrealm
- ou=people
- uid=manager_user
6. Repeat Steps 3 through 5 for user2.

Now user1 and user2 are managed by manager_user. You can check this by logging in to WebCenter Portal as user1 and navigating to the About tab of the Profile page. The user manager_user is shown as the manager (Figure 13-10).

**Figure 13-10  About Tab of the Profile Page**

<table>
<thead>
<tr>
<th>Activities</th>
<th>Connections</th>
<th>Documents</th>
<th>Organization</th>
<th>About</th>
</tr>
</thead>
</table>

**Employee**

Employee Number 1111  
Organization Sales  
Manager manager_user

**Personal Information**

Tip:

Click the value for Manager (in this example, manager_user) to view the manager’s profile. Access the Organization tab to see the organization view associated with the currently viewed profile.
13.6 Setting Profile Configuration Properties

Administrators can use WLST commands to set profile configuration properties, such as setting the profile version that appears in the user interface. Administrators can perform the following actions:

- Set the profile configuration properties by running setProfileConfig.
  
  Syntax:

  ```plaintext
  setProfileConfig(appName, [ProfilePageVersion], [ProfileSyncHourOfDay], [ProfileSyncFrequencyInDays], [server], [applicationVersion])
  ```

  This command takes the following parameters:

  - **appName** - The name of the WebCenter Portal application in which to perform this operation. For example, webcenter.

  - **ProfilePageVersion** - (Optional) The profile page version to use. Valid values for ProfilePageVersion are:
    - **v1** - Use old-style Profile pages (11.1.1.7.0 and earlier)
    - **v2** - (default) Use the new Profile page format (introduced in 11.1.1.8.0)

  **Note:**
  Profile page version changes will not take effect until you restart the server where the WebCenter Portal application is deployed.

  - **ProfileSyncHourOfDay** - (Optional) The hour to start profile synchronization. Any value between 0 and 23. The default value is 23, equivalent to 11pm.

  - **ProfileSyncFrequencyInDays** - (Optional) How often profile synchronization takes place (in days). Any value greater than 0. The default value is 7.

  **Note:**
  If you omit a parameter, the corresponding configuration remains unchanged.

- List the current profile configuration settings by running listProfileConfig.
  
  Syntax:

  ```plaintext
  listProfileConfig(appName)
  ```

  This command takes the following parameter:

  - **appName** - The name of the WebCenter Portal application to perform this operation on. For example, webcenter.

- Get the current value of a profile property by running getProfileConfig.
  
  Syntax:
getProfileConfig(appName, key, [server], [applicationVersion])

This command takes the following parameters:

- **appName** - The name of the WebCenter Portal application to perform this operation on. For example, webcenter.
- **key** - Name of a the Profile Config property to get. Valid values include:
  - ProfilePageVersion
  - ProfileSyncHourOfDay
  - ProfileSyncFrequencyInDays
- **server** - (Optional) The name of the target server where the application is deployed.
- **applicationVersion** - (Optional) The version number of the application.

### 13.7 Synchronizing Profiles with the Identity Store

Administrators can use WLST commands to synchronize profile information in the LDAP identity store with WebCenter Portal. Administrators can perform the following actions:

- Start or stop profile synchronization for all users or a single user by running `startSyncProfiles` or `stopSyncProfiles`.
- Check whether profile synchronization is currently in progress by running `isSyncProfilesRunning`.
- Set various profile synchronization options:
  - Specify whether to synchronize user profile photos in LDAP by running `setProfilePhotoSync`.
  - Synchronize profile information for a specific user by running `syncProfile`.

For more information, see the following command references in *WebCenter WLST Command Reference*:

- `startSyncProfiles`
- `stopSyncProfiles`
- `isSyncProfilesRunning`
- `setProfilePhotoSync`
- `syncProfile`
This chapter describes how to configure and manage RSS functionality for WebCenter Portal.

This chapter includes the following topics:

- About RSS
- RSS Prerequisites
- Setting Up a Proxy Server for External RSS News Feeds
- Testing External RSS News Feed Connections

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

14.1 About RSS

The RSS functionality encompasses a RSS Viewer and RSS service that shows news feeds from various WebCenter Portal tools and services. The RSS Viewer enables users to view external news feeds from different web sites inside WebCenter Portal. RSS also delivers content update information from various portal resources including discussions, lists, and announcements.

14.2 RSS Prerequisites

RSS functionality does not require any back-end server. You do not need to set up a connection to use it. However, depending on your network configuration, you may need to set up a proxy server to enable WebCenter Portal to display content from external RSS news feeds.

14.3 Setting Up a Proxy Server for External RSS News Feeds

To enable external RSS news feeds in WebCenter Portal, you must set up a proxy server.

A proxy server is also required if you want to display external links in Activity Stream task flows. Both RSS and the activity stream share the same proxy server settings.
You can configure a proxy server by using either Fusion Middleware Control or WLST. For information, see Setting Up a Proxy Server.

14.4 Testing External RSS News Feed Connections

After setting up the proxy server for the RSS Viewer, you can test the connection to make sure you can access external RSS feeds.

To ensure the proxy server is accurately configured for the RSS Viewer:

1. In WebCenter Portal, add the RSS task flow to a page.

   For information about adding the RSS task flow and editing the URL, see Adding RSS News Feeds to a Portal in Building Portals with Oracle WebCenter Portal.

2. Edit the RSS task flow and set the URL to an external RSS feed.

   For example:

   http://www.oracle.com/ocom/groups/public/@ocom/documents/webcontent/196280.xml

   If the RSS feed displays correctly, proxy configuration is set up properly.
15

Managing Oracle Secure Enterprise Search in WebCenter Portal

This chapter describes how to configure Oracle Secure Enterprise Search (SES) 11.2.2.2 to index and search most objects in WebCenter Portal.

This chapter includes the following topics:

- About Search with Oracle SES
- Configuration Roadmap for Oracle SES in WebCenter Portal
- Prerequisites for using Oracle SES
- Setting Up Oracle SES Connections
- Configuring Oracle SES to Search WebCenter Portal
- Managing Search in WebCenter Portal Administration

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

15.1 About Search with Oracle SES

Oracle SES provides the following benefits and features:

- Oracle SES provides unified ranking results, with the most relevant items appearing first.
- Oracle SES provides a thorough search. For example, when searching lists in WebCenter Portal, Oracle SES searches list column names and column contents.
- Oracle SES allows search of other repositories outside of WebCenter Portal.
- Oracle SES supports the search REST APIs and data controls for customizing your search interface.
- You can customize search in the administration settings for the application. Oracle SES 11.2.2.2 supports faceted search, filtered search in the search box, and document thumbnails. All customization with Oracle SES 11.2.2.2 is done on the
Tools and Services - Search administration page, even though task flow parameters may display. For more information about configuring search in WebCenter Portal Administration, see Managing Search in WebCenter Portal Administration.

Note:
This task is performed by an administrator. Working with search at the portal level is an application specialist or portal manager task, as described in Adding Search to a Portal in Building Portals with Oracle WebCenter Portal.

- You can configure Oracle SES to search the following resources:
  - Documents, including wikis and blogs
  - Announcements and discussions
  - Portals, lists, page metadata, and people

Note:
When Oracle SES is configured to search WebCenter Portal, other non-crawled resources (for example, notes and events) are not returned in search results.

Results from all sources are listed together, with the most relevant items appearing first. For example, when you run a search for a user name, most likely, you are looking for that person's contact information (that is, the exact user name in People Connections), not necessarily documents that the user wrote.

- You can use three types of Oracle SES crawlers to index WebCenter Portal resources:
  - Documents Crawler: This uses the Oracle SES Content Server source type to crawl documents, including wikis and blogs.
  - Discussions Crawler: This uses the Oracle SES Database source type to crawl discussions and announcements.
  - Spaces Crawler: This uses the Oracle SES Oracle WebCenter source type to crawl certain objects, such as lists, page metadata, portals, and profiles.

Note:
Oracle SES crawlers collect data through connectors to back-end repositories. Each connector is configured in Oracle SES as a "crawl source." Each crawl source has a type that identifies the type of repository that holds the data, such as a relational database or a Content Server repository.

When you configure Oracle SES, all available Oracle SES crawlers should be enabled. It is not recommended to enable one Oracle SES crawler and not another. For example, when you configure Oracle SES you should not have it crawl documents but not discussions.
15.2 Configuration Roadmap for Oracle SES in WebCenter Portal

Use the roadmap in this section to guide you through the configuration process:

- **Roadmap - Configuring Oracle SES**
  
  Use Figure 15-1 (or Table 15-1) to provide an overview of the prerequisites and tasks required to get Oracle SES working.
Figure 15-1 Configuring Oracle SES

1. Install WebCenter Portal and Oracle SES

2. Configure Oracle SES with an identity management system

3. Set up a Document Service Manager in Oracle SES

4. Create a Federation Trusted Entity

   - Use Oracle SES Admin Tool
   - or
   - Use WLST

5. Create a crawl user

6. Create three crawl sources: Documents, Discussion, and Spaces Crawler

   - Use Oracle SES Admin Tool
   - or
   - Use WLST

7. Create a source group for the crawl sources

   - Use Oracle SES Admin Tool
   - or
   - Use WLST

8. Create facets and sorting attributes

9. Configure a connection between WebCenter Portal and Oracle SES, including setting a source group

   - Use Oracle SES Admin Tool
   - or
   - Use WLST

10. Secure the connection to Oracle SES with SSL

    - Use Fusion Middleware Control
    - or
    - Use Oracle SES Admin Tool
    - or
    - Use WLST

11. Configure additional search parameters

Optional

Application Specialist

Log in to WebCenter Portal, and add a Search task flow to a page

</table>

15.3 Prerequisites for using Oracle SES

This section includes the following topics:

- Oracle SES – Installation
- Oracle SES – Configuration
- Oracle SES – Security
15.3.1 Oracle SES – Installation

The sections in this chapter assume that you are running Oracle SES 11.2.2.2 and Oracle WebCenter Content Server 12.2.1. These are the only versions supported with WebCenter Portal 12.2.1.

In addition to the Oracle SES installation, WebCenter Portal 12.2.1 requires some post installation steps. For complete instructions, see Back-End Requirements for Search in Installing and Configuring Oracle WebCenter Portal.

See Also:

It is important to verify that you have installed all required patches for Oracle SES. For the latest information on required patches, check the Release Notes.

15.3.2 Oracle SES – Configuration

1. Oracle SES must be configured with an identity management system to validate and authenticate users. This is necessary for secure searches, so searches return only results that the user is allowed to view based on access privileges.

Because WebCenter Portal uses identity propagation when communicating with Oracle SES, WebCenter Portal’s user base must match that in Oracle SES. One way this can happen is by configuring WebCenter Portal and Oracle SES to the same identity management system, such as Oracle Internet Directory.

Note:

For information on all supported identity management systems, see Default Identity and Policy Stores.

Only one identity plug-in can be set up for each Oracle SES instance. All repositories (Oracle WebCenter Content Server, Oracle WebCenter Portal Discussions Server, and Oracle WebCenter Portal) must share the same user base as Oracle SES.

Oracle SES includes numerous identity plug-ins for identity management systems including Oracle Internet Directory, Oracle WebCenter Content Server, and Microsoft Active Directory. For information, see the Oracle SES documentation included with the product. (This is listed on the WebCenter Portal product area on the Oracle Fusion Middleware documentation library.)

If you are using Oracle Unified Directory (OUD) as an identity store, use the plug-in “Sun Java System Directory Server” to configure the OUD identity store.

The following example sets up the identity plug-in for Oracle Internet Directory:

a. In the Oracle SES administration tool, navigate to the Global Settings - Identity Management Setup page, select Oracle Internet Directory from the available identity plug-ins, and click Activate.

b. Provide the following values:
Host name: The host name of the computer where Oracle Internet Directory is running

Port: The Oracle Internet Directory port number

Use SSL: true or false

Realm: The Oracle Internet Directory realm (for example, dc=us,dc=oracle,dc=com)

User name: The Oracle Internet Directory admin user name (for example, cn=orcladmin)

Password: Admin user password

c. Click Submit.

2. Each Oracle SES instance must have a trusted entity for allowing WebCenter Portal end users to be securely propagated at search time. (A trusted entity allows the WebCenter Portal to authenticate itself to Oracle SES and assert its users when making queries on Oracle SES.) This trusted entity can be any user that either exists on the identity management server behind Oracle SES or is created internally in Oracle SES.

You can do this either in WLST or in Oracle SES.

Note:
This trusted entity name and password is required later as the appUser and appPassword properties on the WLST command createSESConnection.

To do this with WLST, use the createFederationTrustedEntity command.

Example: createFederationTrustedEntity Command

createFederationTrustedEntity(  
appName='webcenter',  
sesUrl='http://mySESEhost.com:7777/search/api/admin/AdminService',  
sesPassword='mySESEadminPassword', entityName='myTrustedEntityUser',  
entityPassword='myTrustedEntityUserPassword', desc='Trusted entity for WebCenter Portal', sesSchema='eqsys')

For command syntax and examples, see createFederationTrustedEntity in WebCenter WLST Command Reference.

To do this in Oracle SES, follow these steps.

a. In the Oracle SES administration tool, navigate to the Global Settings - Federation Trusted Entities page.

b. Enter a name for a trusted entity. This is the name that WebCenter Portal uses to authenticate itself to Oracle SES at search time (before it propagates the end user identity to Oracle SES).

To allow the entity to be authenticated through the active identity plug-in:
- Make sure that the entity name is the name of a user that exists in the identity management system.
- Leave the password field blank.
- Select the Use Identity Plug-in for authentication checkbox.
- Enter the authentication attribute value corresponding to the Authentication Attribute in your active identity plug-in.

**To allow the entity to be authenticated through Oracle SES:**

- Enter any user name (for example, wcsearch) and password (for example, myPassword1).
- Do not select the **Use Identity Plug-in for authentication** checkbox.

For more information, see the online help for the Federation Trusted Entities page in Oracle SES.

**Note:**

For reference, the following sample user names are used in this chapter:

- **wcsearch**: User of the Oracle SES Federation Trusted Entity
- **mycrawladmin**: Crawl admin user in WebCenter Portal and in the identity management system to crawl certain objects, such as lists, page metadata, portals, and profiles
- **sescrawler (or admin user)**: Crawl admin user in Oracle WebCenter Content Server with sescrawlerrole (or admin) role

### 15.3.3 Oracle SES – Security

Most enterprise deployments require that their HTTP connections be secure. SSL (secure socket layer) is an encryption protocol for securely transmitting private content on the internet. Oracle strongly recommends that you use an SSL-protected channel to transmit password and other secure data over networks.

For instructions, see [Securing the Connection to Oracle SES with SSL](#).

### 15.4 Setting Up Oracle SES Connections

This section includes the following topics:

- **Testing the Connection to Oracle SES**
- **Registering Oracle Secure Enterprise Search Servers**
- **Choosing the Active Oracle SES Connection**
- **Modifying Oracle SES Connection Details**
- **Deleting Oracle SES Connections**

#### 15.4.1 Testing the Connection to Oracle SES

Confirm the connection to Oracle SES by entering in a browser the URL for Oracle SES Web Services operations:

```
http://host:port/search/query/
```

If the URL address *does not* render in the browser, then either the host or port for the Oracle SES server is incorrect, or Oracle SES has not been started.
15.4.2 Registering Oracle Secure Enterprise Search Servers

You can register multiple Oracle SES connections with a WebCenter Portal application but only one of them is active at a time. You can register connections using either Fusion Middleware Control or WLST.

This section includes the following topics:

- Registering Oracle SES Connections Using Fusion Middleware Control
- Registering Oracle SES Connections Using WLST

15.4.2.1 Registering Oracle SES Connections Using Fusion Middleware Control

To register an Oracle SES instance:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. To connect to a new Oracle SES instance, click Add (Figure 15-2).

![Figure 15-2 Configuring Oracle Secure Search](image)

5. On the Add Secure Enterprise Search Connection page, enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for the application (Figure 15-3).

![Figure 15-3 Add Secure Enterprise Search Connection](image)

Table 15-2
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter Portal application.</td>
</tr>
<tr>
<td>Active Connection</td>
<td>Select to use the Oracle SES instance defined on this connection as your search platform for WebCenter Portal. While you can register multiple Oracle SES connections for an application, only one connection is used (i.e., the default (or active) connection).</td>
</tr>
</tbody>
</table>

6. Enter connection details for the Oracle SES instance *(Table 15-3)*.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>Enter the Web Services URL that Oracle SES exposes to enable search requests. Use the format: <a href="http://host:port/search/query/OracleSearch">http://host:port/search/query/OracleSearch</a>.</td>
</tr>
<tr>
<td></td>
<td>For example: <a href="http://myHost:7777/search/query/OracleSearch">http://myHost:7777/search/query/OracleSearch</a></td>
</tr>
<tr>
<td>Federation Trusted Entity Name</td>
<td>Enter the user name of the Oracle SES Federation Trusted Entity created in Oracle SES – Configuration. <strong>Tip:</strong> This user is configured in the Oracle SES administration tool, on the Global Settings - Federation Trusted Entities page. The WebCenter Portal application must authenticate itself as a trusted application to Oracle SES to perform searches on behalf of WebCenter Portal users. Examples in this chapter use wcsearch for this value.</td>
</tr>
<tr>
<td>Federation Trusted Entity Password</td>
<td>Enter the password for the Federation Trusted Entity.</td>
</tr>
</tbody>
</table>

7. Click **OK** to save this connection.

**Note:**

To start using the new (active) connection you must restart the managed server on which the application is deployed (by default, *WC_Portal*). For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

15.4.2.2 Registering Oracle SES Connections Using WLST

1. Use the WLST command **createSESConnection** to create a connection to Oracle SES. For example:
createSESConnection(appName='webcenter',
    name='mySesConnection',
    url='http://myhost.com:7777/search/query/OracleSearch',
    appUser='wcsearch',
    appPassword='myPassword1',
    default=true)

where appUser is the user name of the Oracle SES Federation Trusted Entity created in Oracle SES – Configuration.

For command syntax and examples, see createSESConnection in WebCenter WLST Command Reference.

To configure search to actively use a new Oracle SES connection, set default=true. For more information, see Setting the Active Oracle SES Connection Using WLST.

See Also:
Modifying Oracle SES Connection Details Using WLST

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Note:
To start using the new (active) connection or settings, you must restart the managed server on which the application is deployed (by default, WC_Portal). See Starting and Stopping Managed Servers Using Scripts in Administering Oracle Fusion Middleware.

15.4.3 Choosing the Active Oracle SES Connection

You can register multiple Oracle SES connections with a WebCenter Portal application, but only one connection is active at a time.

Note:
The steps in this section are not required if you selected the active connection in Registering Oracle Secure Enterprise Search Servers.

This section includes the following topics:

- Choosing the Active Oracle SES Connection Using Fusion Middleware Control
- Setting the Active Oracle SES Connection Using WLST

15.4.3.1 Choosing the Active Oracle SES Connection Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select Settings > Service Configuration.

   The Manage Secure Enterprise Search Connections table indicates the current active connection (if any).

4. Select the connection you want to make the active (or default) connection, and then click Edit (Figure 15-4).

   ![Edit Icon](image)

   **Figure 15-4  Edit Icon**

   Manage Secure Enterprise Search Connections  
   ![Add Edit Delete](image)

5. Select the Active Connection check box (Figure 15-5).

   ![Active Connection Check box](image)

6. Click OK to update the connection.

   **Note:**
   To start using the new (active) connection you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

15.4.3.2 Setting the Active Oracle SES Connection Using WLST

Use the WLST command `setSESConnection` with `default=true` to activate an existing Oracle SES connection. For example:

```java
setSESConnection(appName='app1',
                 name='SESConn1',
                 url='http://myhost.com:7777/search/query/OracleSearch',
                 appUser='wpadmin',
                 appPassword='password',
                 default=1)
```

For full command syntax and examples, see `setSESConnection` in WebCenter WLST Command Reference.

To subsequently disable an Oracle SES connection, run the same WLST command with `default=false`. Connection details are retained but the connection is no longer named as an active connection.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
15.4.4 Modifying Oracle SES Connection Details

You can modify Oracle SES connection details at any time.

To start using the updated (active) connection you must restart the managed server on which the WebCenter Portal application is deployed.

Note:
The steps in this section are required only to modify the details configured in Registering Oracle Secure Enterprise Search Servers.

This section includes the following topics:

- Modifying Oracle SES Connection Details Using Fusion Middleware Control
- Modifying Oracle SES Connection Details Using WLST

15.4.4.1 Modifying Oracle SES Connection Details Using Fusion Middleware Control

To update connection details for an Oracle SES instance:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

4. Select the connection name, and click Edit.

5. Edit connection details, as required. For detailed parameter information, see Table 15-3.

6. Click OK to save your changes.

Note:
To start using the updated (active) connection you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.
15.4.4.2 Modifying Oracle SES Connection Details Using WLST

Use the WLST command `setSESConnection` to alter an existing Oracle SES connection. For command syntax and examples, see `setSESConnection` in WebCenter WLST Command Reference.

**Note:**
To start using the updated (active) connection you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

15.4.5 Deleting Oracle SES Connections

You can delete Oracle SES connections at any time but take care when deleting the active connection. If you delete the active connection, users are not able to search content on external repositories.

This section includes the following topics:

- Deleting Oracle SES Connections Using Fusion Middleware Control
- Deleting Oracle SES Connections Using WLST

15.4.5.1 Deleting Oracle SES Connections Using Fusion Middleware Control

To delete an Oracle SES server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Service Configuration.

3. From the Service Connection drop-down, select Search.

4. Select the connection name, and click Delete.

**Figure 15-6 Delete Connection Icon**

![Manage Secure Enterprise Search Connections](image)

**Note:**
To effect this change you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.
15.4.5.2 Deleting Oracle SES Connections Using WLST
Use the WLST command deleteConnection to remove an Oracle SES connection. For command syntax and examples, see deleteConnection in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**
To effect this change you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers Using WLST in Administering Oracle Fusion Middleware.

---

**15.5 Configuring Oracle SES to Search WebCenter Portal**

This section describes the steps necessary to set up Oracle SES for WebCenter Portal. It includes the following topics:

- Setting Up WebCenter Portal for Oracle SES
- Setting Up Oracle WebCenter Content Server for Oracle SES
- Setting Up Oracle WebCenter Portal Discussion Server for Oracle SES
- Setting Up Oracle SES to Search WebCenter Portal
- Configuring Oracle SES Version Using WLST
- Configuring Search Crawlers Using WLST

---

**Note:**
For an overview of the tasks that must be performed to enable Oracle SES as the search engine, see Configuration Roadmap for Oracle SES in WebCenter Portal. There may be various acceptable ways and orders to perform the required tasks.

---

**See Also:**
About Search with Oracle SES

---

**15.5.1 Setting Up WebCenter Portal for Oracle SES**

This section describes how to configure WebCenter Portal to work with Oracle SES.

1. Create and configure the connection between WebCenter Portal and Oracle SES, and optionally specifying a source group.
2. To use Oracle SES to search portals, lists, or page metadata, you must first create a crawl admin user in WebCenter Portal and in your back-end identity management server (for example, mycrawladmin). You must only create a crawl admin user once.

**Note:**
See your identity management system documentation for information on creating users.

The following example uses Oracle Directory Services Manager to create the mycrawladmin user.

a. On the Data Browser tab, navigate to the target cn and click Create. This example navigates to "dc=com,dc=oracle,dc=us,cn=Users". In the Add Object Class dialog, select the appropriate object class, and click OK. (Figure 15-7).

![Figure 15-7 Oracle Directory Services Manager - Add Object Class](image)

b. Find the distinguished name (DN) path, and click Select (Figure 15-8). This example selects "dc=com,dc=oracle,dc=us,cn=Users".
c. In the Create New Entry dialog, enter properties, and click Next (Figure 15-9).

![Oracle Directory Services Manager - Create New Entry](image)

**Figure 15-9  Oracle Directory Services Manager - Create New Entry**

When you see that the new entry was created successfully, click Finish. (Figure 15-10)

![Oracle Directory Services Manager - Status](image)

**Figure 15-10  Oracle Directory Services Manager - Status**

d. When you see that the new entry was created successfully, click Finish. (Figure 15-10)

3. Grant the crawl application role to the crawl admin user created in Oracle SES – Configuration. For example:

   grantAppRole(appStripe="webcenter",
   appRoleName="webcenter#defaultcrawl",
   principalClass="weblogic.security.principal.WLSUserImpl",
   principalName="mycrawadmin");

   For command syntax and examples, see WebCenter WLST Command Reference.
4. Enable the Oracle SES crawlers in WebCenter Portal.

With the same WLST command, you can set crawler properties (that is, enable/disable the crawlers) and specify an interval between full crawls for the spaces crawler. By default, full crawls for the spaces crawler occur every seven days, but you can specify a different frequency. (Incremental crawls are initiated by the schedule set in Oracle SES.)

For example:

```
setSpacesCrawlProperties(appName='webcenter',
    fullCrawlIntervalInHours=168,
    spacesCrawlEnabled = true,
    documentCrawlEnabled=true,
    discussionsCrawlEnabled=true)
```

**Note:**

The `spacesCrawlEnabled`, `documentCrawlEnabled` and `discussionsCrawlEnabled` parameters all must be set to `true` to enable Oracle SES.

A clustered instance additionally requires the `server` parameter; for example, `server="WC_Portal1"`.

The following example specifies that WebCenter Portal runs a full crawl every 8 days.

```
setSpacesCrawlProperties(appName='webcenter', fullCrawlIntervalInHours=192)
```

You also can use WLST to return the current crawl settings for WebCenter Portal, such as the number of hours between full crawls (spaces crawler). For example, the following command returns the current crawl settings.

```
getSpacesCrawlProperties(appName='webcenter')
```

```
WebCenter Crawl Properties:
---------------------------
fullCrawlIntervalInHours: 124
spacesCrawlEnabled:       true
documentCrawlEnabled:     true
discussionsCrawlEnabled:  true
```

5. Use Fusion Middleware Control or the `listDocumentsSpacesProperties` command to determine the unique name that the back-end Content Server is using to identify this WebCenter Portal application and the connection name for the primary Content Server that WebCenter Portal is using to store documents.

For example:

```
listDocumentsSpacesProperties(appName='webcenter')
```
The Documents Spaces container is "/WebCenter1221"
The Documents repository administrator is "sysadmin"
The Documents application name is "WC1221"
The Documents primary connection is "stxxl18-ucm12g"

**Note:**
Record the application name and the primary connection returned. These values are required later (in Setting Up Oracle SES to Search Documents) to set up Oracle SES to crawl documents.

**Note:**
To effect WLST changes, you must restart the managed server on which the application is deployed (by default, WC_Portal). For more information, see Starting and Stopping Managed Servers Using Scripts in Administering Oracle Fusion Middleware.

### 15.5.1.1 Configuring Search Parameters Using WLST

Use the WLST command `setSearchConfig` to modify search parameters.

The following example shows how to specify a data group (also known as source group) under which you search Oracle SES.

**Example: Set a Source Group**

```python
setSearchSESConfig(appName='webcenter',
                   dataGroup='mySources')
```

where `dataGroup` is the source group you create in Additional Oracle SES Configuration.

The following example shows how to increase the number of search results displayed. Five is the default setting for the number of search results displayed in Oracle SES results, but result sets generally are larger than five.

**Example: Increase Number of Search Results Displayed**

```python
setSearchConfig(appName='webcenter',
                numResultsMain=10)
```

The following example shows how to configure the maximum time that a service is allowed to execute a search (in ms). When a service times out largely depends on the system load. If you consistently get time out errors, adjust this parameter.

**Example: Configure Maximum Time WebCenter Portal Waits for Search Results**

```python
setSearchConfig(appName='webcenter',
                executionTimeout=10000)
```

For command syntax and examples, see `setSearchConfig` in WebCenter WLST Command Reference.
15.5.1.2 Configuring Search Parameters and Crawlers Using Fusion Middleware Control

You can enable or disable Oracle SES and configure search settings using Fusion Middleware Control.

1. Log in to Fusion Middleware Control and navigate to the home page for your WebCenter Portal application. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings > Application Configuration.

3. In the Search Crawlers section (Figure 15-11), optionally, specify how often WebCenter Portal content is crawled, then click Apply.

By default, full crawls for the spaces crawler occur every seven days, but you can specify a different frequency. (Incremental crawls, for all three crawlers, are initiated by the schedule set in Oracle SES.)

4. On the same page, configure Search Settings parameters as required, and then click Apply.

   - **Oracle Secure Enterprise Search Data Group**: Specify the Oracle SES source group in which to search. If no value is provided, then everything in the Oracle SES instance is searched.

   - **Execution Timeout**: Enter the maximum time that a service is allowed to execute a search (in ms).

   - **Executor Preparation Timeout**: Enter the maximum time that a service is allowed to initialize a search (in ms).

   - **Results per Service - Saved Search Task Flows**: Enter the number of search results displayed, per service, in a Saved Search task flow.

   - **Results per Service - Search Page**: Enter the number of search results displayed, per service, for searches submitted from the main search page. Users can click Show All if they want to see all the results.

You do not need to restart the managed server on which the WebCenter Portal application is deployed.
15.5.2 Setting Up Oracle WebCenter Content Server for Oracle SES

This section describes how to configure Oracle WebCenter Content Server to be crawlable by Oracle SES (in particular, the Content Server that WebCenter Portal uses for storing documents).

The following steps must be done from within the Content Server.

See Also:

Content Server online help for information on administering roles and users in Content Server

1. Create a crawl user.

   If you want users with the admin role to crawl, then use an admin user account as the crawl user.

   If you want non-admin users to crawl, then follow these steps:

   a. Create the role sescrawlerrole.

   b. Create the user sescrawler, and assign it the sescrawlerrole role. This user creates the Content Server source in Oracle SES.

   c. Add sceCrawlerRole=sescrawlerrole to config.cfg (located in MW_HOME/user_projects/domains/yourdomain/ucm/cs/config).

      Alternatively, you can append the sceCrawlerRole=sescrawlerrole line in the WebCenter Content Server user interface (Administration - General Configuration - Additional Configuration Variables).

2. Restart the Content Server.

3. In the Content Server console, install the SESCrawlerExport component on the content server, if not done:

   a. Log on to the Content Server as a system administrator. For example: http://host:port/cs.

   b. From the Administration dropdown menu, select Admin Server (Figure 15-12).
c. Click the button with the instance name.

d. Click Component Manager from the menu list on the left pane (Figure 15-13).

Figure 15-13  Content Server Component Manager

e. Select SESCrawlerExport under Integration and click Update.

f. Enter configuration parameters. (You can change configuration parameters after installation.)

Disable security on authentication and authorization APIs provided by the SESCrawlerExport; that is, set Disable Secure APIs to false. This lets security provided by the SESCrawlerExport be done internally instead of by the content server.

Additionally, in clustered environments only, the feedLoc parameter must specify a location on the shared disk accessed by the nodes of the Content Server, and they each must reference it the same way; for example, sharedDrive/dir1/dir2. Note that this is not the default location (relative path) provided.

g. Restart the Content Server.

4. Take a snapshot of the Content Server repository.
a. Log on to the Content Server as a system administrator. For example: http://host:port/cs.

b. From the Administration dropdown menu, select SESCrawlerExport.

c. Select All sources, and click Take Snapshot (Figure 15-14).

![Content Server Snapshot](image)

Figure 15-14 Content Server Snapshot

It is important to take a snapshot before the first crawl or any subsequent full crawl of the source.

The snapshot generates configFile.xml at the location specified during component installation, and feeds are created at the subdirectory with the source name under feedLoc.

5. If your Content Server is configured to use web rendition, then you must configure the Content Server metadata list to include the dFormat value, so that required MIME types are exported to Oracle SES. This is necessary to be able to narrow searches by MIME type.

If the Content Server is configured for web rendition, then items in the Content Server are rendered in PDF format. The content item’s native MIME type rendition is overwritten. For example, the MIME type of a Microsoft Office Word document is ‘application/msword’, but when the Content Server uses web rendition the MIME type becomes ‘application/pdf’. A search query with the Mimetype parameter set to ‘application/msword’ does not return Word documents.

a. Back on the SESCrawlerExport Administration page, click Configure SESCrawlerExport (Figure 15-15).
b. By default, the Metadata List field is blank (Figure 15-16). Optionally, add to this field any custom metadata values you require (beginning with x). For example, the following entry for Metadata List includes custom attributes:

\[x\text{CollectionID}, x\text{WCTags}, x\text{RegionDefinition}\]

6. Configure Thumbnail Options for faceted search.

   a. On the Administration tab, select Configure Thumbnail Options to enable document thumbnails in search results.

   b. Leave the default settings as is, and click Update (Figure 15-17).
15.5.3 Setting Up Oracle WebCenter Portal Discussion Server for Oracle SES

This section describes how to configure the discussions server to be crawlable by Oracle SES (in particular, the discussions server that WebCenter Portal uses for storing discussions and announcements).

**Note:**

These steps are not required if you have a new installation of WebCenter Portal (with an Oracle database) and Oracle WebCenter Portal’s Discussion Server. It is only required if you are using upgraded (patched) instances. You can find database schema details for the corresponding data sources from your Oracle WebLogic Server console.

To configure the discussions server:

1. Run the Repository Creation Utility (RCU) to confirm that the discussions crawler WebCenter Portal component has been installed on the system.

2. For Oracle and Microsoft SQL Server databases, verify that the Oracle WebCenter Portal’s Discussion Server back end has been configured properly by noting that
the MyPrefix_DISCUSSIONS user is installed in RCU. Then verify that the discussions crawler has been configured properly by noting that the MyPrefix_DISCUSSIONS_CRAWLER user is installed in RCU.

3. If the discussions crawler component is not installed, then you must install it using RCU, selecting the same prefix that was used for the Oracle WebCenter Portal’s Discussion Server component. Also, during the tablespace specification step in RCU, select Prefix_IAS_DISCUSSIONS as the default tablespace. This installs the user for Oracle SES.

15.5.4 Setting Up Oracle SES to Search WebCenter Portal

The steps in this section must be performed in the Oracle SES administration tool. The following steps are required:

1. **Logging on to the Oracle SES Administration Tool**
2. **Setting Up Oracle SES to Search Documents**
3. **Setting Up Oracle SES to Search Discussions and Announcements**
4. **Setting Up Oracle SES to Search Portals, Lists, People, and Page Metadata**
5. **Configuring Oracle SES Facets and Sorting Attributes**
6. **Additional Oracle SES Configuration**

---

**See Also:**

Confirm that you have installed all required patches for Oracle SES. For the latest information on required patches, see Back-End Requirements for Search in *Installing and Configuring Oracle WebCenter Portal* and the Release Notes.

For detailed information about Oracle SES configuration, see the Oracle SES documentation included with the product. (This is listed in the WebCenter Portal product area on the Oracle Fusion Middleware documentation library.)

---

**15.5.4.1 Logging on to the Oracle SES Administration Tool**

Open the Oracle SES administration tool:

1. Open a browser and enter the URL provided after the Oracle SES installation. (This has the form http://host:port/search/admin/index.jsp.)

2. Log on with the Oracle SES admin user name and the password specified during installation.

**15.5.4.2 Setting Up Oracle SES to Search Documents**

To search WebCenter Portal documents using Oracle SES, you must first set up a Document Service Manager (with a Document Service Instance and a Document Service Pipeline), and then create a Content Server source.

1. Configure the Document Service Manager (one time for each Oracle SES instance).
Note:

Document services are plug-ins involved in the processing of a document when it is being crawled. A document service allows WebCenter Portal to add indexable attributes for documents used in a WebCenter Portal application.

Search attribute names must be unique; two attributes cannot have the same name. For example, if an attribute exists with a String data type, and another attribute is discovered by the crawler with the same name but a different data type, then the crawler ignores the second attribute. Before creating new attributes, make sure to check the list of Oracle SES attribute names and types in the Oracle SES documentation.

a. On the Global Settings - Document Services page, click Create.

b. Select Create New Manager, click Next, and enter the following parameters (Figure 15-18):

- Manager Class Name: oracle.webcenter.search.crawl.ucm.ses.WcUcmDsManager
- Manager Jar File Name: search-crawl-ucm.jar

Note:

c. Click Next, and then click Finish.

d. Create the Document Service Instance.

- On the Global Settings - Document Services page, click Create.
- Select Select From Available Managers with Secure Enterprise Search WebCenter UCM Plugin, and click Next (Figure 15-19)
Figure 15-19  Create Document Service

- Enter the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Name</td>
<td>Enter any name here to be used while creating the document pipeline.</td>
</tr>
<tr>
<td>WebCenter Application Name</td>
<td>The unique name being used to identify this WebCenter Portal application in</td>
</tr>
<tr>
<td></td>
<td>the back-end Content Server.</td>
</tr>
<tr>
<td>Connection Name</td>
<td>The name of the primary Content Server connection that WebCenter Portal is</td>
</tr>
<tr>
<td></td>
<td>using to store documents.</td>
</tr>
<tr>
<td>WebCenter URL Prefix</td>
<td>The host and port where the WebCenter Portal application is deployed; for</td>
</tr>
<tr>
<td></td>
<td>example: <a href="http://myhost:8888">http://myhost:8888</a></td>
</tr>
</tbody>
</table>

**Note:**

Use Fusion Middleware Control or the `listDocumentsSpacesProperties` command to determine the application name and connection name, as described in Setting Up WebCenter Portal for Oracle SES.

e. Create the Document Service Pipeline. This invokes the document service instance.

- On the Global Settings - Document Services page, under the Document Services Pipelines section, click Create (Figure 15-20).
f. On the Create Document Service Pipeline page, enter any custom name for this pipeline.

The document service instance you created in the previous step should be listed under **Available Services**. Select that document service instance, and use the arrow button to move it under **Used in pipeline**.

2. Create the Content Server source for documents.

---

**See Also:**

[Configuring Search Crawlers Using WLST](#) for an alternate way to create the Content Server source

---

a. Go to **Home > Sources**.

b. From the Source Type dropdown list, select **Oracle Content Server**, and click **Create** (Figure 15-21).

---

**Figure 15-21  Create Content Server Source**

---

c. Enter the following parameters: (Figure 15-22).
Figure 15-22  Oracle WebCenter Content Server Source Parameters

Source Name: unique_name

Configuration URL: Content_Server_SES_Crawler_Export_endpoint; for example, http://host:port/cs/idcplg?idcService=SES_CRAWLER_DOWNLOAD_CONFIG&source=default

Note: The source=default parameter denotes the name of the source created in the configuration of the SES Crawler Export. The default one is created automatically and called “default.”

Authentication Type:
- If authentication is by SSO, then enter NATIVE
- If the Content Server is protected by Oracle SSO, then enter ORASSO
User ID

The user to crawl the Content Server must have the sceCrawlerRole role defined. The sceCrawlerRole is a configuration parameter in SESCrawlerExport. Typically, administrators create a special role, assign it no privileges to view content, then create a user account that has this role.

If you do not set up a specific sceCrawlerRole, then admin credentials are required to crawl. The sysadmin user ID works by default.

If Authentication Type is ORASSO, then enter a user ID (and password) of a user in the identity management server fronted by Oracle SSO. This user must have been granted the same permissions as sysadmin. If it is not possible to grant those permissions, then delete the “remote” user corresponding to this user in the Content Server, and create a “local” version of the user (same name) in the Content Server.

Password

Password for this Content Server user

Realm

- If Authentication Type is NATIVE, then enter Idc Security /cs/idcplg, where /cs/ is the context root you provided when you installing the Content Server.
- If Authentication Type is ORASSO, then leave this parameter blank.

Oracle SSO Login URL

- If Authentication Type is ORASSO, then specify a value for Oracle SSO. For example: https://login.oracle.com/myssosignon.jsp?site2pstoretoken=
- If Authentication Type is NATIVE, then leave this field blank.

Oracle SSO Action URL

- If Authentication Type is ORASSO, then specify a value for Oracle SSO. For example: https://login.oracle.com/sso/auth
- If Authentication Type is NATIVE, then leave this field blank.

Scratch Directory

Optional. Specify a directory on the system under which the Oracle SES instance resides.
d. Click Next.

e. On the Create User-Defined Source: Step 2: Authorization page, enter the following parameters in the Authorization Manager section, if not entered by default:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plug-in Class Name</td>
<td>oracle.search.plugin.security.auth.stellent.StellentAuthManager</td>
</tr>
<tr>
<td>Jar File Name</td>
<td>oracleapplications/StellentCrawler.jar</td>
</tr>
<tr>
<td>HTTP endpoint for authorization</td>
<td>For example, <a href="http://host:port/cs/idcplg">http://host:port/cs/idcplg</a></td>
</tr>
<tr>
<td>Display URL Prefix</td>
<td>For example, <a href="http://host:port/cs">http://host:port/cs</a></td>
</tr>
<tr>
<td>Authentication Type</td>
<td>NATIVE or ORASSO</td>
</tr>
<tr>
<td>Administrator User</td>
<td>The user to crawl the Content Server must have the sceCrawlerRole role defined. The sceCrawlerRole is a configuration parameter in SESCrawlerExport. Typically, administrators create a special role, assign it no privileges to view content, then create a user account that has this role. If you do not set up a specific sceCrawlerRole, then admin credentials are required to crawl. The sysadmin user ID works by default. If Authentication Type is ORASSO, then enter a user ID (and password) of a user in the identity management server fronted by Oracle SSO. This user must have been granted the same permissions as sysadmin. If it is not possible to grant those permissions, then delete the &quot;remote&quot; user corresponding to this user in the Content Server, and create a &quot;local&quot; version of the user (same name) in the Content Server.</td>
</tr>
<tr>
<td>Administrator Password</td>
<td>Password for crawl admin user</td>
</tr>
<tr>
<td>Authorization User ID Format</td>
<td>Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, nickname or username or something else). If you are using the Oracle E-Business Suite R12 identity plug-in, then leave this parameter blank.</td>
</tr>
</tbody>
</table>
Realm

- If Authentication Type is NATIVE, then enter Idc Security /cs/idcplg, where /cs/ is the context root you provided when you installing the Content Server.
- If Authentication Type is ORASSO, then leave this field blank.

f. Click Create & Customize (or edit a created source) to see other source parameters.

g. On the Crawling Parameters tab, enter the following crawling parameter: Document Service Pipeline.

h. Click Enable and select the pipeline you created.

15.5.4.3 Setting Up Oracle SES to Search Discussions and Announcements

To search WebCenter Portal discussions and announcements using Oracle SES, you must first set up several Oracle SES Database sources: three for discussions and one for announcements. The three discussions sources are for forums, topics in forums, and replies in forums. These separate sources enable users to see search results for forums without also seeing results for all the messages and replies in it.

For example, the discussions sources could have the following:

- source name GS_Forums and View of FORUMCRAWLER_VW
- source name of GS_Topics and View of THREADCRAWLER_VW
- source name of GS_Replies and View of MESSAGECRAWLER_VW

The announcements source could have the source name GS_Announcements and a View of ANNOUNCEMENTS_VW.

Note:

There are slightly different steps for Oracle and Microsoft SQL Server databases.

1. Configure the JDBC driver:

   a. To crawl a Microsoft SQL Server database, download the appropriate JDBC driver jar files into the ORACLE_HOME/search/lib/plugins/oracleapplications directory in Oracle SES.

   Note:

   For Microsoft SQL Server, copy the Microsoft JDBC driver files sqljdbc.jar and sqljdbc4.jar.

   If the JDBC drivers for JRE 1.5 and JRE 1.6 are different, (for example: sqljdbc.jar works for JRE 1.5 and sqljdbc4.jar works for JRE 1.6), then perform the following:
- Download both the driver jars into the ORACLE_HOME/search/lib/plugins/oracleapplications directory in Oracle SES.
- Add an entry for the JRE 1.6 version (sqljdbc4.jar for SQLServer) of the driver jar to the CLASSPATH element of ORACLE_HOME/search/config/searchctl.conf.
- Restart the middle tier.

b. Update the drivers.properties file with the following information:
DatabaseName:DriverClassName.

c. Add the JRE 1.5 JDBC driver jar file name to the classpath in META-INF/MANIFEST.MF of appsjdbc.jar and DBCrawler.jar.
For example, change:

Class-Path: sqljdbc.jar rsscrawler.jar ../../pluginmessages.jar
to

Class-Path: sqljdbc.jar rsscrawler.jar ../../pluginmessages.jar

and change:

Class-Path: appsjdbc.jar
to

Class-Path: appsjdbc.jar

For a key attribute that is not named KEY, change the JDBC driver information in the drivers.properties file to specify the key attribute name:
database_name: driver_class_name, key_attribute_name

For example, for a key attribute named ID:

oracle : oracle.jdbc.driver.OracleDriver, ID

In the crawling query, use key_attribute_name as the alias for the key value column name. In this example, ID is the alias for KEYVAL:

SELECT keyval id, content, url, lastmodifieddate, lang FROM sales_only

Oracle and SQL Server databases: The following default drivers are used if none is specified in drivers.properties:

• Oracle: oracle.jdbc.driver.OracleDriver
• SQL Server: com.microsoft.sqlserver.jdbc.SQLServerDriver

2. Create the discussions sources or the announcements source.

See Also:

Configuring Search Crawlers Using WLST for an alternative way to create these sources

a. In Oracle SES, go to Home > Sources.
b. From the Source Type dropdown list, select **Database**, and click **Create** (Figure 15-23).

**Figure 15-23 Create Database Source**

![Create Database Source](image)

- Make your data searchable by defining a source here.

<table>
<thead>
<tr>
<th>Source Type</th>
<th>Database</th>
</tr>
</thead>
</table>

**c.** Enter the following parameters:

<table>
<thead>
<tr>
<th><strong>Source Name</strong></th>
<th>unique_name; for example, GS_Forums to crawl discussion forums (or GS_Announcements to crawl announcements)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>Database Connection String</strong></th>
<th>Enter one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Oracle database: Enter one of the following:</td>
</tr>
<tr>
<td></td>
<td>jdbc:oracle:thin:@host:port:sid</td>
</tr>
<tr>
<td></td>
<td>jdbc:oracle:thin@host:port/serviceId</td>
</tr>
<tr>
<td></td>
<td>• Microsoft SQL Server database: Enter jdbc:sqlserver://host_or_IP_address:port;database_name</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>User ID</strong></th>
<th>Enter one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Oracle database: The user MyPrefix_DISCUSSIONS_CRAWLER created during Oracle WebCenter Portal’s Discussions Server installation</td>
</tr>
<tr>
<td></td>
<td>• Microsoft SQL Server database: The user MyPrefix_DISCUSSIONS_CRAWLER created during Oracle WebCenter Portal’s Discussions Server installation</td>
</tr>
</tbody>
</table>

| **Password** | Password for this user |
### Query

Enter one of the following queries:

- SELECT * FROM FORUMCRAWLER_VW
- SELECT * FROM THREADCRAWLER_VW
- SELECT * FROM MESSAGECRAWLER_VW
- SELECT * FROM ANNOUNCECRAWLER_VW

- Use FORUMCRAWLER_VW for the source crawling discussion forums.
- Use THREADCRAWLER_VW for the source crawling topics in discussion forums.
- Use MESSAGECRAWLER_VW for the source crawling replies in discussion forums.
- Use ANNOUNCECRAWLER_VW for the source crawling announcements.

### URL Prefix

The URL prefix for the WebCenter Portal application, including host, port, and application name. For example, http://host:port/webcenter

### Grant Security Attributes

WCSECATTR

**Note:** Previous releases of Content Server used FORUMID for Grant Security Attributes.

d. Click Next.
e. On the Create User-Defined Source : Step 2 : Authorization page, enter the following parameters (if not prepopulated) in the Authorization Manager section:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Plug-in Class Name</strong></td>

</thead>
</table>

| Single Record Query | false |

**Authorization Query**

Enter the following (on one line):

```
SELECT DISTINCT forumID as WCSECATTR
FROM AUTHCRAWLER_FORUM_VW
WHERE username = LOWER(?) UNION
SELECT DISTINCT -1 as WCSECATTR
FROM AUTHCRAWLER_FORUM_VW
```

```
SELECT DISTINCT forumID as WCSECATTR FROM
AUTHCRAWLER_FORUM_VW
WHERE username = LOWER(?) UNION
SELECT DISTINCT -1 as WCSECATTR
FROM AUTHCRAWLER_FORUM_VW
```

**Note:** Previous releases of Content Server used the following authorization query:

```
SELECT forumID
FROM AUTHCRAWLER_FORUM_VW
WHERE (username = ? or userID=-1)
UNION SELECT f.forumID
FROM jiveForum f,
AUTHCRAWLER_CATEGORY_VW c
WHERE f.categoryID = c.categoryID
AND (c.username = ? or userID=-1)
```

**Authorization User ID Format**

Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, `nickname` or `username` or something else).

If you are using the Oracle E-Business Suite R12 identity plug-in, then leave this parameter blank.

f. Click **Create** to complete the source creation.
15.5.4.4 Setting Up Oracle SES to Search Portals, Lists, People, and Page Metadata

This section describes how to create the Oracle WebCenter source.

See Also:

Configuring Search Crawlers Using WLST for an alternative way to create the Oracle WebCenter source

1. Go to the Home > Sources page.

2. From the Source Type dropdown list, select the Oracle WebCenter source type, and click Create (Figure 15-24).

   Figure 15-24 Create Oracle WebCenter Source

3. Enter the following source parameters (Figure 15-25):
Note:

If WebCenter Portal is fronted with an Oracle HTTP Server, then the Configuration URL used in this step requires the following in mod_wl_ohs.conf file.

In a non-clustered environment:

```xml
<Location /rsscrawl>
  SetHandler weblogic-handler
  WebLogicHost host_name
  WeblogicPort port
</Location>

<Location /sesUserAuth>
  SetHandler weblogic-handler
  WebLogicHost host_name
  WeblogicPort port
</Location>
```

In a clustered environment:

```xml
<Location /rsscrawl>
  WebLogicCluster host_name1:port, host_name2:port
  SetHandler weblogic-handler
</Location>

<Location /sesUserAuth>
  WebLogicCluster host_name1:port, host_name2:port
  SetHandler weblogic-handler
</Location>
```

where `host_name1` and `host_name2` are the cluster nodes, and `port` is the listening port number of the managed server on which the WebCenter Portal application is deployed.

See Also:

- Installing and Configuring OAM 11g for detailed information about using WebCenter Portal with Oracle Access Manager

Source Name: `unique_name`

Authentication Type: BASIC

User ID: Crawl admin user you registered in Oracle SES – Configuration; for example, `mycrawladmin`

Password: Password for the crawl admin user

Realm: `jazn.com`

Oracle SSO Login URL: Leave this field blank.

Oracle SSO Action URL: Leave this field blank.
Scratch Directory: Optional. Specify a directory on the system under which the Oracle SES instance resides.

Maximum Number of connection attempts: Maximum number of connection attempts to access data feed or upload status feed.

4. Click Next.

5. On the Create User-Defined Source: Step 2: Authorization page, the Plug-in Class Name and Authorization Endpoint are prepopulated on the page. The Plug-in Class name should be `oracle.webcenter.search.auth.plugin.WebCenterAuthManager`.

Enter the following plug-in parameters:

Jar File Name: `webcenter/search-auth-plugin.jar` *(Note: This must be changed from the default value.)*

Realm: `jazn.com`

User ID: Crawl admin user you registered Oracle SES – Configuration; for example, `mycrawladmin`

Password: Password for the crawl admin user

Authorization User ID Format: Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, `nickname` or `username` or something else). If you are using the Oracle E-Business Suite R12 identity plug-in, then leave this parameter blank.

6. Click Create to complete the source creation.
15.5.4.5 Excluding Components from the Spaces Crawler

The spaces crawler collects data for searching the following components:

- `oracle.webcenter.peopleconnections.profile` (people)
- `oracle.webcenter.community` (portals)
- `oracle.webcenter.page` (page metadata)
- `oracle.webcenter.list` (lists)

Use the URL parameter `?excludedServiceIds` to disable search for any of these components. That is, in the Oracle SES administration tool, on the Home - Sources page for the Oracle WebCenter source, the `?excludedServiceIds` in the Configuration URL parameter should equal to the comma-delimited list of service IDs to exclude.

Example: Disable Crawling of People Connections Profiles

http://host:port/rsscrawl?
excludedServiceIds=oracle.webcenter.peopleconnections.profile

Example: Disable Crawling of Page Metadata

http://host:port/rsscrawl?excludedServiceIds=oracle.webcenter.page

Example: Disable Crawling of Profiles and Page Metadata

http://host:port/rsscrawl?
excludedServiceIds=oracle.webcenter.peopleconnections.profile,oracle.webcenter.page

15.5.4.6 Additional Oracle SES Configuration

This section describes the required steps in the Oracle SES administration tool.

1. Create a source group that includes the names of the Content Server, Discussions, Announcements, and WebCenter Portal sources you created.
   a. Go to the Search - Source Groups page, and click Create.
   b. Enter the same source group name entered in Setting Up WebCenter Portal for Oracle SES.
   c. From the Select Source Type dropdown list, select each source type (Database, Oracle WebCenter Content Server, Oracle WebCenter), and then from the Available Sources listed for each source type, move the source you created for that source type into the Assigned Sources list.
   d. Click Finish.

2. Optionally configure the security filter lifespan. This refreshes the authorization policies for users in the system. It is best to have a short lifespan when user policies change frequently. (This chapter uses Oracle Internet Directory identity plug-in as the example.)

   For example, on the Global Settings - Query Configuration page, under Secure Search Configuration, enter 0 for Security Filter Lifespan (minutes).

   Valid values for the security filter lifespan are between 0 minutes (no cache) and 526500 minutes (cache for one year).
3. To index everything, you must force a full crawl for each source; that is, you must change the existing incremental crawl schedule for each source to first process ALL documents.

This step is very important, in that searching does not work unless the content is first indexed completely.

Note:
You can set the schedule for the spaces crawler with the fullCrawlIntervalInHours parameter in WLST or the Full Crawl Interval parameter in Fusion Middleware Control.

Go to the Home - Schedules page, select the source schedule, and click Edit to force a full crawl.

After each source has been crawled, go back to the same page and change the crawl policy back to incremental (index documents that have changed since the previous crawl). Also, in the Frequency section of the page, select a non-manual type for running incremental crawl (for example, weekly or daily).

Note:
Before the first crawl of the Content Server, remember to go to the Content Server Administration page, select SES Crawler Export, and take a snapshot. For more information, see Setting Up Oracle WebCenter Content Server for Oracle SES.

15.5.4.7 Configuring Oracle SES Facets and Sorting Attributes

Facets are Oracle SES objects that let users refine searches by navigating indexed data without running a new search. You must first define facets (using the provided files) in Oracle SES. Facets defined in Oracle SES are picked up in WebCenter Portal through the Tools and Services - Search administration page.

WebCenter Portal provides the following input files to the Oracle SES Admin API command line interface:

- facet.xml: This configures facets in Oracle SES.
- searchAttrSortable.xml: This defines attributes for absolute sort.

Locate these files in oracle.webcenter.framework/ses/webcenter_portal_ses_admin.zip. Unzip this file, and follow the instructions in the readme.txt file.

Running these two files from Oracle SES creates the following facets:

- Author
- Last Modified Date
- Mimetype
- Tags
- **Scope GUID** (This appears as the Portal facet. This value is converted to the portal display name in the search results page.)

- **Service ID** (This facet does not appear in the user interface. All enabled tools and services display in the search results page.)

**Note:**
The `facet.xml` and `searchAttrSortable.xml` scripts are mandatory. Creating facets in Oracle SES alone is not sufficient for search in WebCenter Portal.

Additionally, the **Scope GUID** and the **Service ID** facets are mandatory. Facet names are case-sensitive. You must have these exact facet names.

After you run these files, you can view facets in the Oracle SES administration tool on the Global Settings - Facets page (Figure 15-26).

### Figure 15-26 Oracle SES Facets

![Oracle SES Facets](image)

<table>
<thead>
<tr>
<th>Facet Name</th>
<th>Facet Type</th>
<th>Attribute</th>
<th>Delimiter Edit</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author</td>
<td>String</td>
<td>AUTHOR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Last Modified Date</td>
<td>Date</td>
<td>LASTMODIFIEDDATE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MimeType</td>
<td>String</td>
<td>MIME TYPE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tags</td>
<td>String</td>
<td>WC_TAGS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Scope GUID</td>
<td>String</td>
<td>WC_SCOPEGUID</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Service ID</td>
<td>String</td>
<td>WC_SERVICEID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1. To create a new facet, on the Global Settings - Facets page, click **Create**.

2. Enter a name for the facet and the search attribute from which the facet value should be generated.

   For String facet types, you must also enter the path delimiter. This is a single character used for demarcation for displaying the facet tree hierarchy for the selected facet tree node on the query page, for example, "tools/power tool/drills", where "/" is the path delimiter. You can set it to blank if the facet tree is one-level deep; that is, its nodes do not have child nodes.

3. Click **Create and Customize** to create a facet and configure its nodes on the Edit Facet page.

   You can configure facet nodes for a facet of Date type or Number type. For example, for the Last Modified Date facet, you can create nodes like Last Year, Last Month, Today, Between two specific days, and so on. The Node Configuration tab displays a facet hierarchy in tree format as well as in XML format, where you can add, edit, and delete child nodes for the selected facet node.
4. After editing the facet nodes, click **Apply** to save the changes.

Changes you make in Oracle SES are picked up in WebCenter Portal when the Portal Manager goes to the **Tools and Services - Search** administration page. WebCenter Portal does not detect changes to facets until this Search administration page is opened. WebCenter Portal remembers the facets selected for use by each portal.

### 15.5.5 Configuring Oracle SES Version Using WLST

You must run the `setSESVersion` WLST command to obtain and store version information for the Oracle SES instance associated with your default connection. This command enables faceted search and the Tools and Services - Search administration page, which is necessary for customizing search settings with Oracle SES 11.2.2.2. To confirm that the Oracle SES version is set correctly, run the `listSESVersion` WLST command.

**Example 15-1** shows these commands. For full command syntax and examples, see `setSESVersion` and `listSESVersion` in the [WLST Command Reference for WebLogic Server](#).

**Example 15-1**  **Enable Facet Query and the Tools and Services Search Admin Page**

```bash
setSESVersion(appName='webcenter',
  sesUrl='http://myhost.com:5720/search/api/admin/AdminService',
  sesSchema='searchsys', sesPassword='password'
listSESVersion(appName='webcenter',
  sesUrl='http://myhost.com:5720/search/api/admin/AdminService')
```

### 15.5.6 Configuring Search Crawlers Using WLST

You can use WLST commands to create crawlers and to start, stop and delete crawler schedules. These commands let you crawl new data in Oracle SES or delete old crawlers if the configuration data changes.

The following examples show some of these commands. For more information, see `createSpacesCrawler` in the [WebCenter WLST Command Reference](#).

**Example: Create a Spaces Crawler in WLST**

```java
createSpacesCrawler{
  appName='webcenter', host='myWebcenterHost', port='myWebcenterPort',
  sesUrl='http://mySEShost.com:7777/search/api/admin/AdminService',
  sesPassword='mySESAadminPassword', crawlUser='webcenter-crawl-user',
  crawlPassword='webcenter-crawl-user-pw', scratchDir='/tmp',
  authUserIdFormat='authentication-id-format', crawlingMode='ACCEPT_ALL',
  recrawlPolicy='PROCESS_ALL', freqType='MANUAL', startHour=1,
  hoursBetweenLaunches=1, startDayOfWeek='MONDAY', startDayOfMonth=1,
  daysBetweenLaunches=1, weeksBetweenLaunches=1, monthsBetweenLaunches=1,
  sesSchema='eqsys')
```

**Example: Create a Documents Crawler in WLST**

```java
createDocumentsCrawler{
  appName='webcenter', host='myWebcenterHost', port='myWebcenterPort',
  sesUrl='http://mySEShost.com:7777/search/api/admin/AdminService',
  sesPassword='mySESAadminPassword',
```
Example: Create a Discussions Crawler in WLST

```java
createDiscussionsCrawler(
    appName='webcenter', host='myWebcenterHost', port='myWebcenterPort',
    sesUrl='http://mySEShost.com:7777/search/api/admin/AdminService',
    sesPassword='mySESAdminPassword',
    dbConnString='jdbc:oracle:thin:@database-host:database-port:database-sid',
    user='Jive-crawler-schema', password='Jive-crawler-schema-pw',
    authUserIdFormat='authentication-id-format', crawlingMode='ACCEPT_ALL',
    recrawlPolicy='PROCESS_ALL', freqType='MANUAL', startHour=1,
    hoursBetweenLaunches=1, startDayOfWeek='MONDAY', startDayOfMonth=1,
    daysBetweenLaunches=1, weeksBetweenLaunches=1, monthsBetweenLaunches=1,
    sesSchema='eqsys')
```

Note:

- For `authentication-id-format`, use 'nickname' if the Identity Management plug-in on Oracle SES is set to Oracle Internet Directory; otherwise, use the value of the **Authentication Attribute** parameter on the Identity Management plug-in on Oracle SES.

- For `database-host`, use Oracle WebCenter Portal’s Discussion Server database host name

- For `Jive-crawler-schema`, use the Discussions server crawler schema name. Determine the prefix from RCU, and use `rcu-prefix_DISCUSSION_CRAWLER`.

- For `sesSchema`, the default value is `searchsys`, which is the default admin user name for Oracle SES 11.2.2.2; however, a different name may have been specified during installation.

- To effect WLST changes, you must restart the managed server on which the application is deployed (by default, `WC_Portal`). For more information, see Starting and Stopping Managed Servers Using Scripts in `Administering Oracle Fusion Middleware`.

15.6 Managing Search in WebCenter Portal Administration

System administrators can use the WebCenter Portal Administration Search page to configure search for the Home portal or all portals. Portal managers can reset the search settings for the portals that they manage.
1. Open WebCenter Portal Administration pages (see Accessing the Settings Pages in WebCenter Portal Administration).

2. Click **Tools and Services**, and then select **Search**.

   The Search settings page opens (Figure 15-27).

**Figure 15-27  WebCenter Portal Administration: Search Configuration**

3. Make sure that **Use new search task flow with facet support** (selected by default) is selected to use Oracle Secure Enterprise Search 11.2.2 with facet support. If you deselect this check box, you are using the Search - Non-Faceted Search task flow (which uses refiners instead of facets). If you do this, then the next time this page is accessed, the remaining settings on this page are grayed-out, and you must configure search settings with Search - Non-Faceted Search task flow parameters.

---

**Note:**

Portal managers can set up faceted or non-faceted search for their portals, irrespective of the setting configured at the application-level.

For best performance and scalability, as well as facet support and easier configuration, configure the application to use Oracle SES release 11.2.2.2 or later with the new Search - Faceted Search task flow. However, upgraded instances may choose to remain with the old Search - Non-Faceted Search task flow to retain certain functionality.

Oracle SES 11.1.2 is available, but no longer supported in this current release.

---

**See Also:**

If you have upgraded from earlier WebCenter Portal/Oracle SES instances and you select to use the new search task flow with facet support, then previous search user preferences are overridden by the settings on the Search administration page. To retain your previous customizations, you must reset those customizations on the Search administration page.

4. Select the types of results to display to users by selecting the **Enable filtering dropdown** checkbox.
If the **Enable filtering dropdown** checkbox is selected, users can search for the specific services selected in the **Included** column instead of searching for **Everything**. For more information about configuring filtering, see Configuring the Filtering Dropdown In Faceted Search in *Building Portals with Oracle WebCenter Portal*.

**Note:** Portal managers can configure the filtering dropdown differently for the portals that they manage.

5. Set the **Search scope** to include search results for the Home portal only or all portals, including the Home portal.

6. Select which facets to display with search results (see Configuring Facets in *Building Portals with Oracle WebCenter Portal*).

You must first configure facets (including the required **Scope GUID** and **ServiceID** facets) in Oracle SES. The system administrator creates, modifies, and removes facets in Oracle SES. (WebCenter Portal does not detect changes to facets until this Search administration page is opened.) For more information, see Setting Up Oracle SES to Search Portals, Lists, People, and Page Metadata.

**Note:**

The search results page shows facet names following the translation specified on the Global Settings - Translate Facet Names page in the Oracle SES administration tool. The facet name is the translated name in the user locale. However, the WebCenter Portal Search administration page shows the base facet names (that is, the non-translated names). An exception is the **Portal** facet name, which follows the translation specified in WebCenter Portal instead of Oracle SES.

7. In the **Custom Attributes** section, select which custom search attributes should appear in search results and the order in which they appear by moving the attributes to the **Included** section.

For more information about configuring custom (as opposed to standard) attributes, see Enriching Search Results Using Custom Attributes in *Building Portals with Oracle WebCenter Portal*.

8. Click **Apply** to save your settings.
Managing Subscriptions and Notifications

This chapter describes how to administer subscriptions and notifications. As an administrator, you can create and, potentially, enforce application-wide defaults for application-level subscriptions; specify a connection type that identifies the server that will handle notification delivery; and set and get Notifications messaging configuration details using WLST commands.

This chapter includes the following topics:

- About Subscriptions and Notifications
- Setting Up Default Subscription Preferences
- Setting Up Notifications
- Creating and Applying Custom Notification Templates
- Testing the Notifications Connection

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role in the deployed application. In WebCenter Portal, the Administrator role is granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

16.1 About Subscriptions and Notifications

In WebCenter Portal, subscriptions and notifications provide users with a way to subscribe to the types of services and application objects that interest them. Consequently, users receive timely notice over their selected messaging channels of changes that affect their subscribed services and objects.

See Also:

For information about adding notifications functionality to a portal, see Adding Notifications to a Portal in Building Portals with Oracle WebCenter Portal.

Always use the Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter Portal. Any changes you make to
WebCenter Portal, post deployment, are stored in the MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

**Note:**

Most changes you make to WebCenter Portal tools and services configuration through Fusion Middleware Control or using WLST are not dynamic. For your changes to take effect, you must restart the managed server in which the application is deployed. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

### 16.2 Setting Up Default Subscription Preferences

WebCenter Portal users set their personal Subscriptions preferences through the WebCenter Portal Preferences dialog. Before this happens, the WebCenter Portal administrator can set default values that determine the application-level subscription options that are available to all users and whether those defaults can be changed.

This section provides an overview of Subscription defaults and steps you through the process of setting default values.

This section includes the following subsections:

- About Subscription Defaults
- Setting Subscription Defaults
- Setting Subscriptions Preferences in WebCenter Portal

#### 16.2.1 About Subscription Defaults

Administrator-level Subscription preferences are set in a custom XML file that you create and then use to supersede the file that is provided for this purpose out of the box (notification-service-settings.xml). The settings in the custom XML file are analogous to the application-level subscriptions settings available to users through Subscription Preferences in WebCenter Portal (for more information, see Subscribing to the Application, to Portals, and to Objects in Using Oracle WebCenter Portal.)

Each setting provides three attributes:

- **id**—for specifying the service ID:
  - oracle.webcenter.peopleconnections.connections, the Connections feature of the People Connections service
  - oracle.webcenter.peopleconnections.wall, the Message Board feature of the People Connections service
  - oracle.webcenter.peopleconnections.kudos, the Feedback feature of the People Connections service
  - oracle.connections.community, portal membership management

- **subscription-enabled**—for specifying the initial state of the preference option: true (enabled) or false (not enabled)
Tip:

Rather than enabling or disabling the entire subscription capability, the 
subscription-enabled attribute merely sets the initial state of the 
preference option. For example, if subscription-enabled="true", then 
the associated subscription option is selected by default in the WebCenter 
Portal's Preferences dialog. If subscription-enabled="false", then the 
associated subscription option is deselected by default in the dialog.

- end-user-configurable—for enabling users to change the established default 
or preventing users from doing so: true or false

These attributes work together to determine the initial state of the General 
Subscriptions tab on the Subscriptions page in Preferences (Figure 16-1).

Figure 16-1  Preferences - Subscriptions: General Subscriptions Page

Table 16-1 illustrates the effect of custom administrator-level subscriptions settings on 
the appearance of the General Subscriptions tab.

Table 16-1  Effect of Administrator Defaults on Subscriptions Preferences

<table>
<thead>
<tr>
<th>subscription-enabled¹</th>
<th>end-user-configurable</th>
<th>Option in Preferences</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>True</td>
<td>Rendered normally, check box is selected</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>Grayed out, check box is selected</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>Rendered normally, check box is deselected</td>
</tr>
<tr>
<td>False</td>
<td>False</td>
<td>Hidden, check box is hidden</td>
</tr>
</tbody>
</table>

¹ Rather than enabling or disabling the entire subscription capability, the subscription-enabled attribute merely sets the initial state of the preference option. For example, if subscription-enabled="true", then the associated subscription option is selected by default in WebCenter Portal's Preferences. If subscription-enabled="false", then the associated subscription option is deselected by default.
Tip:

In Table 16-1, the most typical scenario for most notifications is false/true (row 3).

Table 16-2 lists the types of actions that can trigger an application-level notification and associates them with their related service ID.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Related Service ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>A user sends you an invitation to connect</td>
<td>oracle.webcenter.peopleconnections.connections</td>
</tr>
<tr>
<td>Your portal role changes, for example, from Portal Manager to another custom role</td>
<td>oracle.webcenter.community</td>
</tr>
<tr>
<td>You are added as a member of a portal</td>
<td>oracle.webcenter.community</td>
</tr>
<tr>
<td>Your portal membership is removed</td>
<td>oracle.webcenter.community</td>
</tr>
<tr>
<td>A user posts a message to your Message Board</td>
<td>oracle.webcenter.peopleconnections.wall</td>
</tr>
<tr>
<td>A user likes your post on another user’s Message Board</td>
<td>oracle.webcenter.peopleconnections.wall</td>
</tr>
<tr>
<td>A user comments on your post on another user’s Message Board</td>
<td>oracle.webcenter.peopleconnections.wall</td>
</tr>
<tr>
<td>A user posts feedback for you</td>
<td>oracle.webcenter.peopleconnections.kudos</td>
</tr>
</tbody>
</table>

16.2.2 Setting Subscription Defaults

To set defaults for application-level Subscription preferences:

1. Navigate to a directory with a path that contains /oracle/webcenter/notification, and create the folder custom.

   Tip:
   The directory structure can start or end with any directory or directories, as long as it has /oracle/webcenter/notification/custom in the path.

2. In the custom folder, or in any subdirectory under /oracle/webcenter/notification/custom/, create the file notification-service-settings.xml.

3. In the XML file, enter values for all application-level subscription options.

   The following example provides sample content for an application-wide subscription preferences setting file and an example of each required option.
   
   ```xml
   <notification-service_settings xmlns="http://xmlns.oracle.com/webcenter/notification">
     <subscription-settings>
       <service id="oracle.webcenter.peopleconnections.connections" subscription-enabled="true"
            end-user-configurable="false"/>
       <service id="oracle.webcenter.peopleconnections.wall" subscription-enabled="false"
            end-user-configurable="true"/>
   ```
Note:
If an option is not provided, the default values false/false are assigned for the service.

4. Run the WLST command `importMetadata()`, and import the directory content into your metadata store.

See Also:
For information about running WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

For example:

```wls
/wl_domain/serverConfig> importMetadata(application='webcenter', server='ServerName', fromLocation='directoryPath', docs='/**')
```

Where:

- `application` is the name that identifies your WebCenter Portal deployment
- `servername` is the name of the server where WebCenter Portal is running
- `directoryPath` is the directory path under which `oracle/webcenter/notification/custom/<any_sub_dir_after_this>/notification-service-settings.xml` is located.

For example, if the directory path to `notification-service-settings.xml` is `/scratch/mydir/oracle/webcenter/notification/custom`, enter `/scratch/mydir` for `directoryPath`.

- `docs` identifies the content to be imported, in this example, the path and files that fall under `directoryPath`.

For information about the `importMetadata` WLST command, see `importMetadata` in WLST Command Reference for Infrastructure Components.

Table 16-3 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.connections`.

**Table 16-3  Effects of Subscription Configurations for Connections**
### Table 16-3  (Cont.) Effects of Subscription Configurations for Connections

<table>
<thead>
<tr>
<th>subscription-enabled</th>
<th>end-user-configurable</th>
<th>Effect</th>
</tr>
</thead>
</table>
| true                 | true                  | • The subscribing user receives a notification message when another user sends the user an invitation to connect.  
                    |                       | • The user can change this default. |
| true                 | false                 | • The subscribing user receives a notification message when another user sends the user an invitation to connect.  
                    |                       | • The user cannot change this default.  
                    |                       | 1 |
| false                | true                  | • The subscribing user does not receive a notification message when another user sends the user an invitation to connect.  
                    |                       | • The user can change this default. |
| false                | false                 | • The subscribing user does not receive a notification message when another user sends the user an invitation to connect.  
                    |                       | • The option for changing this default is hidden.  

1 This is the out-of-the-box default

Table 16-4 describes the effect of various combinations of settings for the service ID `oracle.webcenter.peopleconnections.wall`.

### Table 16-4  Effects of Subscription Configurations for Message Board

<table>
<thead>
<tr>
<th>subscription-enabled</th>

</table>
| false                | true                  | • The subscribing user does not receive a notification message when the user’s portal membership role changes, the user is added as a member of a portal, or the user is removed as a member of a portal.  
• The user can change this default. |
| false                | false                 | • The subscribing user does not receive a notification message when the user’s portal membership role changes, the user is added as a member of a portal, or the user is removed as a member of a portal.  
• The option for changing this default is hidden. |

### 16.2.3 Setting Subscriptions Preferences in WebCenter Portal

Individual users set their own subscription preferences in WebCenter Portal's Preferences. Two Preferences pages are provided for this purpose:

- **Subscriptions**, where users subscribe to be notified about actions occurring with their portal memberships and the People Connections service (Connections, Message Board, and Feedback) and view and remove their application- and object-level subscriptions
  For more information, see Subscribing to the Application, to Portals, and to Objects in *Using Oracle WebCenter Portal*.

- **Messaging**, where users access controls for configuring their preferred messaging channels and filters (BPEL connection types only)
  For more information, see Establishing and Managing Your Messaging Channels and Filters in *Using Oracle WebCenter Portal*.

### 16.3 Setting Up Notifications

This section provides an overview of messaging connection types, describes prerequisites that must be in place before you can define a notification channel, and steps you through the process of setting up a notification channel for Notifications. It includes the following subsections:

- **About Connection Channels**
- **Notification Prerequisites**
- **Configuration Roadmap for Notifications**
- **Specifying the Notifications Channel Using Fusion Middleware Control**
- **Specifying the Notifications Channel Using WLST**
- **Example - Setting Up Mail Notifications for WebCenter Portal Using WLST**
16.3.1 About Connection Channels

The Notifications connection type determines the messaging channels that are available to users when they configure their own messaging preferences for Notifications in WebCenter Portal.

Use one of two possible connection types:

- **BPEL Server** provides two messaging channel options to users: mail and texting (SMS).

- **Mail Server** delivers notification messages exclusively through a mail server that is configured for WebCenter Portal.

**BPEL Server Connection Type**

Selection of a BPEL server presupposes that you have established a connection to a BPEL server with the User Messaging Service (UMS) is available. For information about connecting to a BPEL server, see Managing the SOA Connection for WebCenter Portal Membership Workflows.

When WebCenter Portal has setSpacesWorkFlowConnectionName set up, the Manage Configuration button becomes available on the Messaging panel in WebCenter Portal’s Preferences.

**Tip:**

You should use the same connection for Notifications that you use for setSpacesWorkFlowConnectionName, provided you use the BPEL Server for notifications.

**Mail Server Connection Type**

Selection of a mail server presupposes that you have established a connection to a mail server. Additionally, the external application associated with the mail server connection must contain shared credentials. For information about connecting to a mail server, see Managing Mail.

When **Mail Server** is the selected connection type, the Manage Configuration button on the Messaging panel in WebCenter Portal’s Preferences might or might not be grayed-out. This depends on whether you have set up spacesWorkFlowConnection. Regardless, when **Mail Server** is the selected connection type, and you click the Manage Configuration button for Messaging preferences to open User Messaging Preferences, any changes you make are ignored.

---

**See Also:**

Establishing and Managing Your Messaging Channels and Filters in Using Oracle WebCenter Portal

---

16.3.2 Notification Prerequisites

Before you can define a connection type for Notifications, you must take the steps and consider the information provided in the following subsections:

- **Installation**
16.3.2.1 Installation

Installation requirements associated with Notifications change according to the type of connection you select for Notifications messaging.

If you will use the User Messaging Service (UMS) through your BPEL connection for Notifications messaging, you should know that only the mail driver is installed by default. To make use of SMS messaging channels, you must install drivers for these as well.

If you will use the Mail service for Notifications messaging, no Notifications-specific installation is required, but the Mail service must be configured as described in Managing Mail.

16.3.2.2 Configuration

Configuration prerequisites for Notifications also depend on the connection type you select for Notifications messaging.

BPEL Server Configuration

If you want users to have messaging channel options—mail and texting (SMS)—a connection to a BPEL server must be in place. Notifications uses the SOA installation for supporting multichannel notifications through the User Messaging Service (UMS). UMS is installed as a part of the SOA domain. Out of the box, only the mail driver is configured. The SMS driver is available, but must be deployed.

For more information see Managing the SOA Connection for WebCenter Portal Membership Workflows in Administering Oracle SOA Suite and Oracle Business Process Management Suite.

Mail Server Configuration

If you want users to always and only be notified through their mail, a connection to a mail server must be in place. Additionally, the external application associated with the mail server connection must contain shared credentials. For more information, see Managing Mail.

Mail notifications are sent in the preferred language specified for each user’s profile. If the preferred language is not specified for a user, the server locale setting is used for mail notifications. For example, if the server is running on the Korean locale and the preferred language is not set for a user, the notification mail is in Korean.

For information about setting the preferred language, see Choosing Your Preferred Display Language in Using Oracle WebCenter Portal.

16.3.2.3 Security

There are no security considerations specifically associated with Notifications.

16.3.2.4 Limitations

Some activities create Notification tasks to be sent in the future. For example, if a user creates an announcement with an active date in the future, a notification task is created on the WebCenter Portal application server, so that a notification will be sent when the announcement becomes active. However, if the Mail service is used for
Notifications, future Notification tasks are deleted if the WebCenter Portal application server is restarted.

UMS supports multiple messaging channels, including voice and instant messaging, that are not supported by Notifications. From UMS, Notifications consumes only mail and SMS.

In WebCenter Portal Release 12.2.1.0.0, a new Documents service task flow has been introduced. Integration between the new task flow and subscriptions and notifications is not in place in this release; consequently, no document-related activities trigger notifications. Integration between the new Documents task flow and subscriptions and notifications will be reintroduced in a subsequent release.

16.3.3 Configuration Roadmap for Notifications

Figure 16-2 and Table 16-7 provide an overview of the prerequisites and tasks required to get the Notifications service working in WebCenter Portal.

**Figure 16-2 Configuring the Notifications Service**

1. Set up the back-end component for notifications
2. If using a mail server for notifications, configure an external application
3. Configure a connection between your application and your chosen back-end component
4. Choose the type of connection to use for notifications - BPEL or mail
5. Restart the managed server to which your application is deployed
6. Set up default subscription preferences for all users
7. Configure and test notifications in your application

**Table 16-7 Configuring Notifications**
### Table 16-7 (Cont.) Configuring Notifications

<table>
<thead>
<tr>
<th>Actor</th>
<th>Task</th>
<th>Sub-task</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>1. Set up the back-end component for Notifications.</td>
<td>• Set up the BPEL server</td>
<td>• Create an external application connection for the mail server</td>

</tbody>
</table>

### 16.3.4 Specifying the Notifications Channel Using Fusion Middleware Control

To specify a Notifications message connection type with Fusion Middleware Control:

1. Log in to Oracle Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   For more information, see [Navigating to the Home Page for WebCenter Portal](#).

2. From the **WebCenter Portal** menu, select **Settings > Application Configuration**.
3. On the **Application Configuration** page, scroll down to **Notifications** (at the bottom of the page), and select a connection type to use for outbound notifications: either **BPEL Server** or **Mail Server**.

4. The next step depends on the selected connection type:
   
   If you select **BPEL Server**:
   
   a. From the **Connection Name** list, select the name you provided for the BPEL server when you set up that connection.
   
   b. In the **Sender Mail Address** field, enter a mail address from which all Notifications messages are sent. The sender mail address must match at least one driver that is configured to send messages from a corresponding domain.
   
   c. In the **Sender SMS Address** field, enter the four- to six-digit number that is used by the User Messaging Server (UMS) as the driver from which all Notifications messages are sent. The sender SMS address must match at least one driver that is configured to send messages from a corresponding domain.

   If you select **Mail Server**, select a mail connection from the **Connection Name** list.

5. Save your changes.

6. To make your changes take effect, restart the managed server where WebCenter Portal is deployed.

**16.3.5 Specifying the Notifications Channel Using WLST**

Use the WLST command `setNotificationsConfig` to configure the connection type used for notifications. For command syntax and examples, see `setNotificationsConfig` in *WebCenter WLST Command Reference*. See also `getNotificationsConfig` in the same guide.

---

**See Also:**

For information about how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

---

**Note:**

Updates to this configuration are stored in the MDS repository. For configuration changes to take effect, you must restart the managed server where the application is deployed. For more information, see *Starting and Stopping Managed Servers Using WLST* in *Administering Oracle Fusion Middleware*.

---

**16.3.6 Example - Setting Up Mail Notifications for WebCenter Portal Using WLST**

This section provides an example of using WLST to set up Mail Notifications for WebCenter Portal using WLST commands.

First, the example shows you how to create an external application that is configured with shared credentials, and create a mail server connection that uses the external application. Next, the example shows you how to configure WebCenter Portal to send
notifications on that mail connection, and finally how to set subscription options through user preferences.

1. At the WLST command prompt, connect to the Administration Server for WebCenter Portal.
   
   ```
   connect('admin_user','mypassword','<servername>:7001')
   ```

2. Create an external application connection:

   ```
   createExtAppConnection(appName='webcenter', name='NotificationSharedApp',
   displayName='NotificationSharedApp')
   ```

   This command creates the connection named NotificationSharedApp.

   For more information, see `createExtAppConnection` in WebCenter WLST Command Reference.

3. Configure shared credentials for the external application, NotificationSharedApp:

   ```
   addExtAppCredential(appName='webcenter', name='NotificationSharedApp',
   type='SHARED', username='john.doe@example.com', password='sharedpassword')
   ```

   Where username refers to the mail account from which mail notifications will be sent. This must be in the format <user>@<domain of the mail server>.

   Optionally, you may add the following fields to use while sending out the mail notification.

   ```
   addExtAppField(appName='webcenter',name='NotificationSharedApp',fieldName='Email Address',fieldValue='sender\'s_email_address',displayToUser=false)
   addExtAppField(appName='webcenter',name='NotificationSharedApp',fieldName='Your Name',fieldValue='sender\'s_display_name',displayToUser=false)
   ```

   For more information, see `addExtAppField` in WebCenter WLST Command Reference.

4. Create a Mail connection:

   ```
   createMailConnection(appName='webcenter',name='NotificationSharedConn',
   imapHost='<mailserver>',imapPort=143,
   smtpHost='<mailserver>',smtpPort=25,
   imapSecured=false,smtpSecured=false,
   appId='NotificationSharedApp',default=1)
   ```

   This creates a mail connection named NotificationSharedConn.

   For more information, see `createMailConnection` in WebCenter WLST Command Reference.

5. Set Mail as the notifications channel:

   ```
   setNotificationsConfig(appName='webcenter', type='MAIL',
   name='NotificationSharedConn')
   ```

   This sets NotificationSharedConn as the mail connection to use when sending notifications.

   For more information, see `setNotificationsConfig` in WebCenter WLST Command Reference.
6. For the changes to take effect, restart the managed server where WebCenter Portal is deployed (WC_Portal by default).

7. Log in to WebCenter Portal, navigate to the About tab of the Profile page, and verify that your e-mail address is set in the Email field. This is to ensure that notifications are sent to the required e-mail address.

   If the e-mail address is not set, click Edit, then in the Email field, specify your e-mail address, and click Save.

8. Subscribe to the activities for which to receive notifications. For example, navigate to the Preferences page, click Subscriptions, and then select Portal Management to get notified about any membership or role changes.

9. Test your configuration by performing a subscribed activity. For example, change your role from Portal Manager to another custom role to trigger a notification.

16.4 Creating and Applying Custom Notification Templates

The notification messages that users receive through mail have a default format for content and content presentation. As the application administrator, you can instead create and apply custom templates to provide your own formats for notification messages.

This section provides information about creating a custom template for notifications messages. It includes the following subsections:

- About Overwriting Default Notification Templates
- Overwriting a Default Notifications Template

16.4.1 About Overwriting Default Notification Templates

You can go through MDS using WLST commands to customize the layout and content of subscription-based notification messages by overwriting the files defaultTemplate.xml (or defaultTemplate_rtl.xml—when right-to-left language support is required).

See Also:

For information about running WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

You can create your own version of these xml files, editing the CSS styles for tables (label, value, background) and footers (note). You can move such tags as <payload> and <group-space-footer> to change the layout. To modify the content of these tags, you can edit the CDATA section within <html-format>.

Note that the tag <text-format/> should always be present and empty. You can use the tag <custom> to add additional content, where the enclosed <html-format> with CDATA contains the new HTML content and <text-format/> remains empty.

The following example illustrates the default content of notification message template files. You can use this to formulate your custom files.
**Note:**

Differences may appear between custom files particularly under the `<style>` tag, where alignment—either right or left—is specified.

**Example**

```xml
<?xml version="1.0"?>
<notification-template xmlns="http://xmlns.oracle.com/webcenter/notification">
  <!-- The CSS Style of the Notification -->
  <style>
    <text-format/>
    <html-format>
      <!-- CSS Style -->
      <![CDATA[
        <style type="text/css">
          .title {font-size:1.2em; font-weight:bold; white-space:nowrap;}
          .label {text-align:right; margin-left:30px; padding-right:10px; white-space:nowrap;}
          .value {text-align:left; margin-right:20px; padding-left:10px; white-space:nowrap; width:100%;}
          .note {font-size:0.8em; color:#999999}
          .background {background-color:#f0f0f0}
        </style>
      ]]> 
    </html-format>
  </style>
  <!-- The Subject line of the Notification -->
  <subject>
    <message-key>NOTIFICATION_SUBJECT</message-key>
  </subject>
  <group-space-subject>
    <message-key>GROUP_SPACE_SUBJECT_SUFFIX</message-key>
  </group-space-subject>
  <!-- Actual srvc-specific data. Provided/Overridden by srvc template -->
  <payload>
    <text-format/>
    <html-format/>
  </payload>
  <!-- Any generic/common footer to appear after service-specific payload -->
  <!-- Group Space footer - if applicable -->
  <group-space-footer>
    <text-format/>
    <html-format>
      <![CDATA[
        <p>
          <a href="<token>groupSpaceUrl</token>" target="_blank">
            <message-key>GO_TO_SPACE</message-key>&nbsp;<token>
              groupSpaceName</token>
          </a>
        </p>
      ]]> 
    </html-format>
  </group-space-footer>
</notification-template>
```
16.4.2 Overwriting a Default Notifications Template

To overwrite a default notifications template (an xml file) to customize notification message formats:

1. Create a directory in the format of: /tmp/repository/oracle/webcenter/notification/custom/template
   This will later be used to import the files into the MDS and override the original application file.

2. Inside the directory you created, create a custom XML file with the name defaultTemplate.xml (or defaultTemplate_rtl.xml, for a right-to-left language template).

3. Populate the custom file with your revised version of one of these default files.

4. Upload the custom file into WebCenter Portal's MDS repository using the importMetadata() WLST command. Overwrite the original file, placing the custom file where the absolute path to the file contains the namespace oracle/webcenter/notification/custom.

   For example:

   ```
   importMetadata(application='webcenter', server='WC_Portal',
   fromLocation='template-file-location', docs='/oracle/webcenter/notification/custom/template/defaultTemplate.xml')
   ```

   **Note:**

   For information about the importMetadata WLST command, see importMetadata in WLST Command Reference for Infrastructure Components.

The template-file-location points to the directory under which the fully qualified custom file is located. The fully qualified custom file is typically placed
under the directory structure equivalent to its namespace, inside the MDS repository. For example, for a file created under the following namespace:

/tmp/repository/oracle/webcenter/notification/custom/template/defaultTemplate.xml

5. Upload the custom file into WebCenter Portal's MDS repository by running the `importMetadata()` WLST command.

For example:

```java
importMetadata(application='webcenter', server='WC_Portal',
               fromLocation='template-file-location',
               docs='/oracle/webcenter/notification/custom/template/defaultTemplate.xml')
```

The `template-file-location` points to the directory under which the fully qualified custom file is located. The fully qualified custom file is typically placed under the directory structure equivalent to its namespace.

For example, for a file that is created under the following namespace:

/tmp/repository/oracle/webcenter/notification/custom/template/defaultTemplate.xml

The `fromLocation` is `/tmp/repository` since the remaining sub-directory consists of the namespace for the XML file. The namespace must have at least the path `/oracle/webcenter/notification/custom`.

### 16.5 Testing the Notifications Connection

In general, Notifications is dependent on the underlying Mail or BPEL connection being valid when the administrator sets it. If these connections prove to be valid, then, by extension, the Notifications connections requirements are met.

**Tip:**

For information about testing Mail connections, see Testing Mail Server Connections.
Managing the SOA Connection for WebCenter Portal Membership Workflows

This chapter describes how to configure and manage the SOA connection for membership workflow notifications from WebCenter Portal. From WebCenter Portal, membership approvals and notifications can be configured to appear in Oracle BPM Worklist.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end servers for WebCenter Portal. Any changes that you make to WebCenter Portal post-deployment are stored in MDS metadata store as customizations. See Oracle WebCenter Portal Configuration Considerations.

Note:
Changes that you make to the SOA connection through Fusion Middleware Control or using WLST are not dynamic, so you must restart the managed server on which WebCenter Portal is deployed for your changes to take effect. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

This chapter includes the following topics:

- Configuration Roadmap for WebCenter Portal Workflows
- About BPEL Connections
- BPEL Server Prerequisites
- Specifying the BPEL Server Hosting WebCenter Portal Workflows
- Configuring WebCenter Portal Workflow Notifications to be Sent by Email
- Excluding Webcenter Portal Workflows URL in OAM
Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role in the deployed application:

- **WebCenter Portal**: Administrator role granted through Oracle WebCenter Portal Administration.

For more information about roles and permissions, see *Understanding Administrative Operations, Roles, and Tools*.

For troubleshooting issues with BPM worklists, see *Email Notifications Not Working*.

### 17.1 Configuration Roadmap for WebCenter Portal Workflows

Table 17-1 in this section provides an overview of the prerequisites and tasks required to use Oracle BPM Worklist in WebCenter Portal.

<table>
<thead>
<tr>
<th>Actor</th>
<th>Task</th>
<th>Sub-Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>1. Install WebCenter Portal and the Oracle SOA Suite</td>
<td></td>

1 Auto configured out-of-the-box

17.2 About BPEL Connections

Consider the following while working with BPEL connections:

- By configuring a default BPEL server, WebCenter Portal users can manage memberships through notifications that can be viewed in the SOA BPM worklist. For more information, see Using Oracle BPM Worklist in Developing SOA Applications with Oracle SOA Suite.

- WebCenter Portal workflows require a single connection to the BPEL server included with the Oracle SOA Suite. For more information, see Specifying the BPEL Server Hosting WebCenter Portal Workflows.

17.3 BPEL Server Prerequisites

Consider the following to ensure smooth functioning of worklists:

- Make sure that the Oracle BPM Worklist application is part of the SOA server. The URL is in the following format:

  http://host:port/integration/worklistapp
If Oracle BPM Worklist is not running in the same domain as the Oracle SOA Suite BPEL server, then the identity store (LDAP) should be either shared (recommended) or contain identical user names.

- Clocks on the WebCenter managed server and the Oracle SOA Suite BPEL’s managed server must be synchronized such that the SAML authentication condition, NotBefore, which checks the freshness of the assertion, is not breached.

- No configuration-related exceptions must exist. Use the WLST command listWorklistConnections to display the configured connections and validate the connection details. After listing the connections, validate them using the URL property appended with /integration/worklistapp. Hence, verify that http://host:port/integration/worklistapp can access the Oracle BPM Worklist application.

- If the Oracle SOA Suite BPEL’s managed server is configured to use an identity store and that store does not contain BPMWorkflowAdmin, weblogic by default, then the BPMWorkflowAdmin user must be configured, as described in Enabling the weblogic User for Logging in to the Worklist in Developing SOA Applications with Oracle SOA Suite

- The wsm-pm application must be running on both worklists and Oracle SOA Suite’s BPEL server’s managed servers without any issues. This can be validated through the URL:

  http://host:port/wsm-pm/validator

For information on how to resolve BPEL server issues, see Troubleshooting WebCenter Portal Workflows.

This section includes the following subsections:

- BPEL Server - Installation and Configuration
- BPEL Server - Security Considerations

17.3.1 BPEL Server - Installation and Configuration

WebCenter Portal uses the BPM Worklists on the Oracle BPEL Process Manager (BPEL) server, which is included with Oracle SOA Suite.

To work with worklist, you must install Oracle SOA Suite. For information about how to install Oracle SOA Suite, see Installing and Configuring Oracle SOA Suite and Business Process Management.

After installing Oracle SOA Suite, you can configure WebCenter Portal to use the BPEL server for viewing and managing worklists.

17.3.2 BPEL Server - Security Considerations

Worklists display tasks for the currently authenticated user. For portal users to store and retrieve tasks on an Oracle SOA Suite BPEL server, their user names must either exist in a shared user directory (LDAP), or be set up similarly on both the BPEL Server and WebCenter Portal.

For example, if the user rsmith wants to store and retrieve tasks from the BPEL server, you must ensure that the user rsmith exists on both the BPEL server and within WebCenter Portal.
To access BPEL worklist task details sent from WebCenter Portal, without incurring additional login prompts, WebCenter Portal and Oracle SOA Suite servers must be configured to a shared Oracle Single Sign-On server. For more information, see Configuring Oracle Access Manager.

For a secure connection you can configure WS-Security between SOA and WebCenter Portal. For information, see Configuring Web Services Security.

17.4 Specifying the BPEL Server Hosting WebCenter Portal Workflows

WebCenter Portal uses the BPEL server included with the Oracle SOA Suite to host internal workflows, such as worklists, portal membership notifications, portal subscription requests, and so on. To enable workflow functionality for WebCenter Portal, a connection to this BPEL server is required.

**Note:**

WebCenter Portal workflows must be deployed on the SOA managed server that WebCenter Portal is configured to use. See also, Back-End Requirements for WebCenter Portal Workflows in Installing and Configuring Oracle WebCenter Portal.

To configure a connection for worklist notifications:

1. Log in to Fusion Middleware Control, and navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings, then Application Configuration (Figure 17-1).
3. In the BPEL SOAP URL field, specify the name of the SOA server for worklists. The SOA server name that you specify here will contain the BPM worklists for WebCenter Portal.

5. Click Apply.

6. Restart WC_Portal, the managed server on which the WebCenter Portal application is deployed, to effect this change.
17.5 Configuring WebCenter Portal Workflow Notifications to be Sent by Email

WebCenter Portal provides human workflows (requiring human interaction), which are integrated with SOA workflows. The SOA server can configure email so that notifications are delivered to a user’s inbox, where the user can accept or reject the notification.

This section briefly explains how to enable email notifications and configure your mail server details to have WebCenter Portal workflow notifications sent to users by email. For a more detailed description, see Configuring Human Workflow Notification Properties in Administering Oracle SOA Suite and Oracle Business Process Management Suite.

1. Use Fusion Middleware Control to update SOA to enable email notifications. Under the SOA server, select SOA Administration, then Workflow Properties, as shown in Figure 17-3.

   Figure 17-3    SOA Administration - Workflow Config

2. With Email selected as the Notification Mode, provide valid email accounts to use, (Figure 17-4).

See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.
3. Click Go to the Messaging Driver page (Figure 17-4).

4. Select the Configure Driver icon for your User Messaging Email Driver (Figure 17-5).

5. To configure your email driver for notifications, see Configuring an Email Driver for Notifications in Using Oracle Managed File Transfer.

6. After you finish, save the configuration updates and restart the SOA managed server. (No configuration or restart is required for WebCenter Portal.)

When a user is invited to join a portal, they are sent an email including Accept or Reject links to the invitation.

Note:
To test notifications, in the portal administration settings Members page, you can add people and edit email notification messages. For more information, see Managing Members and Assigning Roles in a Portal in Building Portals with Oracle WebCenter Portal.

17.6 Excluding Webcenter Portal Workflows URL in OAM

When the Oracle SOA Suite BPEL server is configured to use OAM 11g R2 or later, WebCenter Portal Workflows endpoints need to be excluded from the OAM server.

To exclude WebCenter Portal Workflows endpoints in OAM 11g R2 or later:

1. Open the OAM Admin Console.
2. Navigate to your application domain.
3. Open the Resources tab, and click Create.
4. Create a resource of the type HTTP.

5. For Resource URL, enter:
   /soa-infra/services/default/CommunityWorkflows/**

6. Set the Protection Level to Excluded.

7. Create another HTTP type resource and specify the Resource URL as:
   /soa-infra/services/default/CommunityWorkflows*

8. Set the Protection Level to Excluded.

9. Click Apply.

10. Restart OHS.
Managing Portlet Producers

You can register a WSRP portlet producer by creating a connection to the producer. When you have registered a producer, its portlets can be consumed in WebCenter Portal. This chapter also describes how to deploy WSRP portlet producers.

This chapter includes the following topics:

- About Portlet Producers
- Registering WSRP Producers
- Testing WSRP Producer Connections
- Editing WSRP Producer Registration Details
- Using Portlet-Based Pagelets
- Deregistering WSRP Portlet Producers
- Deploying Portlet Producer Applications
- Managing Oracle PDK-Java Portlet Producers

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role in WebCenter Portal granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

18.1 About Portlet Producers

WebCenter Portal enables you to expose functionality from other applications in your portals by consuming portlets provided by those applications. A portal can consume portlets provided by a third party, such as a packaged-application vendor, as well as those that are built using WebCenter Portal or other Oracle products.

Table 18-1 lists some of the products supported as portlet producers within WebCenter Portal.

By default, users with the Administrator role have the AppConnectionManager role; and therefore, application administrators can configure Portlet Producers through the WebCenter Portal Administration Console. For more information on AppConnectionManager role, see Default Application Roles.
### Table 18-1  Supported Portlet Producers

<table>
<thead>
<tr>
<th>Portlet Producer</th>
<th>Supported?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle WebLogic Portal</td>
<td>Yes</td>
<td>For more information, see Exporting Java Portlets for Use on Other Systems in Portlet Development Guide for Oracle WebLogic Portal.</td>
</tr>
<tr>
<td>Oracle WebCenter Interaction</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>E-Business Suite application</td>
<td>Yes</td>
<td>For more information, see Integrating E-Business Suite Applications</td>
</tr>
<tr>
<td>Peoplesoft application</td>
<td>Yes</td>
<td>For more information, see Integrating PeopleSoft Applications.</td>
</tr>
<tr>
<td>JD Edwards application</td>
<td>Yes</td>
<td>For more information, see Integrating JD Edwards Applications.</td>
</tr>
</tbody>
</table>

**Note:**

WSRP producers built by a third party and consumed by WebCenter Portal should function correctly provided:

- The producer does not rely on any vendor-specific extensions to WSRP.
- The portlets do not make assumptions about the application in which they are consumed, for example by expecting a particular JavaScript method to exist in the page.

Application administrators can register and manage portlet producers at runtime through out-of-the-box administration pages or from any page that includes the Portlet Producer task flow.

System administrators can use Fusion Middleware Control or the WLST command-line tool to register and manage portlet producers for WebCenter Portal.

Consider the following while working with portlet producers:

- Some out-of-the-box producers are provided with WebCenter Portal: OmniPortlet and WSRP Tools. The following EAR files are packaged with WebCenter Portal:
  - portalTools.ear - OmniPortlet
  - wsrp-tools.ear - WSRP Tools

You can install the portalTools.ear and wsrp-tools.ear files using the registerOOTBProducers WLST command. For command syntax and examples, see registerOOTBProducers in WebCenter WLST Command Reference.
Before users can add JSR 286 portlets to a page, you must register the owning WSRP producers. See registerSampleProducers in WebCenter WLST Command Reference.

The Oracle Portlet Producer product (server) must be installed in the production environment and the wsrp-tools and portalTools URLs must be accessible. If the Oracle Portlet Producer is not installed, see Extending an Existing Domain in Installing and Configuring Oracle WebCenter Portal to install it in the production environment.

When you create a connection to a portlet producer, the producer is registered with WebCenter Portal and the connection is added to the connections.xml file. For WSRP producers, a web service connection is also created, which follows the naming convention, connectionname-wsconn. During registration, connection metadata is created in the Oracle Metadata Services (MDS) repository and in the producer being registered. When a producer's portlets are consumed, the user customizations are saved to the producer. During deregistration the producer connection and customizations are removed.

All post deployment connection configuration is stored in MDS. For more information, see Oracle WebCenter Portal Configuration Considerations. For detailed information about MDS, see Managing the Metadata Repository in Administering Oracle Fusion Middleware.

Portlet producer registration is dynamic. New portlet producers and updates to existing producers are immediately available in WebCenter Portal; it is not necessary to restart WebCenter Portal or the managed server.

To migrate producers from one instance to another, use the migration utilities described in Migrating a WSRP Producer Persistence Store in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

For information on securing portlet producers, see Securing a WSRP Producer.

For information about portlet producers created using Oracle PDK-Java, see Managing Oracle PDK-Java Portlet Producers.

18.2 Registering WSRP Producers

When you register a WSRP portlet producer, you provide basic information that describes the producer’s operational parameters. This information is used by WebCenter Portal to communicate with the producer and with the portlets through the producer.

WebCenter Portal supports both WSPR 1.0 and WSRP 2.0 producers. The WSRP 2.0 standard provides support for, among other things, interportlet communication and export and import of portlet customizations. You can leverage the benefits of WSRP 2.0 while building standard-based JSR 286 portlets.

WebCenter Portal provides several tools for registering WSRP producers with deployed applications.

This section includes the following topics:

- Registering a WSRP Producer Using Fusion Middleware Control
- Registering a WSRP Producer Using WLST
- Adding a Grant to the Policy Store for a Mapped User Identity
Registering a WSRP Portlet Producer in WebCenter Portal

You can also register portlet producers that have been developed using Oracle PDK-Java. For more information, see Registering an Oracle PDK-Java Portlet Producer.

18.2.1 Registering a WSRP Producer Using Fusion Middleware Control

You can register a WSRP portlet producer using Fusion Middleware Control.

To register a WSRP portlet producer using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for the WebCenter Portal application. See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. In the Add Portlet Producer Connection section, enter connection details for the WSRP producer.

   For detailed parameter information, see WSRP Producer Connection Parameters.

4. Use the Security section to specify the type of security token to use for the identity propagation/assertion.

   For detailed parameter information, see WSRP Producer Security Connection Parameters.

The security token with the propagated or asserted user information is represented as an XML element in the SOAP header. The security token and the SOAP message body are then digitally signed to prove the authenticity of the SOAP message origin from WebCenter Portal. WebCenter Portal supports six types of security token:

- WSS 1.0 Username Token Without Password
- WSS 1.0 Username Token With Password
- WSS 1.0 SAML Token
- WSS 1.0 SAML Token With Message Integrity
- WSS 1.0 SAML Token With Message Protection
- WSS 1.1 SAML Token With Message Protection

SAML is an abbreviation for Security Assertion Markup Language. For more information about each of these security tokens, see WSRP Producer Security Connection Parameters.

Note:

PeopleSoft WSRP producers support two profiles: Username Token With Password and SAML Token With Message Integrity. Other Oracle WSRP producers support all six profiles. For other WSRP containers, check with the specific vendor to determine the token formats they support.
5. Use the Keystore section to specify the location of the keystore that contains the certificate and private key that is used for signing some parts (security token and SOAP message body) of the SOAP message.

Only configure these properties if you want to override the configuration specified for the domain.

For detailed parameter information, see WSRP Producer Keystore Connection Parameters.

6. Click OK.

The new producer appears in the connection table.

18.2.2 Registering a WSRP Producer Using WLST

Use the WLST command registerWSRPProducer to create a connection to a WSRP portlet producer and register the producer with WebCenter Portal.

For command syntax and examples, see registerWSRPProducer in the WebCenter WLST Command Reference.

See Also:
deregisterWSRPProducer, listWSRPProducers, refreshProducer, registerOOTBProducers, registerSampleProducers

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

18.2.3 Adding a Grant to the Policy Store for a Mapped User Identity

If you are using the Default User field to map an alternative user identity you must also add a grant to the policy store.

To add a grant to the policy store do one of the following:

Note:
Replace MyAppID with the name of the client application, including the version number if any.

- Add the following grant directly to the policy store:

```xml
<grant>
  <grantee>
    <codesource>
      <url>file:${common.components.home}/modules/oracle.wsm.agent.common_11.1.1/wsm-agent.jar</url>
    </codesource>
  </grantee>
  <permissions>
    <permission>
      <class>oracle.wsm.security.WSIdentityPermission</class>
      <name>resource=MyAppID</name>
      <actions>assert</actions>
    </permission>
  </permissions>
</grant>
```
Grant the permission by running the `grantPermission` WLST command.

For example:

```java
grantPermission(codeBaseURL='file:${common.components.home}/modules/oracle.wsm.agent.common_11.1.1/wsm-agent.jar',
permClass='oracle.wsm.security.WSIdentityPermission',
permTarget='resource=MyAppID', permActions='assert')
```

For command syntax and examples, see `grantPermission` in *Infrastructure Security WLST Command Reference*. For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 18.2.4 Registering a WSRP Portlet Producer in WebCenter Portal

You can register a WSRP portlet producer in WebCenter Portal Administration.

To register a WSRP producer in WebCenter Portal:

1. Open WebCenter Portal Administration.
   
   For more information, see *Accessing the Settings Pages in WebCenter Portal Administration*.

2. Click **Tools and Services**, and then select **Portlet Producers**.
   
   Alternatively, use the following URL, and then select **Portlet Producers**:

   ```
   http://host:port/webcenter/portal/admin/settings/tools
   ```

3. On the menu bar, click **Register**.

4. In the Register Portlet Producer page, enter connection details for the WSRP portlet producer.
   
   For details, see *WSRP Producer Connection Parameters*.

5. Use the Security section to specify the type of security token to use for the identity propagation/assertion.
   
   For details, see *WSRP Producer Security Connection Parameters*.

The security token with the propagated or asserted user information is represented as an XML element in the SOAP header. The security token and the SOAP message body are then digitally signed to prove the authenticity of the SOAP message origin from the WebCenter Portal application. WebCenter Portal supports six types of security token:

- WSS 1.0 Username Token Without Password
- WSS 1.0 Username Token With Password
- WSS 1.0 SAML Token
- WSS 1.0 SAML Token With Message Integrity
- WSS 1.0 SAML Token With Message Protection
• WSS 1.1 SAML Token With Message Protection

SAML is an abbreviation for Security Assertion Markup Language. For more information about each of these security tokens, see WSRP Producer Security Connection Parameters.

6. Click Test to verify that the server details you provided are correct.

If the server is contactable, a success message is displayed. If the server is down or the host information is incorrect or no longer valid, a connection failure message is displayed.

**Note:**
The test performs a simple server (host/port) PING test. Anything in the path after the `host:port` is ignored. To verify whether the producer is accessible, access the producer’s test page in your browser. For more information, see Testing WSRP Producer Connections.

7. Click Ok.

### 18.2.5 WSRP Producer Connection Parameters

When you register a WSRP portlet producer, there are several connection parameters that you must set.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name to identify this portlet producer registration within WebCenter Portal. The name must be unique across all WebCenter Portal connection types. The name you specify here appears in the resource catalog (under the Portlets folder).</td>
</tr>
<tr>
<td>Producer Type</td>
<td>Select WSRP Producer.</td>
</tr>
</tbody>
</table>
### Table 18-2 (Cont.) WSRP Portlet Producer Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSDL URL</td>
<td>Enter the registration URL for the WSRP producer. The syntax varies according to your WSRP implementation. For example, possible URL formats for a portlet deployed to the Oracle WSRP container include:</td>
</tr>
<tr>
<td></td>
<td>- <a href="http://host:port/context_root/portlets/?WSDL">http://host:port/context_root/portlets/?WSDL</a> (WSRP 1.0 for backward compatibility)</td>
</tr>
<tr>
<td></td>
<td>Where:</td>
</tr>
<tr>
<td></td>
<td>- host is the server where your producer is deployed.</td>
</tr>
<tr>
<td></td>
<td>- port is the HTTP listener port number</td>
</tr>
<tr>
<td></td>
<td>- context_root is the web application’s context root</td>
</tr>
<tr>
<td></td>
<td>- portlets/wsrp(1</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>For WSRP producers, you can obtain this registration URL by accessing the producer test page at:</td>
</tr>
<tr>
<td></td>
<td>- <a href="http://host:port/context_root/info">http://host:port/context_root/info</a></td>
</tr>
<tr>
<td>Use Proxy?</td>
<td>Select if WebCenter Portal must use an HTTP proxy when contacting this producer. If selected, enter values for Proxy Host and Proxy Port.  A proxy is required when WebCenter Portal and the remote portlet producer are separated by a firewall and an HTTP proxy is needed to communicate with the producer.</td>
</tr>
<tr>
<td>Proxy Host</td>
<td>Enter the host name or IP address of the proxy server. Do not prefix http:// to the proxy server name.</td>
</tr>
<tr>
<td>Proxy Port</td>
<td>Enter the port number on which the proxy server listens. The default port is 80.</td>
</tr>
</tbody>
</table>
Table 18-2 (Cont.) WSRP Portlet Producer Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Execution Timeout (Seconds)</td>
<td>Enter a suitable timeout for communications with the producer, in seconds. For example, the maximum time the producer may take to register, deregister, or display portlets on WebCenter Portal pages. The default is 30 seconds. Individual portlets may define their own timeout period, which takes precedence over the value expressed here.</td>
</tr>
</tbody>
</table>

18.2.6 WSRP Producer Security Connection Parameters

When you register a WSRP portlet producer, there are some security settings that you can specify.

Table 18-3 WSRP Portlet Producer Security Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token Profile</td>
<td>Select the type of token profile to use for authentication with this WSRP producer. Select from: • WSS 1.0 SAML Token With Message Integrity • WSS 1.0 SAML Token With Message Protection • WSS 1.0 Username Token Without Password • WSS 1.0 Username Token With Password • WSS 1.0 SAML Token • WSS 1.1 SAML Token with Message Protection • None For a description of each of these options, see Table 18-4</td>
</tr>
<tr>
<td>Configuration</td>
<td>Select: • Default to use a default token profile configuration. • Custom to provide a custom Oracle Web Service Manager configuration. Additional security options display (including all the keystore properties) when you select Custom.</td>
</tr>
</tbody>
</table>
### Table 18-3  (Cont.) WSRP Portlet Producer Security Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issuer Name</td>
<td>Enter the name of the issuer of the SAML Token. For example: <a href="http://www.example.com">www.example.com</a> The issuer name is the attesting entity that vouches for the verification of the subject, and it must be a trusted SAML issuer on the producer end. Valid for: WSS 1.0 SAML Token With Message Integrity, WSS 1.0 SAML Token With Message Protection, WSS 1.0 SAML Token, WSS 1.1 SAML Token with Message Protection.</td>
</tr>
<tr>
<td>Default User</td>
<td>Enter a user name to assert to the remote producer when the user is not authenticated with the WebCenter Portal application. When unauthenticated, the identity anonymous is associated with the application user. The value anonymous may be inappropriate for the remote producer, so it may be necessary to specify an alternative identity here. Keep in mind though, that in this case, WebCenter Portal has not authenticated the user so the default user you specify should be a low privileged user in the remote producer. If the user has authenticated to the application, the user's identity is asserted rather than the default user. The remote WSRP producer must be set up to accept this information. You must also add a grant to the policy store as described in Adding a Grant to the Policy Store for a Mapped User Identity. Valid for: WSS 1.0 SAML Token With Message Integrity, WSS 1.0 SAML Token With Message Protection, WSS 1.0 SAML Token, WSS 1.1 SAML Token with Message Protection, WSS 1.0 Username Without Password.</td>
</tr>
<tr>
<td>Associated External Application (Username With Password)</td>
<td>If this producer uses an external application for authentication, use the Associated External Application dropdown list to identify the application. If the application you want is not listed, select Create New to define the external application now. Valid for: WSS 1.0 Username With Password only.</td>
</tr>
<tr>
<td>Token Profile</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>WSS 1.0 SAML Token With Message Integrity</td>
<td>This policy provides message-level integrity protection and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses WS-Security’s Basic 128 suite of asymmetric key technologies and SHA-1 hashing algorithm for message integrity.</td>
</tr>
<tr>
<td>WSS 1.0 SAML Token With Message Protection</td>
<td>This policy provides message-level protection (integrity and confidentiality) and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. The web service consumer includes a SAML token in the SOAP header and the confirmation type is sender-vouches. This policy uses WS-Security’s Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.</td>
</tr>
<tr>
<td>WSS 1.0 Username Token Without Password</td>
<td>This policy provides user name (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security 1.0 standard. Credentials (user name only) are included in outbound SOAP request messages through a WS-Security UsernameToken header. No password is included. Message protection is provided using WS-Security 1.0’s Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.</td>
</tr>
</tbody>
</table>
### Table 18-4  (Cont.) Token Profiles Options

<table>
<thead>
<tr>
<th>Token Profile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WSS 1.0 Username Token With Password</td>
<td>This policy provides user name (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security v1.0 standard. Both plain text and digest mechanisms are supported. This policy uses WS-Security’s Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanism for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption. Use this token profile if the WSRP producer has a different identity store. You will need to define an external application pertaining to the producer and associate the external application with this producer.</td>
</tr>
<tr>
<td>oracle/wss10_username_token_with_messageProtection_client_policy</td>
<td></td>
</tr>
<tr>
<td>WSS 1.0 SAML Token</td>
<td>This policy provides SAML-based authentication for outbound SOAP request messages in accordance with the WS-Security 1.0 standard. The policy propagates user identity and is typically used in intra departmental deployments where message protection and integrity checks are not required. This policy does not require any keystore configuration.</td>
</tr>
<tr>
<td>oracle/wss10_saml_token_client_policy</td>
<td></td>
</tr>
<tr>
<td>WSS 1.1 SAML Token with Message Protection</td>
<td>This policy provides message-level protection (integrity and confidentiality) and SAML token population for outbound SOAP requests in accordance with the WS-Security 1.1 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses the symmetric key technology for signing and encryption, and WS-Security’s Basic 128 suite of asymmetric key technologies for endorsing signatures.</td>
</tr>
<tr>
<td>oracle/wss11_saml_token_with_message_protection_client_policy</td>
<td></td>
</tr>
<tr>
<td>None</td>
<td>No token. If None is selected, no WS-Security header is attached to the SOAP message.</td>
</tr>
</tbody>
</table>

### 18.2.7 WSRP Producer Keystore Connection Parameters

When you register a WSRP portlet producer, you can specify the location of the keystore that contains the certificate and private key that is used for signing the SOAP message.

### Table 18-5  WSRP Producer Key Store Connection Parameters
### Table 18-5  (Cont.) WSRP Producer Key Store Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recipient Alias</td>
<td>Specify the keystore alias that is associated with the producer’s certificate. This certificate is used to encrypt the message to the producer.</td>
</tr>
<tr>
<td>Store Path</td>
<td>Enter the absolute path to the keystore that contains the certificate and the private key that is used for signing or encrypting the SOAP message (security token and message body). The signature, encryption, and recipient keys described in this table must be available in this keystore. The keystore file specified must be created using JDK's keytool utility.</td>
</tr>
<tr>
<td>Password</td>
<td>Provide the password to the keystore that was set when the keystore was created. The producer is not available if a password is not specified or incorrect.</td>
</tr>
<tr>
<td>Signature Key Alias</td>
<td>Enter the signature key alias. The <strong>Signature Key Alias</strong> is the identifier for the certificate associated with the private key that is used for signing.</td>
</tr>
<tr>
<td>Signature Key Password</td>
<td>Enter the password for accessing the key identified by the alias specified in <strong>Signature Key Alias</strong>.</td>
</tr>
<tr>
<td>Encryption Key Alias</td>
<td>Enter the key alias used by the producer to encrypt the return message. A valid value is one of the key aliases that is located in the specified keystore. This property is optional. If not specified, the producer uses the signing key for encrypting the return message.</td>
</tr>
<tr>
<td>Encryption Key Password</td>
<td>Enter the password for accessing the encryption key.</td>
</tr>
</tbody>
</table>

### 18.3 Testing WSRP Producer Connections

You can test a WSRP portlet producer connection to confirm that the producer is up and running.

1. Obtain the producer URL from:

   http://host:port/context_root/info

   For a WSRP v2 producer connection, the producer URL format is:

   http://host:port/context_root/portlets/wsrp2?WSDL

   For example:

For a WSRP v1 producer connection, the producer URL format is:
http://host:port/context_root/portlets/wsrp1?WSDL
For example:
http://example.com:7778/MyPortletApp/portlets/wsrp1?WSDL

2. Run the producer URL in a browser window.

18.4 Editing WSRP Producer Registration Details

WebCenter Portal provides several tools for editing WSRP portlet producer registration details.

This section includes the following topics:

- About Editing WSRP Producer Registration Details
- Editing WSRP Producer Registration Details Using Fusion Middleware Control
- Editing Producer Registration Details Using WLST
- Editing WSRP Producer Registration Details in WebCenter Portal
- Migrating WSRP Producer Metadata to a New WSDL URL
- Editing the Portlet Client Configuration

For information about how to edit Oracle PDK-Java portlet producer registration details, see Editing Oracle PDK-Java Portlet Producer Registration Details.

18.4.1 About Editing WSRP Producer Registration Details

You can update producer registration details at any time.

If a producer moves to a different location, then you must reconfigure any connections you have defined to this producer. You can use Fusion Middleware Control or WLST to edit the WDSL URL property.

To retain all the portlet customizations and personalizations that users make while working with WebCenter Portal, you must also migrate producer customizations and personalizations to the producer’s new location. Use the WLST commands exportPortletClientMetadata and importPortletClientMetadata to migrate portlet client metadata to a different location.

For more information, see Backing Up (Exporting) Portlet Client Metadata and Backing Up (Exporting) Portlet Client Metadata.

18.4.2 Editing WSRP Producer Registration Details Using Fusion Middleware Control

You can edit WSRP producer registration details using Fusion Middleware Control.

To update connection details for a portlet producer using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. From the list of services on the WebCenter Portal Service Configuration page, select Portlet Producers.
4. In the Manage Portlet Producer Connections section, select the producer you want to modify, and click **Edit**.

5. In the Edit Portlet Producer Connection section, modify connection details, as required.

For more information, see **WSRP Producer Connection Parameters**.

6. Click **OK**.

### 18.4.3 Editing Producer Registration Details Using WLST

Use the WLST command `setWSRPProducer` to edit WSRP portlet producer connection details.

For command syntax and examples, see `setWSRPProducer` in **WebCenter WLST Command Reference**.

For information on how to run WLST commands, see **Running Oracle WebLogic Scripting Tool (WLST) Commands**.

### 18.4.4 Editing WSRP Producer Registration Details in WebCenter Portal

In WebCenter Portal, you can access and revise many of the registration details provided for a portlet producer.

To edit portlet producer registration details in WebCenter Portal:

1. Open WebCenter Portal Administration.

For more information, see **Accessing the Settings Pages in WebCenter Portal Administration**.

2. Click **Tools and Services**, and then select **Portlet Producers**.

Alternatively, use the following URL, and then select **Portlet Producers**:

   `http://host:port/webcenter/portal/admin/tools`

3. Select the portlet producer that you want to edit.

4. On the menu bar, click **Edit**.

5. Edit the producer registration properties as required

   For details, see **WSRP Producer Connection Parameters** and **WSRP Producer Security Connection Parameters**.

   You cannot edit the **Producer Name** or **Producer Type**.

---

**Note:**

While it is possible to edit the value of the **WSDL URL**, for example, if the producer port has changed, you can point to a different producer only if the new producer has access to the persistence store of the old producer, or if the persistence store of the old producer has been migrated to that of the new producer. For more information, see **Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET)**.
6. When you have changed all the necessary settings, you can click **Test** to verify that the server details you provided are correct.

If the server is contactable, a success message is displayed. If the server is down or the host information is incorrect or no longer valid, a connection failure message is displayed.

**Note:**

The test performs a simple server (host/port) PING test. Anything in the path after the `host:port` is ignored. To verify whether the producer is accessible, access the producer’s test page in your browser. For more information, see [Testing WSRP Producer Connections](#).

7. When you are done, click **Ok**.

### 18.4.5 Migrating WSRP Producer Metadata to a New WSDL URL

If a producer moves to a different location, then to retain all the portlet customizations and personalizations that users have made while working with WebCenter Portal, you must also migrate the existing producer metadata to the new location. Any existing connections to the producer must be reconfigured to point to the new location.

To migrate WSRP producer metadata to a new URL endpoint:

1. Export the producer metadata, using the WLST command `exportPortletClientMetadata`.

   For command syntax and examples, see `exportPortletClientMetadata` in [WebCenter WLST Command Reference](#).

2. Change the producer’s WSDL URL, using the WLST command `setWSRPProducer`.

   For command syntax and examples, see `setWSRPProducer` in [WebCenter WLST Command Reference](#).

3. Import the producer metadata, using the WLST command `importPortletClientMetadata`.

   For command syntax and examples, see `importPortletClientMetadata` in [WebCenter WLST Command Reference](#).

### 18.4.6 Editing the Portlet Client Configuration

The `adf-config.xml` file contains configuration information for WebCenter Portal services. Portlet client configuration details are specified in the `adf-portlet-config` section of the file.

The following example shows the `adf-portlet-config` element of the `adf-config.xml` file.

```xml
<adf-portlet-config xmlns="http://xmlns.oracle.com/adf/portlet/config">
  <supportedLocales>
    <value>en</value>
    <value>fr</value>
    <value>de</value>
    <value>es</value>
  </supportedLocales>
</adf-portlet-config>
```
Application developers can edit the adf-config.xml file for an application and edit the portlet client configuration. However, this requires that the application be redeployed after the changes are made. To edit the configuration of the portlet client at runtime, without having to redeploy the application, you can use WLST commands.

Use the WLST command setPortletClientConfig to edit the portlet client configuration information. For command syntax and examples, see setPortletClientConfig section in WebCenter WLST Command Reference.

After using this WLST command, you must restart the Managed Server on which the WebCenter Portal application is deployed. For details, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

See Also:
listPortletClientConfig, getPortletClientConfig

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

18.5 Deregistering WSRP Portlet Producers
WebCenter Portal provides several tools for deregistering WSRP portlet producers. This section includes the following topics:

- About Deregistering Portlet Producers
- Deregistering a WSRP Portlet Producer Using Fusion Middleware Control
- Deregistering a WSRP Portlet Producer Using WLST
- Deregistering a WSRP Portlet Producer in WebCenter Portal

For information about how to deregister Oracle PDK-Java portlet producers, see Deregistering an Oracle PDK-Java Portlet Producer.

18.5.1 About Deregistering Portlet Producers
You can deregister a WSRP portlet producer at any time.

Before deregistering a producer, consider the impact to WebCenter Portal as portlets associated with a deregistered producer no longer work. Check the Portlets Producer Invocation metric to see how frequently the producer is being used. For more information, see Viewing Performance Metrics Using Fusion Middleware Control.
When you deregister a producer, registration data is removed from both WebCenter Portal and the remote producer:

- **WebCenter Portal** - The producer connection is deleted and producer metadata is also deleted.
- **Remote producer** - Portlet instances are deleted (not the portlets themselves).

Portlet instances are not removed from WebCenter Portal pages. In place of the portlet, users see a **Portlet unavailable** message.

---

**Note:**

Consider also deleting the external application associated with this portlet producer if the application's sole purpose was to support this producer. See [Deleting External Application Connections](#).

---

### 18.5.2 Deregistering a WSRP Portlet Producer Using Fusion Middleware Control

You can deregister a WSRP portlet producer using Fusion Middleware Control. To deregister a portlet producer:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   
   See [Navigating to the Home Page for WebCenter Portal](#).

2. From the **WebCenter Portal** menu, select **Settings** and then **Service Configuration**.

3. From the list of services on the WebCenter Portal Service Configuration page, select **Portlet Producers**.

4. Select the name of the producer you want to deregister, and click **Delete**.

The connection details are removed. Portlets associated with this producer are no longer accessible within WebCenter Portal.

### 18.5.3 Deregistering a WSRP Portlet Producer Using WLST

Use WLST commands to deregister a WSRP portlet producer. Use the WLST command `deregisterWSRPProducer` to deregister a WSRP portlet producer connections.

For command syntax and examples, see `deregisterWSRPProducer` in [WebCenter WLST Command Reference](#).

Use the following WLST commands to deregister the out-of-the-box or sample producers provided with WebCenter Portal:

- **Out-of-the-box producers** - `deregisterOOTBProducers`
  
  For command syntax and examples, see `deregisterOOTBProducers` in [WebCenter WLST Command Reference](#).

- **Sample producers** - `deregisterSampleProducers`
  
  For command syntax and examples, see `deregisterSampleProducers` in [WebCenter WLST Command Reference](#).
For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

18.5.4 Deregistering a WSRP Portlet Producer in WebCenter Portal

If you no longer want to use a particular producer in WebCenter Portal, you can deregister the producer.

To deregister a WSRP portlet producer in WebCenter Portal:

1. Open WebCenter Portal Administration.
   
   For more information, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select Portlet Producers.

   Alternatively, use the following URL, and then select Portlet Producers:
   
   http://host:port/webcenter/portal/admin/settings/tools

3. Select the portlet producer that you want to deregister.

4. From the menu bar, click Deregister.

5. In the Delete Confirmation dialog, click Deregister to complete the deregistration process.

18.6 Deploying Portlet Producer Applications

After developing a Portlet Producer application in JDeveloper, you can deploy that application to any Oracle WebLogic Managed Server instance that is configured to support WebCenter Portal portlet producers.

To deploy an application to a managed server, you can use Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Administration Console, or WLST.

For more information about these administration tools, see Oracle WebCenter Portal Administration Tools.

You can also deploy a Portlet Producer application from within JDeveloper.

This section includes the following topics:

- Preparing Portlet Producer Applications for Deployment
- Deploying a Portlet Producer Application Using Fusion Middleware Control
- Deploying a Portlet Producer Application Using Oracle WebLogic Server Administration Console
- Deploying a Portlet Producer Application Using WLST
- Deploying a Portlet Producer Application Using Oracle JDeveloper

For more information about deploying applications, see Deploying Applications in Administering Oracle Fusion Middleware.
18.6.1 Preparing Portlet Producer Applications for Deployment

WebCenter Portal provides a predeployment tool that adds the required configuration to a portlet producer application’s EAR file to expose the portlets over WSRP.

The predeployment tool must be run in the following circumstances:

- You created the application’s WAR file outside of JDeveloper.
- You created the application’s WAR file in JDeveloper, but selected to not expose the application as a WSRP application. That is, you selected No in the Select deployment type dialog.

To add the required configuration to a portlet producer application’s EAR file to expose the portlets over WSRP, run the WSRP producer predeployment tool located in the Middleware directory at \WCP_ORACLE_HOME\webcenter\modules\oracle.portlet.server_11.1.1, as follows:

```java
java -jar wsrp-predeploy.jar source EAR target EAR
```

For JSR 286 portlets developed with servlet version 2.3, you must specify web proxies using the following command:

```java
java -Dhttp.proxyHost=proxy host -Dhttp.proxyPort=proxy port -jar
wsrp-predeploy.jar source EAR target EAR
```

where:

- `proxy host` is the server to which your producer has been deployed.
- `proxy port` is the HTTP Listener port.
- `wsrp-predeploy.jar` is located in the `WCP_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1` directory.
- `source EAR` is the name of the JSR 286 EAR file.
- `target EAR` file is the name of the new EAR file to be created. If the file name for the targeted EAR file is not specified, then a new EAR file called `WSRP-source EAR` is produced.

The `wsrp-predeploy.jar` predeployment tool makes all the necessary changes to a JSR 286 portlet to be able to deploy it to the Oracle portlet container and expose it as a WSRP producer. Here are some examples of what the predeployment tool does:

- Creates the `wsdldeploy` directory in the `java.io.tmpdir` folder.
  - On UNIX, the default value of this property is `/tmp` or `/var/tmp`
  - On Microsoft Windows, the default value of this property is `c:\temp`.
- Unpacks the EAR file into `wsdldeploy/EAR`.
- Unpacks the WAR files into `wsdldeploy/warfilename.war/`.
- Inserts `WEB-INF/WSDLs` into the unpacked application.
- Modifies `WEB-INF/web.xml` in the unpackaged WAR files.
- Inserts or modifies `WEB-INF/webservices.xml` in the WAR files.
• Inserts or modifies WEB-INF/oracle-webservices.xml in the WAR files.
• Repackages the WARs and builds a new EAR file.

In the following example a web proxy is specified:

```java
java -Dhttp.proxyHost=myhttpproxy.com -Dhttp.proxyPort=80 -jar wsrp-predeploy.jar wsrp-samples.ear
```

This example produces WSRP-wsrp-samples.ear.

### 18.6.2 Deploying a Portlet Producer Application Using Fusion Middleware Control

You can deploy a Portlet Producer using Fusion Middleware Control.

When deploying a Portal Framework application using Fusion Middleware Control you must know the location of the application archive, and whether a deployment plan exists for the application.

To deploy a Portlet Producer application using Fusion Middleware Control:

1. Log in to Fusion Middleware Control.
2. In the Target Navigation pane, expand WebLogic Domain and click the domain in which your target Managed Server was created.
3. From the WebLogic Domain menu, select Deployments.
   
   The Select Archive page displays.
5. In the Archive or Exploded Directory section, do one of the following:
   
   • Select Archive is on the machine where this web browser is running and enter the location of the archive or click Browse to find the archive file.
   
   • Select Archive or exploded directory is on the server where Enterprise Manager is running and enter the location of the archive or click Browse to find the archive file.
6. In the Deployment Plan section, do one of the following:
   
   • Select Create a new deployment plan when deployment configuration is done to automatically create a new deployment plan after the redeployment process.
   
   • Select Deployment plan is on the machine where this web browser is running and enter the path to the plan or click Browse to find the plan.
   
   • Select Deployment plan is on the server where Enterprise Manager is running and enter the path to the plan or click Browse to find the plan.
7. Click Next.
   
   The Select Target page displays.
8. Select the target server(s) to deploy the application and click Next.
   
   The Application Attributes page displays.
9. Click Next.
The Deployment Settings page displays.

10. Click the edit icon for Configure ADF Connections to check connection settings associated with the Portal Framework application.

The Configure ADF Connections page displays.

11. Click the edit icon for each connection and check that the connection settings are correct for the target environment (for example, staging or production).

For WSRP producers, two connections are shown for each producer: a WSRP Producer and a Web Service connection. Typically only the Web Service connection must be changed to the target producer, and this contains four URL endpoints, all of which must be changed. The WSRP Producer connection only configures proxy settings that can be set independent of the default proxy setting for the application server, if this is required.

If any connections to portlet producers in the EAR file must be changed to point to producers in the target deployment environment, it is important to change them here. This ensures the portlet customizations are imported to the target producers as the application starts.

Note:

If any target producers are not reachable as the application starts for the first time, the import fails. After the portlet producer becomes reachable, restart the application and try to import again.

If you do not modify producer connections using the Configure ADF Connections page and they are pointing to incorrect but reachable producer locations (for example, a producer in a development environment), portlets are imported to the incorrect producers.

To correct this, after deployment use Fusion Middleware Control or WLST commands to modify the producer URL endpoint, and then redeploy the application.

12. If required, specify additional deployment options such as the Web modules to include in your application or security migration settings.

13. In the Deployment Plan section, click Edit Deployment Plan to optionally edit the currently selected Deployment Plan.

14. In the Deployment Plan section, click Save Deployment Plan to optionally save the currently selected Deployment Plan for reuse when you redeploy the application.

15. To start the deployment process, click Deploy.

Fusion Middleware Control displays processing messages.

16. Click Close in the Deployment Succeeded page.

The portlet producer application (and its deployment plan) is now deployed on the WebLogic Managed Server instance.

17. If you restart the WebLogic Managed Server on which you deployed the application during your Fusion Middleware Control session, refresh the Farm from the Farm menu to update the application status.
If you configured connections during deployment, these are not stored as part of the deployment plan. You must specify these connection details again the next time you deploy.

18.6.3 Deploying a Portlet Producer Application Using Oracle WebLogic Server Administration Console

You can use the WebLogic Server Administration Console to deploy a Portlet Producer application. However, the Console does not offer a means to change ADF connections, including the essential MDS connection.

To use the Console to deploy a Portlet Producer application, the MDS connection in the EAR file must be configured to the target deployment repository. Follow steps 1-5 in Deploying a Portlet Producer Application Using WLST then follow the steps below to deploy a Portlet Producer application using the WLS Administration Console.

---

**Note:**

Oracle does not recommend deploying Portlet Producer applications to any of the preconfigured Managed Servers created during the installation, or to the Administration Server. Create a new Managed Server instance before deploying, or optionally deploy to the WC_Portlet server.

---

To deploy a Portlet Producer application using the WLS Administration Console:

1. Log in to the WLS Administration Console.
   
   For information on logging into the WLS Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, click **Deployments**.

   The Summary of Deployments page displays.

3. Click **Install**.

   The Install Application Assistant page displays.

4. Using the Install Application Assistant **Path** field, locate the EAR file that corresponds to the Portlet Producer application you want to install. Select the EAR file and click **Next**.

   Page 2 of the Install Application Assistant page displays.

5. Select **Install this deployment as an application** and click **Next**.

   Page 3 of the Install Application Assistant displays.

6. Select the deployment target to which to deploy the application and click **Next**.

7. Review the configuration settings you specified, and click **Finish** to complete the installation.

   To change a producer URL after deployment, use Fusion Middleware Control or WLST commands to modify the producer URL endpoint, and then redeploy the application.
18.6.4 Deploying a Portlet Producer Application Using WLST

You can deploy a Portlet Producer application using the WLST command line.

To deploy a Portlet Producer application using the WLST command line, WLST must be connected to the Administration Server. You must invoke the deploy command on the computer that hosts the administration server.

To deploy a Portlet Producer Application using WLST:

1. Start the WLST shell.
   
   For information on starting the WLST shell, see Oracle WebLogic Scripting Tool (WLST).

2. Connect to the Administration Server of your Oracle WebCenter Portal installation:
   
   ```bash
   connect("user_name","password","host_name:port")
   ```
   
   Where:
   - `user_name` is the user name to access the Administration server (for example, weblogic).
   - `password` is the password to access the Administration server (for example, welcome1).
   - `host_name` is the host name of the Administration Server (for example, myserver.example.com).
   - `port` is the port number of the Administration Server (7001 by default)

   You should see the following message:
   
   Successfully connected to Admin Server 'AdminServer' that belongs to domain 'wc_domain'.

3. Retrieve the MDS configuration by running the following command:
   
   ```bash
   archive = getMDSArchiveConfig(fromLocation='ear_file_path')
   ```
   
   Where `ear_file_path` is the path and file name of the EAR file you are deploying (for example, /tmp/myEarFile.ear). For more information, see `getMDSArchiveConfig` in WLST Command Reference for Infrastructure Components.

4. After retrieving the MDS configuration information from the EAR file, you must set the proper MDS schema information according to your Oracle WebCenter Portal setup (for example, your application might be using a database connection based on a specific schema). To set the MDS schema information, run the following command:
   
   ```bash
   archive.setAppMetadataRepository(repository='repository',partition='partition',type='DB',jndi='jndi')
   ```
   
   Where:
   - `repository` is the name of the database schema (for example, mds-Feb23demo).
• *partition* is the individual entity in the repository to allow each application to have its own namespace (for example, webcenter).

• *jndi* is the path and name used to allow access by the application server's other components (for example, "jdbc/mds/Feb23demo").

5. After setting the MDS repository information, save the MDS configuration information with the following command:

```java
archive.save()
```

6. Deploy the Portlet Producer application using the WLST *deploy* command.

```java
deploy(app_name, path, [targets] [stageMode], [planPath], [options])
```

Where:

• *appName* is the name of the Portlet Producer application to be deployed (for example, "myPortlets").

• *path* is the path to the EAR file to be deployed (for example, "/tmp/customApp.ear").

• *targets* specifies the target Managed Server(s) to which to deploy the application (for example, "AppServer"). You can optionally list multiple comma-separated targets. To enable you to deploy different modules of the application archive on different servers, each target may be qualified with a module name, for example, "module1@server1". This argument defaults to the server to which WLST is currently connected.

• *stageMode* optionally defines the staging mode for the application you are deploying. Valid values are "stage", "nostage", and "external_stage".

• *planPath* optionally defines the name of the deployment plan file. The file name can be absolute or relative to the application directory. This argument defaults to the "plan/plan.xml" file in the application directory, if one exists.

• *options* is an optional comma-separated list of deployment options, specified as name-value pairs. For more information about valid options, see WLST *deploy* in *WLST Command Reference for WebLogic Server*.

When you see the following message, the application has been successfully deployed and is ready to be accessed:

```
Completed the deployment of Application with status completed
```
Note:
Since WLST does not prompt you to modify connections during deployment, the connection information in the EAR file is used to identify the target producer location in the last start-up. If that location is unreachable, correct the location after deploying the application by bringing up the target producers and restarting the application. Migration of portlet customizations starts automatically.

If the producer connections point to incorrect producers (for example, development producers), and those producers are reachable, the migration of portlet customizations starts using those producers. Since the migration completes, although incorrectly, restarting the application does not automatically restart the migration process.

To remedy this, after deployment, use Fusion Middleware Control or WLST commands to modify the producer URL endpoint, and then redeploy the application.

18.6.5 Deploying a Portlet Producer Application Using Oracle JDeveloper

You can deploy a Portlet Producer application to an Oracle WebLogic Managed Server instance directly from the development environment using Oracle JDeveloper, if you have the necessary credentials to access the WebLogic server.

For more information, see the Deploying Portlet Producers in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

18.7 Managing Oracle PDK-Java Portlet Producers

System administrators can use Fusion Middleware Control or the WLST command-line tool to register and manage Oracle PDK-Java portlet producers for WebCenter Portal.

This section includes the following topics:

- Registering an Oracle PDK-Java Portlet Producer
- Testing Oracle PDK-Java Producer Connections
- Editing Oracle PDK-Java Portlet Producer Registration Details
- Deregistering an Oracle PDK-Java Portlet Producer

18.7.1 Registering an Oracle PDK-Java Portlet Producer

You can register an Oracle PDK-Java portlet producer using Fusion Middleware Control, WLST commands, or WebCenter Portal Administration.

Registering an Oracle PDK-Java Portlet Producer Using Fusion Middleware Control

To register an Oracle PDK-Java portlet producer using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.

   See Navigating to the Home Page for WebCenter Portal.
2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. In the Add Portlet Producer Connection section, enter connection details for the Oracle PDK-Java portlet producer.
   For detailed parameter information, see Oracle PDK-Java Portlet Producer Connection Parameters.

4. Click OK.
   The new producer appears in the connection table.

Registering an Oracle PDK-Java Portlet Producer Using WLST
Use the WLST command registerPDKJavaProducer to create a connection to an Oracle PDK-Java portlet producer and register the producer with WebCenter Portal.
For command syntax and examples, see registerPDKJavaProducer in WebCenter WLST Command Reference.

See Also:
deregisterPDKJavaProducer, listPDKJavaProducers,
refreshProducer

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Registering an Oracle PDK-Java Portlet Producer in WebCenter Portal
To register an Oracle PDK-Java portlet producer in WebCenter Portal:

1. Open WebCenter Portal Administration.
   For more information, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select Portlet Producers.
   Alternatively, use the following URL, and then select Portlet Producers:
   http://host:port/webcenter/portal/admin/settings/tools

3. On the menu bar, click Register.

4. In the Register Portlet Producer page, enter connection details for the Oracle PDK-Java portlet producer. For details, see Oracle PDK-Java Portlet Producer Connection Parameters.

5. Click Test to verify that the server details you provided are correct.
   If the server is contactable, a success message is displayed. If the server is down or the host information is incorrect or no longer valid, a connection failure message is displayed.
Note:
The test performs a simple server (host/port) PING test. Anything in the path after the host:port is ignored. To verify whether the producer is accessible, access the producer's test page in your browser. For more information, see Testing Oracle PDK-Java Producer Connections.

6. Click Ok.

18.7.2 Testing Oracle PDK-Java Producer Connections
To verify an Oracle PDK-Java portlet producer connection, run the producer URL in a browser window.

Use the following format:

http://host:port/context-root/providers/producer_name

For example:

http://domain.example.com:7778/axyz/providers/sample

18.7.3 Editing Oracle PDK-Java Portlet Producer Registration Details
WebCenter Portal provides several tools for editing Oracle PDK-Java portlet producer registration details.

Editing Oracle PDK-Java Portlet Producer Registration Details Using Fusion Middleware Control

1. Log in to Fusion Middleware Control and navigate to the home page for the WebCenter Portal application. For more information, see: Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Settings and then Service Configuration.

3. From the list of services on the WebCenter Portal Service Configuration page, select Portlet Producers.

4. In the Manage Portlet Producer Connections section, select the producer you want to modify, and click Edit.

5. In the Edit Portlet Producer Connection section, modify connection details, as required.

For more information, see Oracle PDK-Java Portlet Producer Connection Parameters.

6. Click OK.

Editing Oracle PDK-Java Portlet Producer Registration Details Using WLST
Use the WLST command setPDKJavaProducer to edit Oracle PDK-Java portlet producer connection details.

For command syntax and examples, see setPDKJavaProducer in WebCenter WLST Command Reference.
For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

**Editing Oracle PDK-Java Portlet Producer Registration Details in WebCenter Portal**

In WebCenter Portal, you can access and revise many of the registration details provided for a portlet producer.

1. Open WebCenter Portal Administration.
   For more information, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click **Tools and Services**, and then select **Portlet Producers**.
   Alternatively, use the following URL, and then select **Portlet Producers**:
   
   ```
   http://host:port/webcenter/portal/admin/tools
   ```

3. Select the portlet producer that you want to edit.

4. On the menu bar, click **Edit**.

5. Edit the producer registration properties as required.
   For details, see Oracle PDK-Java Portlet Producer Connection Parameters.
   You cannot edit the **Producer Name** or **Producer Type**.

   **Note:**
   While it is possible to edit the value of the URL Endpoint, for example, if the producer port has changed, you can point to a different producer only if the new producer has access to the persistence store of the old producer, or if the persistence store of the old producer has been migrated to that of the new producer. For more information, see Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET).

6. When you have changed all the necessary settings, you can click **Test** to verify that the server details you provided are correct.
   If the server is contactable, a success message is displayed. If the server is down or the host information is incorrect or no longer valid, a connection failure message is displayed.

   **Note:**
   The test performs a simple server (host/port) PING test. Anything in the path after the `host:port` is ignored. To verify whether the producer is accessible, access the producer's test page in your browser. For more information, see Testing Oracle PDK-Java Producer Connections.

**18.7.4 Deregistering an Oracle PDK-Java Portlet Producer**

WebCenter Portal provides several tools for deregistering WSRP portlet producers.

You can deregister a WSRP portlet producer at any time.
Before deregistering a producer, consider the impact to WebCenter Portal as portlets associated with a deregistered producer no longer work. Check the Portlets Producer Invocation metric to see how frequently the producer is being used. For more information, see Viewing Performance Metrics Using Fusion Middleware Control.

When you deregister a producer, registration data is removed from both WebCenter Portal and the remote producer:

- WebCenter Portal - The producer connection is deleted and producer metadata is also deleted.
- Remote producer - Portlet instances are deleted (not the portlets themselves).

Portlet instances are not removed from WebCenter Portal pages. In place of the portlet, users see a Portlet unavailable message.

Note:
Consider also deleting the external application associated with this portlet producer if the application’s sole purpose was to support this producer. See Deleting External Application Connections.

Deregistering an Oracle PDK-Java Portlet Producer Using Fusion Middleware Control

To deregister an Oracle PDK-Java portlet producer using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal.
   See Navigating to the Home Page for WebCenter Portal
2. From the WebCenter Portal menu, select Settings and then Service Configuration.
3. From the list of services on the WebCenter Portal Service Configuration page, select Portlet Producers.
4. Select the name of the producer you want to deregister, and click Delete.
   The connection details are removed. Portlets associated with this producer are no longer accessible within WebCenter Portal.

Deregistering an Oracle PDK-Java Portlet Producer Using WLST

Use the WLST command deregisterPDKProducer to deregister an Oracle PDK-Java portlet producer.

For command syntax and examples, see deregisterPDKJavaProducer in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Deregistering an Oracle PDK-Java Portlet Producer in WebCenter Portal

To deregister an Oracle PDK-Java portlet producer in WebCenter Portal

1. Open WebCenter Portal Administration.
For more information, see Accessing the Settings Pages in WebCenter Portal Administration.

2. Click Tools and Services, and then select Portlet Producers. Alternatively, use the following URL, and then select Portlet Producers:

   http://host:port/webcenter/portal/admin/settings/tools

3. Select the portlet producer that you want to deregister.

4. On the menu bar, click Deregister.

5. In the Delete Confirmation dialog, click Deregister to complete the deregistration process.

18.7.5 Oracle PDK-Java Portlet Producer Connection Parameters

When you register an Oracle PDK-Java portlet producer, there are several connection parameters that you must set.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Enter a unique name that identifies this portlet producer registration within WebCenter Portal. The name must be unique across all WebCenter Portal connection types. The name you specify here appears in the resource catalog (under the Portlets folder).</td>
</tr>
<tr>
<td>Producer Type</td>
<td>Select Oracle PDK-Java Producer.</td>
</tr>
</tbody>
</table>
| URL End Point       | Enter the Oracle PDK-Java producer’s URL using the following syntax: http://host:port/context_root/providers  
Where:  
• host is the server where the producer is deployed  
• port is the HTTP Listener port number  
• context_root is the Web application’s context root  
• providers is static text  
For example  
http://myHost.com:7778/myEnterprisePortlets/providers |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service ID</td>
<td>Enter a unique identifier for this producer. PDK-Java enables you to deploy multiple producers under a single adapter servlet. Producers are identified by their unique service ID. A service ID is required only if the service ID is not appended to the URL endpoint. For example, the following URL endpoint requires sample as the service ID: <a href="http://domain.example.com:7778/axyz/providers">http://domain.example.com:7778/axyz/providers</a>. However, the following URL endpoint, does not require a service ID: <a href="http://domain.example.com:7778/axyz/providers/sample">http://domain.example.com:7778/axyz/providers/sample</a>. The service ID is used to look up a file called service_id.properties, which defines the characteristics of the producer, such as whether to display its test page. Use any value to create the service ID. When no Service ID is specified, _default.properties is used.</td>
</tr>
<tr>
<td>Use Proxy?</td>
<td>Select this check box if WebCenter Portal must use an HTTP proxy when contacting this producer. If selected, enter values for Proxy Host and Proxy Port. A proxy is required if WebCenter Portal and the remote portlet producer are separated by a firewall and an HTTP proxy is needed for communication with the producer.</td>
</tr>
<tr>
<td>Proxy Host</td>
<td>Enter the host name or IP address of the proxy server. Do not prefix http:// to the proxy server name.</td>
</tr>
<tr>
<td>Proxy Port</td>
<td>Enter the port number on which the proxy server listens. The default port is 80.</td>
</tr>
<tr>
<td>Associated External Application</td>
<td>If one of this producer’s portlets requires authentication, use the Associated External Application drop-down to identify the correct external application. If the application you want is not listed, select Create New to define the external application now. See Also Registering External Applications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Establish Session?</td>
<td>Select to enable a user session when executing portlets from this producer. When sessions are enabled, they are maintained on the producer server. This allows the portlet code to maintain information in the session. Message authentication uses sessions, so if you specify a shared key, you must also select this option. For sessionless communication between the producer and the server, do not select this option.</td>
</tr>
<tr>
<td>Default Execution Timeout (Seconds)</td>
<td>Enter a suitable timeout for communications with the producer, in seconds. For example, the maximum time the producer may take to register, deregister, or display portlets on WebCenter Portal pages. This defaults to 30 seconds. Individual portlets may define their own timeout period, which takes precedence over the value expressed here.</td>
</tr>
<tr>
<td>Subscriber ID</td>
<td>Enter a string to identify the consumer of the producer being registered. When a producer is registered with WebCenter Portal, a call is made to the producer. During the call, the consumer (WebCenter Portal in this instance) passes the value for Subscriber ID to the producer. If the producer does not see the expected value for Subscriber ID, it might reject the registration call.</td>
</tr>
<tr>
<td>Shared Key</td>
<td>Enter a shared key to use for producers that are set up to handle encryption. The shared key is used by the encryption algorithm to generate a message signature for message authentication. Note that producer registration fails if the producer is set up with a shared key and you enter an incorrect shared key here. The shared key can contain between 10 and 20 alphanumeric characters. The Shared Key is also known as the HMAC key.</td>
</tr>
</tbody>
</table>
Oracle WebCenter Portal’s Pagelet Producer (previously called Oracle WebCenter Ensemble) provides a collection of useful tools that facilitate dynamic pagelet development and deployment. The Pagelet Producer proxy provides users with external access to internal resources including internal applications and secured content. Using the Pagelet Producer, you can expose WSRP portlets and OpenSocial gadgets as pagelets for use in any web page or application.

This chapter describes how to register, edit and deploy pagelets using the Pagelet Producer Administrative Console.

This chapter includes the following topics:

• About Pagelet Producer
• Registering Pagelet Producer
• Registering WSRP Portlet Producers in Pagelet Producer
• Configuring the Trust Service Identity Asserter
• Managing Import, Export, Backup and Recovery of Pagelet Producer Components

For information about developing and deploying pagelets, see Working with Pagelets in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through Oracle WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

19.1 About Pagelet Producer

This section is an introduction to Pagelet Producer concepts and features and includes the following topics:

• Overview
• Using the Pagelet Producer Console
• Exposing WSRP Portlets
• Exposing OpenSocial Gadgets
19.1.1 Overview

Pagelet Producer (previously known as Oracle WebCenter Ensemble) can be used to create pagelets to expose platform-specific portlets in other web environments, including WebCenter Portal applications. Pagelet Producer provides a collection of useful tools and features that facilitate dynamic pagelet development. For information about Pagelet Producer architecture, component descriptions, and Pagelet Producer requirements, see Introduction to Pagelets in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Pagelet Producer registration is dynamic. Additions and updates to existing producers are immediately available; in most cases, it is not necessary to restart the application or the managed server.

Note:
In the current release, only a single administrator can modify Pagelet Producer administrative settings at any given time. Concurrent edits will result in only one edit succeeding. However, data integrity will always be preserved.

19.1.2 Using the Pagelet Producer Console

The Pagelet Producer Console is a browser-based administration tool used to create and manage the various objects in your Pagelet Producer deployment. From the Console you can register web applications as resources, create pagelets, manage proxy and transformation settings, and more.

• From WebCenter Portal, you can access the Pagelet Producer Console from the Shared Assets page.

Note:
Pagelet Producer Console supports the standard administration languages and Dutch only. If you configure the browser language to something other than one of these languages, it will revert to the language defined for the current server.

• The Pagelet Producer Console is also accessible from any web browser at the following URL:

http://host:port/pagelets/admin

The Pagelet Producer Console can also be launched in accessibility mode at:

http://host:port/pagelets/admin/accessible

For more information about using the Pagelet Producer Console to configure Pagelet Producer, see Configuring Pagelet Producer Settings in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.
19.1.3 Exposing WSRP Portlets

Using Pagelet Producer, you can expose WSRP portlets as pagelets for use in any web page or application.

After setting up Pagelet Producer as described in Configuring Pagelet Producer Settings in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper, follow the steps below to import WSRP portlets:

1. Register the portlet producer with the Pagelet Producer as described in Registering WSRP Portlet Producers in Pagelet Producer.

2. This automatically creates a resource and pagelets in the Pagelet Producer Console based on the portlet definitions for the producer. For details on resource settings, see Creating Resources in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

3. To modify the imported resource or the associated pagelets, you must make a copy of the imported resource. For details, see Using Portlet-Based Pagelets.

You can also use the same steps to expose Oracle PDK-Java portlets.

19.1.4 Exposing OpenSocial Gadgets

Using Pagelet Producer, you can expose OpenSocial gadgets as pagelets for use in any web page or application. For more information, see How to Configure OpenSocial Resources (OpenSocial Gadget Producers) and How to Configure OpenSocial Settings in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

19.1.5 Exposing WebCenter Interaction Portlets

Pagelet Producer can be used as a portlet provider for Oracle WebCenter Interaction. There are several configuration pages that allow you to define CSP settings for use with Oracle WebCenter Interaction. For details on configuring these settings and objects, see How to Configure a WCI Data Source and Consuming a Pagelet in WebCenter Interaction (an Example) in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

1. Configure Pagelet Producer settings for use with the Oracle WebCenter Interaction Credential Mapper, SOAP API service and image service on the CSP Settings page in the Pagelet Producer Console.

2. Set up the Pagelet Producer's connection to the server hosting the portlet code by creating a "CSP" resource.

3. Create pagelets for Oracle WebCenter Interaction portlets.

19.2 Registering Pagelet Producer

This section describes how to register and configure Pagelet Producer using Fusion Middleware Control and WLST commands.

This section includes the following subsections:

- Registering Pagelet Producer Using Fusion Middleware Control
- Registering Pagelet Producer Using WLST
• Configuring the Pagelet Producer Service for WebCenter Portal
• Registering Pagelet Producer Using WebCenter Portal
• Redeploying Pagelet Producer to a Different Context

For information about developing and deploying pagelets, see Working with Pagelets in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

19.2.1 Registering Pagelet Producer Using Fusion Middleware Control

To register Pagelet Producer using Fusion Middleware Control:

1. Log in to Fusion Middleware Control and navigate to the WebCenter Portal home page. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Register Producer.

3. Enter connection details for Pagelet Producer (Table 19-1).

Table 19-1  Pagelet Producer Connection Parameters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>A unique name to identify this Pagelet Producer instance within the application. The name must be unique across all WebCenter Portal connection types. The name specified here appears in Composer under the UI Components &gt; Pagelet Producers folder (by default).</td>
</tr>
<tr>
<td>Producer Type</td>
<td>Select Pagelet Producer.</td>
</tr>
<tr>
<td>Server URL</td>
<td>The URL to Pagelet Producer. The URL must include a fully-qualified domain name. Use the following syntax: &lt;protocol&gt;://&lt;host_name&gt;:&lt;port_number&gt;/pagelets/ For example: <a href="http://myhost.com:7778/pagelets/">http://myhost.com:7778/pagelets/</a> If pagelets contain secure data, the registered URL must use the https protocol. For example: <a href="https://myhost.com:7779/pagelets/">https://myhost.com:7779/pagelets/</a> The context root can be changed from /pagelets/ if necessary; for details, see Redeploying Pagelet Producer to a Different Context. Note: In WebCenter Portal, if the Pagelet Producer URL is protected by OAM, the URL to the pagelet catalog must be excluded (mapped directly without access control), or the catalog will appear to be empty when using REST. The pagelet catalog URL is http://&lt;host_name&gt;:&lt;port_number&gt;/pagelets/api/v2/ensemble/pagelets</td>
</tr>
</tbody>
</table>

4. Click OK. The new producer appears in the connection table.

19.2.2 Registering Pagelet Producer Using WLST

Use the registerPageletProducer command to register Pagelet Producer for your WebCenter Portal application. For command syntax and examples, see registerPageletProducer in WebCenter WLST Command Reference.

You can also use WLST to list or edit the current connection details.
19.2.3 Configuring the Pagelet Producer Service for WebCenter Portal

This section describes how to set up Pagelet Producer for use as a service by Oracle WebCenter Portal using the Oracle Configuration Wizard.

To set up Pagelet Producer as a WebCenter Portal service:

2. Select Extend an existing WebLogic Domain and then click Next.
3. Select Base this domain on an existing template and select the Pagelet Producer domain template. Confirm that the template location is correct and click Next.
4. Complete the domain configuration wizard. For details, see the online help.

All post deployment connection configuration is stored in the Oracle Metadata Services (MDS) repository. For more information, see Oracle WebCenter Portal Configuration Considerations. For detailed information about MDS, see Managing the MDS Repository in Administering Oracle Fusion Middleware.

Pagelet Producer stores all configuration data on a separate partition in the MDS schema of RCU. Typically, this schema is installed as part of the Oracle WebCenter Portal installation. This configuration data does not conflict with data that belongs to other services. When the Pagelet Producer domain template is deployed, the wizard prompts for connectivity information to the database in which the schema has been created. The names that Pagelet Producer expects are:

- Datasource Name: mds-PageletProducerDS
- JNDI name: jdbc/mds/PageletProducerDS
- MDS partition name: pageletproducer

To use OpenSocial gadgets in conjunction with WebCenter Portal profile and activities features, you must manually configure the WebCenterDS data source to target the WC_Portlet server.

1. In the Oracle WebLogic Server Console, go to Services > Data Source.
2. Click on the WebCenterDS data source.
3. Go to the Targets tab.
4. Select the WC_Portlet server and click Save.

19.2.4 Registering Pagelet Producer Using WebCenter Portal

This section explains how to register Pagelet Producer in WebCenter Portal.

Log in to WebCenter Portal and click Administration.

Navigate to the Tools and services

Click Portlet producers

1. Log in to WebCenter Portal and click Administration.
2. Navigate to the Configuration tab and click Tools and Services.

4. Click Register and select Pagelet Producer.

5. Enter the connection details for Pagelet Producer (Table 19-2).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Name</td>
<td>A unique name to identify this Pagelet Producer instance within WebCenter Portal.</td>
</tr>
<tr>
<td>Server URL</td>
<td>The URL to the Pagelet Producer. The URL must include a fully-qualified domain name. Use the following syntax:</td>
</tr>
<tr>
<td></td>
<td>&lt;protocol&gt;://&lt;host_name&gt;:&lt;port_number&gt;/pagelets/</td>
</tr>
<tr>
<td></td>
<td>where host and port correspond to the WC_Portlet managed server where Pagelet Producer is configured.</td>
</tr>
<tr>
<td></td>
<td>For example: <a href="http://myhost.com:7778/pagelets/">http://myhost.com:7778/pagelets/</a></td>
</tr>
<tr>
<td></td>
<td>If pagelets contain secure data, the registered URL must use the HTTPS protocol. For example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://myhost.com:7779/pagelets/">https://myhost.com:7779/pagelets/</a></td>
</tr>
<tr>
<td></td>
<td>The context root can be changed from /pagelets/ if necessary; for details, see Redeploying Pagelet Producer to a Different Context.</td>
</tr>
</tbody>
</table>

Note: In WebCenter Portal, if the Pagelet Producer URL is protected by OAM, the URL to the pagelet catalog must be excluded (mapped directly without access control), or the catalog will appear to be empty when using REST. The pagelet catalog URL is http://<host_name>:<port_number>/pagelets/api/v2/ensemble/pagelets

19.2.5 Redeploying Pagelet Producer to a Different Context

In some cases, the default web context defined for the Pagelet Producer may need to be changed. This section describes how to redeploy Pagelet Producer to a different context.

The first step is to target the Pagelet Producer data source to the Administration Server and locate the Pagelet Producer EAR file.

1. In the Oracle WebLogic Server Console, go to Services > Data Source.

2. Click the mds-PageletProducerDS data source.

3. Go to the Targets tab.

4. Check the box next to AdminServer and click Save.

5. Navigate to Deployments/pagelet-producer.

6. If Fusion Middleware Control is running on the same host as Pagelet Producer, record the path to the EAR file. If Fusion Middleware Control is on a different host than Pagelet Producer, copy the EAR file from the Pagelet Producer host machine to the browser host machine.

Next, use Fusion Middleware Control to redefine the context:
1. Navigate to (Application) Deployments/pagelet-producer.

2. From the Application Deployment Menu, select Application Deployment > Undeploy and follow any prompts that appear. Click Undeploy.

3. From the Weblogic Domain menu, select Application Deployment > Deploy.

4. Set the Archive location to the Pagelet Producer EAR file (located and/or copied in the first set of steps above).
   - If Fusion Middleware Control is running on the same host as the Pagelet Producer, select the second option and browse to the EAR file location.
   - If Fusion Middleware Control is on a different host than Pagelet Producer, select the first option and click Choose File to select the EAR file from the location it was copied to on the browser host machine.

5. Select WC_Portal.

6. Change the Context Root of the Web Modules as follows, where "new_context" is the web context that should be used (to redeploy to root, omit "new_context"):
   - ensemblestatic.war: new_context/ensemblestatic
   - pageletadmin.war: new_context/admin
   - opensocial.war: new_context/os
   - loginserver.war: new_context/loginserver
   - ensembleproxy.war: new_context/

   **Note:**
   OpenSocial pagelets will not function properly if Pagelet Producer is deployed to root context.

7. Click Deploy.

If your implementation uses OpenSocial, update the context setting in the Pagelet Producer Console. For details, see How to Configure OpenSocial Settings in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

### 19.3 Registering WSRP Portlet Producers in Pagelet Producer

The Pagelet Producer can expose WSRP portlets as pagelets for use in Oracle WebCenter Portal and third-party portals, but before you can use a portlet producer as a pagelet, you must first register it.

To register a WSRP portlet producer using Fusion Middleware Control:

You can use the Pagelet Producer Console to register a WSRP endpoint as a portlet producer, or you can also use Fusion Middleware Control, WLST, or the WebCenter Administration page as described in Managing Portlet Producers. After registration, a new Pagelet Producer resource is created and automatically populated with pagelets to represent the portlets associated with the WSRP endpoint.
To access portlet producer settings from the Pagelet Producer Console.

1. Log into WebCenter Portal as an administrator and go to the Administration page.
2. Open the Shared assets tab and select Pagelets.
3. Click Create and log into Pagelet Producer.
4. From the Navigator toolbar menu, select Producers and click Register.

5. On the Register Portlet Producer page, enter the registration details for the producer. See WSRP Producer Connection Parameters for detailed parameter information.

6. Click Test to test the settings, then click Ok when you’re ready to register the producer or Cancel to return to the Pagelet Producer Console.
19.4 Using Portlet-Based Pagelets

Auto-generated portlet resources and pagelets cannot be modified. To make changes and create a permanent reference to the producer, the auto-generated asset must first be copied. Select the asset on the Shared Assets page and select Copy from the Actions menu. The copied version of the resource can be edited, and various elements such as injectors can be added to customize pagelet functionality. Any replicated resources will be included in metadata exports.

You can also define a portlet-based pagelet from scratch by creating a new resource based on an existing portlet producer and then creating individual pagelets. For details, see Consuming WSRP Portlets as Pagelets in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

19.5 Configuring the Trust Service Identity Asserter

This section describes how to configure the trust service identity asserter.

This section includes the following topics:

• About the Trust Service Identity Asserter
• Preparing for Configuring the Trust Service Identity Asserter
• Executing Trust Service Identity Asserter Configuration

19.5.1 About the Trust Service Identity Asserter

The WebCenter Portal communicates with a Pagelet Producer using a server to server REST call. In order to pass the identity of the administrative user to the Pagelet Producer a WLS "Trust Service Identity Asserter" must be set up on the Pagelet Producer (server) and OPSS keystore service credentials must be set up on both the Pagelet Producer (server) and WebCenter Portal (client). For more information, see Integrating Application Security with OPSS in Securing Applications with Oracle Platform Security Services.

19.5.2 Preparing for Configuring the Trust Service Identity Asserter

The WebCenter Portal installation (same installer is used for both the WebCenter Portal and the Pagelet Producer) will place the following two files in the WCP_HOME/webcenter/scripts directory (for example, /home/user/Oracle/Middleware/Oracle_WC1/webcenter/scripts):

• configureTrustServiceIdentityAsserter.py
• configureTrustServiceIdentityAsserter.properties

The WLST script configureTrustServiceIdentityAsserter.py uses the values set in the configureTrustServiceIdentityAsserter.properties file to configure trust identity on both the client (WebCenter Portal) and server (Pagelet Producer).

Properties to Fill Out

The following properties must be filled out before executing configureTrustServiceIdentityAsserter.py:
### Table 19-3 Properties Used by configureTrustServiceIdentityAsserter.py

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>admin.user</td>
<td>WLS administrative user</td>
<td>weblogic</td>
</tr>
<tr>
<td>admin.password</td>
<td>WLS administrative user password</td>
<td>welcome1</td>
</tr>
<tr>
<td>admin.url</td>
<td>WLS administrative server host url</td>
<td>t3://localhost:7001</td>
</tr>
<tr>
<td>trust.alias</td>
<td>Keystore alias name that will contain private key pair used for signing token used in REST calls. Use alphanumeric characters.</td>
<td>wckey</td>
</tr>
<tr>
<td>trust.issuer</td>
<td>This is the value placed inside the token that indicates who the issuer of the token is</td>
<td>mycompany</td>
</tr>
<tr>
<td>keystore.exported.cert</td>
<td>This is a file path where the public key for the key pair in trust.alias is exported to and exported from.</td>
<td>/home/user/Oracle/Middleware/user_projects/domains/my_domain/config/fmwconfig/wckey.cer</td>
</tr>
</tbody>
</table>

In addition to the above properties there are several optional properties defined in configureTrustServiceIdentityAsserter.properties. If these properties are not defined in the file the values listed under 'Default Value' column below will be used:

### Table 19-4 Properties Used by configureTrustServiceIdentityAsserter.py

<table>
<thead>
<tr>
<th>Original Property</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>keystore.distinguished.name</td>
<td>DN used in keystore key pair generation</td>
<td>CN=&lt;property value of trust.issuer&gt;, O=Oracle, C=US</td>
</tr>
<tr>
<td>trust.identity.asserter.name</td>
<td>Name to give the WLS Trust Service Identity Asserter</td>
<td>TrustServiceIA</td>
</tr>
</tbody>
</table>

For more details, open the configureTrustServiceIdentityAsserter.properties file. A full description of each property and the overall trust identity assertion configuration process is provided in inline comments.

#### 19.5.3 Executing Trust Service Identity Asserter Configuration

**WebCenter Portal and Pagelet Producer on same WLS Domain**

In most deployment scenarios, the Pagelet Producer and WebCenter Portal run on separate WebLogic managed servers on the same WebLogic domain. In this scenario, the OPSS keystore configuration runs once and handles both the client (WebCenter Portal) and server (Pagelet Producer) set up as shown in the following examples:
19.6 Managing Import, Export, Backup and Recovery of Pagelet Producer Components

Pagelet Producer stores data related to its configuration and content in the Oracle metadata store (MDS) to facilitate disaster recovery and the full production lifecycle from development through staging and production. This section describes the import, export and backup capabilities available.

- Exporting and Importing Pagelet Producer Resources
- Exporting and Importing Pagelet Producer Metadata Using WLST
- Backing Up and Restoring Pagelet Producer

For detailed information about MDS, see Managing the Oracle Metadata Repository in Administering Oracle Fusion Middleware.

19.6.1 Exporting and Importing Pagelet Producer Resources

Pagelet Producer assets can be exported and imported using the Pagelet Producer Console. Note that you cannot export or import pagelets directly from the Shared Assets page in WebCenter Portal. To export or import Pagelet Producer shared assets you must use the Pagelet Producer Console as described in this section, or use WLST as described in Exporting and Importing Pagelet Producer Metadata Using WLST.

To import or export Pagelet Producer assets using the Pagelet Producer Console:

1. Open the Pagelet Producer Console in either of the following ways:
   - From WebCenter Portal, navigate to Administration > Shared Assets > Pagelets. Click Create and then click Continue to open the Pagelet Producer Console. When you’re ready to return to WebCenter Portal click Cancel.
   - Navigate to the following URL:
     http://<host_name>:<port_number>/pagelets/admin.

2. From the Jump to: dropdown list, select Export/Import.

3. Click either Export, Import, or Variables to select the activity to be performed:
   - Use the Export pane to choose from a list of assets and export them to a new MDS package.
   - Use the Import pane to browse to an existing MDS package and import it into Pagelet Producer.
   - Use the Variables pane to define variables for root URLs to protect internal URLs and simplify import.

4. To export resources, click Export.
   The Export pane displays (see Figure 19-1)
a. Check the items to include in the export.

b. Click Next.

The Host URL displays (Figure 19-2):

**Figure 19-2  Host URL**

<table>
<thead>
<tr>
<th>Host</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://portlet.uk.oracle.com">http://portlet.uk.oracle.com</a></td>
<td></td>
</tr>
</tbody>
</table>

5. To import resources, click Import.

The Import pane displays (see Figure 19-1).

**Figure 19-3  Pagelet Producer Console - Import Options**

a. Click Browse to select the file to import.

b. Click Submit to start the import.

c. If prompted, select either Skip or Overwrite if there is an existing resource on the target side of the import.

6. To define a variable, click Variables.

The Variables pane displays (Figure 19-4).
a. Click **Add Variable**.

b. Enter the host name in the **Host** field.

c. Enter the variable name with which to associate the host URL in the **Variable** field.

d. To continue adding variables, click **Add Variable**.

Once added, you can use the variables as part of the host URL in the Export pane.

### 19.6.2 Exporting and Importing Pagelet Producer Metadata Using WLST

The metadata created by Pagelet Producer is stored in MDS and can be accessed using WLST. For detailed information on running WLST commands, see [Running Oracle WebLogic Scripting Tool (WLST) Commands](#).

Only global migration using WLST is currently supported; all data in the source environment is included in the exported MDS package, and all data in the target environment is overwritten when the package is imported.

**Note:**

If you are migrating your WebCenter Portal implementation from staging to production, exporting and importing Pagelet Producer data is handled by the migration tool. However, if changes were made to Pagelet Producer objects in the staging environment, these changes must be migrated independently using the WLST commands described in this section. If Pagelet Producer does not function after migration, check the Server URL defined for Pagelet Producer in your WebCenter Portal application. For information on setting this URL, see [Registering Pagelet Producer](#). For details on WebCenter Portal migration, see [Understanding WebCenter Portal Life Cycle](#).

#### 19.6.2.1 Exporting Pagelet Producer Metadata Using WLST

To export base documents for Pagelet Producer, including any resources, pagelets and custom configuration settings, use the WLST command `exportMetadata`.

For example:

```bash
exportMetadata(application='pagelet-producer', server='WC_Protlet_Staging', toLocation='c:\work\myexport', docs='/**')
```

Where:
• application: Name of the Pagelet Producer application for which the metadata is to be exported (for example, pagelet-producer).

• server: Server on which Pagelet Producer is deployed (for example, WC_PortletStaging).

• toLocation: Target directory to which documents selected from the source partition are to be exported. The toLocation parameter can be used as a temporary file system for migrating metadata from one server to another.

• docs: List of comma-separated fully qualified document name(s) and/or document name patterns (* and ** patterns).

For detailed syntax and examples, see exportMetadata in WebCenter WLST Command Reference.

19.6.2.2 Importing Pagelet Producer Metadata Using WLST

To import Pagelet Producer metadata and customizations, use the WLST command importMetadata.

For example:

importMetadata{application='pagelet-producer', server='WC_Portlet_Production', fromLocation='c:\work\myexport', docs='**'}

Where:

• application: Name of the Pagelet Producer application for which the metadata is to be imported (for example, pagelet-producer).

• server: Name of the target server on which Pagelet Producer is deployed (for example, WC_Portlet_Production).

• fromLocation: Source directory from which documents are imported. The fromLocation parameter can be any temporary file system location for migrating metadata from one server to another.

• docs: List of comma separated fully qualified document name(s) and/or document name patterns (* and ** patterns).

For detailed syntax and examples, see importMetadata in WebCenter WLST Command Reference.

Note:
Any environment-specific URLs used in object configuration must be updated manually after import.

19.6.3 Backing Up and Restoring Pagelet Producer

Backup and recovery operations for Pagelet Producer are part of standard MDS backup and restoration and can be managed through database export and import utilities, and various other tools. For detailed information, see Advanced Administration: Backup and Recovery in Administering Oracle Fusion Middleware.

By default, the MDS configuration for Pagelet Producer is as follows (from adf-config.xml):
<metadata-store name="PageletProducerMetadataRepos" class-name="oracle.mds.persistence.stores.db.DBMetadataStore">
  <property name="partition-name" value="pageletproducer"/>
  <property name="jndi-datasource" value="jdbc/mds/PageletProducerDS"/>
  <property name="repository-name" value="mds-PageletProducerDS"/>
</metadata-store>
Managing External Applications

This chapter describes how to register and manage external applications for WebCenter Portal deployments.

An external application is any application that implements its own authentication process. Specifically, it is an application that does not take part in the single sign-on process for your WebCenter Portal application.

Application administrators can register and manage external applications using Fusion Middleware Control or the WLST command-line tool, or at runtime through out-of-the-box administration pages or using external application task flows.

All external application changes that you make for WebCenter Portal post deployment, are stored in the MDS repository as customizations.

---

**Note:**

External application configuration is dynamic. Configuration changes are immediately reflected in WebCenter Portal; it is not necessary to restart the application or the managed server.

---

This chapter includes the following topics:

- About External Applications
- Registering External Applications
- Modifying External Application Connection Details
- Managing External Applications with the WebCenter Portal Administration Console
- Testing External Application Connections
- Deleting External Application Connections

---

**Permissions:**

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role granted through WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.
20.1 About External Applications

If WebCenter Portal interacts with an application that handles its own authentication, you can associate that application with an external application definition to allow for credential provisioning. In doing so, you use an external application definition to provide a means of accessing content from these independently authenticated applications.

To replicate a single sign-on experience from the end user's perspective, the external application service captures the user name and password, and any other credentials for the external application, and supplies it to the WebCenter Portal tool or application requiring the credentials. The WebCenter Portal tool or other application then uses this information to log in on behalf of the end user. This username and password combination is securely stored in a credential store configured for the WebLogic domain where the application is deployed.

**Note:**

When logging in to an external application, if you clear the **Remember My Login Information** check box, then the credentials provisioned for that user session are lost in the event of a failover in a high availability (HA) environment. You are prompted to specify the credentials again if you try to access the external application content in the same user session.

20.2 Registering External Applications

You can register external applications for WebCenter Portal through Fusion Middleware Control or using WLST commands.
Before registering an external application, access the application’s login page and examine the HTML source for the application’s login form. All the registration details you require are located in the `<form>` tag.

For example, the underlying code for the *Yahoo! Mail* login form looks something like this:

```html
<form method=post action="https://login.yahoo.com/config/login?" autocomplete="off"
name="login_form">
... 
<td><input name="login" size="17"></td>
... 
<td><input name="passwd" size="17"></td>
... 
</form>
```

In this example, to provide WebCenter Portal users with a direct link to the *Yahoo! Mail* application, the following sample registration information is required:

<table>
<thead>
<tr>
<th>Registration Information</th>
<th>Sample Value</th>
<th>HTML Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login URL</td>
<td><a href="https://login.yahoo.com/config/login">https://login.yahoo.com/config/login</a>?</td>
<td>action</td>
</tr>
<tr>
<td>User Name / User ID Field</td>
<td>login</td>
<td>name=&quot;login&quot;</td>
</tr>
<tr>
<td>Password Field Name</td>
<td>passwd</td>
<td>name=&quot;passwd&quot;</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>post</td>
<td>method</td>
</tr>
</tbody>
</table>

**Note:**

External application configuration is dynamic. New external applications and updates to existing applications are immediately available; there is no need to restart WebCenter Portal.

This section includes the steps for:

- Registering External Applications Using Fusion Middleware Control
- Registering External Applications Using WLST

For information about registering external applications through WebCenter Portal Administration, see Configuring Tools and Services for WebCenter Portal.

### 20.2.1 Registering External Applications Using Fusion Middleware Control

To register an external application:

1. Log in to Fusion Middleware Control and navigate to the home page for your WebCenter Portal: For more information, see Navigating to the Home Page for WebCenter Portal.
2. From the *WebCenter Portal* menu, select Settings > Service Configuration.
3. From the list of services on the WebCenter Portal Service Configuration page, select External Applications.

4. To register a new external application, click Add.

Table 20-1  External Application Connection - Name

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>Enter a name for the application. The name must be unique (across all connection types) within the application. For example: yahoo</td>
</tr>
</tbody>
</table>

Note: Once registered, you cannot edit the Application Name.
5. Enter a unique name for the external application and a display name that application users working with this external application will see. See also Table 20-1.

Table 20-2 External Application Connection - Name

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>Enter a name for the application. The name must be unique (across all connection types) within the application. For example: yahoo</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Once registered, you cannot edit the Application Name.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Enter a user friendly name for the application that WebCenter Portal users will recognize. Application end-users working with this external application will see the display name you specify here. For example: My Yahoo If you leave this field blank, the Application Name is used.</td>
</tr>
</tbody>
</table>

6. Enter the login details for the external application (Table 20-3).
Table 20-3  (Cont.) External Application Connection - Login Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable Automatic Login        | Select to allow automatically log users in to this application. Choosing this option requires you to complete the Login URL, HTML User ID Field Name, and HTML User Password Field Name fields. With automated single sign-on, the user directly links to the application and is authenticated automatically, as their credentials are retrieved from the credential store. Selecting this option provides the end user with a seamless single sign-on experience. **Note:** Automated login is not supported for:  
  • External applications using BASIC authentication.  
  • External applications configured for SSO.  
  • External applications with a customized login form (built using ADF Faces) that does not implement the J2EE security container login method `j_security_check` for authentication.  
  • External sites that do not support UTF8 encoding.  
  • External applications that accept randomly generated hidden field values or cookies for successful login. |
| Login URL                     | Enter the login URL for the external application. To determine the URL, navigate to the application's login page and record the URL. For example: http://login.yahoo.com/config/login. **Note:** A login URL is not required if the sole purpose of this external application is to store and supply user credentials on behalf of another service. |
| HTML User ID Field Name       | Enter the name that identifies the "user name" or "user ID" field on the login form. **Tip:** To find this name, look at the HTML source for the login page. This property does not specify user credentials. Mandatory if the Authentication Method is GET or POST. Leave this field blank if the application uses BASIC authentication (see Authentication Method). |
| HTML User Password Field Name | Enter the name that identifies the "password" field on the login form. **Tip:** To find this name, look at the HTML source for the login page. Mandatory if the Authentication Method is GET or POST. Leave this field blank if the application uses BASIC authentication (see Authentication Method). |

7. Select the authentication method used by the external application (Table 20-4).
### Table 20-4  (Cont.) External Application Connection - Authentication Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Method</td>
<td>Select the form submission method used by the external application. Choose from one of the following:</td>
</tr>
<tr>
<td></td>
<td>• GET: Presents a page request to a server, submitting the login credentials as part of the login URL. This authentication method may pose a security risk because the user name and password are exposed in the URL.</td>
</tr>
<tr>
<td></td>
<td>• POST: Submits login credentials within the body of the form. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• BASIC: Submits login credentials to the server as an authentication header in the request. This authentication method may pose a security risk because the credentials can be intercepted easily and this scheme also provides no protection for the information passed back from the server. The assumption is that the connection between the client and server computers is secure and can be trusted.</td>
</tr>
</tbody>
</table>

The **Authentication Method** specifies how message data is sent by the browser. You can find this value by viewing the HTML source for the external application’s login form, for example,

```html
<form method="POST" action="https://login.yahoo.com/config/login?
AutoComplete="off">
```

8. Specify additional login fields and details, if required.

For more information, see **Table 20-5**.

### Table 20-5  External Application Connection - Additional Login Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Login Fields</td>
<td>If your application requires additional login criteria, expand <strong>Additional Login Fields</strong>.</td>
</tr>
<tr>
<td></td>
<td>For example, in addition to <strong>user name</strong> and <strong>password</strong>, the Lotus Notes application requires two additional fields - <strong>Host</strong> and <strong>MailFilename</strong>.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Add</strong> to specify an additional field for the login form.</td>
</tr>
<tr>
<td></td>
<td>For each new field, do the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name</strong> – Enter the name that identifies the field on the HTML login form that may require user input to log in. This field is not applicable if the application uses basic authentication.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Value</strong> – Enter a default value for the field or leave blank for a user to specify. This field is not applicable if the application uses basic authentication.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Display to User</strong> – Select to display the field on the external application login screen. If the field is not displayed (unchecked), then a default <strong>Value</strong> must be specified.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Delete</strong> to remove a login field.</td>
</tr>
</tbody>
</table>

9. Specify shared and public user credentials, if required (**Table 20-6**).
Table 20-6  External Application Connection - Shared User and Public User Credentials

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Shared Credentials</td>
<td>Indicate whether this external application enables shared user credentials, and specify the credentials. Select Enable Shared Credentials, and then enter User Name and Password credentials for the shared user. When shared credentials are specified, every user accessing this external application through WebCenter Portal is authenticated using the user name and password defined here. WebCenter Portal users are not presented with a login form. Because WebCenter Portal users do not need to define personal credentials of their own, external applications with shared credentials are not listed in the external application’s change password task flows such as My Accounts.</td>
</tr>
<tr>
<td>Enable Public Credentials</td>
<td>Indicate whether unauthenticated users (public users) may access this external application. Select Enable Public Credentials, and then enter User Name and Password credentials for the public user. When public credentials are specified, public users accessing this external application through WebCenter Portal’s public pages are logged in using the user name and password defined here. If public credentials are not specified, public users will see an authorization error indicating this external application is not accessible to public users.</td>
</tr>
</tbody>
</table>

10. Click OK to register the application.

20.2.2 Registering External Applications Using WLST

Use the WLST command createExtAppConnection to create an external application connection. For command syntax and examples, see createExtAppConnection in WebCenter WLST Command Reference.

Use the WLST command addExtAppCredential to add shared or public credentials for an existing external application connection. For more information, see addExtAppCredential in WebCenter WLST Command Reference.

Use the WLST command addExtAppField to define additional login criteria for an existing external application connection. For more information, see addExtAppField in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

20.3 Modifying External Application Connection Details

This section shows you how to modify the external application connection details by:

- Modifying External Application Connection Using Fusion Middleware Control
- Modifying External Application Connection Using WLST
20.3.1 Modifying External Application Connection Using Fusion Middleware Control

To update external application connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for your WebCenter Portal application.
2. From the WebCenter Portal menu, select Settings > Service Configuration.
3. From the list of services on the WebCenter Portal Service Configuration page, select External Applications.
4. Select the name of the external application you want to modify, and click Edit.
5. Edit the connection details, as required. For detailed parameter information, see Table 20-3. Note that you cannot edit the name of the external application.
6. Click OK to save your changes.

20.3.2 Modifying External Application Connection Using WLST

Use the WLST command setExtAppConnection to edit existing external application connection details. For command syntax and examples, see setExtAppConnection in WebCenter WLST Command Reference.

**Note:**

To edit details relating to an additional login field, use setExtAppField. To edit existing shared or public credentials, use setExtAppCredential.

To delete an additional login field, use removeExtAppField. To delete shared or public credentials, use removeExtAppField.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

For information about modifying external applications in WebCenter Portal, see Editing External Application Connection Details in Using Oracle WebCenter Portal.

20.4 Managing External Applications with the WebCenter Portal Administration Console

An external application is any application that implements its own authentication process. Specifically, it is an application that does not take part in the WebCenter Portal application's single sign-on process. If your WebCenter Portal application interacts with an application that handles its own authentication, you can register an external application to allow for credential provisioning.

By default, users with the Administrator role have the AppConnectionManager role; and therefore, application administrators can configure external applications through the WebCenter Portal Administration Console. Application administrators can register, edit, and delete external applications for WebCenter Portal at runtime, through the WebCenter Portal Administration Console. For more information on AppConnectionManager role, see Default Application Roles.

This section includes the following topics:
20.4.1 Registering External Applications

To register an external application at runtime:

1. Navigate to the Services administration tab.
2. Select External Application (Figure 20-2).
3. Click Register.

4. Enter connection details for the external application.
   
   If you need help with one or more fields, refer to the following tables:
   
   * Table 20-1
   * Table 20-3
   * Table 20-4
   * Table 20-5
   * Table 20-6

5. Click Test to verify your connection details.
6. Click OK to register the application.

20.4.2 Editing and Deleting External Applications

To modify or delete external applications at runtime:
1. Navigate to the **Services** administration tab.

2. Select **External Application** (Figure 20-2).

3. Select the external application required and then click one of the following:
   - Click **Edit** to update connection details for an external application.
   - Click **Deregister** to remove the external application.

Take care when deleting an external application connection as users will no longer have access to that application, and any services dependent on the external application may not function correctly.

### 20.5 Testing External Application Connections

For external applications that are created using login URLs, ensure that their login URLs are accessible. For information about direct URLs, see Automated Single Sign-On in *Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper*.

### 20.6 Deleting External Application Connections

Take care when deleting an external application connection as users in WebCenter Portal will no longer have access to that external application, and any tools or services dependent on the external application may not function correctly.

This section includes the following topics:

- Deleting External Application Connections Using Fusion Middleware Control
- Deleting External Application Connections Using WLST

#### 20.6.1 Deleting External Application Connections Using Fusion Middleware Control

To delete an external application connection:

1. Log in to Fusion Middleware Control and navigate to the home page for your WebCenter Portal application:

2. From the **WebCenter Portal** menu, select **Settings > Service Configuration**.

3. From the list of services on the **WebCenter Portal Service Configuration** page, select **External Applications**.

4. Select the name of the external application you want to remove, and click **Delete**.

#### 20.6.2 Deleting External Application Connections Using WLST

Use the WLST command `deleteConnection` to remove an external application connection. For command syntax and examples, see `deleteConnection` in *WebCenter WLST Command Reference*.

**Note:**

To delete an additional login field, use `removeExtAppField`. To delete shared or public credentials, use `removeExtAppCredential`.

---

Managing External Applications 20-11
For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
21 Managing REST Services

This chapter provides an overview of managing Oracle WebCenter Portal’s REST services.

This chapter includes the following topics:

- About REST Services
- Performing Required Manual Configurations to Enable REST
- Understanding Security Tokens
- Changing the REST Root Name
- Using Compression
- Handling Authentication

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console and the Administrator role through Oracle WebCenter Portal Administration.

For more information about roles and permissions, see Understanding Administrative Operations, Roles, and Tools.

21.1 About REST Services

REST (REpresentational State Transfer) is an architectural style for making distributed resources available through a uniform interface that includes uniform resource identifiers (URIs), well-defined operations, hypermedia links, and a constrained set of media types. Typically, these operations include reading, writing, editing, and removing. Media types include JSON and XML/ATOM.

REST APIs are commonly used in client-side scripted, Rich Internet Applications. For example, a browser-based application written in Javascript can use Ajax techniques with REST APIs to send and receive application data from the server and update the client view.

Oracle WebCenter Portal provides a RESTful interface to many of its tools and services, like discussions, lists, people connections, and search. For a complete list of the services that support REST and a more complete introduction to REST and Oracle WebCenter Portal REST APIs, see Using the WebCenter Portal REST APIs in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.
21.2 Performing Required Manual Configurations to Enable REST

Oracle WebCenter Portal REST APIs are not enabled by default. To enable the REST APIs to work, you must perform the two separate server-side configurations: you must configure an identity asserter and you must seed required entries in the credential store to enable the REST security tokens to function properly. For more information on security tokens, see Security Considerations for WebCenter Portal REST APIs in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Perform the following configuration tasks after Oracle WebCenter Portal is installed for the first time or if you know the configuration tasks have not been previously performed.

- Configuring an Identity Asserter
- Configuring the WebLogic Server Credential Store

21.2.1 Configuring an Identity Asserter

You must configure an identity asserter before using the REST APIs. For detailed instructions, see Configuring the REST Service Identity Asserter.

21.2.2 Configuring the WebLogic Server Credential Store

After configuring an identity asserter, the next step is to configure the WLS credential store. To configure the credential store, execute the following WLST commands while the server is running. No restart is required.

```plaintext
createCred(map="o.webcenter.jf.csf.map", key="keygen.algorithm", user="keygen.algorithm", password="AES")
createCred(map="o.webcenter.jf.csf.map", key="cipher.transformation", user="cipher.transformation", password="AES/CBC/PKCS5Padding")
```

21.3 Understanding Security Tokens

A user-scoped security token is embedded in the href and template attributes of every REST service URI. The token is both generated and validated by the server, and is enabled by the keygen.algorithm and cipher.transformation configuration steps described in Configuring the WebLogic Server Credential Store. The purpose of the security token is to prevent Cross-Site Request Forgery (CSRF) attacks.

For example:

```plaintext
<link
    template="opaque-template-uri/@me?startIndex={startIndex}&itemsPerPage={itemsPerPage}&utoken=generated-token"
    resourceType="urn:oracle:webcenter:messageBoard"
    href="opaque-uri/@me?token=generated-token"
    capabilities="urn:oracle:webcenter:read"/>
```

**Note:**
The security token is not used for authentication or identity propagation.
Security tokens are based on the authenticated user's name. They do not expire, making it possible to both cache and bookmark the URIs.

Security tokens are also "salted," a cryptographic technique of adding extra characters to a string before encrypting it. Because of salting, if a security token is compromised, you will not have to change the user's user name across the entire system to address the problem.

This technique prevents cases where a user name is compromised and you don't want to have to change the user name system wide to fix the problem. If you need to regenerate the salt, you can do so by simply deleting it with the following WLST command:

```java
deleteCred(map="o.webcenter.jf.csf.map", key="user.token.salt", user="user.token.salt", password="AES")
```

For more information on security tokens, see Security Considerations for WebCenter Portal REST APIs in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

### 21.4 Changing the REST Root Name

Although not required, in some cases you might want to change the root name for the REST APIs. The recommended technique for changing the REST root name is to do so by URL Rewriting. For more information, see URL Rewriting and Proxy Server Capabilities in Administrator’s Guide for Oracle HTTP Server. For example, after URL Rewriting, the following REST API URLs point to the same server:

- http://myhost:8888/rest/api/resourceIndex
- http://myhost:8888/pathname/rest/api/resourceIndex

### 21.5 Using Compression

This section explains techniques for enabling compression on the XML or JSON responses that are returned to the client by the Oracle WebCenter Portal REST APIs.

If you are running Apache, you can add the `mod_deflate` or `mod_gzip` server modules to the server configuration. Refer to the Apache documentation for more information.

If you are using Oracle HTTP Server (OHS), Oracle recommends using Oracle Web Cache for this purpose. For detailed information, see Oracle Fusion Middleware Administrator’s Guide for Oracle Web Cache.

If you are using Oracle HTTP Server (OHS) or running Apache, you can add the HTTP request header `Accept-Encoding: gzip, deflate` to use the compression in the REST API response.

If you are using OHS, you can also add the `mod_deflate` or `mod_gzip` server module to enable compression. For detailed information on this technique, see Understanding Oracle HTTP Server Modules in Oracle Fusion Middleware Administrators Guide for Oracle HTTP Server.

For more information on Oracle Web Cache, see Compression and Caching and Compressing Content in Oracle Fusion Middleware Administrators Guide for Oracle HTTP Server.
21.6 Handling Authentication

By default, REST services are configured to accept authentication from identity assertion providers. If no identity assertion providers are configured, basic authentication is used.

For information on configuring identity assertion providers, see Configuring the REST Service Identity Asserter.

For more information, see Configuring Authentication Providers in Administering Security for Oracle WebLogic Server 12c (12.2.1).
This part of *Administering Oracle WebCenter Portal* provides information about monitoring WebCenter Portal and Portal Framework applications using Oracle Enterprise Manager Fusion Middleware Console.

- Monitoring Oracle WebCenter Portal Performance
- Managing Oracle WebCenter Portal Logs
- Managing Oracle WebCenter Portal Audit Logs
This chapter describes the range of performance metrics available for WebCenter Portal and how to monitor them through Fusion Middleware Control. It also describes how to troubleshoot issues by analyzing information that is recorded in diagnostic log files. Administrators who monitor WebCenter Portal regularly will learn to recognize trends as they develop and prevent performance problems in the future.

This chapter includes the following topics:

- **Understanding Oracle WebCenter Portal Performance Metrics**
- **Viewing Performance Metrics Using Fusion Middleware Control**
- **Customizing Key Performance Metric Thresholds and Collection**
- **Diagnosing and Resolving Performance Issues with Oracle WebCenter Portal**
- **Tuning Oracle WebCenter Portal Performance**
- **Improving Data Caching Performance**

**Permissions:**

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin, Operator, or Monitor role through the Oracle WebLogic Server Administration Console.

See also, **Understanding Administrative Operations, Roles, and Tools.**

### 22.1 Understanding Oracle WebCenter Portal Performance Metrics

Through Fusion Middleware Control, administrators can monitor the performance and availability of all the components, tools, and services that make up WebCenter Portal, as well as the application as a whole. To access Oracle WebCenter Portal metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.

To make best use of the information displayed it is important that you understand how performance metrics are calculated and what they mean. All Oracle WebCenter Portal’s performance metrics are listed and described here for your reference. Some applications (such as Oracle WebCenter Portal) might use the full range of social networking, personal productivity, and collaboration metrics listed, while others may only use one or more of these features.

This section includes the following topics:
22.1.1 Understanding Oracle WebCenter Portal Metric Collection

Performance metrics are automatically enabled for Oracle WebCenter Portal and display in Fusion Middleware Control. You do not need to set options or perform any extra configuration to collect performance metrics for WebCenter Portal. If you encounter a problem, such as, an application running slowly or hanging, you can find out more about the problem by investigating performance metrics, in real-time, through Fusion Middleware Control.

This section describes the different ways Oracle WebCenter Portal collects and presents metric data:

- Metric Collection: Since Startup
- Metric Collection: Recent History
- Metric Collection: Last ’N’ Samples

22.1.1.1 Metric Collection: Since Startup

At any given time, real-time metrics are available for the duration for which the WebLogic Server hosting WebCenter Portal is up and running. Real-time metrics that are collected or aggregated since the startup of the container are displayed on Oracle WebCenter Portal metric pages under the heading Since Startup. These metrics provide data aggregated over the lifetime of the WebLogic Server. The aggregated data enables you to understand overall system performance and compare the performance of recent requests shown in Recent History.

For example, consider WebCenter Portal deployed on a managed server that was started 4 hours ago. During that time, WebCenter Portal serviced 10,000 portlet requests with a total response time of 500,000 ms. For this scenario, Since Startup metrics for portlets show:

- Since Startup: Invocations (count) - 10000
- Since Startup: Average Time (ms) - 50
Note:
Metric collection starts afresh after the container is restarted. Data collected before the restart becomes unavailable.

22.1.1.2 Metric Collection: Recent History

In addition to Since Startup metrics, Oracle WebCenter Portal reports metrics for requests serviced in the last 10 to 15 minutes as Recent History metrics. To do this, Oracle WebCenter Portal takes regular snapshots of real time metrics at an internal frequency. These metric snapshots are used to calculate the "delta" time spent performing service requests in the last 10 to 15 minutes and this data displays as Recent History metrics. Since Recent History metrics only aggregate data for the last 10-15 minutes, this information is useful if you want to investigate ongoing performance/availability issues.

If you compare Recent Metrics to Since Startup metrics you can gauge how the system characteristics have changed, compared to overall system availability/performance.

For example, consider a system that has been up and running for 2 days. During that time, Oracle WebCenter Portal recorded that the total time spent servicing 100,000 portlet requests was 5,000,000 ms. The system starts to experience performance issues, that is, in the last 10-15 minutes, 100 portlet requests took a total time of 3,000,000 ms. In this scenario, the average response time reported “Since Startup” is quite low and would not indicate a performance issue (5,000,000ms/100,000 = 50ms). However, the same Recent History metric is considerably higher (3,000,000ms/100 = 30 seconds) which immediately tells the administrator that performance degraded recently. A quick comparison of “Recent History” with the corresponding “Since Startup” metric can clearly show whether or not the recent metric data is normal and in this case shows there is currently a problem with the system.

Recent History metrics can also help you prioritize which areas to investigate and which areas you can ignore when performance issues arise. For example, if an ongoing performance issue is reported and Recent History metrics for a particular component shows a value of 0, it indicates that the component has not been used in the last 10-15 minutes. Similarly, if the "Average Response Time" value is small and the "Invocation" count is low, the component may not be contributing to the performance problem. In such cases, administrators can investigate other areas.

Typically, Recent History shows data for the most recent 10-15 minutes. However, there are situations when the data does not reflect the last 10-15 minutes:

- If the WebLogic Server has just started up, and has been running for less than 10-15 minutes, then Recent History shows data for the duration for which the server has been up and running.

- If one or more tools or services are not accessed for an extended period of time, then older metric snapshots slowly age out. In such cases, metric data is no longer available for the last 10-15 minutes so Recent History metrics cannot calculate the delta time spent in performing service requests that occurred in last 10-15 minutes. When this happens, the Recent History data can show the same values as the Since Startup metrics. When the tool or service is used again, metric snapshots for it resume. After enough recent data is available, the Recent History metrics again start to display metrics for the last 10-15 minutes.

Most live environments are not idle for extended periods, so recent metric collection is rarely suspended due to inactivity. However, if you have a test
environment that is used intermittently or not used for a while, you might notice recent metric collection stop temporarily, as described here.

22.1.1.3 Metric Collection: Last 'N' Samples

Since Startup and Recent History metrics calculate performance over a specific duration, and show aggregated metrics for that duration. In addition to these, Oracle WebCenter Portal collects and reports per-request performance information for a range of key WebCenter Portal metrics. Such metrics allow you to look at the success and response time of each request individually, without considering previous requests. Out-of-the-box, the last 100 samples are used to calculate key metric performance/availability but you can increase or decrease the sample set to suit your installation.

For example, if 10 out of the last 100 page requests failed, page availability is calculated as 90%. If you reduce the sample set to 50 and 10 pages fail, page availability is reported to be 80%.

The examples show how the sample set size can effect the performance reports. The value you select is up to you but if you increase the number of samples, consider the additional memory requirements since the last 'N' metric samples are maintained in memory. Oracle recommends a few hundred samples at most.

To change the number of samples used to report key performance metrics in your installation, see Configuring the Number of Samples Used to Calculate Key Performance Metrics.

To find out more about Oracle WebCenter Portal's key performance metrics and thresholds, refer to Understanding the Key Performance Metrics.

22.1.2 Understanding the Key Performance Metrics

Diagnosing the availability and performance of WebCenter Portal typically requires that you look at various important metrics across multiple components such as the JVM, the WebLogic Server, as well as the application.

To help you quickly identify and diagnose issues that can impact WebCenter Portal performance, Oracle WebCenter Portal collects the last 'N' samples for a range of "key performance metrics" and exposes them in Fusion Middleware Control. To access key performance metric information for your application, see Viewing Performance Metrics Using Fusion Middleware Control.

Thresholds determine when a performance alert or warning is triggered. Allowing you to set threshold values that represent suitable boundaries for your Oracle WebCenter Portal system, ensures that you obtain relevant performance alerts in Enterprise Manager Fusion Middleware Control. When key performance metrics are "out of bounds" with respect to their configured thresholds they are easy to find in Fusion Middleware Control as they appear color-coded. For more information about thresholds, see Customizing Key Performance Metric Thresholds and Collection.

You do not need to specifically set thresholds for metrics, such as "availability", that report success or failure.

Oracle WebCenter Portal allows you to manage warning thresholds for the key performance metrics described in Table 22-1:

| Table 22-1 | Key Performance Metric Collection |
Oracle WebCenter Portal captures end-user requests for pages and portlets, and a metric sample is collected for each request. For example, if user A accesses page X, both the availability of page X (success/fail metric) and the response time of the request is captured by Oracle WebCenter Portal. Metric samples that take longer than a configured metric alert threshold or fail, show “red” in Fusion Middleware Control to immediately alert administrators when issues arise.

Other metrics, such as JVM and WebLogic Server metrics, are collected at a pre-defined frequency. Out-of-the-box, the sample frequency is 1 sample every 5 minutes but you can customize this value if required. For details, see Configuring the Frequency of WebLogic Server Health Checks.

The total number of samples that Oracle WebCenter Portal collects is configurable too, as described in Configuring the Number of Samples Used to Calculate Key Performance Metrics. The default sample set is 100 samples. Since there is a memory cost to maintain metric samples, do not specify an excessive number of samples; Oracle recommends a few hundred at most.

Oracle WebCenter Portal’s key performance metrics are specifically selected to help administrators quickly identity and diagnose common issues that can impact WebCenter Portal performance. You can view all key performance metric data from your application’s home page in Fusion Middleware Control.

### Table 22-1  (Cont.) Key Performance Metric Collection

22.1.3 Using Key Performance Metric Data to Analyze and Diagnose System Health

If you monitor WebCenter Portal regularly, you will learn to recognize trends as they develop and prevent performance problems in the future. The best place to start is your application’s home page in Enterprise Manager Fusion Middleware Control. The home page displays status, performance, availability, and other key metrics for the various components, tools, and services that make up your application, as well as the WebLogic Server on which the application is deployed.

If you are new to Oracle WebCenter Portal, use the information in this section to better understand how to use the information displayed through Fusion Middleware Control to identify and diagnose issues.

Figure 22-1 presents high-level steps for monitoring the out-of-the-box application WebCenter Portal.

Figure 22-1  Analyzing System Health for WebCenter Portal - Main Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Check CPU and heap memory usage</td>
</tr>
<tr>
<td>2</td>
<td>Verify the health of WebLogic Server</td>
</tr>
<tr>
<td>3</td>
<td>Monitor page performance</td>

</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 1 Check CPU and heap memory usage | Overall performance deteriorates when CPU or memory usage is too high so it’s important that you always look at the CPU and memory metrics before looking at any Oracle WebCenter Portal-specific metric. Check the Recent CPU and Memory Usage charts to see the current usage trend:
  - **High CPU usage**: Occasional spikes in CPU usage is normal but if CPU usage remains high (85-90%) over a long period of time, it normally indicates there is an issue with CPU. To troubleshoot CPU issues, see: Understanding WebLogic Server Metrics
  - **High memory usage**: When the chart shows that memory is close to the maximum heap size and the trend is not downwards, take some memory dumps to further analyze the cause. To access maximum heap size information:
    1. Log in to WebLogic Server Administration Console.
    2. Navigate to: Environment > Servers > <managed_server name>
    3. Click Monitoring > Performance tab.
    4. Look at "Heap Size Max".
    See Troubleshooting Slow Requests Using JFR Recordings.
Next Step: If the charts indicate that CPU and memory usages are normal, verify the health of the WebLogic Server.
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 2 Verify the health of WebLogic Server | Look in the WebLogic Server Metrics region:  
  • **Health** - The bar chart summarizes recent WebLogic Server health, as reported by the Oracle WebLogic Server self-health monitoring feature. For example, if 10 out of the last 100 WebLogic Server health checks fail (do not report OK), WebLogic Server health is shown as 90%. Click the **Health** link to navigate to more detail on the Recent WebLogic Server Metrics page.  
  • **Incidents** - The number of times WebLogic Server metrics, such as CPU usage, memory usage, thread count, number of JDBC connections, session metrics, and so on, exceed threshold settings. Click the **Incidents** link to diagnose incidents further.  

The actions you take next depend on the metric data. For example, if there are hogging threads, you can take thread dumps. If JDBC connections are exceeding limits, you can analyze further for connection leaks. If the garbage collection rate is exceeding limits, you can take heap dumps, and so on.  
For details, see Understanding WebLogic Server Metrics and Troubleshooting Oracle WebCenter Portal Performance Issues.  
Out-of-bound metrics show "red" in charts and "orange" in the Health Metrics table. Examine all occurrences of such situations by scanning the diagnostic logs. In-memory information is limited to "N" metric samples, but the logs store much more historical information about how often a problem is happening, as well as additional contextual information, such as which user.  
Here is sample message:  

```
[WC_Portal] [WARNING] [WCS-69252]  
[oracle.webcenter.system-management] [tid: oracle.webcenter.DefaultTimer] [ecid: 0000JhEX92mEq8KGlx8DyfgHz32000002,0] [APP: webcenter#11.1.1.4.0] wlcPcpuUsage: 21.92100394175851 % of WebLogicServer is out-of-bounds
```

**Tip:** You can use Fusion Middleware Control to locate all messages of this type by searching the message type, message code, and other string pattern details. See Viewing and Configuring Log Information.  
By default, a warning threshold is only set for CPU Usage but you can configure thresholds for other key WebLogic Server metrics, such as Heap Memory Usage. See Configuring Thresholds for Key Metrics.  
Look at diagnostics logs for errors, failures, and any configuration or network issues.  
If an issue relates to another backend server, such as, WebCenter Content and SOA, verify the JVM/WebLogic Server health (CPU, heap, threads, and so on) for those managed servers too.  
Similarly, investigate WebLogic Server health for other managed servers in your WebCenter Portal installation such as WC_Portlet, WC_Utilities, and WC_Collaboration.  
**Next Step:** If the charts indicate that WebLogic Server is performing within thresholds, verify the health of your WebCenter Portal application.
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 Monitor page performance</td>
<td>Look at the WebCenter Portal Metrics section at the top of the home page. Review the page availability/performance charts to see whether page requests are currently responding as expected. Drill down to more detail to investigate issues relating to recent page requests. Use the Sort Ascending/Descending arrows for the Time and Page Name columns to see whether a pattern is emerging for a specific page or set of pages, or whether performance spikes appear to be more random. Out-of-bound metrics show &quot;red&quot; in charts and &quot;orange&quot; in the Page Metrics table. For details, see Understanding Page Request Metrics. Examine all occurrences of such situations by scanning the diagnostic logs. In-memory information is limited to &quot;N&quot; metric samples, but the logs store much more historical information about how often a problem is happening, as well as additional contextual information, such as which user. Here is sample message:</td>
</tr>
</tbody>
</table>

```
[WC_Portal] [WARNING] [WCS-69251]
[oracle.webcenter.system-management] [tid: [ACTIVE].ExecuteThread: '4' for queue: 'weblogic.kernel.Default (self-tuning)'] [userId: weblogic] [ecid: 6356ef0164cbad47:3fe105c5:13b4e847973:-8000-0000000000000031,0] [APP: webcenter#11.1.1.4.0] [DSID: 0000JhEYRT^EgKG_Ix8Dyf1Ghz32000005] pageResponseTime: 22223 ms of PersonalSpace/Activities is out-of-bounds
```

**Tip:** You can use Fusion Middleware Control to locate all messages of this type by searching the message type, message code, and other string pattern details. See Viewing and Configuring Log Information. Identify individual pages that are not performing. For details, see How to Identify Slow Pages. Navigate to the "Overall Page Metrics" page to see how this page has performed historically (since startup, and last 10-15 minutes). Has it always been slow? For pages that are failing, see How to Troubleshoot Slow Page Requests. |
Table 22-2    (Cont.) Analyzing System Health - Step by Step

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 4. Monitor portlet performance | Look at the WebCenter Portal Metrics section at the top of the home page. Review the portlet availability/performance charts to see whether portlets are currently performing as expected. Drill down to more detail to investigate issues relating to recent portlet requests. Out-of-bound metrics show "red" in charts and "orange" in the Portlet Metrics table. For details, see Understanding Portlet Producer Metrics.

Out-of-bound conditions are also logged in managed server diagnostic logs so you can examine all historical events, that is, more that the most recent sample set that is held in memory. For example:

```
[WC_Portal] [WARNING] [WCS-69253]
[oracle.webcenter.system-management] [tid: pool-3-daemon-thread-1] [userId: weblogic] [ecid: 6356ef0164cbad47:3fe105c5:13b4e847973:-8000-0000000000000088,0 :16] [APP: webcenter#11.1.1.4.0] portletResponseTime: 20523 ms
```

of Portlet: slowRenderingPortlet from Web Producer MyPortlets is out-of-bounds.

Identify individual portlets or portlet producers that are not performing as expected.

Navigate to the "Overall Service Metrics" page, and then select Portlet Producers or Portlets to see how these portlets/portlet producers have performed historically (since startup, and last 10-15 minutes). Has performance deteriorated recently or always been slow?

If portlet performance is normally within thresholds:

1. Verify JVM/WebLogic Server health for the managed server that is hosting the portlets (for example, WC_Portlets), that is, investigate CPU, heap, threads, and so on.

2. Enter the portlet producer's URL in your browser to determine whether the producer is available.

3. Review the portlet producer's connection configuration.

4. Check for network connectivity issues between the WebCenter Portal application and the portlet producer.

5. Simulate portlet operations in WebCenter Portal, that is, view, personalize, or interact with the portlet to verify whether the problem is pervasive or intermittent.

For portlets that are failing, see Troubleshooting Portlets in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Next Step: If the charts indicate that portlet requests are performing within thresholds, verify the performance of your LDAP server.
Table 22-2  (Cont.) Analyzing System Health - Step by Step

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 5. Monitor LDAP server performance | Look at the LDAP metrics in the Security section on the home page. When the server first starts up the cache hit ratio is zero and typically increases above 90% as the system warms up. For more information, see Understanding Security Metrics. Typically, the average LDAP lookup time is only a few milliseconds. If lookups are taking a long time there maybe a problem with the LDAP server or network relate issue.  
- If you want to measure the response time from the LDAP server for a simple bind operation, run the command: `ldapbind -D "UserDN" -h ldaphost.example.com -p <port> -w <password>`  
If you are using Oracle Internet Directory, see Oracle Internet Directory Performance Tuning in Tuning Performance for advice on how to improve performance and avoid bottlenecks. For other LDAP servers, refer to the appropriate product documentation.  
Next Step: If your LDAP server is performing within thresholds, investigate other areas. |
| 6. Monitor individual tools and services | Look at the WebCenter Portal Services section at the bottom of the home page. For details, see Understanding Tool and Service Metrics. Quickly see if a particular tool or service is "Down" or "Unknown". Refer to Troubleshooting Common Issues with Tools and Services for guidance on possible causes and actions.  
Sort the table by Average Time or Invocations to prioritize which tool or service to focus on.  
Click a name to navigate to the "Overall Service Metrics" page. Compare Since Startup and Recent History metrics to see if performance deteriorated recently or always been slow. |

22.1.4 Understanding Some Common Performance Issues and Actions

If an Oracle WebCenter Portal metric is out-of-bounds, do the following:

- Check system resources, such as memory, CPU, network, external processes, or other factors. See Troubleshooting Oracle WebCenter Portal.
- Check other metrics to see if the problem is system-wide or only in a particular tool or service.
- If the issue is related to a particular tool or component, then check if the back-end server is down or overloaded.
- If the WebLogic Server has been running for a long time, compare the Since Startup metrics with the Recent History metrics to determine if performance has recently deteriorated, and if so, by how much.
- When the status of a tool or service is Down or some operations do not work, then validate, test, and ping the back-end server through direct URLs. For details, refer to the "Testing Connection" section in the relevant chapter. For a list of chapters, see Administering Tools and Services.
When you reconfigure connections to tools and services you must always restart the managed server on which the WebCenter Portal application is deployed to pick up the changes. If key connection attributes change, such as a server’s host/port details, connectivity to the server may be lost and the service may become unavailable until you reconfigure the connection and restart the managed server.

---

**Note:**

You can customize the threshold at which some key performance metrics trigger out-of-bound conditions. See Customizing Key Performance Metric Thresholds and Collection.

---

### 22.1.5 Understanding Page Request Metrics

You can monitor the availability and performance of page requests for WebCenter Portal through Fusion Middleware Control. You can monitor recent page data and historical (overall) page data.

This section includes the following information:

- Understanding Full Page and Partial Page Metrics
- Recent Page Metrics
- Overall Page Metrics

---

**Note:**

The page request metrics discussed in this section are different from the page operation metrics discussed in Page Operation Metrics. Page operation metrics monitor page related operations such as creating pages. Whereas the page request metrics described here monitor individual page view/display requests (do not include page edit operations).

---

#### 22.1.5.1 Understanding Full Page and Partial Page Metrics

Performance data is collected for full page and partial page requests. Full page metrics do not include partial page metrics.

Partial page requests display only portions of the page. Therefore, you can monitor the performance of pages within a page. Partial page refresh behavior is called partial page rendering (PPR). PPR allows only certain components on a page to be rerendered without the need to refresh the entire page. A common scenario is when an output component displays what a user has chosen or entered in an input component. Similarly, a command link or button can cause another component on the page to be rerendered without refreshing the entire page.

Partial page rendering of individual components on a page only increases partial page metrics and does not cause any change in full page metrics. For example, a calendar refresh on a page increases partial page invocations by 1, but full page invocations remain unchanged.

For more information about PPR, see Rerendering Partial Page Content in Developing Web User Interfaces with Oracle ADF Faces.
22.1.5.2 Recent Page Metrics

Recent page availability and performance metrics are summarized on the home page for WebCenter Portal (Figure 22-2 and Table 22-3). The page availability/performance charts show at a glance if page requests are slower than expected or failing.

**Note:**

To access the home page, see Navigating to the Home Page for WebCenter Portal.

The **Page Availability** and **Page Performance** charts report availability and performance over the last 'N' page requests (by default, 'N' is 100). The time range starts with the earliest page/portlet request time and ends with the current time. See Configuring the Number of Samples Used to Calculate Key Performance Metrics.

The % value on the right shows the percentage of page requests that responded within a specific time limit. The percentage is calculated using information from the last 'N' page requests. For example, if 'N' is 100, and if 3 of the last 100 page requests exceeded the page response threshold, page performance is shown as 97%.

The bar chart status (green/red) does not change over time until the status changes, so the % performance value and the visual green/red ratio do not always match up. For example, consider a scenario where the first 5 page requests are "out of bounds", the system is idle (no page requests) for 9 hours, and then there are 95 "good" page requests within an hour. In this instance the chart displays 90% red (9 hours) and 10% green (1 hour) but the % performance value shows 95% ('N' is 100 and 95 samples out of 100 are "good"). The mismatch occurs because the bar charts plot uniformly over time, whereas page requests are not usually uniformly distributed over time.

![Recent Page Summary on the WebCenter Portal Home Page](image)

If the chart indicates issues or incidents, click the **Page Availability** or **Page Performance** link to navigate to more detailed information to diagnose the issue further (see Figure 22-3 and Table 22-3).

Use the information on the Recent Page Metrics page (Figure 22-3) to troubleshoot recent page performance issues. The page availability/performance charts at the top of the page show "red" if page requests are slower than expected or failing.
Out-of-the-box, the page response threshold is 10,000ms so pages taking longer than 10,000ms to respond show “red” in the chart. If this threshold is not suitable for your installation you can change the threshold value. See Customizing Key Performance Metric Thresholds and Collection.

The charts report availability/performance over the last ‘N’ page requests. The time range starts with the earliest page request time and ends with the time of the last page request.

Use the information in the table to identify slow pages, that is, the name of the page and the portal to which the page belongs.

To diagnose page response issues, refer to the advice in “Step 3. Monitor page performance” in Table 22-2.

22.1.5.3 Overall Page Metrics

Historical performance metrics associated with page activity are also available as shown in Figure 22-4 and described in Table 22-4. This page displays metrics for both full and partial page requests and you can filter the data displayed to suit your requirements.

**Note:**

To access these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.
Figure 22-4 Overall Page Request Metrics

The table at the top of this page summarizes the status and performance of individual pages. Use the table to quickly see which pages are available, and to review their individual and relative performances.

Statistics become available when a page is created and are updated every time someone accesses and uses the page.

**Note:**

Metrics for pages in the Home portal are not included.

Table 22-4 Page Request Metrics - Full Page and Partial Page

</tbody>
</table>
Table 22-4  (Cont.) Page Request Metrics - Full Page and Partial Page

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pages per Minute</td>
<td>Number of times the page is accessed per minute, also referred to as page throughput:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
</tbody>
</table>

Overall Page Request Metrics - Graphs

Use the graphs below the table to see, at a glance:

- **Invocations** - Graph showing the most popular or least used pages, that is, pages recording the most or least invocations.

- **Page Throughput** - Graph showing the average number of pages accessed per minute. Use this graph to identify pages with high (or low) hit rates.

- **Errors** - Graph showing the number of errors. Use this graph to compare error rates.

- **Average Processing Time** - Graph showing the average page response time (in milliseconds). Use this graph to identify pages with the best (or worst) performance.

To compare a different set of pages:

- Specify the appropriate filtering criteria in the Page Name Filter.
- Select one or more pages in the table, and then click Display in Chart.

22.1.6 Understanding Portlet Producer Metrics

You can monitor the availability and performance of all the portlets and portlet producers used by WebCenter Portal through Fusion Middleware Control. You can monitor recent and historical (overall) portlet data. The following topics describe the metrics that are available:

- **Recent Portlet Metrics**
- **Overall Portlet Producer Metrics**
- **Overall Portlet Metrics**

22.1.6.1 Recent Portlet Metrics

Recent portlet availability and performance metrics are summarized on the home page for WebCenter Portal (Figure 22-5 and Table 22-5). The portlet availability/performance charts show at a glance if portlet requests are slower than expected or failing.

Note:

To access the home page, see Navigating to the Home Page for WebCenter Portal.
The Portlet Availability and Portlet Performance charts report availability and performance over the last 'N' portlet requests (by default, 'N' is 100). The time range starts with the earliest page/portlet request time and ends with the current time. See Configuring the Number of Samples Used to Calculate Key Performance Metrics.

The % value on the right shows the percentage of portlet requests that responded within a specific time limit. The percentage is calculated using information from the last 'N' portlet requests. For example, if 'N' is 100, and if 25 of the last 100 portlet requests exceeded the portlet response threshold, portlet performance is shown as 75%. For more information, see Table 22-5.

The bar chart status (green/red) does not change over time until the status changes, so the % performance value and the visual green/red ratio do not always match up. An explanation for this is provided in Recent Page Metrics and the same applies to the portlet charts.

**Figure 22-5  Recent Portlet Metric Summary on the WebCenter Portal Home Page**

If the chart indicates issues or incidents, click the Portlet Availability or Portlet Performance link navigate to more detailed information to diagnose the issue further (Figure 22-6 and Table 22-5).

**Figure 22-6  Recent Portlet Metrics**
Use the information on this page to troubleshoot recent portlet performance issues. The portlet availability/performance charts at the top of the page show "red" if portlet requests are slower than expected or failing.

**Note:**

Out-of-the-box, the portlet response threshold is 10,000ms so portlets taking longer than 10,000ms to respond show "red" in the chart. If this threshold is not suitable for your installation you can change the threshold value. For more information, see Customizing Key Performance Metric Thresholds and Collection.

The charts report availability/performance over the last 'N' portlet requests. The time range starts with the earliest portlet request time and ends with the time of the last portlet request.

Use the information in the table to identify slow portlets. You can determine the name of the portlet and the producer to which the portlets belongs.

To diagnose portlet issues, refer to the advice in *Step 5. Monitor portlet performance* in Table 22-2.

**Table 22-5  Recent Portlet Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portlet Availability</td>
<td>Indicates portlet availability over the last 'N' portlet requests:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong> - Indicates successful portlet requests.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong> - Indicates that a failure occurred during a portlet request.</td>
</tr>
<tr>
<td></td>
<td>Look at the Status column in the table below to identify any portlet requests that fail.</td>
</tr>
<tr>
<td></td>
<td>• % - Percentage of portlet requests that succeeded. The percentage is calculated using status information from the last 'N' portlet requests. For example, if 'N' is 100 and 5 of the last 100 portlet requests failed, portlet availability is shown as 95%.</td>
</tr>
</tbody>
</table>
Table 22-5 (Cont.) Recent Portlet Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portlet Performance</td>
<td>Indicates portlet performance over the last 'N' portlet requests:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong> - Indicates acceptable portlet response times, that is, the time taken to respond is less than a predefined threshold.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong> - Indicates portlet responses exceeding the limit set. For example, if your installation specifies the portlet response threshold to be 60 ms, responses longer than 60 ms trigger a warning message and an <code>out-of-bounds</code> condition is logged.</td>
</tr>
<tr>
<td></td>
<td>Out-of-the-box, the portlet response threshold is 10,000ms. Look at the <strong>Time</strong> column in the table below. Responses that exceed the threshold appear in orange. Click the <strong>Sort Descending</strong> arrow to identify the slowest portlets. Once you have the portlet's name, you can examine the portlet to assess how they might be modified to improve efficiency.</td>
</tr>
<tr>
<td></td>
<td>• <strong>%</strong> - Percentage of portlet requests that responded within the time limit specified. The percentage is calculated using information from the last 'N' portlet requests. For example, 'N' is 100, and 10 of the last 100 portlet requests exceeded the portlet response threshold, portlet performance is shown as 90%.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Date Time</th>
<th>Date and time of the portlet request.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portlet Name</td>
<td>Name of the portlet requested.</td>
</tr>
</tbody>
</table>

22.1.6.2 Overall Portlet Producer Metrics

Historical performance metrics are also available for portlet producers used by WebCenter Portal, as shown in Figure 22-7. The information displayed on this page is described in the following tables:

- Table 22-6
- Table 22-7

**Note:**

To access these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.
The current status of portlet producers used in the application:

- **Up** (Green Up Arrow) - Indicates that all portlet producers are up and running.
- **Down** (Red Down Arrow) - Indicates that the one or more portlet producers are currently unavailable. A producer instance might be down, or there could be some network connectivity issues.
- **Unknown** (Clock) - Unable to query the status of the portlet producers for some reason. Maybe the managed server is down or the node cannot be reached due to a network issue. To diagnose further, review the Admin Server log, and the managed server logs.

The percentage of portlet producer invocations that succeeded:

- Since Startup
- Last 15 Minutes

Any request that fails will impact availability. This includes application-related failures such as timeouts and internal errors, and also client/server failures such as requests returned with response codes HTTP4xx or HTTP5xx, responses with a bad content type, and SOAP faults, where applicable.

If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See Viewing and Configuring Log Information.
### Table 22-6 (Cont.) Portlet Producers - Summary

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocations</td>
<td>The number of portlet producer invocations per minute:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td></td>
<td>This metric measures each application-related portlet request and therefore, due to cache hits, errors, or timeouts on the application, this total may be higher than the number of actual HTTP requests made to the producer server.</td>
</tr>
<tr>
<td>Average Time (ms)</td>
<td>The average time taken to make a portlet request, regardless of the result:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
</tbody>
</table>

### Table 22-7 Portlet Producer - Detail

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Most Popular Producers</td>
<td>The number of invocations per producer (displayed on a chart). The highest value on the chart indicates which portlet producer is used the most. The lowest value indicates which portlet producer is used the least.</td>
</tr>
<tr>
<td>Response Time</td>
<td>The average time each portlet producer takes to process producer requests since WebCenter Portal started up (displayed on a chart). The highest value on the chart indicates the worst performing portlet producer. The lowest value indicates which portlet producer is performing the best.</td>
</tr>
<tr>
<td>Producer Name</td>
<td>The name of the portlet producer being monitored. Click the name of a portlet producer to pop up more detailed information about each portlet that the application uses. See Table 22-9.</td>
</tr>
<tr>
<td>Status</td>
<td>The current status of each portlet producer:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Up</strong> (Green Up Arrow) - Indicates that the portlet producer is up and running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Down</strong> (Red Down Arrow) - Indicates that the portlet producer is currently unavailable. The producer instance might be down, or there could be some network connectivity issues.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown</strong> (Clock) - Unable to query the status of portlet producer for some reason.</td>
</tr>
</tbody>
</table>
Table 22-7  (Cont.) Portlet Producer - Detail

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Type</td>
<td>The portlet producer type: Web or WSRP</td>
</tr>
<tr>
<td></td>
<td>• Web portlet producer - Oracle PDK Java producer deployed to a J2EE application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP.</td>
</tr>
<tr>
<td></td>
<td>• WSRP portlet producer - Web Services for Remote Portlets (WSRP) is a Web services standard that allows interoperability between a standards enabled container and any WSRP application.</td>
</tr>
<tr>
<td>Successful Invocations (%)</td>
<td>The percentage of producer invocations that succeeded:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td>Invocations</td>
<td>The number of invocations, per producer:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td></td>
<td>By sorting the table on this column, you can find the most frequently accessed portlet producer in WebCenter Portal.</td>
</tr>
<tr>
<td>Average Time (ms)</td>
<td>The average time taken to make a portlet request, regardless of the result:</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td></td>
<td>Use this metric to detect non-functional portlet producers. If you use this metric with the Invocations metric, then you can prioritize which producer to focus on.</td>
</tr>
<tr>
<td>Maximum Time (ms)</td>
<td>The maximum time taken to process producer requests:</td>
</tr>
<tr>
<td></td>
<td>- Successes - HTTP200xx response code</td>
</tr>
<tr>
<td></td>
<td>- Re-directs - HTTP300xx response code</td>
</tr>
<tr>
<td></td>
<td>- Client Errors - HTTP400xx response code</td>
</tr>
<tr>
<td></td>
<td>- Server Errors - HTTP500xx response code</td>
</tr>
</tbody>
</table>

22.1.6.3 Overall Portlet Metrics

Historical performance metrics are available for individual portlets used by WebCenter Portal, as shown in Figure 22-8. The information displayed on this page is described in the following tables:

- Table 22-8
- Table 22-9
- Table 22-10
- Table 22-11
Note:
To access these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.

22.1.7 Understanding WebLogic Server Metrics

Recent WebLogic Server performance is summarized on the home page for WebCenter Portal (Figure 22-9 and Table 22-12). If the chart indicates issues or incidents, you can navigate to more detailed information to diagnose the issue further.

**Note:**
To access the home page, see Navigating to the Home Page for WebCenter Portal.

Figure 22-9   Recent WebLogic Server Metric Summary on the Home Page

The charts report results from the last WebLogic Server 100 health checks. By default, metrics are recorded every five minutes so data collected over the last 8 hours can display here. If the server started up recently, the chart displays data from the time the server started to the current time.

**Note:**
If required, you can customize the metric collection frequency to better suit your installation. For details, see Customizing Key Performance Metric Thresholds and Collection.

Table 22-12   Recent WebLogic Server Metrics on the Home Page

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| Health | Summarizes recent WebLogic Server health as reported by the Oracle WebLogic Server self-health monitoring feature. This metric considers recent server health, thread health, and JDBC health:  
  • **Green** - Indicates successful WebLogic Server health checks.  
  • **Red** - Indicates that an incident occurred during a WebLogic Server health check.  
    Click **Health** to identify health checks that fail (do not report OK). See Figure 22-10.  
  • % - Percentage of WebLogic Server health checks that succeeded. By default, the percentage is calculated using status information from the last 100 health checks. For example, if 5 of the last 100 health checks fail (do not report OK), Health is shown as 95%. |
**Table 22-12 (Cont.) Recent WebLogic Server Metrics on the Home Page**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incidents</td>
<td>Number of times WebLogic Server metrics exceed threshold settings (that is, metrics such as CPU usage, memory usage, thread count, number of JDBC connections, session metrics, and so on). For example, if the metric data set contains 2 incidents where thread count exceeded the predefined threshold and the number of JDBC connections exceeded the threshold limit 3 times, then the number of incidents displayed is 5. When the number of incidents is greater than 0, an icon with a red cross displays. Click the <strong>Incidents</strong> link to drill down to the Recent WebLogic Server Metrics Page (Figure 22-9) and examine the Health Metrics table to diagnose the incidents further.</td>
</tr>
</tbody>
</table>

You can click **Health** or **Incidents** to drill down to the Recent WebLogic Server Metrics Page (Figure 22-9). The metrics displayed on this page are described in the following topics:

- WebLogic Server Metrics Section
- Recent CPU and Memory Usage Section
- Recent Session and Thread Usage Section
- Recent JDBC Usage Section
- Health Metrics Section
22.1.7.1 WebLogic Server Metrics Section

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>General</strong></td>
<td></td>
</tr>
<tr>
<td>Up Since</td>
<td>Date and time the server last started up.</td>
</tr>
<tr>
<td>State</td>
<td>Current lifecycle state of this server. For example, a server can be in a RUNNING state in which it can receive and process requests or in an ADMIN state in which it can receive only administrative requests. For more information, see Understanding Server Life Cycle in <em>Administering Server Startup and Shutdown for Oracle WebLogic Server</em>.</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Health</td>
<td>Health status of the server, as reported by the Oracle WebLogic Server self-health monitoring feature. For example, the server can report if it is overloaded by too many requests, if it needs more memory resources, or if it will soon fail for other reasons. For more information, see Configure health monitoring in Oracle WebLogic Server Administration Console online help.</td>
</tr>
<tr>
<td>CPU Usage (%)</td>
<td>Percentage of the CPU currently in use by the Java Virtual Machine (JVM). This includes the load that the JVM is placing on all processors in the host computer. For example, if the host uses multiple processors, the value represents a snapshot of the average load on all the processors.</td>
</tr>
<tr>
<td>Heap Usage (MB)</td>
<td>Size of the memory heap currently in use by the Java Virtual Machine (JVM), in megabytes.</td>
</tr>
<tr>
<td>Java Vendor</td>
<td>Name of the company that provided the current Java Development Kit (JDK) on which the server is running.</td>
</tr>
<tr>
<td>Java Version</td>
<td>Version of the JDK on which the current server is running.</td>
</tr>
<tr>
<td>Performance</td>
<td></td>
</tr>
<tr>
<td>Garbage Collection Rate (per min)</td>
<td>Rate (per minute) at which the Java Virtual Machine (JVM) is invoking its garbage-collection routine. By default, this metric shows the rate recorded in the last five minutes. See Configuring the Frequency of WebLogic Server Health Checks.</td>
</tr>
<tr>
<td>Average Garbage Collection Time (ms)</td>
<td>Average length of time (ms) the Java Virtual Machine spent in each run of garbage collection. The average shown is for the last five minutes. By default, this metric shows the average over the last five minutes. See Configuring the Frequency of WebLogic Server Health Checks.</td>
</tr>
<tr>
<td>Active Execute Threads</td>
<td>Number of active execute threads in the pool.</td>
</tr>
<tr>
<td>Execute Threads Idle Count</td>
<td>Number of idle threads in the pool. This count does not include standby threads or stuck threads. The count indicates threads that are ready to pick up new work when it arrives.</td>
</tr>
<tr>
<td>Hogging Execute Threads</td>
<td>Number of threads that are being held by a request right now. These threads will either be declared as stuck after a configured timeout or return to the pool. The self-tuning mechanism backfills if necessary.</td>
</tr>
<tr>
<td>Active Sessions</td>
<td>Number of active sessions for the application.</td>
</tr>
<tr>
<td>Open JDBC Sessions</td>
<td>Number of JDBC connections currently open.</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Incidents</td>
<td>Number of times WebLogic Server metrics exceed threshold settings (that is, metrics such as CPU usage, memory usage, thread count, number of JDBC connections, session metrics, and so on). For example, if the metric data set contains 2 incidents where thread count exceeded the predefined threshold and the number of JDBC connections exceeded the threshold limit 3 times, then the number of incidents displayed is 5. When the number of incidents is greater than 0, an icon with a red cross displays.</td>
</tr>
</tbody>
</table>
| Health     | Summarizes recent health status, as reported by the Oracle WebLogic Server self-health monitoring feature. The Health charts report results from the last 100 performance checks. By default, metrics are recorded every five minutes so data collected over the last 500 minutes displays. If the server started up recently, the chart displays data from the time the server started to the current time.  
  - **Green** - Indicates successful health checks, that is, checks that return "OK".  
  - **Red** - Indicates that a health check returned a status other than "OK". For example, if all threads in the default queue become stuck, server health state changes to "CRITICAL". Similarly, if all threads in weblogic.admin.HTTP, weblogic.admin.RMI, or a user-defined execute queue become stuck, server health state changes to "WARNING". To identify failed health checks, review the Health Metrics Section at the bottom of the page.  
  - **%** - Percentage of health checks that succeeded (OK). The percentage is calculated using status information from the last 100 health checks. For example, if 5 of the last 100 thread health checks fail, thread health is shown as 95%. |
| WebLogic Server | Reports recent WebLogic Server health checks. For example, if 10 out of the last 100 WebLogic Server health checks failed (not "OK"), WebLogic Server health is shown as 90%. |
| Thread     | Reports recent thread health checks. For example, if 10 out of the last 100 WebLogic Server health checks report a thread health status other than "OK", WebLogic Server thread health is shown as 90%. Some example thread health failures include:  
  - If all threads in the default queue become stuck, server health state changes to "CRITICAL".  
  - If all threads in weblogic.admin.HTTP, weblogic.admin.RMI, or a user-defined execute queue become stuck, server health state changes to "WARNING". |
| JDBC       | Reports recent JDBC health checks. For example, the server can report too many JDBC connection requests. If 10 out of the last 100 WebLogic Server health checks report a JDBC health status other than "OK", WebLogic Server JDBC health is shown as 90%. |
22.1.7.2 Recent CPU and Memory Usage Section

This graph charts CPU and memory utilization for the Java Virtual machine over the the last 100 health checks. The time range starts with the earliest health check and ends with the time of the last health check.

From this performance graph, you will be able to tell how much of the memory/CPU configured for the virtual machine is actually being used and whether the trend is increasing. This might reveal to you that the applications running inside that virtual machine need more memory than the virtual machine has been assigned and that adding more memory to the virtual machine -- assuming that there is sufficient memory at the host level -- might improve performance. Similarly, you can assess whether additional CPU resources are required.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU Usage (%)</td>
<td>Percentage of the CPU currently in use by the Java Virtual Machine (JVM). This includes the load that the JVM is placing on all processors in the host computer. For example, if the host uses multiple processors, the value represents a snapshot of the average load on all the processors.</td>
</tr>
<tr>
<td>Heap Usage (MB)</td>
<td>Size of the memory heap currently in use by the Java Virtual Machine (JVM), in megabytes.</td>
</tr>
</tbody>
</table>

22.1.7.3 Recent Session and Thread Usage Section

This graph charts the number of active sessions and active threads recorded over the last 100 health checks. The time range starts with the earliest health check and ends with the time of the last health check.

The number of active sessions and threads should rise and fall with the load on your system. If the graph shows a sudden rise or the number of sessions or threads keep increasing, investigate the issue further to understand what triggered the change in behavior.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Sessions</td>
<td>Number of active sessions for the application.</td>
</tr>
<tr>
<td>Active Thread</td>
<td>Number of active threads for the application.</td>
</tr>
</tbody>
</table>

22.1.7.4 Recent JDBC Usage Section

This graph charts the number of open JDBC sessions recorded over the last 100 health checks. The time range starts with the earliest health check and ends with the time of the last health check.

The Current Active Connection Count metric across all the data sources belonging to the server are used to calculate the overall open JDBC session count displayed here.

Use this chart to determine the number of JDBC sessions being used and to see whether the system is leaking JDBC resources. You can use the information in this chart to assess whether JDBC configuration or the connection pool size needs to be adjusted.
### 22.1.7.5 Health Metrics Section

This table displays data from the last 100 WebLogic Server health metrics collected, as reported by the Oracle WebLogic Server self-health monitoring feature.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Date Time</strong></td>
<td>Date and time of the WebLogic Server health check.</td>
</tr>
<tr>
<td><strong>Server Health</strong></td>
<td>Sever health status, as reported by the Oracle WebLogic Server self-health monitoring feature. Successful health checks return &quot;OK&quot;. Unsuccessful health checks report various failures, for example, the server can report if it is overloaded by too many requests, if it needs more memory resources, or if it will soon fail for other reasons. For more information, see Configure health monitoring in Oracle WebLogic Server Administration Console online help.</td>
</tr>
<tr>
<td><strong>Thread Health</strong></td>
<td>Thread health status, as reported by the Oracle WebLogic Server self-health monitoring feature. Successful health checks return &quot;OK&quot;. Unsuccessful thread checks report various failures, for example, if all the threads in the default queue become stuck, server health state changes to &quot;CRITICAL&quot;. If all threads in weblogic.admin.HTTP, weblogic.admin.RMI, or a user-defined execute queue become stuck, server health state changes to &quot;WARNING&quot;. For more information, see Configure health monitoring in Oracle WebLogic Server Administration Console online help.</td>
</tr>
<tr>
<td><strong>JDBC Health</strong></td>
<td>JDBC health status, as reported by the Oracle WebLogic Server self-health monitoring feature. Successful health checks return &quot;OK&quot;. Unsuccessful JDBC checks report various failures, for example, if the server reports too many JDBC connection requests or that more memory resources are required, server health state changes to &quot;WARNING&quot;. For more information, see Configure health monitoring in Oracle WebLogic Server Administration Console online help.</td>
</tr>
<tr>
<td><strong>Server CPU (%)</strong></td>
<td>If you are using the Oracle JRockit JDK, this metric shows the percentage of the CPU currently in use by the Java Virtual Machine (JVM). This includes the load that the JVM is placing on all processors in the host computer. For example, if the host uses multiple processors, the value represents a snapshot of the average load on all the processors.</td>
</tr>
<tr>
<td><strong>Heap Usage (MB)</strong></td>
<td>Total heap memory (in MB) currently in use by the JVM.</td>
</tr>
<tr>
<td><strong>Average Garbage Collection Time (ms)</strong></td>
<td>Average length of time (ms) the Java Virtual Machine spent in each run of garbage collection. The average shown is for the last five minutes. By default, this metric shows the average over the last five minutes. See Configuring the Frequency of WebLogic Server Health Checks.</td>
</tr>
</tbody>
</table>
## Garbage Collection Rate (per min)

Rate (per minute) at which the Java Virtual Machine (JVM) is invoking its garbage-collection routine. By default, this metric shows the rate recorded in the last five minutes. See Configuring the Frequency of WebLogic Server Health Checks.

## Active Sessions

Number of active sessions for the application.

## Active Execute Threads

Number of active execute threads in the pool.

## Execute Threads Idle Count

Number of idle threads in the pool. This count does not include standby threads or stuck threads. The count indicates threads that are ready to pick up new work when it arrives.

## Hogging Thread Count

Number of threads that are being held by a request right now. These threads will either be declared as stuck after a configured timeout or return to the pool. The self-tuning mechanism backfills if necessary.

## Open JDBC Connections

Number of JDBC connections currently open.

### 22.1.8 Understanding Security Metrics

Some key security-related performance metrics are displayed for WebCenter Portal on the home page (Figure 22-11 and Table 22-13).

---

**Note:**

To access the home page, see Navigating to the Home Page for WebCenter Portal.

---

#### Figure 22-11  Security Metrics on the Home Page

<table>
<thead>
<tr>
<th>Metric</th>
<th>Since Startup</th>
<th>Last 10 Minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Cache Hit Ratio (%)</td>
<td>66% out of 12</td>
<td>100% out of 1...</td>
</tr>
<tr>
<td>Average LDAP Lookup Time (ms)</td>
<td>177.6</td>
<td>0.0</td>
</tr>
</tbody>
</table>

If you compare Since Startup metrics with Recent History metrics you can determine whether performance has recently deteriorated, and if so, by how much.

#### Table 22-13  Security Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDAP Cache Hit Ratio (%)</td>
<td>Percentage of LDAP searches that result in a cache hit.</td>
</tr>
</tbody>
</table>
Table 22-13  (Cont.) Security Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| Average LDAP Lookup Time (ms) | Average time to complete an LDAP search request:  
- Since Startup  
- Last 15 Minutes  
  If LDAP searches are taking too long, its most likely an issue on the LDAP server that is causing slow response times. If you are using Oracle Internet Directory, see Oracle Internet Directory Performance Tuning in Tuning Performance for advice on how to improve performance and avoid bottlenecks. For other LDAP servers, refer to the appropriate product documentation. |

1 The last 10-15 minutes of data is used to calculate recent performance metrics. For details, see Understanding Oracle WebCenter Portal Metric Collection.

22.1.9 Understanding Page Response and Load Metrics

The page response chart on your application’s home page (Figure 22-11) shows you how quickly WebLogic Server is responding to page requests and how many requests are being processed (its load).

The average page processing time (in ms) for all portals, is calculated over a 15 minute period. The number of invocations per minute is also displayed to help you determine whether the average page processing time is increasing or decreasing. If slower page processing times are due to a large number of users accessing the system, an increase in invocations per minute will display on the graph. If the number of users has not increased (the invocations per minute graph is not increasing or fluctuating), then slower page processing times are most likely due to machine resource issues or lack of JVM resources (low memory, contention for database connections, and so on).

Click Table View to see detailed response and load values, recorded at 5 minute intervals.

Note: To access the home page, see Navigating to the Home Page for WebCenter Portal.

Figure 22-12  Page Response Metrics on the Home Page

If you compare Since Startup metrics with Recent History metrics (last 15 minutes), you can determine whether performance has recently deteriorated, and if so, by how much.
22.1.10 Understanding Portal Metrics

(WebCenter Portal only) You can view live performance metrics for individual portals through Fusion Middleware Control, as shown in Figure 22-13. The metrics displayed on this page are described in Table 22-14 and Metrics Common to all Tools and Services.

Note:
Metrics for the Home portal are not included.

Figure 22-13 Portal Metrics

To monitor these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.

The table at the top of this page summarizes the status and performance of individual portals. Use the table to quickly see which portals are up and running, and to review their individual and relative performances.

Statistics become available when a portal is created and are updated every time a member accesses and uses the portal.

You can filter the data displayed in the following ways:

- **Portal Name Filter** - Enter a full or partial search term, and then press Enter to refresh the list with all portals for which a match is found in the display name. To display metrics for all portals, clear the search term and press Enter again.
- **Maximum Rows** - Restrict the total number of portals displayed in the table.

- **Display** - Display metrics for the most accessed portals, the slowest portals, or the portals experiencing the most errors. Depending on your selection, the table orders portals by:
  - Number of Invocations (most accessed portals)
  - Average Page Processing Time (slowest portals)
  - Number of Errors (portals with most errors)

- **Duration** - Display metric information collected since startup or in the last 15 minutes (Recent History).

The top five portals display in the chart.

**Table 22-14  Portal Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Names of portals that match your filter criteria (if any). If you do not specify filter criteria, all the portals are listed.</td>
</tr>
<tr>
<td>Status</td>
<td>Current status of each portal:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Up</strong> (Green Up Arrow) - Indicates that the last portal operation was successful. The portal is up and running.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Down</strong> (Red Down Arrow) - Indicates that the portal is not currently available or the last portal operation was unsuccessful due to an unexpected error or exception. User errors, such as an authentication failure, do not change the status to 'Down'.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unavailable</strong> (Clock) - Status information is currently unavailable.</td>
</tr>
<tr>
<td>Invocations</td>
<td>Total number of portal invocations:</td>

</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td>Maximum Time (ms)</td>
<td>Maximum time taken to display a page in the portal.</td>
</tr>
</tbody>
</table>
Table 22-14 (Cont.) Portal Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum Time (ms)</td>
<td>Minimum time taken to display a page in the portal.</td>
</tr>
</tbody>
</table>

Portal Metrics - Graphs

Use the graphs below the table to see information about portals:

- **Invocations** - Graph showing the most active/popular portals, that is, portals recording the most invocations.
- **Page Throughput** - Graph showing the average number of pages accessed per minute for each portal. Use this graph to identify portals with high (or low) page hit rates.
- **Average Processing Time** - Graph showing the average page response time (in milliseconds). Use this graph to identify portals with the best (or worst) page performance.
- **Errors** - Graph showing which portals are reporting the most errors. Use this graph to compare error rates.

To compare a different set of portals:

- Specify the appropriate filtering criteria.
- Select one or more portals in the table, and then click **Display in Chart**.

22.1.11 Understanding Tool and Service Metrics

This section includes the following topics:

- **Metrics Common to all Tools and Services**
- **Metrics Specific to a Particular Tool or Service**
- **Troubleshooting Common Issues with Tools and Services**

22.1.11.1 Metrics Common to all Tools and Services

Fusion Middleware Control provides capabilities to monitor performance of tools and services used in WebCenter Portal in the following ways:

- **Services summary**: Summary of performance metrics for each tool or service used in WebCenter Portal. Table 22-15 lists tools and services that use common performance metrics and Table 22-16 describes the common metrics.
- **Most popular operations and response time for individual operations**: Table 22-17 describes these metrics.
- **Per operation metrics**: Performance metrics for individual operations. Table 22-15 lists common performance metrics used to monitor performance of individual operations. Table 22-17 describes these metrics.

22.1.11.2 Metrics Specific to a Particular Tool or Service

This section describes per operation metrics for all tools, services and components. This section includes the following topics:

- Announcements Metrics
- BPEL Worklist Metrics
- Content Repository Metrics
- Discussion Metrics
- External Application Metrics
- Events Metrics
- Instant Messaging and Presence Metrics
- Import and Export Metrics
**List Metrics**

**Mail Metrics**

**Note Metrics**

**Page Operation Metrics**

**People Connection Metrics**

**RSS News Feed Metrics**

**Search Metrics**

To access live performance metrics for WebCenter Portal, see [Viewing Performance Metrics Using Fusion Middleware Control](#).

### 22.11.2.1 Announcements Metrics

Performance metrics associated with announcements (Figure 22-14) are described in Table 22-18 and [Metrics Common to all Tools and Services](#).

**Figure 22-14  Announcements Metrics**

<table>
<thead>
<tr>
<th>Service Name</th>
<th>Status</th>
<th>Successful Invocations (%)</th>
<th>Average Time (ms)</th>
<th>Successful Invocations (%)</th>
<th>Average Time (ms)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Announcements</td>

22.1.11.2.2 BPEL Worklist Metrics

Performance metrics associated with worklists are described in Metrics Common to all Tools and Services.

To monitor these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.

22.1.11.2.3 Content Repository Metrics

Performance metrics associated with documents and Content Presenter (Figure 22-15 and Figure 22-16) are described in the following tables:

- Table 22-19
- Table 22-20
- Table 22-21
**Table 22-22**

**Figure 22-15  Content Repository Metrics**

<table>
<thead>

</table>
| Upload    | Uploads one or more documents to a content repository. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |
| Search    | Searches for documents stored in a content repository. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |
| Login     | Establishes a connection to the content repository and authenticates the user. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |
| Delete    | Deletes one or more documents stored in a content repository. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |
| List Folders | Lists folders stored in a content repository. This operation is specific to Content Presenter. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |
| Get Items | Displays items, such as a document or image stored in a content repository. This operation is specific to Content Presenter. | For specific causes, see Content Repository (Documents and Content Presenter) - Issues and Actions.  
For common causes, see Understanding Some Common Performance Issues and Actions. |

### Table 22-20  Content Repository Metrics - Summary (All Repositories)
### Table 22-20  (Cont.) Content Repository Metrics - Summary (All Repositories)

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>The current status of document tool:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Up</strong> (Green Up Arrow) - Indicates that documents tool is up and running and the last operation was successful.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Down</strong> (Red Down Arrow) - Indicates that documents tool is not currently available or service requests are failing. This also indicates that the last operation was unsuccessful due to an unexpected error or exception. User errors, such as an authentication failure, do not change the status to <strong>Down</strong>. If you are having problems with documents, check the diagnostic logs to establish why this tool is &quot;Down&quot;. See Viewing and Configuring Log Information. Some typical causes of failure include: - Content repository is down or not responding. - Network connectivity issues exist between the application and one or more content repositories. - Connection configuration information associated with one or more content repositories is incorrect or no longer valid.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown</strong> (Clock) - Unable to query the status of the tool for some reason. Maybe the managed server is down or the node cannot be reached due to a network issues. To diagnose further, review the Admin Server log, and the managed server logs.</td>
</tr>
<tr>
<td>Successful Invocations (%)</td>
<td>The percentage of document invocations that succeeded (Upload, Download, Search, Login, Delete):</td>
</tr>
<tr>
<td></td>
<td>- Since Startup</td>
</tr>
<tr>
<td></td>
<td>- Last 15 Minutes</td>
</tr>
<tr>
<td></td>
<td>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See Viewing and Configuring Log Information.</td>

#### 22.1.11.2.8 Import and Export Metrics

Performance metrics associated with import and export (Figure 22-21) are described in Table 22-27 and Metrics Common to all Tools and Services. These metrics apply to WebCenter Portal only.

**Figure 22-21  Import/Export Metrics**

To monitor these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.
Table 22-27 Import/Export - Operations Monitored

<table>
<thead>
<tr>

<td>For specific causes, see Import and Export - Issues and Actions. For common causes, see Understanding Some Common Performance Issues and Actions.</td>
</tr>
</tbody>
</table>

22.1.11.2.9 List Metrics

(WebCenter Portal only) Performance metrics associated with lists (Figure 22-22) are described in Table 22-28 and Metrics Common to all Tools and Services.

Figure 22-22 List Metrics

To monitor these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.
### Table 22-28  Lists - Operations Monitored

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Performance Issues - User Action</th>

</tr>
</tbody>
</table>

22.1.11.2.12 Page Operation Metrics

Performance metrics associated with the page operations (Figure 22-25) are described in Table 22-31 and Metrics Common to all Tools and Services.

Note:

The page operation metrics discussed in this section are different from the page request metrics discussed in Understanding Page Request Metrics. Page operation metrics monitor page related operations such as creating pages. Whereas the page request metrics monitor individual page view/display requests (do not include page edit operations).

Figure 22-25  Page Operation Metrics

To monitor these metrics through Fusion Middleware Control, see Viewing Performance Metrics Using Fusion Middleware Control.
Table 22-31  Page Service - Operations Monitored

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Performance Issues - User Action</th>

</table>

**22.1.11.3 Troubleshooting Common Issues with Tools and Services**

This section describes issues that you may have with individual tools and services and suggests actions you can take to address those issue.

---

**See Also:**

[Understanding Some Common Performance Issues and Actions](#)

This section includes the following topics:

- **Announcements - Issues and Actions**
- **Content Repository (Documents and Content Presenter) - Issues and Actions**
- **Discussions - Issues and Actions**
- **External Applications - Issues and Actions**
- **Events - Issues and Actions**
- **Instant Messaging and Presence - Issues and Actions**
- **Import and Export - Issues and Actions**
- **Lists - Issues and Actions**
- **Mail - Issues and Actions**
- **Notes - Issues and Actions**
- **Page Services - Issues and Actions**
- **Portlets and Producers - Issues and Actions**
• People Connections - Issues and Actions

• RSS News Feeds - Issues and Actions

• Search - Issues and Actions

22.1.11.3.1 Announcements - Issues and Actions

If you are experiencing problems with announcements and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• Discussions server is down or not responding.

• Network connectivity issues exist between the application and the Discussions server.

• Connection configuration information associated with announcements is incorrect or no longer valid.

22.1.11.3.2 Content Repository (Documents and Content Presenter) - Issues and Actions

If you are experiencing problems with documents service and the status is Down, check the diagnostic logs to establish why this service is unavailable. Also, do one of the following:

• For Content Server (Oracle WebCenter Content), verify that the back-end server is up and running.

• For Content Server, verify that the socket connection is open for the client for which the service is not functioning properly. Check the list of IP addresses that are allowed to communicate with the Content Server through the Intradoc Server Port (IP Address Filter). For details, see Using Fusion Middleware Control to Modify Internet Configuration in Oracle Fusion Middleware Administering Oracle WebCenter Content.

• (Functional check) Check logs on the back-end server. For Content Server, go to Content Server > Administration > Log files > Content Server Logs.

• (Functional check) Search for entries in the diagnostic log where the module name starts with oracle.vcr, oracle.webcenter.content, oracle.webcenter.doclib, and oracle.stellent. Specifically, the diagnostics log for the managed server on which WebCenter Portal is deployed located at:

  DOMAIN_HOME/servers/managed_server_name/logs/<managed_server>-diagnostic.log

  For example, the diagnostics log for WebCenter Portal is named WC_Portal-diagnostic.log. See Viewing and Configuring Log Information.

22.1.11.3.3 Discussions - Issues and Actions

If you are experiencing problems with discussions and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• Discussions server is down or not responding.

• Network connectivity issues exist between the application and the discussion server.
• Connection configuration information associated with discussions is incorrect or no longer valid.

22.1.11.3.4 External Applications - Issues and Actions
If you are experiencing problems with the External Applications service and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• Credential store is not configured for the application.
• Credential store that is configured, for example Oracle Internet Directory, is down or not responding.

22.1.11.3.5 Events - Issues and Actions
If you are experiencing problems with events (portal events or personal events) and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• WebCenter Portal's repository is not available (the database where event information is stored).
• Network connectivity issues exist between the application and the WebCenter Portal's repository.
• Connection configuration information associated with events is incorrect or no longer valid.

22.1.11.3.6 Instant Messaging and Presence - Issues and Actions
If you are experiencing problems with instant messaging and presence and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• Instant messaging and presence server is not available.
• Network connectivity issues exist between the application and the instant messaging and presence server.
• Connection configuration information associated with instant messaging and presence server is incorrect or no longer valid.

22.1.11.3.7 Import and Export - Issues and Actions
If you are experiencing import and export problems and the status is Down, check the diagnostic logs to establish why this service is unavailable.

22.1.11.3.8 Lists - Issues and Actions
If you are experiencing problems with lists and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

• MDS repository or WebCenter Portal's repository, in which the data associated with lists is stored, is not available.
• Network connectivity issues exist between the application and the repository.
22.1.11.3.9 Mail - Issues and Actions
If you are experiencing problems with mail and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Mail server is not available.
- Network connectivity issues exist between the application and the mail server.
- Connection configuration information associated with mail server is incorrect or no longer valid.

22.1.11.3.10 Notes - Issues and Actions
If you are experiencing problems with notes, check if the MDS repository is unavailable or responding slowly (the repository where note information is stored).

22.1.11.3.11 Page Services - Issues and Actions
If you are experiencing problems with the page editing services and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- WebCenter Portal's repository is not available (the database where page information is stored).
- Network connectivity issues exist between the application and the WebCenter Portal's repository.

22.1.11.3.12 Portlets and Producers - Issues and Actions
If you are experiencing problems with a portlet producer and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Portlet producer server is down or not responding.
- Connection configuration information associated with the portlet producer is incorrect or no longer valid.
- Producer requests are timing out.
- There may be a problem with a particular producer, or the performance issue is due to a specific portlet(s) from that producer.

22.1.11.3.13 People Connections - Issues and Actions
If you are experiencing problems with people connections and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- The service is down or not responding.
- WebCenter Portal's repository is not available (the database where people connection information is stored).
- Network connectivity issues exist between the application and the WebCenter Portal's repository.
22.1.11.3.14 RSS News Feeds - Issues and Actions
If you are experiencing problems with RSS news feeds and the status is Down, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- RSS services are not available.
- A service being searched for activity data has failed, for example:
  - Unable to get discussions or announcement data - check the performance of discussions and announcements.
  - Unable to get list data - check the performance of lists.

22.1.11.3.15 Search - Issues and Actions
If you are facing problems with search (a service executor) and the status is Down, check the diagnostic logs to establish why this executor is unavailable. Some typical causes of failure include:

- The repository of the executor is not available.
- Network connectivity issues exist between the application and the repository of the executor.
- Connection configuration information associated with the executor is incorrect or no longer valid.
- Content repositories being searched is currently unavailable.

22.2 Viewing Performance Metrics Using Fusion Middleware Control
Fusion Middleware Control monitors a wide range of performance metrics for WebCenter Portal.

Administrators can monitor the performance and availability of all the components and services that make up WebCenter Portal, and the application as a whole. These detailed metrics will help diagnose performance issues and, if monitored regularly, you will learn to recognize trends as they develop and prevent performance problems in the future.

Some key performance metrics display on the WebCenter Portal home page (Figure 22-29).
The charts at the top of the page enable you to see at a glance whether the WebCenter Portal application is performing as expected or running slowly. You can drill down to more detailed metrics to troubleshoot problem areas and take corrective action. For guidance on what to look out for, see Using Key Performance Metric Data to Analyze and Diagnose System Health.

This section describes how to navigate around WebCenter Portal metric pages and includes the following topics:

- Monitoring Recent Performance Metrics for WebCenter Portal
- Monitoring Portal Metrics
- Monitoring Service Metrics for WebCenter Portal
- Monitoring Page Metrics for WebCenter Portal
- Monitoring All Metrics Through the Metrics Palette

### 22.2.1 Monitoring Recent Performance Metrics for WebCenter Portal

To see how well WebCenter Portal or a particular portal is currently performing:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Portal.
See Navigating to the Home Page for WebCenter Portal.

2. Check the home page to see whether or not WebCenter Portal is operating as expected.

For guidance on what to look out for, see Using Key Performance Metric Data to Analyze and Diagnose System Health.

3. Drill down to more detailed metrics by clicking links on the home page, such as Page Performance, Portlet Availability, Health, and so on.

Alternatively, access detailed recent metrics through the following menu options:

- WebCenter Portal > Monitoring > Recent Page Metrics
- WebCenter Portal > Monitoring > Recent Portlet Metrics
- WebCenter Portal > Monitoring > Recent WebLogic Server Metrics

For more information about the metrics on these pages, see Understanding Page Request Metrics, Understanding Portlet Producer Metrics, and Understanding WebLogic Server Metrics.

### 22.2.2 Monitoring Portal Metrics

To access performance metrics for portals created in WebCenter Portal:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Portal:

   See Navigating to the Home Page for WebCenter Portal.

2. From the **WebCenter Portal** menu, select **Monitoring > Overall Portal Metrics**.

   To learn more about the metrics displayed, see Understanding Portal Metrics. See Understanding Some Common Performance Issues and Actions.

3. Drill down to detailed page metrics for a particular portal or compare a specific set of portals:

   - To see detailed performance information for a specific portal (previously referred to as *spaces*):
     
     In the **Portal Name Filter** field, enter the name of a portal, then press [Enter].
     For information about portal filtering options, see Understanding Portal Metrics.
     
     OR
     
     In the **Name** column, click the portal name (link) for which you want to display performance metrics.
     
     In both cases, page metrics for the selected portal display.

   - To compare the performance of one or more portals, select one or more rows in the table, and select **Display in Chart**.

### 22.2.3 Monitoring Page Metrics for WebCenter Portal

To access page metrics:
1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. Review page availability/performance charts on the home page to see whether page requests are currently responding as expected.
   
   To drill down to more detailed information, click Page Availability, Page Performance, or select Monitoring > Recent Page Metrics. For more information about the metrics displayed, see Recent Page Metrics.

3. To monitor page performance since start up, select Monitoring > Overall Page Metrics.
   
   You can view metrics for a particular page, all pages, or a specific set of pages. For more information about the metrics displayed and page filtering options, see Overall Page Metrics.

4. To monitor the performance of page editing operations, select Monitoring > Overall Service Metrics and then click Pages in the table.
   
   For information about the metrics displayed, see Page Operation Metrics.

22.2.4 Monitoring Service Metrics for WebCenter Portal

To access service metrics for the WebCenter Portal application:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Monitoring > Overall Service Metrics.
   
   Use Services Summary at the top of the WebCenter Portal Service Metrics page to quickly see which services are up and running, and to review individual and relative performances of those services used by WebCenter Portal.

   Metrics become available when a tool, service, application, or portlet is accessed for the first time. If a service is not configured or has never been used it will not appear in the Summary table.

3. Click the name of a service to drill down to more detailed metrics.
   
   To learn more about individual metrics, see Metrics Specific to a Particular Tool or Service. See also, Troubleshooting Common Issues with Tools and Services.

22.2.5 Monitoring All Metrics Through the Metrics Palette

To access and chart any performance metric collected for WebCenter Portal:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Portal.
   
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Monitoring > Performance Summary.
Use the **Show Metric Palette** button at the top of the **Performance Summary** page to display the **Metric Palette**. This palette enables you to select and monitor individual metrics.

3. In the **Metric Palette**, expand the folders under **WebCenter Portal** and then select the metric check boxes to monitor the metric in graphical or tabular format.

   **Figure 22-30** shows the Performance Summary page and Metric Palette. In addition to **WebCenter Portal** performance metrics, the Metric Palette also displays general performance metrics associated with any J2EE application, for example, **ADF Application Module Pool** metrics.

   To display online help for any metric, right-click the required directory or any metric in the directory and select **Help**.

   ![Image of Performance Summary and Metric Palette](image)

### 22.3 Customizing Key Performance Metric Thresholds and Collection

This section includes the following topics:

- Understanding Customization Options for Key Performance Metrics
- Understanding Default Metric Collection and Threshold Settings
- Configuring Thresholds for Key Metrics
- Configuring the Frequency of WebLogic Server Health Checks
- Configuring the Number of Samples Used to Calculate Key Performance Metrics
- Editing Thresholds and Collection Options for WebCenter Portal

#### 22.3.1 Understanding Customization Options for Key Performance Metrics

You can fine-tune how Oracle WebCenter Portal collects and reports key performance metrics to best suit your installation in several ways:

- Customize warning thresholds for key performance metrics
For example, you can specify that in your installation, page response times greater than 15 seconds must trigger a warning message and report an "out-of-bounds" condition in DMS. Out-of-bound conditions also display "red" in performance charts to notify you that there is an issue.

For more information, see: Configuring Thresholds for Key Metrics.

- **Customize how many samples to collect for key performance metrics**

  If the default sample size (100) is too large or too small for your installation you can configure a more suitable value.

  For more informations, see Configuring the Number of Samples Used to Calculate Key Performance Metrics.

- **Customize health check frequency**

  If your installation demands a more aggressive schedule you can check the system health more often. The default health check frequency is 5 minutes.

  For details, see Configuring the Frequency of WebLogic Server Health Checks.

See also, Editing Thresholds and Collection Options for WebCenter Portal.

### 22.3.2 Understanding Default Metric Collection and Threshold Settings

You can configure metric collection options and metric threshold settings for WebCenter Portal through the `metric_properties.xml` file. The default settings are shown in Example 22-1 and highlighted bold.

---

**Note:**

All time thresholds are specified in milliseconds. Memory sizes are specified in bytes and CPU usage is specified as a percentage.

---

**Example 22-1  Default Metric Collection and Threshold Settings (metric_properties.xml)**

```xml
<registry>
  <global_setting>
    <thread_config>
      <thread component_type="oracle_webcenter" interval="5"/>
    </thread_config>
    <health_check_config>
      <health_check name="wlsHealthCheck" enabled="true" collect="1"/>
    </health_check_config>
    <metric_config>
      <metric name="pageResponseTime" type="time" threshold="10000" comparator="gt"/>
      <metric name="portletResponseTime" type="time" threshold="10000" comparator="gt"/>
      <metric name="wlsCpuUsage" type="number" threshold="80" comparator="gt"/>
      <metric name="wlsGCTime" type="number" threshold="undef" comparator="gt"/>
      <metric name="wlsGcInvPerMin" type="number" threshold=" undef" comparator="gt"/>
      <metric name="wlsActiveSessions" type="number" threshold="undef" comparator="gt"/>
      <metric name="wlsExecuteIdleThreadCount" type="number" threshold="undef" comparator="gt"/>
      <metric name="wlsActiveExecuteThreads" type="number" threshold="undef" comparator="gt"/>
      <metric name="wlsHoggingThreadCount" type="number" threshold="0" comparator="gt"/>
      <metric name="wlsOpenJdbcConn" type="number" threshold="undef" comparator="gt"/>
      <metric name="wlsHeapSizeCurrent" type="number" threshold="undef" comparator="gt"/>
    </metric_config>
    <custom_param_config>
      <custom_param name="downloadTimeThreshold" value="500"/>
    </custom_param_config>
  </global_setting>
</registry>
```
For descriptions of all the settings in this file, refer to the following tables:

- Table 22-35
- Table 22-36

For information on how to modify the default settings, see Customizing Key Performance Metric Thresholds and Collection.

22.3.3 Configuring Thresholds for Key Metrics

You can customize the default warning thresholds for some key performance metrics to make them more suitable for your Oracle WebCenter Portal installation. Table 22-34 lists key performance metrics you can configure and their default thresholds (if any).

Out-of-the-box, thresholds are only pre-configured for page response (more than 10 seconds), portlet response (more than 10 seconds), and CPU usage (over 80%).

**Note:**
The value **undef** means that a threshold is not defined.

You can change the threshold for any of the metrics listed in Table 22-34. For example, by default, pages that take longer than 10 seconds to display trigger a warning message, report an "out-of-bounds" condition in DMS, and show "red" in performance charts to immediately notify you when page responses are too slow. Some portal applications might consider 5 seconds to be an acceptable response time, in which case you can change the threshold to 5,000 (ms) so that your performance charts only show "red" if there really is a problem for you.

**Table 22-34 Configurable Metric Thresholds**

<table>
<thead>
<tr>
<th>Metric Name</th>
<th>Description</th>
<th>Default Threshold Value</th>
<th>Comparator</th>
</tr>
</thead>
<tbody>
<tr>
<td>pageResponseTime</td>
<td>Number of milliseconds to render a page.</td>
<td>10,000 ms</td>
<td>gt</td>
</tr>
<tr>
<td>portletResponseTime</td>
<td>Number of milliseconds to render a portlet.</td>
<td>10,000 ms</td>
<td>gt</td>
</tr>
<tr>
<td>wlsCpuUsage</td>
<td>Percentage CPU usage of the WebLogic Server's JVM.</td>
<td>80%</td>
<td>gt</td>
</tr>
<tr>
<td>wlsGcTime</td>
<td>Average length of time (ms) the JVM spent in each run of garbage collection. The average shown is for the last five minutes.</td>
<td>undefined</td>
<td>gt</td>
</tr>
</tbody>
</table>
Table 22-34  (Cont.) Configurable Metric Thresholds

<table>
<thead>
<tr>
<th>Metric Name</th>
<th>Description</th>
<th>Default Threshold Value</th>
<th>Comparator</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlsGcInvPerMin</td>
<td>Rate (per minute) at which the JVM is invoking its garbage-collection routine. The rate shown is for the last five minutes.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsActiveSessions</td>
<td>Number of active sessions on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsExecuteIdleThreadCount</td>
<td>Number of execute idle threads on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsActiveExecuteThreads</td>
<td>Number of active execute threads on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsHoggingThreadCount</td>
<td>Number of hogging threads on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsOpenJdbcConn</td>
<td>Number of open JDBC connections on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
<tr>
<td>wlsHeapSizeCurrent</td>
<td>JVM's current heap size on WebLogic Server.</td>
<td>undef</td>
<td>gt</td>
</tr>
</tbody>
</table>

Metric thresholds are configured in metrics_properties.xml using the format:

```
<metric_config>
  <metric name="<metric_name>" type="<number/time/string>" threshold="<value>" comparator="gt/lt/eq"/>
  ...
</metric_config>
```

Table 22-34 describes each parameter.

Table 22-35  Key Performance Metric Threshold Configuration

<table>
<thead>
<tr>
<th>&lt;Metric&gt; Parameter</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>No</td>
<td>Name of the metric. The metric name must exactly match the DMS sensor name as listed in Table 22-34.</td>
</tr>
<tr>
<td>type</td>
<td>Yes</td>
<td>Specifies whether the metric is a number, time, or string.</td>
</tr>
</tbody>
</table>
Table 22-35  (Cont.) Key Performance Metric Threshold Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold</td>
<td>Yes</td>
<td>(Only applies when type is set to number or time). Specifies a numeric threshold value. If specified, you must also specify a comparator. For example, if portlet response times greater than 5 seconds are considered out-of-bounds: metric name=&quot;portletResponseTime&quot; type=&quot;time&quot; threshold=&quot;5000&quot; comparator=&quot;gt&quot; Note: Time must be specified in milliseconds.</td>
</tr>
<tr>
<td>comparator</td>
<td>Yes</td>
<td>Specify one of gt, lt, or eq. Where: gt - greater than lt - less than eq - equal to</td>
</tr>
</tbody>
</table>

To edit one or more metric thresholds, follow the steps in Editing Thresholds and Collection Options for WebCenter Portal.

22.3.4 Configuring the Frequency of WebLogic Server Health Checks

Out-of-the-box, the general health of the WebLogic Server on which WebCenter Portal is deployed is checked every 5 minutes and the results are reported on the Understanding WebLogic Server Metrics page.

If your installation demands a more aggressive schedule you can check the system health more often.

Health check frequency is configured in metrics_properties.xml using the format:

```
<thread_config>
  <thread component_type="oracle_webcenter" interval="<value>"/>
</thread_config>
```

Table 22-36 describes each parameter.

Table 22-36  Health Check Frequency Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_type</td>
<td>oracle_webcenter</td>
<td>No</td>
<td>For Oracle WebCenter Portal, the component_type is always oracle_webcenter.</td>
</tr>
<tr>
<td>interval</td>
<td>5 minutes</td>
<td>Yes</td>
<td>Specifies the interval between health checks, in minutes. For example: &lt;thread component_type=&quot;oracle_webcenter&quot; interval=&quot;10&quot;/&gt;</td>
</tr>
</tbody>
</table>
To change the frequency, follow the steps in Editing Thresholds and Collection Options for WebCenter Portal.

22.3.5 Configuring the Number of Samples Used to Calculate Key Performance Metrics

Oracle WebCenter Portal collects and reports recent performance for several key performance metrics (page, portlet, and WebLogic Server) based on a fixed number of data samples. Out-of-the-box, the last 100 samples of each metric type are used to calculate these key performance metrics, that is, 100 samples for page metrics, 100 samples for portlet metrics, and so on.

You can increase or decrease the sample set to suit your installation. If you decide to increase the number of samples you must consider the additional memory cost of doing so, since all the key performance metrics samples are maintained in memory. Oracle recommends that you specify a few hundred at most. See Understanding Oracle WebCenter Portal Metric Collection.

**Note:**
Since all "out-of-bounds" metrics are recorded in the managed server's diagnostic log, you can always scan the logs at a later date or time to see what happened in the past, that is, beyond the 'N' metric samples that are temporarily held in memory.

The server startup property `WC_HEALTH_MAX_COLLECTIONS` determines the number of metric samples collected by Oracle WebCenter Portal. If the property is not specified, 100 samples are collected.

To customize the number of samples collected for key performance metrics:

1. Log in to WebLogic Server Administration Console.
2. Navigate to the managed server on which WebCenter Portal is deployed: Environment> Servers> WC_Portal.
3. Click the Server Start tab.
4. In the Arguments text area, enter the server startup argument `WC_HEALTH_MAX_COLLECTIONS` and specify the number of samples you want to collect.

   For example:
   ```
   -DWC_HEALTH_MAX_COLLECTIONS=200
   ```

   Separate multiple arguments with a space. For example:
   ```
   -DWC_HEALTH_MAX_COLLECTIONS=200
   -DWEBCENTER_METRIC_PROPERTIES=/scratch/mythresholds/metric_properties.xml
   ```
5. Restart the managed server.

22.3.6 Editing Thresholds and Collection Options for WebCenter Portal

To change metric thresholds and collection criteria for WebCenter Portal:

1. Copy the XML snippet in Example 22-1 and save it to a text file named `metric_properties.xml`. 
2. Edit metric collection parameters and/or metric thresholds in `metric_properties.xml`, as required.

   **Note:**
   You must consider your machine resources, as well as the system topology and configuration when choosing suitable thresholds for your Oracle WebCenter Portal installation. As each installation is different, most metrics do not have default or recommended threshold settings.

A description of all the settings and their defaults (if any) are described in the following tables:

- Table 22-35
- Table 22-36

3. Copy the updated `metric_properties.xml` file to:
   - Your `DOMAIN_HOME`.
   - Another suitable directory.

4. Configure the server startup argument `WEBCENTER_METRIC_PROPERTIES` to point to the full path of the properties file:
   a. Log in to WebLogic Server Administration Console.
   b. Navigate to the managed server on which your application is deployed.
      For WebCenter Portal, navigate to `Environment> Servers> WC_Portal`.
   c. Click the Server Start tab.
   d. In the Arguments text area, enter the `WEBCENTER_METRIC_PROPERTIES` argument and specify the full path of the properties file.
      For example:
      
      ```
      -DWEBCENTER_METRIC_PROPERTIES=/scratch/mythresholds/metric_properties.xml
      ```

   **Note:**
   If you only specify the file name, Oracle WebCenter Portal looks for this file in your `DOMAIN_HOME`.
   Separate multiple arguments with a space. For example:
   
   ```
   -DWEBCENTER_METRIC_PROPERTIES=/scratch/mythresholds/metric_properties.xml
   ```

   e. Restart the managed server.
22.4 Diagnosing and Resolving Performance Issues with Oracle WebCenter Portal

The performance metrics described in this chapter enable you to quickly assess the current status and performance of WebCenter Portal from Fusion Middleware Control. When performance is slow, further investigations may be required for you to fully diagnose and fix the issue. For guidance, see Using Key Performance Metric Data to Analyze and Diagnose System Health.

Some common performance issues and actions are described in this chapter:

- Understanding Some Common Performance Issues and Actions
- Troubleshooting Common Issues with Tools and Services

For more detailed troubleshooting tips relating to performance, see Troubleshooting Oracle WebCenter Portal.

22.5 Tuning Oracle WebCenter Portal Performance

See Oracle WebCenter Portal Performance Tuning in Tuning Performance for information on tuning WebCenter Portal. For example, how to tune the system limit (open-files-limit), JDBC data sources, JVM arguments, session timeouts, page timeouts, connection timeouts, concurrency timeouts, caching, and more.

22.6 Improving Data Caching Performance

To enhance performance and scalability, WebCenter Portal uses Coherence by default for its data caching solution. However, the Oracle Coherence license included in WebCenter Portal is restricted, which means that by default a Local caching scheme without any distributed data caching is supported. In a High-Availability (HA) environment deployment, the cached entries are not shared across JVMs/machines.

You can however, use the distributed mode for better performance in a clustered environment if you have Coherence or WebLogic Suite licensing. This section guides you on how to set up distributed cache and override WebCenter Portal's default caching configuration to improve performance, provided you have the appropriate license.

This section contains the following topics:

- Summary of Coherence Cache Types
- Default Coherence Caches in WebCenter Portal
- Overriding the Default Configuration

Note:

For more information about configuring coherence, see Configuring and Managing Coherence Clusters in Administering Clusters for Oracle WebLogic Server.
22.6.1 Summary of Coherence Cache Types

The basic types of cache modes provided by Coherence are outlined in Table 22-37.

<table>
<thead>
<tr>
<th>Cache Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distributed</td>
<td>Data is partitioned among all the machines of the cluster. For fault-tolerance, partitioned caches can be configured to keep each piece of data on one or more unique machines within a cluster. Distributed caches are the most commonly used caches in Coherence.</td>
</tr>
<tr>
<td>Replicated</td>
<td>Data is fully replicated to every member in the cluster. This cache offers the fastest “read” performance with linear performance scalability for “reads,” but poor scalability for “writes” (because “writes” must be processed by every member in the cluster). Because data is replicated to all machines, adding servers does not increase aggregate cache capacity.</td>
</tr>
<tr>
<td>Optimistic</td>
<td>Similar to the replicated cache, but without any concurrency control. This implementation offers higher write throughput than a replicated cache. It also allows using an alternative underlying store for the cached data (for example, a MRU/MFU-based cache). However, if two cluster members are independently pruning or purging the underlying local stores, it is possible that a cluster member may have different store content than that held by another cluster member.</td>
</tr>
<tr>
<td>Near</td>
<td>A near cache is a hybrid cache; typically fronts a distributed cache or a remote cache with a local cache. Near cache backed by a partitioned cache offers zero-millisecond local access for repeat data access, while enabling concurrency and ensuring coherency and fail-over, effectively combining the best attributes of replicated and partitioned caches.</td>
</tr>
<tr>
<td>Local</td>
<td>A local cache is a cache that is local to (completely contained within) a particular cluster node. While it is not a clustered service, the Coherence local cache implementation is often used in combination with various clustered cache services.</td>
</tr>
</tbody>
</table>

For more information about the types of caches provided by Coherence, see Introduction to Coherence Caches in Developing Applications with Oracle Coherence guide.

22.6.2 Default Coherence Caches in WebCenter Portal

The default user-configurable Coherence cache entries for WebCenter Portal are shown in Table 22-38.

<table>
<thead>
<tr>
<th>Cache Name</th>
<th>Purpose</th>
<th>Default Coherence Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.webcenter.spaces.model.ApplicationSpaceObjects</td>
<td>Cache for Application Space</td>
<td>WebCenter_12HourCache</td>
</tr>
<tr>
<td>oracle.webcenter.spaces.model.SpaceProperties</td>
<td>Cache for Space Properties</td>
<td>WebCenter_12HourCache</td>
</tr>
</tbody>
</table>
Table 22-38  (Cont.) Default Coherence Caches in WebCenter Portal

<table>
<thead>
<tr>
<th>Cache Name</th>
<th>Purpose</th>
<th>Default Coherence Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.webcenter.genericsiteresources</td>
<td>Cache for Generic Site Resources</td>
<td>WebCenter_12HourCache</td>
</tr>
<tr>
<td>oracle.webcenter.profile</td>
<td>Cache for People Profile</td>
<td>WebCenter_60MinuteCache</td>
</tr>
<tr>
<td>oracle.webcenter.doclib.provisioned</td>
<td>Doc lib caches (Provisioned and configured)</td>
<td>WebCenter_12HourCache</td>
</tr>
<tr>
<td>oracle.webcenter.page</td>
<td>Cache for Page definitions</td>
<td>WebCenter_12HourCache</td>
</tr>
</tbody>
</table>

The properties of the default Coherence configuration shown in Table 22-38 are described as follows:

<table>
<thead>
<tr>
<th>Default Configuration</th>
<th>Eviction Policy</th>
<th>High Units</th>
<th>Expiration Delay</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebCenter_12HourCache</td>
<td>Hybrid</td>
<td>1000</td>
<td>12 hours</td>
</tr>
<tr>
<td>WebCenter_60MinuteCache</td>
<td>Hybrid</td>
<td>1000</td>
<td>1 hour</td>
</tr>
</tbody>
</table>

Where:

- High Units is the maximum number of units that can be placed in the cache before pruning occurs.
- Hybrid Eviction Policy chooses which entries to evict based on the combination (weighted score) of how often and how recently they were accessed. Those entries that are accessed least frequently and those that were not accessed for the longest period are evicted first.
- Expiration Delay specifies the amount of time from the last update that entries will be kept by the cache before being marked as expired. Any attempt to read an expired entry will result in a reloading of the entry from the configured cache store. Expired values are periodically discarded from the cache.

Coherence can be deployed with a standalone application, as an application server library or part of a Java EE module within an EAR or WAR file or also within the WebLogic Server context.

22.6.3 Overriding the Default Configuration

By default, WebCenter Portal uses the local data caching mode. To use the distributed mode for better performance in a clustered environment, you can override the default configuration.

To override the default configuration:

1. Configure WebLogic Clusters (as needed by High Availability configuration) and Coherence clusters.

For more information, see Configuring and Managing Coherence Clusters in Administering Clusters for Oracle WebLogic Server.
2. Define a cache configuration file to override the default configuration.

For more information, see Configuring Caches and Cache Configuration by Example in Developing Applications with Oracle Coherence.

Note:
To override a cache configuration file at runtime, the cache configuration file must be bound to a JNDI name. The JNDI name that is defined for using the override-property in WebCenter Portal in the GAR file is ExamplesGar. Be sure to use the same name when you override.

By default, local caching is used. Make sure to use the exact names of the available caches provided in Table 22-38 in your cache configuration file.

For example, the people profile cache is uniquely identified by the name oracle.webcenter.profile and maps to the local scheme WebCenter_60MinuteCache by default. If you have a large number of users working on the portal, you might want to cache the users' profiles as recreating this object is expensive. By increasing the size for this cache, you can retain the user profile objects in the cache and achieve better performance in the Activity Stream.

To override this cache to use a distributed scheme, make sure to specify the cache name correctly.

```xml
<cache-mapping>
  <cache-name>oracle.webcenter.profile</cache-name>
  <scheme-name>my_distributed_scheme</scheme-name>
</cache-mapping>
```

where, my_distributed_scheme refers to your newly defined distributed caching scheme.

3. After the configuration file is defined, override the default cache configuration file using WLST on the cluster.

For more information, see Overriding a Cache Configuration File in Administering Clusters for Oracle WebLogic Server.

You can also override the default cache configuration from the WebLogic Server Administration Console. For more information, see Create cluster cache configurations in WebLogic Server Administration Console Online Help.

Any configuration changes persist on the Admin server by default, and will remain even after an upgrade of WebCenter Portal.
Managing Oracle WebCenter Portal Logs

This chapter describes how to configure diagnostic logging and error messages in WebCenter Portal.

This chapter includes the following topics:

- Introduction to Diagnostic Logging
- Viewing and Configuring Log Information

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin, Operator, or Monitor role through the Oracle WebLogic Server Administration Console.

See also, Understanding Administrative Operations, Roles, and Tools.

23.1 Introduction to Diagnostic Logging

All diagnostic information relating to startup and shutdown information, errors, warning messages, access information on HTTP requests, and other additional information is stored in log files.

For general information about managing and analyzing logs using Fusion Middleware Control and WLST, see Managing Log Files and Diagnostic Data in Administering Oracle Fusion Middleware.

See also, Understanding the Diagnostic Framework in Administering Oracle Fusion Middleware.

This section includes the following topics:

- WebCenter Portal Diagnostics Log
- Oracle WebCenter Portal Message IDs
- Out-Of-Bound Conditions for Oracle WebCenter Portal Performance Metrics
- Loggers

23.1.1 WebCenter Portal Diagnostics Log

The diagnostics log file for WebCenter Portal is $WC_Portal-diagnostic.log$. This log is available under the $DOMAIN_HOME/servers/WC_Portal/logs$ directory.
23.1.2 Oracle WebCenter Portal Message IDs

Oracle WebCenter Portal log messages fall into these categories:

<table>
<thead>
<tr>
<th>Message ID Range</th>
<th>Message Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>BI Integration</td>
<td>WCS-01001 ~ WCS-02000</td>
</tr>
<tr>
<td>Blogs</td>
<td>WCS-02001 ~ WCS-03000</td>
</tr>
<tr>
<td>Calendar Tasks</td>
<td>WCS-03001 ~ WCS-04000</td>
</tr>
<tr>
<td>Collaboration Integration</td>
<td>WCS-04001 ~ WCS-05000</td>
</tr>
<tr>
<td>Portal Builder</td>
<td>WCS-05001 ~ WCS-06000</td>
</tr>
<tr>
<td>VCR</td>
<td>WCS-06001 ~ WCS-07000</td>
</tr>
<tr>
<td>Document Library</td>
<td>WCS-07001 ~ WCS-08000</td>
</tr>
<tr>
<td>Discussions</td>
<td>WCS-08001 ~ WCS-09000</td>
</tr>
<tr>
<td>Mail</td>
<td>WCS-09001 ~ WCS-10000</td>
</tr>
<tr>
<td>Explorer Toolbar</td>
<td>WCS-10001 ~ WCS-11000</td>
</tr>
<tr>
<td>Desktop Integration</td>
<td>WCS-11001 ~ WCS-12000</td>
</tr>
<tr>
<td>Lifecycle</td>
<td>WCS-12001 ~ WCS-13000</td>
</tr>
<tr>

23.1.3 Out-Of-Bound Conditions for Oracle WebCenter Portal Performance Metrics

Out-of-bound conditions are also logged in managed server diagnostic logs so you can examine historical events at any time. Performance related messages are logged with the message ID prefix WCS-692<nn> and include the metric name, the value, and a message describing the metric that is out-of-bounds.

Here are some examples of messages that you might see in diagnostic logs for WebCenter Portal:

[WC_Portal] [WARNING] [WCS-69251] [oracle.webcenter.system-management] [tid: [ACTIVE].ExecuteThread: '4' for queue: 'weblogic.kernel.Default (self-tuning)'] [userId: weblogic] [ecid: 6356ef0164cbad47:3fe105c5:13b4e847973:-8000-0000000000000031,0] [APP: webcenter#11.1.1.4.0] [DSID: 0000JhEYRT?EqKG_Ix8Dyf1Ghz32000005] pageResponseTime: 22223 ms of PersonalSpace/Activities is out-of-bounds

[WC_Portal] [WARNING] [WCS-69252] [oracle.webcenter.system-management] [tid: oracle.webcenter.DefaultTimer] [ecid: 0000JhEX92mEqKG_Ix8Dyf1Ghz32000002,0] [APP: webcenter#11.1.1.4.0] wlsCpuUsage: 21.92100394175851 % of WebLogicServer is out-of-bounds

23.1.4 Loggers

23.2 Viewing and Configuring Log Information

This section includes the following topics:

- Viewing and Configuring WebCenter Portal Logs
- Viewing and Configuring Error Messages in WebCenter Portal

23.2.1 Viewing and Configuring WebCenter Portal Logs

To view log messages for a WebCenter Portal application:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Portal. See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Logs > View Log Messages.

3. In the Log Messages page, search for warnings, errors, notifications, and so on.

To configure log files for WebCenter Portal:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Portal. See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Logs > Log Configuration.

3. In the Log Configuration page, in the Log Files tab, configure log settings.

For more information, see Viewing and Searching Log Files in Administering Oracle Fusion Middleware.

23.2.2 Viewing and Configuring Error Messages in WebCenter Portal

To help developers debug WebCenter Portal assets, administrators can enable error messages with the calling stack to be displayed in the WebCenter Portal error page.

Caution:

For security reasons, error messages should not be enabled in a production environment. Oracle recommends that you restrict error messages to development and staging environments.

To enable error messages:

1. Connect to the WebCenter domain’s Administration server using WLST. For information about how to run WLST commands to connect to the Administration server, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Create a new folder (/tmp/WCconfig) on your local file system.
3. Export the `webcenter-config.xml` configuration file to the `/tmp/WCconfig` folder you created by running:

   ```
   exportMetadata(application='webcenter', server='WC_Portal', toLocation='/tmp/WCconfig', docs='/oracle/webcenter/webcenterapp/metadata/webcenter-config.xml')
   ```

4. Open the `webcenter-config.xml` file (in the `/tmp/WCconfig/oracle/webcenter/webcenterapp/metadata`) folder and change the `showError-enabled` property to `true` to enable error messages:

   ```xml
   <webcenter:showError-enabled>true</webcenter:showError-enabled>
   ```

   or `false` to disable it:

   ```xml
   <webcenter:showError-enabled>false</webcenter:showError-enabled>
   ```

5. Save the file and import it back to the Administration server using the following WLST command:

   ```
   importMetadata(application='webcenter', server='WC_Portal', fromLocation='/tmp/WCconfig', docs='/oracle/webcenter/webcenterapp/metadata/webcenter-config.xml')
   ```

   Note that you do not need to restart the Administration server for the change to take effect.
This chapter provides an introduction to managing audit logging for WebCenter Portal.

This chapter includes the following topics:

- Introduction to Managing Audit Logs
- Configuring Audit Logging
- Viewing WebCenter Portal Audit Events

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

24.1 Introduction to Managing Audit Logs

When enabled, audit logging tracks portal-related events as part of the Fusion Middleware Audit Service. Audit log events are stored in a file (the Audit Bus-stop) by default, but can also be uploaded to a database for persistency (for more information, see Configuring the Audit Store Database). The Audit Bus-stop file has a limited capacity so storing log information in a database where events can be queried long after their occurrence is recommended.

Note:

If you enable WebCenter Portal Impersonation, it is highly recommended that you also enable audit logging. When Impersonation is enabled, audit logging tracks the impersonator, impersonatee, and the context surrounding an event.

Audit logging provides the following key benefits:

- Events that alter the security settings of portal, portal server, and major portal server artifacts are traceable
- Definable logging levels
• Events logged are available in perpetuity when uploaded to a database

• Reports on audit events are available through the Audit Service

For more information about the Audit Service and configuring the Audit Service, see Introduction to Oracle Fusion Middleware Audit Framework in Securing Applications with Oracle Platform Security Services. For information about configuring the Audit Service to use a database, see Configuring and Managing Auditing in Securing Applications with Oracle Platform Security Services. For information about out-of-the-box Audit Service reports, see Pre-built Audit Reports in Securing Applications with Oracle Platform Security Services.

24.2 Configuring Audit Logging

This section describes how to turn logging on and off for WebCenter Portal, how to set the log level, and how to set up the Audit Store Database.

This section includes the following topics:

• Setting the Logging Level

• Configuring the Audit Store Database

24.2.1 Setting the Logging Level

By default, audit logging for WebCenter Portal is turned off (that is, set to None). To turn it on, set the logging level to a value other than none (for example, Low) as shown in the examples below. For the details of which logging categories are included for each logging level, see Using WebCenter Portal Audit Logs.

Use the following WLST commands to modify the audit logging level for WebCenter Portal audit events:

To set the logging level to Low:

```java
setAuditPolicy(componentType="webcenter",filterPreset="Low")
```

Set the logging level to Medium:

```java
setAuditPolicy(componentType="webcenter",filterPreset="Medium")
```

To turn logging off for WebCenter Portal:

```java
setAuditPolicy(componentType="webcenter",filterPreset="None")
```

Successful execution does not throw any error and completes silently. Restart the WC_Portal server to complete the logging level change.

For information about additional WLST commands you can use to manage and configure audit logging, see WLST Commands for Auditing in Securing Applications with Oracle Platform Security Services.

24.2.2 Configuring the Audit Store Database

The audit store is a database that contains a pre-defined Oracle Fusion Middleware Audit Framework schema created by the Repository Creation Utility (RCU). By default, audit logs are stored as files in the `auditlogs` directory as shown in the following example:

```text
DOMAIN_HOME/servers/WC_Portal/logs/auditlogs/webcenter#11.1.1.4.0/audit_1_0.log
```
Once database persistence has been configured, the Audit loader picks up data from this file and puts it in the Audit Framework schema. For information about configuring the Audit Service to use a database, see Configuring and Managing Auditing in *Securing Applications with Oracle Platform Security Services*.

You will need to know the name of the audit schema (the suffix is always IAU). You will also need to set the audit repository to the database as shown below:

```python
setAuditRepository(switchToDB='true', dataSourceName='jdbc/AuditDB', interval='15')
```

**Note:**

The audit data in the store is expected to be cumulative and will grow over time. Ideally, the database should not be an operational database used by any other applications, and should be a standalone RDBMS used for audit purposes only.

### 24.3 Viewing WebCenter Portal Audit Events

This section describes the WebCenter Portal audit events that are available in the audit log, and shows a simple SQL statement that you can use to query the audit schema for impersonation events.

This section includes the following subsections:

- **Using WebCenter Portal Audit Logs**
- **Querying the Audit Schema**

#### 24.3.1 Using WebCenter Portal Audit Logs

Table 24-1 lists the WebCenter Portal audit events that appear in the audit log depending on the log level that is set. The various WebCenter Portal tools (such as documents, announcements, discussions, wikis and blogs, forum, forum message, forum topic, forum category) are identified in the log by their corresponding ToolArtifactID and ToolType.

When the log level is set to **Low**, events in the following categories are logged:

- PortalLifeCycle
- PortalRoleManagement
- PortalRoleMemberManagement
- PortalToolAccessManagement
- ImpersonationSessionMgmt

When the log level is set to **Medium**, events in the following additional categories are logged:

- PortalToolsManagement
- PortalPagesManagement

24.3.2 Querying the Audit Schema

Once you’ve configured the audit schema and the audit repository is set to database, you can create reports based on this generated audit data. Follow the steps below to create a report:

1. Generate a view based on audit tables by running the following command to generate a SQL file that can then be used to create a view for the WebCenter Portal component-specific data from audit DB tables:
createAuditDBView(fileName="/tmp/WCPortalAuditView.sql",
componentType="webcenter")

The IAU schema owner (for example, TEST_IAU) will need to have 'create view' privileges. To create the view, run the WCPortalAuditView.sql file or run the following SQL command as a system DBA:

grant create view to TEST_IAU

The created view will have name like 'webcenter_AUDITVIEW'.

2. Use the view to query the audit database using WebCenter Portal tool audit attribute names as table column name as shown in the following examples. Open the WCPortalAuditView.sql file to see the mapping of table column names with WebCenter Portal attributes.

• The following SQL statement returns all the attributes of WebCenter Portal tools that are logged with the event types BeginImpersonation and EndImpersonation:

```sql
select * from webcenter_AUDITVIEW where EventType like '%Impersonation';
```

• The following SQL statement lists all users who have deleted any portal along with the deleted portal information:

```sql
select InitiatorUID, InitiatorMail, PortalID, PortalName, PortalURL from
webcenter_AUDITVIEW where EventType = 'DeletePortal';
```

• The following SQL statement returns all audit data for WebCenter Portal:

```sql
select * from webcenter_AUDITVIEW;
```

If you want to regularly monitor WebCenter Portal activities you can create a SQL data control using SQL queries and drop the data control as a table or other visualization onto a portal page. For more information about SQL data controls, see Working with Data Presenter in Building Portals with Oracle WebCenter Portal.
This part of *Administering Oracle WebCenter Portal* provides information about the security administration topics for Oracle WebCenter Portal:

- Managing Oracle WebCenter Portal Security
- Configuring the Identity Store
- Configuring the Policy and Credential Store
- Configuring Single Sign-On
- Configuring SSL
- Configuring Web Services Security
- Configuring Security for Portlet Producers
- Managing Impersonation
This chapter provides an introduction to securing WebCenter Portal, and describes the security configuration that is in place when it is initially deployed.

This chapter includes the following topics:

- Introduction to Application Security
- Default Security Configuration

For information about specific aspects of configuring security for WebCenter Portal, see:

- Configuring the Identity Store
- Configuring the Policy and Credential Store
- Configuring Single Sign-On
- Configuring SSL
- Configuring Web Services Security
- Configuring Security for Portlet Producers

**Permissions:**

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

### 25.1 Introduction to Application Security

The recommended security model for WebCenter Portal is based on Oracle ADF Security, which implements the Java Authentication and Authorization Service (JAAS) model. For more information about Oracle ADF Security, see *Developing Fusion Web Applications with Oracle Application Development Framework*.

*Figure 25-1* shows the relationship between a WebCenter Portal application deployment and its services, servers, portlets, portlet producers, its identity, credential and policy stores, and Oracle Enterprise Manager.
The diagram in Figure 25-2 shows a basic WebCenter Portal application after deployment with its back-end server connections.

The diagram in Figure 25-3 shows the security layers for a WebCenter Portal application.
WebCenter Portal applications share the same four bottom security layers (WebCenter Security Framework, ADF Security, OPSS, and WebLogic Server Security). The application layer will, of course, depend on the implementation.

**WebCenter Portal Application Security**

WebCenter Portal provides support for:

- Application role management and privilege mapping
- Self-registration
- Portal-level security management
- External application credential management

**WebCenter Portal Security Framework**

The WebCenter Portal Security Framework provides support for:

- Service Security Extension Framework (a common permission-based and role-mapping based model for specifying the security model for services)
- Permission-based authorization
- Role-mapping based authorization
- External applications and credential mapping

**ADF Security**

ADF Security provides support for:

- Page authorization
- Task flow authorization
- Secure connection management
- Credential mapping APIs
- Logout invocation, including logout from SSO-enabled configurations with Oracle Access Manager and Oracle SSO
- Secured login URL for ADF Security-based applications (the adfAuthentication servlet)

**Oracle Platform Security Services (OPSS)**

OPSS provides support for:

- Anonymous-role
- Authenticated-role
- Identity store, policy store, and credential store
- Identity Management Services
- Oracle Web Service Manager Security
- Authorization
- Policy and Credential Lifecycle
WebLogic Server Security
WebLogic Server Security provides support for:

- WebLogic authenticators
- Identity asserters
- J2EE container security
- SSL

25.2 Default Security Configuration

This section describes the security configuration that is in place when a WebCenter Portal application is deployed, and the configuration tasks that should be carried out after deployment:

- Administrator Accounts
- Application Roles and Enterprise Roles
- Default Identity and Policy Stores
- Default Policy Store Permissions and Grants
- Post-deployment Security Configuration Tasks

25.2.1 Administrator Accounts

Although the WebCenter Portal application does not contribute any pre-seeded accounts, there are certain pre-seeded grants that are given to the default system administrator account (weblogic) for the WebCenter Portal application. If your installation does not use weblogic as the account name for the system administrator role, you must configure one or more other users for this role as described in Managing Users and Application Roles.

**Note:**
The weblogic account is a system administrator account and should not be used to create user-level artifacts. The weblogic account should only be used to create new user accounts in Fusion Middleware Control.

25.2.2 Application Roles and Enterprise Roles

Application roles differ from roles that appear in the identity store portion of the embedded LDAP server or in roles defined by the enterprise LDAP provider. Application roles are specific to an application and defined in an application-specific stripe of the policy store.

Enterprise roles, which are stored in the enterprise identity store, apply at the enterprise level. That is, the roles and permissions that you or a system administrator define within the enterprise identity store do not imply permissions within an application.

Within WebCenter Portal you can assign application roles and permissions to users in the corporate identity store. You can also assign application roles and permissions to enterprise roles defined in the enterprise identity store.
25.2.3 Default Identity and Policy Stores

By default, WebCenter Portal is configured to use a file-based embedded LDAP identity store to store application-level user IDs, and an Oracle RDBMS (releases 10.2.0.4 or later; releases 11.1.0.7 or later; and releases 11.2.0.1 or later) policy store to store policy grants.

Although secure, the embedded LDAP identity store is not a "production-class" store and should be replaced with an external LDAP-based identity store such as Oracle Internet Directory for enterprise production environments. For list of supported versions of identity store types, see Oracle Fusion Middleware 12c Certifications.

**Caution:**

The default file-based policy store should only be used for development, and only for single-node WebCenter Portal configurations. For enterprise deployments you must reassociate the policy and credential store with a database, or with an external LDAP-based store as described in Configuring the Identity Store.

The policy and credential stores can use either the default database store or Oracle Internet Directory 11gR1 or 10.1.4.3. Note that when using an external LDAP-based store, the policy and credential stores must use the same LDAP server. Similarly, when using a database, the policy and credential stores must use the same database.

For more information about the supported identity store and policy and credential store configurations, see Supported LDAP-, DB-, and File-Based Services in Securing Applications with Oracle Platform Security Services. For more information on reconfiguring the identity store and the policy and credential stores, see Configuring the Identity Store and Configuring the Policy and Credential Store.

**Note:**

By default, discussions are configured to use the embedded LDAP identity store: All users in the embedded LDAP store can log onto the discussions server, and all users in the Administrators group have administrative privileges on the discussions server.

If you reassociate the identity store with an external LDAP server, you must either move the system administrator account to the external LDAP (as described in Moving the Administrator Account to an External LDAP Server), or if you choose not to move the administrator account, you must perform some additional steps to identify the new administrator account for the discussions server as described in Migrating the Discussions Server to Use an External LDAP.

Both WebCenter Portal and Content Server must share the same LDAP server. For more information, see Configuring Oracle WebCenter Content to Share the WebCenter Portal Identity Store LDAP Server.
25.2.4 Default Policy Store Permissions and Grants

The ADF Security permissions model supports both permission-based and role-based authorization. These two types of authorization, and the default Policy Store permissions and code based grants are discussed in the following topics:

- Permission-based Authorization
- Role-mapping Based Authorization
- Default Policy Store Permissions for WebCenter Portal
- Default Code-based Grants

25.2.4.1 Permission-based Authorization

Permission-based authorization is used for tools, such as lists, where access control is implemented within the WebCenter Portal application using Oracle Platform Security Services (OPSS). WebCenter Portal provides extensive user and role management tools with which you can create application roles, and define what permissions should be granted to those roles. For information on managing users and roles in WebCenter Portal, see Managing Security Across Portals. For information on managing roles in portals, see the "Managing Application Roles and Permissions" section in *Using Oracle WebCenter Portal*.

25.2.4.2 Role-mapping Based Authorization

Tools and services that need to access "remote" (back-end) resources require role-mapping based authorization. For example, for discussions, role mapping is required when WebCenter Portal users (mapping to one or more application roles) must be mapped to another set of roles on the discussions server.

For example, in the WebCenter Portal application:

- WebCenter Portal roles are mapped to corresponding roles on the back-end discussions server.
- When a user is granted a new WebCenter Portal role, a similar grant (privilege) is granted in the back-end discussions server. For example, when user Pat is granted *Discussions-Create/Edit/Delete* permissions in WebCenter Portal, Pat is granted corresponding permissions in the back-end discussions server.

See also the "Understanding Discussions Server Role and Permission Mapping" section in *Using Oracle WebCenter Portal*.

25.2.4.3 Default Policy Store Permissions for WebCenter Portal

Out-of-the box, WebCenter Portal provides the following default roles:

Default application roles:

- Administrator
- Application Specialist
- Portal Creator
- Authenticated-User
- Public-User
For more information about the default application roles, see Managing Security Across Portals.

Default role in a portal:

- Portal Manager

**Note:**

The portal-level roles of Participant and Viewer are no longer created by default. In order to create portals faster and eliminate unneeded roles, there are fewer default portal-level roles created by default.

### 25.2.4.4 Default Code-based Grants

WebCenter Portal makes internal calls to APIs on the security platform that are secured with permission checks. Consequently, the application must be granted appropriate permissions to invoke the OPSS APIs (for example, the permission to access the policy store and grant or revoke permissions *(PolicyStoreAccessPermission*, or grant basic permissions to application roles).

Similarly, WebCenter Portal must pre-authorize access to various operations that it wants to expose using the WebCenter Portal permissions, and then invoke the OPSS APIs as privileged actions.

### 25.2.5 Post-deployment Security Configuration Tasks

After deploying WebCenter Portal, you should consider the following security-related configuration tasks for your site:

- **Reassociating the identity store to use an external LDAP**

  By default, WebCenter Portal uses an embedded LDAP for the identity store. Although secure, the out-of-the-box embedded LDAP may not scale appropriately for large enterprise production environments. For instructions on how to configure the identity store to use an external LDAP such as Oracle Internet Directory (OID), see Configuring the Identity Store.
Note:

By default, WebCenter Portal's discussions server is configured to use the embedded LDAP identity store. All users in the embedded LDAP store can log on to the discussions server, and all users in the Administrators group have administrative privileges on the discussions server.

If you reassociate the identity store with an external LDAP server, you must either move the system administrator account to the external LDAP (as described in Moving the Administrator Account to an External LDAP Server), or if you choose not to move the administrator account, you must perform some additional steps to identify the new administrator account for the discussions server as described in Migrating the Discussions Server to Use an External LDAP.

For WebCenter Portal, both the WebCenter Portal application and Content Server must share the same LDAP server. For more information, see Configuring Oracle WebCenter Content to Share the WebCenter Portal Identity Store LDAP Server.

• Configuring SSO

Single Sign-On (SSO) lets users log in once across WebCenter Portal and components rather than having to log in for each sub-application (for example, to accessing a wiki page). Users do not have to maintain a separate user ID and password for each application or component that they access. However, you can still configure a variety of authentication methods, so that more sensitive applications can be protected using more stringent methods. WebCenter Portal supports four single sign-on solutions: Oracle Access Manager (OAM), Oracle Single Sign-on (OSSO), a SAML-based single sign-on solution, and an SSO solution for Microsoft clients, using Windows authentication based on the Simple and Protected Negotiate (SPNEGO) mechanism and the Kerberos protocol. For a discussion of these solutions and an overview of single sign-on, see Configuring Single Sign-On.

• Configuring SSL

Secure Sockets Layer (SSL) provides additional security for connections between WebCenter Portal and components by providing an additional authentication layer, and by encrypting the data exchanged. For connections between applications or components where the data exchanged is sensitive, consider securing the connection with SSL. For a list of the connections that can and should be protected with SSL in a production environment, see Configuring SSL.

Note:

Using SSL is computationally intensive and adds overhead to a connection. SSL should therefore not be used where it is not required, and is best reserved for production environments.
Configuring the Identity Store

This chapter describes how to reassociate the identity store with an external LDAP instead of the default embedded LDAP identity store. It also describes how to configure an LDAP server for Oracle WebCenter Content Server.

This chapter includes the following topics:

• Reassociating the Identity Store with an External LDAP Server
• Configuring the GUID Attribute for External LDAP Identity Stores
• Adding Users to the Embedded LDAP Identity Store
• Moving the Administrator Account to an External LDAP Server
• Configuring Oracle WebCenter Content to Share the WebCenter Portal Identity Store LDAP Server
• Aggregating Multiple Identity Store LDAP Servers Using libOVD
• Configuring Dynamic Groups for WebCenter Portal
• Configuring the REST Service Identity Asserter

Caution:
Before reassociating the identity store, be sure to back up the relevant configuration files:

• config.xml
• jps-config.xml

As a precaution, you should also back up the boot.properties file for the Administration Server for the domain.

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.
26.1 Reassociating the Identity Store with an External LDAP Server

In almost all cases, you should reassociate the identity store with an external LDAP server rather than using the default embedded LDAP. Although you can use many different types of LDAP servers, this section focuses on how to configure the identity store to use Oracle Internet Directory (OID).

Note:
Reassociating the identity store with an external LDAP server is mandatory only if you’re using the documents or discussions tools, in which case the WC_Portal server, Content Server, and Collaboration server must all be configured to use the same external LDAP server.

It is recommended that you set a strong password policy on the LDAP server for the identity store. Oracle recommends that user passwords meet the following requirements:

• Passwords should not contain the user’s account name or parts of the user’s full name that exceed two consecutive characters.

• Passwords must be at least six characters in length or the number of characters specified in the minimum password length policy setting.

• Enforce password history policy setting, which determines the number of unique new passwords that have to be associated with a user account before an old password can be reused. The setting for this value can be between 0–24 (if this value is set to 0, Enforce password history is disabled; a higher value, such as 24, is preferable to prevent security vulnerability through password reuse).

• Passwords must contain characters from at least three of the following four categories: English uppercase alphabet characters (A to Z), English lowercase alphabet characters (a to z), base 10 digits (0 to 9), non-alphanumeric characters (for example, !$#,%).

For the GUID attribute for other supported LDAPs, see Configuring the GUID Attribute for External LDAP Identity Stores. For other user attribute mappings for supported LDAP servers, see the User and Role API Reference in Securing Applications with Oracle Platform Security Services. For information about tuning and performance for LDAPs supported by WebCenter Portal, see Tuning Identity Store Configuration in Tuning Performance.

Note:
To use an existing database (i.e., not a default database store created when WebCenter Portal is installed in its default configuration) for the identity store, you must either use OVD or write a custom provider based on the User and Role API. Note that LibOVD should not be used in conjunction with a database identity store.
Caution:

Reassociating an external LDAP identity store (such as OID) in a production environment with another external LDAP store is not supported. If you have a business need to carry out such a reassociation, please contact Oracle support before going ahead as user information and artifacts may be lost in the process.

To reassociate the identity store with OID:

1. Log in to the WebLogic Server Administration Console.
   
   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane click Security Realms.
   
   The Summary of Security Realms pane displays.

3. In the Name column, click the realm for which you want to reassociate the identity store.
   
   The Realm Settings pane displays.

4. Open the Providers tab.
   
   The Providers Settings pane displays.

5. Click New to add a new provider.
   
   The Create a New Authentication Provider pane displays.

6. Enter a name for the provider (for example OIDAuthenticator for a provider that authenticates the user for the Oracle Internet Directory).

7. Select the authenticator appropriate for your LDAP directory from the list of authenticators.
   
   Be sure to select the authenticator associated with the LDAP you are configuring rather than choosing the generic DefaultAuthenticator. For example, for OID select OracleInternetDirectoryAuthenticator, or for iPlanet select IPlanetAuthenticator.

**Note:** If using iPlanet, set the virtualize property to true in .//
user_projects/domains/soainfra/config/fmwconfig/jps-
config.xml.

```xml
<serviceInstance name="idstore.ldap" provider="idstore.ldap.provider">
  <property name="idstore.config.provider" value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider"/>

  <property name="CONNECTION_POOL_CLASS" value="oracle.security.idm.providers.stdldap.JNDIPool"/>

  <property name="virtualize" value="true"/>

  <property name="OPTIMIZE_SEARCH" value="true"/>
</serviceInstance>
```
8. Click **OK** to save your settings.

The Settings pane displays with the new authentication provider.

9. In the list of Authentication Providers, click the newly created provider.

The Settings Pane for the new authentication provider displays.

10. Set the Control Flag to **SUFFICIENT**.

Setting the Control Flag to **SUFFICIENT** indicates that if a user can be authenticated successfully by this authenticator, then the authentication provider should accept that authentication and should not invoke any additional authenticators.

    **Note:**
    If the authentication fails, it falls through to the next authenticator in the chain. Therefore, be sure all subsequent authenticators also have their control flag set to **SUFFICIENT**.

11. Click **Save** to save this setting.

12. Open the **Provider Specific** tab to enter the details for the LDAP server.

13. Enter the details specific to your LDAP server.

    **Note:**
    The table below shows values appropriate for OID. For the permissible values for other LDAPs, such as Active Directory, see OPSS System and Configuration Properties appendix in *Securing Applications with Oracle Platform Security Services*.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host:</td>
<td>The LDAP server's server ID (for example, (&lt;\text{ldap_host}&gt;example.com)&gt; )</td>
<td></td>
</tr>
<tr>
<td>Port:</td>
<td>The LDAP server's port number (for example, 3060)</td>
<td></td>
</tr>
<tr>
<td>Principal:</td>
<td>The LDAP user DN used to connect to the LDAP server (for example, (\text{cn=orcladmin})&gt; )</td>
<td></td>
</tr>
<tr>
<td>Credential:</td>
<td>The password used to connect to the LDAP server</td>
<td></td>
</tr>
<tr>
<td>User Base DN:</td>
<td>Specify the DN under which your Users start (for example, (\text{cn=users,dc=example,dc=com})&gt; )</td>
<td></td>
</tr>
<tr>
<td>Group Base DN:</td>
<td>Specify the DN that points to your Groups node (for example, (\text{cn=groups,dc=example,dc=com})&gt; )</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the GUID Attribute for External LDAP Identity Stores

This section describes the different GUID attributes used by non-Oracle LDAP implementations. For other user attribute mappings for other supported LDAP servers, see the User and Role API Reference section in *Securing Applications with Oracle Platform Security Services*. See also Mapping User Attributes to LDAP Directories in *Securing Applications with Oracle Platform Security Services*. Note that as shown in the table in Mapping User Attributes to LDAP Directories, not all attributes are available across all LDAP servers, including the embedded LDAP server that comes with WebLogic Server (WLS).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Retrieved User Name as Principal</td>
<td>Checked</td>
<td>Must be turned on</td>
</tr>
<tr>
<td>All Users Filter:</td>
<td>(&amp;(uid=*) (objectclass=person))</td>
<td>Search to find all users under the <strong>User Base DN</strong></td>
</tr>
<tr>
<td>User From Name Filter:</td>
<td>(&amp;(uid=%u) (objectclass=person))</td>
<td></td>
</tr>
<tr>
<td>User Name Attribute:</td>
<td>uid</td>
<td></td>
</tr>
</tbody>
</table>

**14.** Click **Save**.

**15.** Return to the **Providers** tab and reorder the providers so that the new authentication provider is on top, followed by any other authenticators with the **DefaultAuthenticator** placed at the end of the list.

All should have their control flags set to **SUFFICIENT** so that subsequent authenticators can authenticate identities that fall through from the new provider all the way through to the **DefaultAuthenticator** (which is used only for the default file-based embedded LDAP). For example, logins such as the default administrator account are not typically created in the LDAP directory, but still need to be authenticated to start up the server. Unless identities are allowed to fall through to the **DefaultAuthenticator**, the default administrator account will not be authenticated. For more information about the **DefaultAuthenticator** and the default administrator account, see *Moving the Administrator Account to an External LDAP Server*.

**Note:**

Do not use the **REQUIRED** control flag if you are using multiple authenticators. If a **REQUIRED** control flag is found in the list of authenticators, regardless of its position, no further authenticators will be examined.

**16.** Restart the Administration Server and the managed server for the changes to take effect.
Note:
If you are using an LDAP identity store that does not use the orclGuid attribute, such as IBM Tivoli, you can map the GUID attribute in the WLS authenticator and it will be used automatically.

IBM Tivoli® Directory Server:
ibm-entryUUID

Microsoft® Active Directory:
objectGUID

If you are using Active Directory, remember that the samAccountName attribute has a 20-character limit; other IDs used by Lotus Connections have a 256-character limit.

Microsoft Active Directory Application Mode (ADAM):
objectGUID

To use objectSID as the default for ADAM, add the following line to the <config:attributeConfiguration> section of the wimconfig.xml file:

<config:externalIdAttributes name="objectSID" syntax="octetString"/>

BM Domino® Enterprise Server:
dominoUNID

Note that if the bind ID for the Domino LDAP does not have sufficient manager access to the Domino directory the Virtual Member Manager (VMM) does not return the correct attribute type for the Domino schema query; DN is returned as the VMM ID. To override VMM's default ID setting, add the following line to the <config:attributeConfiguration> section of the wimconfig.xml file:

<config:externalIdAttributes name="dominoUNID"/>

Sun Java™ System Directory Server:
nsuniqueid
eNovell Directory Server:
GUID

26.3 Adding Users to the Embedded LDAP Identity Store

For development or testing purposes, you can add users to the embedded LDAP using the WebLogic Server Administration Console, or using an LDIF file and LDAP commands. Using an LDIF file lets you add additional attributes not available through the WebLogic Server Administration Console.
Adding Users to the Embedded LDAP Identity Store

Note:
The embedded LDAP server should only be used for testing or "proof of concept." For production use, Oracle recommends using external identity stores, such as Oracle Internet Directory or Microsoft Active Directory, that are supported by the OPSS user and role APIs. For information about the user and role attributes, see the Mapping User Attributes to LDAP Directories section in Securing Applications with Oracle Platform Security Services.

For Oracle Internet Directory, users are typically managed using ODSM (described in Managing Directory Entries in Oracle Internet Directory Administrator’s Guide).

Note:
If you are planning to reassociate your identity store with an external LDAP, perform that step first (as described in Reassociating the Identity Store with an External LDAP Server) as when you reassociate the embedded LDAP with OID or other external LDAP implementation users and user artifacts may not be carried forward. Consequently, do not add users to the embedded LDAP with the expectation of moving them to a production environment. The embedded LDAP is intended to be used only as a test environment, and is not intended as a staging environment that can be moved to production.

WebCenter Portal supports self-registration. New users who self-register with WebCenter Portal are added directly to the identity store. For more information about self-registration, see Enabling Self-Registration.

Note:
Adding users to the identity store is typically a system administrator task and may not be a task for which application-level administrators have the required permissions.

This section includes the following subsections:

- Adding Users to the Identity Store Using the WLS Administration Console
- Adding Users to the Identity Store Using an LDIF File

26.3.1 Adding Users to the Identity Store Using the WLS Administration Console

To add users to the embedded LDAP identity store from the WebLogic Server Administration Console:

1. Log in to the WebLogic Server Administration Console.
   
   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, click Security Realms.
   
   The Summary of Security Realms pane displays.
3. In the Name column, click the realm to which you want to add users.
   The Realm Settings pane displays.

4. Click the Users and Groups tab to display the list of current users.

5. Click New to add a new user.

6. On the Create a New User page, enter the new user login name in the Name field.
   User names are case sensitive and must be unique. Do not use commas, tabs or any
   of the other characters in the following comma-separated list:
   \(<\>,\#,,\&,?,()(\}),\}

7. In the Description field, enter a description for the user (for example, the user’s full
   name).

8. From the Provider drop-down menu, select DefaultAuthenticator.

9. In the Password field, enter a password for the user.
   The minimum password length for a user defined in the WebLogic Authentication 
   provider is 8 characters (note that other LDAP providers may have different 
   requirements for the password length). Do not use user name/password 
   combinations such as weblogic/weblogic in a production environment.

10. Reenter the password in the Confirm Password field.

11. Click OK to save your changes and add the user.
   The user should now appear in the list of users.

26.3.2 Adding Users to the Identity Store Using an LDIF File

You can add users directly to the embedded LDAP identity store using an LDIF file. 
Using an LDIF file enables you to specify additional user attributes that are not 
available through the WebLogic Server Administration Console. As the embedded 
LDAP server is a conformant LDAP server, you can use LDAP commands to add or 
modify users. You can also search the directory, which is useful when exporting and 
importing user accounts.

To add users to the embedded LDAP using an LDIF file you must perform the 
following tasks:

- **Enable External LDAP Access**
- **Create an LDIF File**
- **Add the Users**

26.3.2.1 Enable External LDAP Access

When WebLogic Server is installed, the LDAP access credential is set as a randomized 
value and encrypted in the config.xml file. To enable external LDAP access, you 
must reset the access credential for the embedded LDAP.

To reset the access credential for the embedded LDAP:

1. Log in to the WebLogic Server Administration Console.
For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, click **wc_domain**.

3. In the Settings pane for **wc_domain**, click the Security tab, and then click the Embedded LDAP tab.

   The Settings Pane for **wc_domain** displays the embedded LDAP settings.

4. Enter a new password in the **Credential** field, and reenter it in the **Confirm Credential** field.

5. Click **Save** to save your settings.

6. Restart the WebLogic server.

   After this, you are ready to access the LDAP server with the following values:
   - the DN value for admin access is "cn=Admin"
   - the password is the value you entered in the Credential field
   - the port is the same as the admin port, which by default is 7001

**26.3.2.2 Create an LDIF File**

You can create an LDIF file with any text editor, and can include any attributes appropriate for the embedded LDAP directory. The **objectclasses** that are supported by default in the embedded LDAP server for WebLogic Server are the following:

- **person**
- **inetOrgPerson**
- **organizationalPerson**
- **wlsUser**

In order to interact successfully with the embedded LDAP server, you should understand the default layout of the directory information tree (DIT). The default layout in the embedded LDAP directory is shown in **Figure 26-1**.

**Figure 26-1  Embedded LDAP Directory Information Tree**
The naming attribute for the user entry in the embedded LDAP directory tree is "uid". This is different from the default configuration for Oracle Internet Directory (OID), where the naming attribute is "cn". Also, the location of the users in this tree is "ou=people,ou=myrealm,dc=wc_domain".

The following example shows an LDIF file with the attributes that are displayed in the WebCenter Portal user profile screens:

dn: uid=john.doe,ou=people,ou=myrealm,dc=wc_domain
description: John Doe
cn: john.doe
uid: john.doe
sn: Doe
objectclass: wlsUser
objectclass: organizationalperson
objectclass: inetOrgPerson
objectclass: person
objectclass: top
userpassword: MyPassword
displayName: John Doe
employeeNumber: 12345
employeeType: Regular
givenName: John
homePhone: 650-555-1212
mail: john.doe@example.com
title: Manager
manager: uid=mary.jones,ou=people,ou=myrealm,dc=wc_domain
preferredLanguage: en
departmentNumber: tools
facsimiletelephonenumber: 650-555-1200
mobile: 650-500-1200
pager: 650-400-1200
telephoneNumber: 650-506-1212
postaladdress: 200 Oracle Parkway
l: Redwood Shores
homepostaladdress: 123 Main St., Anytown 12345

To create a file with multiple user entries, just replicate the above lines as many times as required, with a blank line between entries.

Note:
WebCenter Portal user profiles include some attributes that are only available in Oracle Internet Directory. These include the following attributes from the orclUserV2 objectclass:

- orclTimeZone
- orclDateOfBirth
- maidenName

You cannot add these attributes to an embedded LDAP identity store.
26.3.2.3 Add the Users

The example below uses the `ldapadd` command, a part of the LDAP command line utilities provided with the Oracle Internet Directory server. For more information about using the `ldapadd` command, see Oracle Internet Directory Data Management Tools in Reference for Oracle Identity Management. For a complete list of user attribute mappings for LDAP servers supported by WebCenter Portal, see Mapping User Attributes to LDAP Services in the Securing Applications with Oracle Platform Security Services.

```
ldapadd -h weblogichost.example.com -p 7001 -D cn=Admin -w password -v -f newuser.ldif
```

```
add description:  
  John Doe
add cn:  
  john.doe
add uid:  
  john.doe
add sn:  
  Doe
add objectclass:  
  wlsUser  
  organizationalperson  
  inetOrgPerson  
  person  
  top
add userpassword:  
  password
add displayname:  
  John Doe
add employeenumber:  
  12345
add employeetype:  
  Regular
add givenname:  
  John
add homephone:  
  650-555-1212
add mail:  
  john.doe@example.com
add title:  
  Manager
add manager:  
  uid=mary.jones,ou=people,ou=myrealm,dc=wc_domain
add preferredlanguage:  
  en
add departmentnumber:  
  tools
add facsimiletelephonenumber:  
  650-555-1200
add mobile:  
  650-500-1200
add pager:  
  650-400-1200
add telephonenumber:  
  650-506-1212
add postaladdress:  
  200 Oracle Parkway
add l:  
```
26.4 Moving the Administrator Account to an External LDAP Server

When configuring the domain to use an external LDAP server, you can also optionally move the system administrator account (weblogic by default) to the LDAP server.

If the system administrator account, or any other appropriate user in LDAP, is in an LDAP group called "Administrators", then this account should be sufficient to manage the server, and the DefaultAuthenticator provider can be removed from the list of authentication providers. In this case, all users, including the administrator account, are authenticated against the external LDAP.

**Note:**

WebCenter Portal only recognizes users in the identity store that is mapped by the first authenticator. Since the WebCenter Portal Administrator account is initially created only in the embedded LDAP server, if an external LDAP such as Oracle Internet Directory is configured as the primary authenticator for WebCenter Portal, you must also create a user in that LDAP and grant that user the WebCenter Portal Administrator role. For more information about granting the WebCenter Portal Administrator role to a user, see Granting the WebCenter Portal Administrator Role.

If you cannot create the weblogic (default) user in the external LDAP directory, there are two options. You can:

- Keep the DefaultAuthenticator provider and use the weblogic account with the local embedded LDAP server in WebLogic Server to start and stop servers and do other administrator operations from the WebLogic Server Administration Console. If you keep the DefaultAuthenticator, make sure that the control flag for the DefaultAuthentication provider is set to SUFFICIENT. If you choose this option, you must also perform the additional steps described in Migrating the Discussions Server to Use an External LDAP.

**Note:**

If the weblogic user account is used from the DefaultAuthenticator, this account should not be used to access WebCenter Portal as the application code will not be able to find the user in the external LDAP store.

- Remove the DefaultAuthenticator and make sure that any valid user account used for administrator operations, such as starting and stopping servers, is included in an "Administrators" group or other named group that contains the list of users that are allowed to manage your domain in OID or other external LDAP. If a name other than "Administrators" is used, then you must update the group name in the definition of the WebLogic Server Global Administrator role. By default, this is defined as membership in the enterprise group called "Administrators". For information about changing the administrator group name, see Changing the Administrator Group Name.
Note:
Since OWSM is dependent on the OracleSystemUser and OracleSystemGroup entities, which are provided by the DefaultAuthenticator, to get OWSM working after the embedded LDAP is removed you’ll need to modify the default user. For more information, see Modifying the Default User in Securing Web Services and Managing Policies with Oracle Web Services Manager.

This section includes the following topics:

- Migrating the Discussions Server to Use an External LDAP
- Changing the Administrator Group Name

### 26.4.1 Migrating the Discussions Server to Use an External LDAP

If you’ve installed the discussions server and choose not to move the administrator account to an external LDAP (as described in Moving the Administrator Account to an External LDAP Server), you must perform some additional steps to identify the new administrator account for the discussions server prior to reordering the authenticators on the WebLogic server:

1. Select a user account from the external LDAP to be the administrator for the discussions server.

2. Create an administrator account in the `DefaultAuthenticator` (that is, the embedded LDAP) that matches the one you selected from the external LDAP. The account names in the embedded LDAP and the external LDAP server must be the same.

   For information about adding users to the embedded LDAP, see Adding Users to the Embedded LDAP Identity Store.

3. Log in to the discussions server Admin Console with the boot-identity account (that is, `weblogic`) at:

   http://host:port/owc_discussions/admin

   Where `host` and `port` are the host ID and port number of the `WLS_Services` managed server.

4. Click Settings > Admins/Moderators.

   The Admins & Moderators page displays (see Figure 26-2).
5. Click Grant New Permissions.

The Grant New Permissions pane displays (see Figure 26-3).

**Figure 26-3  Grant New Permissions Pane**

Granular permissions are either additive or negative. Additive permissions (✓) are permissions that should be added to the permissions retrieved from parent categories and those that are globally set, while negative permissions (x) are permissions that should be revoked or removed from permissions retrieved from parent categories and those that are globally set. For more information about permissions, please read the administrator guide distributed with this product or click the help icon above.

**Permissions Summary**

<table>
<thead>
<tr>
<th>Permission Summary</th>
<th>Grant New Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td></td>
</tr>
<tr>
<td>System Admin</td>
<td>Category Admin</td>
</tr>
<tr>
<td>User Admin</td>
<td>Group Admin</td>
</tr>
<tr>
<td>Administrator</td>
<td>Moderator</td>
</tr>
</tbody>
</table>

**Legend**

- Special permission type: Anyone and Registered Users cannot be removed, only cleared.
- System admin: do not delete all system admin users. You need at least one to log in to this tool.
- Permission is inherited because it has already been set globally or for a parent folder/category.
- Permission has been explicitly blocked in a parent folder/category.
- Indicates a permission is set

6. Grant System Admin privileges to the user you created, as shown in Figure 26-4.
7. Click System > System Properties.

The Jive Properties page displays (see Figure 26-5).

Figure 26-5  Jive Properties Page

8. Check that the properties marked in red have been added and are set as shown in Figure 26-5.

9. Log in to the WebLogic Server Administration Console.

For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

10. In the Domain Structure pane, click Security Realms.

The Summary of Security Realms pane displays.
11. In the **Name** column, click the realm for which you want to change the administrator group name.

The **Realm Settings** pane displays.

12. Select the **Providers** tab and the **Authentication** subtab, and reorder the authentication providers so that the authenticator for the external LDAP appears at the top of the list as shown in the example in Figure 26-6:

**Figure 26-6    Providers Tab with Reordered Authentication Providers**

13. Restart the domain Administration server and discussions server.

14. If you have not done so already, create a user in the external LDAP and grant that user the WebCenter Portal Administrator role (see Granting the WebCenter Portal Administrator Role).

### 26.4.2 Changing the Administrator Group Name

You can change the group name to any other valid enterprise role in your LDAP server that contains users authorized to manage the domain. This lets you delegate the administration of specific domains in your enterprise. You can create various administration groups in the directory and have the corresponding domains be configured to use the appropriate group for defining its administrators.

The following example LDIF file creates an administrative group in Oracle Internet Directory:

```
dn: cn=wc_domain_Admin,cn=groups,dc=example,dc=com
cn: wc_domain_Admin
uniqueMember: cn=joe.admin,cn=users,dc=example,dc=com
owner: cn=orcladmin
displayName: WebLogic Administrators Group
description: WebLogic Administrators Group
objectClass: orclgroup
objectclass: groupofuniquenames
```

Once this group is created, you must update the role definition for the WebLogic Server global Admin role using the WebLogic Server Administration Console.

To update the role definition for the WebLogic Server global Admin role:
1. Log in to the WebLogic Server Administration Console.
   
   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, click Security Realms.

   The Summary of Security Realms pane displays.

3. In the Name column, click the realm for which you want to change the administrator group name.

   The Realm Settings pane displays.

4. Open the Roles and Policies tab, and then the Realm Roles subtab.

   The Realm Roles settings pane displays.

5. Expand the Global Roles node, and then the Roles node.

6. Click View Role Conditions for the Admin role.

   The Edit Global Role page displays.

   By default, the Administrators group in Oracle Internet Directory (or other configured identity store) defines who has the administrator role in WebLogic Server.

7. Click Add Conditions to add a different group name.

   The Edit Global Role - Predicate List page displays.

8. Select Group from the Predicate List list and click Next.

   The Edit Global Role - Arguments page displays.

9. Enter the name for the new administrator group and click Add.

10. Select the pre-existing administrator group and click Remove to delete it leaving the new one you've selected in its place.

11. Click Finish to save your changes.

   After making this change, any members of the new group specified are authorized to administer WebLogic Server.

#### 26.5 Configuring Oracle WebCenter Content to Share the WebCenter Portal Identity Store LDAP Server

The WebCenter Content server must be configured to use the same identity store LDAP server as WebCenter Portal. For more information on configuring WebCenter Content, see Managing Connections to Oracle WebCenter Content Server and also see Configuring the LDAP Identity Store Service in Securing Applications with Oracle Platform Security Services.
26.6 Aggregating Multiple Identity Store LDAP Servers Using libOVD

Sites with multiple identity stores can use libOVD to aggregate their user profile information. Two scenarios are covered in the step-by-step configuration instructions below:

- Users are available in distinct identity stores with complete user profile information available in the respective identity store.
- The same user is available in both identity stores with some attributes in one store and other attributes in the other store.

Note:
If you are supporting self-registration with Active Directory, be sure to see the troubleshooting note in Users Cannot Self-Register when WebCenter Portal Configured with Active Directory.

This section contains the following topics:

- Configuring libOVD for Identity Stores with Complete User Profiles
- Configuring libOVD for Identity Stores with Partial User Profiles
- Restoring the Single Authenticator

26.6.1 Configuring libOVD for Identity Stores with Complete User Profiles

To configure libOVD where each identity store contains complete user profiles:

1. Create the required authenticators in the WLS Admin Console for the identity stores being configured and restart the Weblogic Admin and managed servers for the domain. Alternatively, you can also configure the identity store information in jps-config.xml by hand.

2. Update the identity store service instance in jps-config.xml and add a property virtualize with the value true. You can do this either by editing the jps-config.xml file by hand, or using Fusion Middleware Control.

3. WebCenter Portal lets users self-register, which creates a new user or group in the identity store. Since multiple identity stores are being used, you also need to explicitly specify the user create bases and group create bases in jps-config.xml. This step must be done by directly editing jps-config.xml.

The jps-config.xml file should look like the example below after the configuration.

```xml
<serviceInstance provider="idstore.ldap.provider" name="idstore.ldap">
  <property value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider"
           name="idstore.config.provider"/>
  <property value="oracle.security.idm.providers.stdldap.JNDIPool"
           name="CONNECTION_POOL_CLASS"/>
  <property value="true" name="virtualize"/>
  <extendedProperty>
    <name>user.create.bases</name>
    <values>
      ...
    </values>
  </extendedProperty>
</serviceInstance>
```
26.6.2 Configuring libOVD for Identity Stores with Partial User Profiles

To configure libOVD where each identity store contains only partial user profiles:

1. Create the required authenticators in the WLS Admin Console for the identity stores being configured and restart the Weblogic Admin and managed servers for the domain. Alternatively, you can also configure the identity store information in jps-config.xml by hand.

2. Update the identity store service instance in jps-config.xml and add a property virtualize with the value true. You can do this either by editing the jps-config.xml file by hand, or using Fusion Middleware Control.

3. WebCenter Portal lets users self-register, which creates a new user or group in the identity store. Since multiple identity stores are being used, you also need to explicitly specify the user create bases and group create bases in jps-config.xml. This step must be done by directly editing jps-config.xml.

The jps-config.xml file should look like the example below after the configuration.

```xml
<serviceInstance provider="idstore.ldap.provider" name="idstore.ldap">
  <property value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider" name="idstore.config.provider"/>
  <property value="oracle.security.idm.providers.stdldap.JNDIPool" name="CONNECTION_POOL_CLASS"/>
  <property value="true" name="virtualize"/>

  <extendedProperty>
    <name>user.create.bases</name>
    <values>
      <value>ou=people,ou=myrealm,dc=wc_domain</value>
    </values>
  </extendedProperty>

  <extendedProperty>
    <name>group.create.bases</name>
    <values>
      <value>ou=groups,ou=myrealm,dc=wc_domain</value>
    </values>
  </extendedProperty>
</serviceInstance>
```

In the above example "ou=people,ou=myrealm,dc=wc_domain" and "ou=groups,ou=myrealm,dc=wc_domain" are the user and group create bases.
respectively. The actual values should be substituted while doing the configuration.

4. Run the following OVD WLST commands to configure the Join Adapter for the identity stores. Go to `MW_HOME/oracle_common/common/bin` and invoke `wlst.sh` (`wlst.cmd` in windows) and bring up the WLST prompt. Connect to the Weblogic Administration Server and run the following WLST commands.

```
createJoinAdapter(adapterName="<Join Adapter Name>", root="<Namespace>", primaryAdapter="<Primary adapter Name>")
```

```
addJoinRule(adapterName="<Join Adapter Name>", secondary="<Secondary Adapter Name>", condition="<Join Condition>")
```

If there are more secondary identity stores, then run the `addJoinRule` command for each secondary identity store.

```
modifyLDAPAdapter(adapterName="<AuthenticatorName>", attribute="Visible", value="Internal")
```

Run the above `modifyLDAPAdapter` command for each identity store that is configured.

**Example**

**Authenticator 1:**

In this example, the same user is available in both identity stores with some attributes in one store and some in the other. For this example, AD is the primary store and OID is the secondary store.

**Authenticator Name:** AD

**User Base:** `cn=users,dc=acme,dc=com`

**Authenticator 2:**

**Authenticator Name:** OID

**User Base:** `cn=users,dc=oid,dc=com`

Perform steps 1 - 3 above, specifying the `user.create.bases` and `group.create.bases` corresponding to the primary adapter's namespace.

Perform the following WLST commands:

```
createJoinAdapter(adapterName="JoinAdapter1", root="dc=acme,dc=com", primaryAdapter="AD")
addJoinRule(adapterName="JoinAdapter1", secondary="OID", condition="uid=cn")
```

"uid=cn" is the join condition in the above example, which indicates that if the `uid` value of a user in the secondary identity store (OID) matches with the `cn` value of the user in the primary identity store (AD), then the attributes will be combined.

```
modifyLDAPAdapter(adapterName="OID", attribute="Visible", value="Internal")
modifyLDAPAdapter(adapterName="AD", attribute="Visible", value="Internal")
```

Restart the WebLogic Administration server and managed servers.
26.6.3 Restoring the Single Authenticator

You can restore the single authenticator by removing the Join Adapter rule, thereby backing out the configuration done in Configuring libOVD for Identity Stores with Partial User Profiles.

To remove the Join Adapter rule, connect to the Weblogic Administration Server and run the following WLST commands:

```
deleteAdapter(adapterName="JoinAdapter1")
modifyLDAPAdapter(adapterName="oid auth", attribute="Visible", value="Yes")
modifyLDAPAdapter(adapterName="AD", attribute="Visible", value="Yes")
```

Restart the WebLogic Administration server and managed servers and make sure that users from both identity stores are able to log in.

26.7 Configuring Dynamic Groups for WebCenter Portal

A dynamic group is a static group that is dynamically populated. Dynamic groups can be assigned to roles and used within WebCenter Portal in the same way as static groups.

Within the application, WebCenter Portal does not distinguish between static and dynamic groups. Dynamic groups are configured entirely in the identity store (and their configuration is specific to the LDAP implementation being used), and exposed in the same manner as static groups (in fact a dynamic group can be a composite of a static member list and a dynamically determined membership).

The dynamic membership of the group is defined by setting the group's labeledURI attribute with an appropriate LDAP query filter. The query filter defines the set of users that will define the membership of the group.

For Oracle Internet Directory, you can create a dynamic group with an LDIF file and using the `ldapadd` command, or using the Oracle Directory Services Manager (ODSM). These two options are described in the following topics:

- Creating a Dynamic Group Using an LDIF File
- Creating a Dynamic Group Using the Oracle Directory Services Manager

Note:
Dynamic groups is not supported for LDAPs other than OID unless OVD is used.

26.7.1 Creating a Dynamic Group Using an LDIF File

To create the dynamic group using an LDIF file:

1. Create an LDIF file with a text editor. The following example shows how a dynamic group can be defined that represents all users under the default user search base, with the title of "Manager":

Example: Defining a Dynamic Group Using an LDIF File

```
dn: cn=managers,cn=portal.070720.104824.056918000,cn=groups,dc=us,dc=oracle,dc=com
labeleduri: ldap://myserver.example.com:12061/cn=users,dc=us,dc=mybiz,dc=com
??sub?(title=Manager)
```
description: Dynamic Group of Managers
cn: Managers
orclisvisible: true
objectclass: orclDynamicGroup
objectclass: orclGroup
objectclass: top
objectclass: groupOfUniqueNames
displayname: Managers
owner: cn=fmwadmin,cn=users,dc=us,dc=mybiz,dc=com

Note:
The labeledURI syntax for an LDAP URL is defined in RFC 2255 (http://www.faqs.org/rfcs/rfc2255.html). In the example above, it is representing a search for any entry under the DN cn=users,dc=us,dc=mybiz,dc=com with the attribute title=Manager. This is to be done on the server myserver.example.com at LDAP port 12061 and using a subtree ("sub") search.

A dynamic group can be defined on any attribute or condition that can be represented as an LDAP URL and defined in the labeledURI attribute. Dynamic groups can also be defined using the ConnectBy assertion, which is included in the orclDynamicGroup objectClass. Refer to the Oracle Internet Directory Administrator’s Guide for more information for this alternate approach.

2. Save the file, and then update the OID server by issuing the ldapadd command. For example:

Example: Updating OID Using the ldapadd Command

ldapadd -h myserver -p 12061 -D cn=fmwadmin -w mybiz1 -f managers.ldif -v
add labeleduri: ldap://myserver.example.com:12061/cn=users,dc=us,dc=mybiz,dc=com??
sub?(title=Manager)
add description: Dynamic Group of Managers
add cn: Managers
add orclisvisible: true
add objectclass: orclDynamicGroup
orclGroup
top
groupOfUniqueNames
add displayname: Managers
add owner: cn=fmwadmin,cn=users,dc=us,dc=mybiz,dc=com
adding new entry cn=managers,cn=portal.070720.104824.056918000,cn=groups,dc=us,dc=mybiz,dc=com
modify complete

26.7.2 Creating a Dynamic Group Using the Oracle Directory Services Manager

To create a dynamic group using ODSM:

1. Invoke Oracle Directory Services Manager (ODSM) and connect to the Oracle Internet Directory server.
Refer to Using Oracle Directory Services Manager to Manage Oracle Internet Directory in Oracle Internet Directory Administrator’s Guide for information on invoking and using the Oracle Directory Services Manager.

2. From the Go to list, select Data Browser.

3. Click the New Entry icon in the data browser.

4. Provide the DN and add the objectclasses orclDynamicGroup and groupOfUniqueNames.

5. On the Mandatory Properties tab, provide the CN attribute.

6. On the Optional Properties tab, provide the attributes for labeleduri.

7. Click OK to complete the definition of the dynamic group.

When you refresh the tree view you’ll see the new group that you created. Note that group members will not be shown in ODSM.

26.8 Configuring the REST Service Identity Asserter

This section describes how to configure an identity asserter for the REST service. For the REST service, including REST service APIs, to be used with WebCenter Portal applications requires that an identity asserter be configured for it in the WebCenter domain identity store. The following topics show how to configure OPSS Trust Service instances and identity asserters for Oracle WebLogic Server.

This section contains the following topics:

- Understanding the REST Service Instance and Identity Asserter
- Setting up the Client Application
- Configuring the WLS Trust Service Asserter

26.8.1 Understanding the REST Service Instance and Identity Asserter

Although WebCenter Portal and other Oracle WebLogic applications can use REST APIs to display information the way they need to, since such calls originate from the mid-tier, users will be prompted again to provide login credentials. To overcome this, we use perimeter authentication where the user identity is propagated in the HTTP header and asserted using the OPSS Trust Service Asserter.

In order to successfully propagate user identity from one application to another application, these applications must be using correctly configured Trust Service instances. Figure 26-7 shows the different components involved in the identity propagation and assertion.
The following depicts the sequence of events involved in REST identity propagation and assertion:

1. End clients (browsers, smart phone applications) connect to a WebCenter Portal application.
2. The application page queries data from REST APIs and builds its own UI on top and therefore needs to call the REST end point.
3. The application calls WebCenter Security API \(\text{WCSecurityUtility.issueTrustServiceSecurityToken}\) to issue the token used for securely propagating the user identity. The token is generated using the Trust Service Embedded Provider. Generated tokens are compressed to optimize token size and then BASE64-encoded to ensure that the token can be safely transported using an HTTP header.
4. The application takes the issued token and adds it against the "Authorization" security header. The client then dispatches the token as part of its call to the REST URI.
5. WebLogic Server checks if the identity asserter exists for the given token type.
6. The identity asserter parses and verifies that the token is using OPSS Trust Service APIs.
7. The asserter maps the username to a WLS username, a user Subject is established, and the call ends up on the REST application.
8. The REST application recognizes that the user is already an authenticated user and sends a response. The WebCenter Portal uses the response and shows the page to the end user.
26.8.2 Setting up the Client Application

This section describes how to configure the client for a REST service identity asserter.

To configure the client for a REST service identity asserter:

1. Using JDeveloper, create the client application.

   The client application could be a JSE or a servlet application. The following example shows the skeleton of a sample client application.

   ```java
   // The authenticated username
   // String user = "weblogic";
   // URL of the target application
   URL url = "http://host:port/destinationApp";
   //-----------------------------------------
   String b64EncodedToken = WCSecurityUtility.issueTrustServiceSecurityToken()
   HttpURLConnection connection = (HttpURLConnection) url.openConnection();
   connection.setRequestMethod("GET");
   connection.setDoOutput(true);
   connection.setReadTimeout(10000);
   connection.setRequestProperty("Authorization", AUTH_TYPE_NAME + " " + b64EncodedToken);
   connection.connect();
   BufferedReader rd = new BufferedReader(new InputStreamReader(
   connection.getInputStream()));
   StringBuilder sb = new StringBuilder();
   String line = null;
   while ((line = rd.readLine()) != null) {
      sb.append(line);
   }
   connection.disconnect();
   System.out.println(sb.toString());
   
   2. Create and configure the keystore as shown in Creating the WebCenter Portal Domain Keystore, and then configure WebLogic Server for the identity asserter. The keystore is first provisioned for a client certificate and private key. The client certificate is then exported and imported into a trust key store.

   3. Edit the jps-config.xml configuration file.

      a. Navigate to your DOMAIN_HOME/config/fmwconfig directory and open the jps-config.xml file in a text editor.

      b. Make sure you have the following in the jps-config.xml file:

         ```xml
         <serviceInstance name="keystore" provider="keystore.provider" location="./default-keystore.jks">
         <propertySets>
         <propertySet name="trust.provider.embedded">
         ... existing entries
         <property value="orakey" name="trust.aliasName"/>
         <property value="orakey" name="trust.issuerName"/>
         </propertySet>
         </propertySets>
         ```

      c. Modify the trust.provider.embedded propertySet node as below:

         ```xml
         <propertySet name="trust.provider.embedded">
         ... existing entries
         <property value="orakey" name="trust.aliasName"/>
         <property value="orakey" name="trust.issuerName"/>
         </propertySet>
         ```
Where:

trust.aliasName is the alias looked up by the identity asserter in the configured keystore for a certificate with which the asserter verifies the issued trust token.

trust.issuerName is the alias looked up by the token issuer to look up the private key with which the trust token is issued/signed.

4. If the client and REST applications are in different domains, repeat these steps for both domains.

5. Restart all servers.

26.8.3 Configuring the WLS Trust Service Asserter

This section describes how to configure the WebLogic Server Trust Service asserter. To configure the WebLogic Server Trust Service asserter:

1. Log into the WebLogic Administration Console as an administrator.

3. Open the Providers tab, and then the Authentication subtab.

   The Create a New Authentication Provider page displays.

4. Enter the Name of the new asserter (for example, TrustServiceIdAsserter).

5. Select TrustServiceIdentityAsserter as the asserter Type.

   This asserter calls the Trust Service APIs to decode and validate the token from the incoming request, and pass the username to the WebLogic for establishing the asserted subject.

6. Click OK to save your changes.

7. Restart all managed servers.
This chapter describes how to configure the policy and credential store to use an external LDAP server such as Oracle Internet Directory (OID).

When WebCenter Portal is first installed, the policy and credential store is configured to use a database. For production environments, your policy and credential store must be configured to use the default database or an external LDAP (either Oracle Internet Directory 11gR1 or 10.1.4.3). You should not attempt to use a file-based LDAP for HA or production environments.

Reassociating the policy and credential store with OID consists of creating a root node in the LDAP directory, and then reassociating the policy and credential store with the OID server using Fusion Middleware Control, or from the command line using WLST. Note that if you reassociate the policy and credential store to use an external LDAP-based store, the credential store and policy store must be configured to use the same LDAP server. The identity store can, however, use any of the other supported LDAP servers; it does not need to use the same LDAP server as the policy and credential stores. For troubleshooting information, see Reassociation Failure in Securing Applications with Oracle Platform Security Services.

Caution:
Before reassociating the policy store, be sure to back up the relevant configuration files:

- jps-config.xml
- system-jazn-data.xml

As a precaution, you should also back up the boot.properties file for the Administration Server for the domain.

This chapter includes the following topics:

- Creating a root Node
- Reassociating the Credential and Policy Store Using Fusion Middleware Control
- Reassociating the Credential and Policy Store Using WLST
- Managing Credentials
- Managing Users and Application Roles
- Configuring Self-Registration By Invitation in WebCenter Portal
- Setting the Policy Store Refresh Interval and Other Cache Settings
Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

27.1 Creating a root Node

The first step in reassociating the policy and credential store with OID, is to create an LDIF file in the LDAP directory and add a root node under which all data is added. To create the root node, follow the steps in Prerequisites to Using an LDAP-Based Security Store in Securing Applications with Oracle Platform Security Services. After creating the file and adding the node, continue by reassociating the store using either Fusion Middleware Control or WLST.

27.2 Reassociating the Credential and Policy Store Using Fusion Middleware Control

Before reassociating the policy and credential store with Oracle Internet Directory, you must first have created the root node as described in Prerequisites to Using an LDAP-Based Security Store in Securing Applications with Oracle Platform Security Services. After creating the root node, follow the steps in Reassociating with Fusion Middleware Control in Securing Applications with Oracle Platform Security Services. If the reassociation fails, see Reassociation Failure in Securing Applications with Oracle Platform Security Services.

27.3 Reassociating the Credential and Policy Store Using WLST

Before reassociating the policy and credential store with Oracle Internet Directory, you must first have created the root node as described in Prerequisites to Using the LDAP Policy Store in Securing Applications with Oracle Platform Security Services. If the reassociation fails, see Reassociation Failure in Securing Applications with Oracle Platform Security Services.

To reassociate the Credential and Policy Store using WLST:

1. Start WLST as described in Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Connect to the Administration Server for the target domain with the following command:

   ```
   connect('username','password', 'host_id:port')
   ```

   where:

   - `username` is the administrator account name used to access the Administration Server (for example, `weblogic`)
   - `password` is the administrator password used to access the Administration Server (for example, `weblogic`)
• `host_id` is the server ID of the Administration Server (for example, example.com)

• `port` is the port number of the Administration Server (for example, 7001).

3. Reassociate the policy and credential store using the reassociateSecurityStore command:

   ```
   reassociateSecurityStore(domain="domain_name", admin="admin_name",
   password="password",
   ldapurl="ldap_uri", servertype="ldap_srvr_type", jpsroot="root_webcenter_xxxx")
   ```

   Where:

   • `domain_name` specifies the domain name where reassociation takes place.

   • `admin_name` specifies the administrator's user name on the LDAP server. The format is `cn=usrName`.

   • `password` specifies the password associated with the user specified for the argument `admin`.

   • `ldap_uri` specifies the URI of the LDAP server. The format is `ldap://host:port`, if you are using a default port, or `ldaps://host:port`, if you are using a secure LDAP port. The secure port must have been configured to handle an anonymous SSL connection, and it is distinct from the default (non-secure) port.

   • `ldap_srvr_type` specifies the kind of the target LDAP server. Specify OID for Oracle Internet Directory.

   • `root_webcenter_xxxx` specifies the root node in the target LDAP repository under which all data is migrated. Be sure to include the `cn=`. The format is `cn=nodeName`.

   All arguments are required. For example:

   ```
   reassociateSecurityStore(domain="myDomain", admin="cn=adminName",
   password="myPass", ldapurl="ldaps://myhost.example.com:3060", servertype="OID",
   jpsroot="cn=testNode")
   ```

### 27.4 Managing Credentials

Administrators can manage credentials for the WebCenter Portal domain credential store using Fusion Middleware Control. For more information, see Managing Credentials with Fusion Middleware Control in *Securing Applications with Oracle Platform Security Services*.

### 27.5 Managing Users and Application Roles

This section describes how you can use Fusion Middleware Control, WLST, and the runtime administration pages in WebCenter Portal to manage users and application roles.

This section contains the following subsections:

- Granting the WebCenter Portal Administrator Role
- Granting Application Roles
• Using the Runtime Administration Pages

27.5.1 Granting the WebCenter Portal Administrator Role

WebCenter Portal only recognizes users in the identity store that is mapped by the first authenticator. Since the WebCenter Portal Administrator account is initially created only in the embedded LDAP server, if an external LDAP such as Oracle Internet Directory is configured as the primary authenticator for WebCenter Portal, you must also create a user in that LDAP and grant that user the WebCenter Portal Administrator role.

You can grant a user the WebCenter Portal Administrator role using Fusion Middleware Control or WLST as shown below in the sections on:

• Granting the WebCenter Portal Administrator Role Using Fusion Middleware Control

• Granting the WebCenter Portal Administrator Role Using WLST

For more information, see Granting Administrator Privileges to a Non-Default User in Installing and Configuring Oracle WebCenter Portal.

27.5.1.1 Granting the WebCenter Portal Administrator Role Using Fusion Middleware Control

This section describes how to grant the WebCenter Portal administrator role to a user account other than the default "weblogic" account.

To grant the WebCenter Portal Administrator role using Fusion Middleware Control:

1. Log into Fusion Middleware Control and navigate to the WebCenter Portal home page.
   See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Security and then Application Roles.
   The Application Roles page opens (see Figure 27-1).

   Figure 27-1 Application Roles Page

3. Search for the WebCenter Portal Administrator role:
   • In the Role Name field, enter the following internal identifier for the Administrator role, and then click the Search (arrow) icon:

   
   s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator
   
   The search should return s8bba98ff_4cbb_40b8_beee_296c916a23ed #- #Administrator, which is the administrator role identifier.
4. Click the administrator role identifier from the search results and click **Edit**.

The Edit Application Role page opens (see **Figure 27-2**).

**Figure 27-2  Edit Application Role Page**

5. Click **Add** from the **Members** section.

The Add Principal dialog opens (see **Figure 27-3**).

**Figure 27-3  Add Principal Dialog**

6. Search for the user to assign the Administrator role to.

   a. From the **Type** drop-down, select **User**.

   b. Enter search criteria in the **Principal Name** and/or **Display Name** fields to either include part of the user name and/or the initial characters of the user name.

   c. Optionally, when you select User, select the **Check to enter principal name here** option from the **Advanced Option** section, enter your search criteria in the **Principal Name** and/or **Display Name** fields.

   d. Click **OK**.

      The Add Principal dialog closes and the user name is added to the list of members.

7. To remove the **weblogic** role from the Edit Application Role page, select the role and click **Delete**, then click **Yes** on the confirmation dialog.

8. On the Edit Application Role page, click **OK**.
27.5.1.2 Granting the WebCenter Portal Administrator Role Using WLST

To grant the WebCenter Portal Administrator role to another user using WLST:

1. Start WLST as described in Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Connect to the WebCenter Portal Administration Server for the target domain with the following command:
   
   ```
   connect('user_name','password', 'host_id:port')
   ```

   Where:
   
   - `user_name` is the name of the user account with which to access the Administration Server (for example, `weblogic`)
   - `password` is the password with which to access the Administration Server
   - `host_id` is the host ID of the Administration Server
   - `port` is the port number of the Administration Server (for example, `7001`).

3. Grant the WebCenter Portal administrator application role to the user in Oracle Internet Directory using the `grantAppRole` command as shown below:

   ```
   grantAppRole(appStripe="webcenter",
   appRoleName="s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator",
   principalClass="weblogic.security.principal.WLSUserImpl",
   principalName="wc_admin")
   ```

   Where `wc_admin` is the name of the administrator account to create.

4. To test the new account, log into WebCenter Portal using the new account name.

   The Administration link should appear, and you should be able to perform all administrator operations.

5. After granting the WebCenter Portal Administrator role to new accounts, remove this role from accounts that no longer need or require it using the WLST `revokeAppRole` command. For example, if WebCenter Portal was installed with a different administrator user name than `weblogic`, the administrator role should be given to that user and should be revoked from the default `weblogic`.

   ```
   revokeAppRole(appStripe="webcenter",
   appRoleName="s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator",
   principalClass="weblogic.security.principal.WLSUserImpl",
   principalName="weblogic")
   ```

27.5.2 Granting Application Roles

This section describes how to add users to application roles using Fusion Middleware Control and WLST commands.

This section contains the following topics:

- Granting Application Roles Using Fusion Middleware Control
- Granting Application Roles Using WLST
27.5.2.1 Granting Application Roles Using Fusion Middleware Control

This section describes how to grant an application role to users using Fusion Middleware Control.

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Security and then Application Roles. The Application Roles page opens (see Figure 27-1).

3. In the Role Name field, enter webcenter to search for all application roles in WebCenter Portal, or enter the name of the role (for example, appConnectionManager), and then click the Search (arrow) icon.

   If you are not sure of the name, enter a partial search term or leave the field blank to display all the application roles.

   The Application Roles page opens (see Figure 27-5).

4. Select the role you want to add the user to, then click Edit (see Figure 27-6).

   For example, to add a user to the Public Role, select the row Public Role.
5. In the Edit Application page that opens for the selected role, click **Add** (see *Figure 27-7*).

*Figure 27-7 Edit Application Role Page*

![Edit Application Role Page](image)

6. In the Add Principal dialog that opens (see *Figure 27-3*), search for the user.
   
   a. From the **Type** drop-down, select **User**.
   
   b. Enter search criteria in the **Principal Name** and/or **Display Name** fields to either include part of the user name and/or the initial characters of the user name.
   
   c. Select the user name from the Searched Principals table, then click **OK**. The Add Principal dialog closes and the user name is added to the list of members for the application role on the Edit Application Role page (see *Figure 27-8*).

*Figure 27-8 User Added to Application Role*

![User Added to Application Role](image)

7. On the Edit Application Role page, click **OK**.

8. Restart the WebCenter Portal (**WC_Portal**) managed server.

### 27.5.2.2 Granting Application Roles Using WLST

Use the `grantAppRole` command to grant an application role to a user. For syntax and usage information, see `grantAppRole` in *WLST Command Reference for WebLogic Server*.

### 27.5.3 Using the Runtime Administration Pages

WebCenter Portal provides a **Security tab** from which an administrator can define application roles and grant application roles to users defined in the identity store. For
information about managing users and application roles in WebCenter Portal, see Managing Users and Application Roles.

**Caution:**

The "Allow Password Change" property, which specifies whether users can change their passwords within WebCenter Portal, should be carefully controlled for corporate identity stores. WebCenter Portal administrators can set this property from the Profile Management Settings page in WebCenter Portal. For more information, see Configuring Profile.

### 27.6 Configuring Self-Registration By Invitation in WebCenter Portal

WebCenter Portal supports self-registration by invitation, as described in Enabling Self-Registration By Invitation-Only. The self-registration 'by-invitation' feature requires that the WebCenter Portal domain credential store contain the following password credentials:

- **map name** = o.webcenter.security.selfreg
- **key** = o.webcenter.security.selfreg.hmackey
- **user name** = o.webcenter.security.selfreg.hmackey

To enable **Allow Self-Registration Through Invitations** in WebCenter Portal Administration, use Fusion Middleware Control or the WLST command `createCred` to create the password credentials detailed above. For example:

```
createCred(map="o.webcenter.security.selfreg", key="o.webcenter.security.selfreg.hmackey", type="PC", user="o.webcenter.security.selfreg.hmackey", password="<password>", url="<url>", port="<port>", [desc="<description>"])```

For more information, see “Managing Credentials with WLST Commands in Securing Applications with Oracle Platform Security Services.”

### 27.7 Setting the Policy Store Refresh Interval and Other Cache Settings

This section provides recommended cache settings that should be configured after installation. Although settings for cache sizes and maximum group hierarchies should be based on your specific environment, the following sections provide recommendations that you can use as a starting point. For a complete list of tuning parameters and recommended values for WebCenter Portal, see Oracle WebCenter Portal Performance Tuning in Tuning Performance.

This section includes the following topics:

- Setting the Policy Store Refresh Interval
- Setting the Connection Pool Cache
- Setting User Cache Settings
- Setting Group Cache Settings
27.7.1 Setting the Policy Store Refresh Interval

The authorization policies used by WebCenter Portal use an in-memory cache with a default policy refresh time of 10 minutes. When a portal is created in a multi-node high availability environment, and you need a node failure to replicate the policy data more quickly, you can shorten the policy store refresh interval by modifying the domain-level jps-config.xml file, and adding the following entry:

```
oracle.security.jps.ldap.policystore.refresh.interval=<time_in_milli_seconds>
```

This should be added to the PDP service node:

```
<serviceInstance provider="pdp.service.provider" name="pdp.service">
```

Note that the policy refresh interval should not be set to too small a value as the frequency at which the server cached policy is refreshed may impact performance.

After modifying the jps-config.xml file, restart all servers in the domain. For more information, see Refreshing the Policy Cache in Securing Applications with Oracle Platform Security Services.

27.7.2 Setting the Connection Pool Cache

This section describes the recommended settings for the connection pool cache.

To set the connection pool cache:

1. Log into the WLS Administration Console.

3. Set the connection pool cache parameters to the following recommended values:

   - Connection Pool Size = max connection users
   - Connect Timeout = 30
   - Connection Retry Limit = 1
   - Results Time Limit = 1000
   - Keep Alive Enable = true

4. Save your changes and restart all servers in the domain.

27.7.3 Setting User Cache Settings

This section describes the recommended settings for user cache settings.

To set user cache settings:

1. Log into the WLS Administration Console.

3. Set the user cache parameters to the following recommended values:

   - Cache Enabled = true
• **Cache Size** = 3200
• **Cache TTL** = session timeout
• **Results Time Limit** = 1000
• **Keep Alive Enable** = true

4. Save your changes and restart all servers in the domain.

### 27.7.4 Setting Group Cache Settings

This section describes the recommended settings for group cache settings.

To set group cache settings:

1. Log into the WLS Administration Console.
3. Set the group cache parameters to the following recommended values:
   - **Enable Group Membership Lookup Hierarchy Caching** = true
   - **Cache Size** = 3200
   - **Max Group Hierarchies in Cache** = 1024
   - **Group Hierarchy Cache TTL** = session timeout
   - **Keep Alive Enable** = true
4. Save your changes and restart all servers in the domain.
This chapter describes the available single sign-on (SSO) solutions for WebCenter Portal, and how each is configured.

This chapter includes the following topics:

- Introduction to Single Sign-On
- Configuring Oracle Access Manager
- Configuring SAML-based Single Sign-On
- Configuring SSO for Microsoft Clients
- Configuring SSO with Virtual Hosts

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

28.1 Introduction to Single Sign-On

Single sign-on provides authentication across a topology’s components allowing users to log in once, rather than having to log in each time they access a component. Without implementing single sign-on, users must provide credentials each time they access components, such as discussions or Content Server, from WebCenter Portal.

Single sign-on can be implemented for WebCenter Portal using several solutions. This section describes their benefits and recommended application.

Oracle Access Manager (OAM), part of Oracle’s enterprise class suite of products for identity management and security, provides a wide range of identity administration and security functions, including several single sign-on options for WebCenter Portal. OAM (in particular, OAM 11g) is the recommended single sign-on solution for Oracle WebCenter Portal 12c installations.

For non-production, development environments where you do not have an enterprise-class single sign-on infrastructure like Oracle Access Manager or Oracle SSO, and you only need to provide a single sign-on capability within WebCenter Portal and associated Web tools like discussions, you can configure a SAML-based SSO solution. If you need to provide single sign-on for other enterprise applications as well, this solution is not recommended.
If your enterprise uses Microsoft desktop log-ins that authenticate with a Microsoft domain controller with user accounts in Active Directory, then configuring SSO with Microsoft Clients may also be an option to consider.

### 28.2 Configuring Oracle Access Manager

Oracle Access Manager (OAM) provides flexible and extensible authentication and authorization, and provides audit services. This section describes how to configure WebCenter Portal for OAM single sign-on authentication, including how to configure the WebLogic server side and the WebCenter Portal application as the partner application participating in SSO.

The installation and configuration steps for OAM 11g are presented in the following topics:

- OAM Components and Topology
- Roadmap to Configuring OAM
- Installing and Configuring OAM 11g
- Configuring the WebLogic Domain for OAM
- Installing and Configuring the Oracle HTTP Server
- Additional Single Sign-on Configurations
- Testing Your OAM Installation

#### 28.2.1 OAM Components and Topology

*Figure 28-1* shows the components and topology required to set up single sign-on with Oracle Access Manager for a WebCenter Portal application.

*Figure 28-1  OAM Single Sign-On Components and Topology*
OAM consists of the following components:

- **Access Server** – a standalone server that provides authentication, authorization, and auditing services for Access Gates. There is one access server set up on OAM. This is done as part of the OAM install itself.

- **WebGate** – an out-of-the-box plug-in that intercepts Web resource (HTTP) requests and forwards them to the Access Server for authentication and authorization.

- **Identity Assertion Provider (IAP)** – a type of security provider that asserts the identity of the user based on header information that is set by perimeter authentication. The OAM integration provides an OAM ID Asserter that can be configured as the OAM IAP. The OAM ID Asserter can be used for authentication or for identity assertion. For OAM SSO integration, the OAM ID Asserter should be configured as an Identity Assertion Provider (IAP) by selecting `obSSOCookie` under **Active Types** in the provider's Common settings.

**OAM Single Sign-on Process Flow**

Figure 28-2 shows the single sign-on process flow for OAM.

**Figure 28-2  OAM Single Sign-on Process Flow**

**SSO Log-in Processing with OAM Agents**

1. The user requests a resource.

2. The WebGate forwards the request to OAM for policy evaluation.
3. OAM:
   • Checks for the existence of an SSO cookie.
   • Checks policies to determine if the resource protected and if so, how?
4. The OAM server logs and returns decisions.
5. WebGate responds as follows:
   • Unprotected resource: resource is served to the user.
   • Protected resource:
     – Request is redirected to the credential collector
     – The login form is served based on the authentication policy
     – Authentication processing begins
6. User sends credentials.
7. OAM verifies credentials.
8. OAM starts the session and creates the following host-based cookies:
   • One per partner: OMAuthnCookie set by 11g WebGates (ObSSOCookie set by 10g WebGate) using the authentication token received from the OAM server after successful authentication.
     Note: A valid cookie is required for a session.
   • One for OAM Server: OAM_ID
9. OAM logs Success or Failure.
10. OAM Credential collector redirects to WebGate and authorization processing begins.
11. WebGate prompts OAM to look up policies, compare them to the user’s identity, and determine the user’s level of authorization.
12. OAM logs policy decision and checks the session cookie.
13. OAM Server evaluates authorization policies and cache the result.
14. OAM Server logs and returns decisions
15. WebGate responds as follows:
   • If the authorization policy allows access, the request get redirected to mod_wl which in turn redirects the request to the WLS server where the WebCenter Portal application is running, and from where desired content or applications are served to the user, as shown below:
     WebGate -> mod_wl -> WebCenter Portal application [ , discussions, .. etc] --> Content is served to the authenticated user
   • If the authorization policy denies access, the user is redirected to another URL determined by the administrator.
28.2.2 Roadmap to Configuring OAM

Figure 28-3 and Table 28-1 provide an overview of the prerequisites and tasks required to configure single sign-on for WebCenter Portal using OAM.

**Figure 28-3 Configuring Single Sign-on for WebCenter Portal Using OAM**

1. Install and configure OAM
   - Configure the WebLogic domain for OAM
     - Configure the OID authenticator
     - Configure the OAM Identity Asserter
     - Configure the default authenticator and provider order
     - Add an OAM SSO provider

2. Configure Oracle Access Manager
   - Install and configure OHS
   - Perform additional relevant configurations
     - Configure WebCenter Portal for SSO
       - Configure the discussions server for SSO
     - Configure SOA server for SSO
     - Configure OAM for RSS feeds using external readers
     - Configure the WLS Administration Console and Enterprise Manager for OAM
     - Configure Content Server for OAM
     - Restrict access using connection filters

3. Test your OAM installation
   - End

Table 28-1 shows the tasks and subtasks for configuring single sign-on for WebCenter Portal using OAM.

**Table 28-1 Configuring Single Sign-on for WebCenter Portal Using OAM**
### Table 28-1 (Cont.) Configuring Single Sign-on for WebCenter Portal Using OAM

#### 28.2.3 Installing and Configuring OAM 11g

This section describes how to install and configure OAM 11g, and includes the following topics:

- Installing and Configuring OAM 11g
- Installing and Configuring the Oracle HTTP Server
- Installing the WebGate on the Web Tier
28.2.3.1 Installing and Configuring OAM 11g

Note:
OAM should be installed only after you've installed Oracle WebCenter Portal (described in Installing and Configuring Oracle WebCenter Portal) and any other components required for your environment. You should also have configured and tested any required connections.

Install Oracle Access Manager (OAM) as described in Installing and Configuring Oracle Identity Management in Installation Guide for Oracle Identity Management. Ideally, OAM and all the applications that participate in single sign-on should share the same identity store. By default, OAM uses the embedded LDAP identity store.

To configure OAM to use an external identity store, such as OID, see Registering a New User Identity Store in Administrator’s Guide for Oracle Access Management. This section has pointers to setting the external identity store configured as the default or system store and configuring one or more authentication modules to point to this store. By default, the WebCenter policy configured in OAM uses the default authentication scheme (typically, the form-based authentication scheme LDAPScheme) specified in OAM.

If you intend to use the default scheme, the authentication module used by the scheme must point to the same identity store as your WebCenter installation. Optionally, you can choose to configure a different authentication scheme rather than the default, in which case you must also ensure that it points to the identity store used by WebCenter. Continue by configuring Oracle Access Manager in a WebLogic administration domain as described in Installing and Configuring Oracle Identity Management in Installation Guide for Oracle Identity Management.

28.2.3.2 Installing and Configuring the Oracle HTTP Server

If you don’t already have Oracle HTTP Server (OHS) installed, install OHS as described in Installing and Configuring the Oracle HTTP Server.

After installing, continue by installing the WebGate as described in Installing the WebGate on the Web Tier.

28.2.3.3 Installing the WebGate on the Web Tier

This section describes how to install and configure the OHS WebGate.

Note:
Ensure that your Oracle HTTP server is down while installing OHS WebGate, and restart it only after you register the WebGate agent as described in Registering the WebGate Agent.

1. Install the WebGate as described in Installing and Configuring Oracle HTTP Server 11g WebGate for OAM in Installing WebGates for Oracle Access Manager. Use the same middleware home that was specified during OHS install.
2. After installing Oracle HTTP Server 11g WebGate for Oracle Access Manager, move to the following directory under your Oracle Home for Webgate:

For Unix operating systems:
<Webgate_Home>/webgate/ohs/tools/deployWebGate

For Windows operating systems:
<Webgate_Home>\webgate\ohs\tools\deployWebGate

3. From the command line, run the following command to copy the required bits of the agent from the Webgate_Home directory to the WebGate instance location:

For Unix operating systems:
./deployWebGateInstance.sh -w <Webgate_Instance_Directory> -oh <Webgate_Oracle_Home>

For Windows operating systems:
deployWebGateInstance.bat -w <Webgate_Instance_Directory> -oh <Webgate_Oracle_Home>

Where <Webgate_Oracle_Home> is the directory where you have installed Oracle HTTP Server WebGate and defined it as the Oracle Home for WebGate, as in the following example:

<MW_HOME>/Oracle_OAMWebGate1

The <Webgate_Instance_Directory> is the location of the Webgate Instance Home (which should be the same as the Instance Home of Oracle HTTP Server), as in the following example:

<MW_HOME>/Oracle_WT1/instances/instance1/config/OHS/ohs1

Note that an Instance Home for Oracle HTTP Server is created after you configure the Oracle HTTP Server. This configuration should be performed after installing or patching to Oracle HTTP Server.

4. Run the following command to ensure that the LD_LIBRARY_PATH variable contains <Oracle_Home_for_Oracle_HTTP_Server>/lib:

For Unix operating systems (depending on the shell):
export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:<Oracle_Home_for_Oracle_HTTP_Server>/lib

For Windows operating systems:
Add the <Webgate_Installation_Directory>\webgate\ohs\lib and <Oracle_Home_for_Oracle_HTTP_Server>\bin locations to the PATH environment variable. Add a semicolon (;) followed by this path at the end of the entry for the PATH environment variable.

5. From your current working directory, move up one level:

For Unix operating systems, move to:
<Webgate_Home>/webgate/ohs/tools/setup/InstallTools

For Windows operating systems, move to:
<Webgate_Home>\webgate\ohs\tools\EditHttpConf
6. From the command line, run the following command to copy the
`apache_webgate.template` from the `Webgate_Home` directory to the WebGate
Instance location (renaming it to `webgate.conf`) and update the `httpd.conf`
file to add one line to include the name of `webgate.conf` file:

For Unix operating systems:

```
./EditHttpConf -w <Webgate_Instance_Directory> [-oh <Webgate_Oracle_Home>] [-o <output_file>]
```

For Windows operating systems:

```
EditHttpConf.exe -w <Webgate_Instance_Directory> [-oh <Webgate_Oracle_Home>] [-o <output_file>]
```

**Note:**

The `-oh <WebGate_Oracle_Home>` and `-o <output_file>` parameters
are optional.

Where `<Webgate_Oracle_Home>` is the directory where you have installed
Oracle HTTP Server WebGate and defined it as the Oracle Home for WebGate, as
in the following example:

```
<MW_HOME>/Oracle_OAMWebGate1
```

The `<Webgate_Instance_Directory>` is the location of the Web Gate instance
home (which should be the same as the instance home of OHS), as in the following
example:

```
<MW_HOME>/Oracle_WT1/instances/instance1/config/OHS/ohs1
```

### 28.2.3.4 Registering the WebGate Agent

After installing the WebGate on the web tier, you also need to register the WebGate
agent. The steps below will automatically create a protected policy that uses the
default Authentication Scheme that is configured in your OAM installation (typically,
the form-based authentication scheme LDAPScheme). If you want to customize the
single sign-on login page, or want resources to be protected by some other
authentication scheme, then change it using the OAM Console (see Managing
Authentication Schemes in *Administrator’s Guide for Oracle Access Management* for more
information).

**Note:**

If you are using WebCenter Portal in conjunction with other applications in
your environment, and you require single sign-on for these applications, you
must ensure that the authentication schemes used by these applications are
either the same or at least at the same level and point to the same identity
store.

For more information about registering the WebGate agent, see also Getting Started
with a New Oracle HTTP Server 11g WebGate in *Installing WebGates for Oracle Access
Manager*. 

Follow the steps below to register the WebGate agent on the machine where OAM is installed using the oamreg tool in inband mode:

1. Change directories to `<RREG_Home>/input` (where `<RREG_Home>` is the directory to where you extracted the contents of RREG.tar.gz/rreg).

   The default location for `WEBCENTER_HOME` is `$ORACLE_HOME/Oracle_WC1`.

3. Copy over `$SOA_HOME/soa/prov/soa.oam.conf` and `$WC_CONTENT_ORACLE_HOME/common/security/oam.conf` from the SOA and Content Server installations respectively.

   The default location for `SOA_HOME` is `$ORACLE_HOME/Oracle_SOA1` and the default location for `WC_CONTENT_ORACLE_HOME` is `$ORACLE_HOME/Oracle_ECM1`. Note that the SOA-related location mappings contained in `soa.oam.conf` only come into effect when deploying and using WebCenter Portal-provided work flows on a SOA server, and that even the SOA related URLs protected within `webcenter.oam.conf` will come into effect if SOA is being used.

4. Create a new file named `WebCenterOAM11gRequest.xml` to serve as a parameter file to the oamreg tool.

   In the example below, replace the contents within `$$webtier..$$` with your web tier host and port IDs, and `$$oam...$$` with the OAM host and administration server port.

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!--
   Copyright (c) 2009, 2010, Oracle and/or its affiliates. All rights reserved.
   
   NAME: OAM11GRequest_short.xml - Template for OAM 11G Agent Registration
   Request file
   (Shorter version - Only mandatory values - Default values will be used for all other fields)
   
   DESCRIPTION: Modify with specific values and pass file as input to the tool.
   -->
   <OAM11GRegRequest>
   <serverAddress>http://$$oamhost$$:$$oamadminserverport$$</serverAddress>
   <hostIdentifier>$$webtierhost$$_webcenter</hostIdentifier>
   <agentName>$$webtierhost$$_webcenter</agentName>
   <logOutUrls>
   <url>/oamsso/logout.html</url>
   </logOutUrls>
   </OAM11GRegRequest>
   ```

5. Change directories to `<RREG_Home>`. 

6. Run the following command:

   `<RREG_Home>/bin/oamreg.sh` inband input/WebCenterOAM11gRequest.xml

   - When prompted for agent credentials enter your OAM administrator credentials.
   - Enter your WebGate password.
• Enter yes when asked whether you want to import a URIs file. Specify the full path to the `<RREG_HOME>/input/webcenter.oam.conf` file you copied there earlier.

You should see output like that below indicating that registration has been successful:

```
----------------------------------------
Request summary:
OAM11G Agent Name:example_webcenter
URL String:example_webcenter
Registering in Mode:inband
Your registration request is being sent to the Admin server at: http://example.com:7001
----------------------------------------
```

Inband registration process completed successfully! Output artifacts are created in the output folder.

7. Copy the generated files and artifacts (`ObAccessClient.xml` and `cwallet.sso`) from `<RREG_Home>/output/$$webtierhost$$_webcenter` to your WebGate instance configuration directory `<Webgate_Instance_Directory>/webgate/config`. Note that `<Webgate_Instance_Directory>` should match the instance home of OHS, as in the following example:

```
<WE_HOME>/Oracle_WT1/instances/instance1/config/OHS/ohs1/webgate/config
```

8. Change directories to `<RREG_Home>/input`.

9. If you have SOA or WebCenter Content Server installed

   a. Create a policy update file called `WebCenterOAM11gPolicyUpdate.xml` as shown in the example below, replacing the contents within `$$webtier$$` with your web tier host and port IDs, and `$$oam$$` with the OAM host and administration server port as you did earlier:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!--
   Copyright (c) 2009, 2011, Oracle and/or its affiliates. All rights reserved.

   NAME: UpdatePolicyRequest.xml - Template for updating application domain and/or policies without changes to any agent profile
   DESCRIPTION: Modify with specific values and pass file as input to the tool
   -->
   <PolicyRegRequest>
   <serverAddress>http://$$oamhost$$:$$oamadminserverport$$</serverAddress>
   <hostIdentifier>$$webtierhost$$_webcenter</hostIdentifier>
   <applicationDomainName>$$webtierhost$$_webcenter</applicationDomainName>
   </PolicyRegRequest>
   ```

   b. Run the following command:

   ```
   <RREG_Home>/bin/oamreg.sh policyUpdate input/
   WebCenterOAM11gPolicyUpdate.xml
   ```
Enter your OAM credentials when prompted. Enter yes when asked whether you want to import a URIs file, and specify $<RREG_HOME>/input/soa.oam.conf$.

Your policy will be updated with SOA resources.

c. Run the policyUpdate command again, this time specifying $<RREG_HOME>/input/oam.conf$ to update the policy with Content Server resources. Your policy now contains Oracle WebCenter Portal, SOA and Content Server artifacts.

10. From the OAM Console, you should now be able to see the following artifacts:

- 11g WebGate agent named $$webtierhost$$_webcenter
- 11g host identifier by the same name
- an application domain with the same name containing authentication and authorization policies which in turn contain protected and public policies

11. Go to Application Domain> $$webtierhost$$_webcenter > Authentication Policies. You should be able to see the following policies:

- Exclusion Scheme
- Protected Resource Policy
- Public Resource Policy
- WebCenter REST Policy

12. Open the WebCenter REST Policy and make sure that the Authentication Scheme is set to BasicSessionlessScheme or BasicScheme.

13. Open the Resources tab and search for resources with their Authentication Policy set to Exclusion Scheme. You should see the following resources:

- /rsscrawl*
- /rsscrawl/.../*
- /sesUserAuth*
- /sesUserAuth/.../*
- /services-producer/portlets*
- /services-producer/portlets/.../*
- /wsrp-tools/portlets
- /wsrp-tools/portlets/.../*

14. Select the /rsscrawl* resource in the search results and click Edit.

15. Change the Protection Level from Protected to Excluded and click Apply. Note that the resource's authentication policy and authorization policy is removed.

16. Close the Resources tab and repeat the steps for the remaining Exclusion Scheme resources.
When you now search for resources with their Authentication Policy set to Exclusion Scheme you should see no results.

17. Restart OHS.

18. After installing and configuring the web tier and associated components, continue by configuring the Policy Manager as described in Configuring the WebLogic Domain for OAM, and performing any additional service and component configurations that apply as described in Additional Single Sign-on Configurations.

28.2.4 Configuring the WebLogic Domain for OAM

If your environment spans multiple domains (for example, a domain for WebCenter Portal, a separate domain for SOA, and a separate domain for Content Server), repeat the steps in this section for each domain.

This section includes the following subsections:

- Configuring the Oracle Internet Directory Authenticator
- Configuring the OAM Identity Asserter
- Configuring the Default Authenticator and Provider Order
- Adding an OAM Single Sign-on Provider

28.2.4.1 Configuring the Oracle Internet Directory Authenticator

Assuming Oracle Internet Directory is backing the OAM identity store, an Oracle Internet Directory authenticator (OracleInternetDirectoryAuthenticator) should be configured for the LDAP server that is used as the identity store of OAM, and the provider should be set to SUFFICIENT.

To configure the Oracle Internet Directory authenticator:

1. Log in to the WebLogic Server Administration Console.
   
   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. From the Domain Structure pane, click Security Realms.
   
   The Summary of Security Realms pane displays.

3. Click the realm entry for which to configure the OID authenticator.
   
   The Settings pane for the realm displays.

4. Open the Providers tab.
   
   The Provider Settings display.

5. Click New to create a provider.
   
   The Create a New Authentication Provider pane displays.

6. Enter a name for the new provider (for example, OID Authenticator), select OracleInternetDirectoryAuthenticator as its type and click OK.

7. On the Providers tab, click the newly added provider.
The Common Settings pane for the authenticator displays.

8. Set the control flag to SUFFICIENT and click Save.

9. Open the Provider Specific tab.

The Provider Specific Settings pane for the authenticator displays.

10. Complete the fields as shown in the table below. Leave the rest of the fields set to their default values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td></td>
<td>The host ID for the LDAP server</td>
</tr>
<tr>
<td>Port</td>
<td></td>
<td>The LDAP server port number</td>
</tr>
<tr>
<td>Principal</td>
<td></td>
<td>The LDAP administrator principal (for example, cn=orcladmin)</td>
</tr>
<tr>
<td>Credential</td>
<td>&lt;password&gt;</td>
<td>The administrator principal password</td>
</tr>
<tr>
<td>Confirm Credential</td>
<td>&lt;password&gt;</td>
<td></td>
</tr>
<tr>
<td>User Base DN</td>
<td></td>
<td>User Search Base - this value should be the same as for the OAM Access Manager setup</td>
</tr>
<tr>
<td>All Users Filter</td>
<td>&quot;(&amp;(uid=*) (objectclass=person))&quot;</td>
<td>The specified user name attribute must match in these three filters: All Users Filter and User Name Attribute and User From Name Filter</td>
</tr>
<tr>
<td>User Name Attribute</td>
<td>&quot;uid&quot;</td>
<td></td>
</tr>
<tr>
<td>User From Name Filter</td>
<td>&quot;(&amp;(uid=%u) (objectclass=person))&quot;</td>
<td></td>
</tr>
<tr>
<td>Group Base DN</td>
<td></td>
<td>Group search base - Same as User Base DN</td>
</tr>
<tr>
<td>Use Retrieved User Name as Principal</td>
<td>Checked</td>
<td>User login IDs are usually case insensitive. This flag is required so that the subject established contains the user name as stored in the OID.</td>
</tr>
</tbody>
</table>

**Note:**

The User Name Attribute, All Users Filter, and Users From Name Filter fields should all point to same OID attribute (uid in this case) and should match the Identity Store configuration for OAM. Additionally, these three fields should also match across all services participating in single sign-on, as well as OAM and WebCenter Portal.

11. Click Save.
28.2.4.2 Configuring the OAM Identity Asserter

An OAM identity asserter must be configured with the provider Control Flag set to REQUIRED.

To configure the OAM Identity asserter:

1. Log in to the WebLogic Server Administration Console.
   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. From the Domain Structure pane, click Security Realms.
   The Summary of Security Realms pane displays.

3. Click the realm entry for which to configure the OAM identity asserter.
   The Settings pane for the realm displays.

4. Open the Providers tab.
   The Provider Settings display.

5. Click New to create a provider.
   The Create a New Authentication Provider pane displays.

6. Enter a name for the new provider (for example, OAM ID Asserter), select OAMIIdentityAsserter as its type and click OK.

7. On the Providers tab, click the newly added provider.
   The Common Settings pane for the authenticator displays.

8. Set the control flag to REQUIRED and check that OAM_REMOTE_USER and ObSSOCookie is set for Active Types.

9. Click Save to save your settings.

28.2.4.3 Configuring the Default Authenticator and Provider Order

After configuring the OAM identity asserter, ensure that the default authenticator's control flag is set to SUFFICIENT and reorder the providers as shown below:

1. Navigate to the Provider Settings pane.

2. Open the Default Authenticator and check that the control flag is set to SUFFICIENT.

3. Do the same for any providers other than the two you just created.

4. On the Settings Pane, reset the provider order to:
   - OAMIIdentityAsserter(REQUIRED)
   - OracleInternetDirectoryAuthenticator(SUFFICIENT)
   - DefaultAuthenticator(SUFFICIENT)
• DefaultIdentityAsserter

5. Continue by configuring WebCenter Portal for single sign-on mode as described in Configuring WebCenter Portal for SSO. Also be sure to perform any further service and component configurations that apply to your environment as described in Additional Single Sign-on Configurations.

28.2.4.4 Adding an OAM Single Sign-on Provider

After checking that the default authenticator’s control flag is set correctly, and that the order of the providers is correct, add an OAM SSO provider and restart all servers as described below.

1. Connect to the WebLogic domain using WLST and run the following command:

   ```
   addOAMSSOProvider(loginuri="/${app.context}/adfAuthentication", logouturi="/oamsso/logout.html")
   ```

2. Restart all servers.

28.2.5 Installing and Configuring the Oracle HTTP Server

This step should be performed after installing and configuring OAM, and before configuring the WebLogic domain.

To install and configure the Oracle HTTP server (OHS).

1. If you do not have already have an OHS install you’d like to use, install the Oracle HTTP Server using the instructions in Installing and Configuring Oracle Web Tier in Installing and Configuring Oracle HTTP Server.

2. Configure web tier OHS so that it forwards requests to the Oracle WebLogic Server for WebCenter Portal using the following example in `mod_wl_ohs.conf`. Make sure that the WebLogic port numbers match your configuration. For more information, see Installing and Configuring Oracle HTTP Server 11g Webgate for OAM in Installing WebGates for Oracle Access Manager.

   **Note:**
   
   This example assumes that WebCenter Portal is a non-cluster based installation. For a clustered environment change the WebLogicHost and WebLogicPort to WeblogicCluster as required for your environment. See the section on Installing and Configuring Oracle HTTP Server 11g Webgate for OAM in Installing WebGates for Oracle Access Manager for details.

   ```
   # NOTE : This is a template to configure mod_weblogic.
   LoadModule weblogic_module  "${ORACLE_HOME}/ohs/modules/mod_wl_ohs.so"

   # This empty block is needed to save mod_wl related configuration from EM to this file when changes are made at the Base Virtual Host Level
   #IfModule weblogic_module>
   #  WebLogicHost <WEBLOGIC_HOST>
   #  WebLogicPort <WEBLOGIC_PORT>
   #  Debug ON
   #  WLLogFile /tmp/weblogic.log
   #  MatchExpression *.jsp
   ```
<Location /webcenter>
  SetHandler weblogic-handler
  WebLogicHost webcenter.example.com

28.2.6 Additional Single Sign-on Configurations

The configurations described in the following sections may be necessary or helpful in providing additional security for your site. After completing these configurations, continue by testing your OAM installation as described in Testing Your OAM Installation.

- Configuring WebCenter Portal for SSO
- Configuring the Discussions Server for SSO
- Configuring SOA Server Connections for SSO
- Configuring OAM for RSS Feeds Using External Readers
- Configuring the WebLogic Server Administration Console and Enterprise Manager for OAM 11g
- Configuring Secure Enterprise Search for SSO
- Configuring Content Server for SSO
- Restricting Access with Connection Filters
- Configuring Portlet Producers and Additional Components

28.2.6.1 Configuring WebCenter Portal for SSO

Configure the WebCenter Portal application for SSO by adding a setting to EXTRA_JAVA_PROPERTIES.

There is a system property that tells WebCenter Portal and ADF that the application is configured in SSO mode and some special handling is required. The following system property is required in this mode:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle.webcenter.spaces.osso</td>
<td>true</td>
<td>This flag tells WebCenter Portal that SSO is being used, so no login form should be displayed on the default landing page. Instead, it displays a login link that the user can click to invoke the SSO authentication.</td>
</tr>
</tbody>
</table>

To set this property, edit the setDomainEnv.sh script located in your <domain>/bin directory, and add an entry like the following:

```
EXTRA_JAVA_PROPERTIES="-Doracle.webcenter.spaces.osso=true $(EXTRA_JAVA_PROPERTIES)"
export EXTRA_JAVA_PROPERTIES
```

After making this change, restart the WC_Portal server.
28.2.6.2 Configuring the Discussions Server for SSO

This section describes how to configure the discussions server for single sign-on. Before configuring the discussions server for SSO, ensure that it has been configured to use the same identity store LDAP as WebCenter Portal, as described in Reassociating the Identity Store with an External LDAP Server. If you’ve chosen not to move the default administrator account to an external LDAP, be sure to also follow the instructions in Migrating the Discussions Server to Use an External LDAP.

Note:
Direct login to the discussions server is not supported after SSO is configured. Log in must be done through the Oracle HTTP Server URL.

To set up the discussions server for SSO:

1. Log in to the discussions server Admin Console at:
   
   http://host:port/owc_discussions/admin

   Where host and port are the host ID and port number of the WC_Collaboration managed server.

2. Open the System Properties page and edit (if it already exists) or add the owc_discussions.sso.mode property, setting it's value to true.

3. Edit or add the jiveURL property to point to the base URL of the web tier. For example:

   jiveURL = webtier.example.com:7777/owc_discussions

   The jiveURL property is used when constructing links to forums in emails.

   Note:

   The registered WebCenter connection in WebCenter Portal for discussions and forums should point to the OHS URL.

28.2.6.2.1 Creating a Discussions Server Connection for WebCenter Portal

This section describes how to update the discussions server connection for WebCenter Portal so that it uses the web tier’s host and port values. Note that the steps below assume that the discussions component has already been installed and configured in the WebCenter Portal domain.

1. Using Fusion Middleware Control or WLST, change the Discussion server’s URL host and port settings from the WC_Portal managed server’s settings, to the web tier’s host and port settings. For information about how to change these settings, see Modifying Discussions Server Connection Details.

2. Restart the WC_Portal managed server.

   When you log in to WebCenter Portal, you automatically sign on to the Discussion server as well.
28.2.6.3 Configuring SOA Server Connections for SSO

Assuming that you've already set up a SOA server connection, modify the URL to use the web tier host and port instead of the SOA server host and port. You can do this using Fusion Middleware Control as described in Specifying the BPEL Server Hosting WebCenter Portal Workflows.

After modifying the URL and completing the setup required for OAM SSO, run the following command on the WebCenter Portal Administration server so that the changes take effect:

```java
setBPELConnection('webcenter','WebCenter-Worklist', 'http://webtier.example.com:7777')
```

28.2.6.4 Configuring OAM for RSS Feeds Using External Readers

By default, WebCenter Portal RSS feeds are protected by SSO. However, they will not work well with external readers if left protected. If access using external readers is important, Oracle recommends that the WebCenter Portal RSS resource be excluded from the OAM policy so that the authentication for the RSS Servlet is handled by WebLogic Server's BASIC authentication that external readers can handle.

Follow the steps below to unprotect RSS feed for OAM 11g:

1. Open the OAM Admin Console.
2. Open the Policy Configuration tab and select Application Domain > <your application domain>.
3. Open the Resources tab and search for /rss*.
   
   Among the results, you should see:

   - /rss*
   - /rss/*/*
   - /rss/rsservlet*
   - /rss/rssServlet/*/*

4. For each resource, select the resource and click Edit.
5. Change each resource's Protection Level from Protected to Excluded and click Apply.

   Note that the resource's authentication policy and authorization policy are removed.

6. Close the tab and restart OHS.

28.2.6.5 Configuring the WebLogic Server Administration Console and Enterprise Manager for OAM 11g

This section describes how to optionally set up OAM 11g single sign-on for the WebLogic Server Administration Console and Enterprise Manager.
Note:
Setting up OAM SSO for Enterprise Manager and the WebLogic Server Administration Console would provide single sign-on access to same set of users for whom OAM SSO access has been configured. If want the web tier to be accessible to external users through OAM, but want administrators to log in directly to Enterprise Manager and the WebLogic Server Administration Console, then you may not want to complete this additional configuration step.

To set up OAM 11g SSO for the WebLogic Server Administration Console and Enterprise Manager:

1. Log in to the OAM Console using your browser:
   http://host:port/oamconsole

2. Go to Policy Configuration > Application Domains.
   The Policy Manager pane displays.

3. Locate the application domain you created using the name while registering webgate agent.

4. Expand the Resources node and click Create.
   The Resource page displays.

5. Add the resources that must be secured. For each resource:
   a. Select http as the Resource Type.
   b. Select the Host Identifier created while registering the WebGate agent.
   c. Enter the Resource URL for the WebLogic Server Administration Console (/console) or Enterprise Manager (/em).
   d. Enter a Description for the resource and click Apply.

6. Go to Authentication Policies > Protected Resource Policy and add the newly created resource.

7. Do the same under Authorization Policies > Protected Resource Policy.

8. In your web tier, modify the mod_wl_ohs.conf file (in WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/) to include the WebLogic Server Administration Console and Enterprise Manager, by adding two additional Location entries using the actual host ID for the WebCenter Portal Administration Server for WebLogicHost.

   <Location /console>
   SetHandler weblogic-handler
   WebLogicHost webcenter.example.com
   WebLogicPort 7001
   </Location>

   <Location /em>
   SetHandler weblogic-handler
   WebLogicHost webcenter.example.com
   </Location>
9. Restart the Oracle HTTP Server for your changes to take effect.

You should now be able to access the WebLogic Server Administration Console and Enterprise Manager with the following links:

http://host:OHS port/console
http://host:OHS port/em

and be prompted with the OAM SSO login form.

28.2.6.6 Configuring Secure Enterprise Search for SSO

The crawl sources that are defined to crawl WebCenter Portal data and repositories used by WebCenter Portal and the corresponding authentication end points defined in SES must be routed through the web tier OHS ports so that they can be properly authenticated (the authentication method continues to be BASIC and realm jazn.com). For information about configuring SES connections, see Setting Up Oracle SES Connections.

28.2.6.7 Configuring Content Server for SSO

After you've completed your SSO setup, and after setting up a connection for Content Server, specify the web context root in the JCRContentServerConnection using Fusion Middleware Control, or as shown in the following WLST example:

```java
setJCRContentServerConnection(appName, name, webContextRoot='©/cs©)
```

Setting the web context root tells the Document Library code that SSO has been set up. Note that this setting should not be set until after SSO has been completely set up.

28.2.6.8 Restricting Access with Connection Filters

Follow the steps below to only allow users to access WebCenter Portal and associated components through the web tier OHS ports so that they can be properly authenticated.

1. Log in to the WebLogic Server Administration Console.

   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, select the domain you want to configure (for example, webcenter).

3. Open the Security tab and the Filter subtab.

   The Security Filter Settings pane displays.

4. Check Connection Logger Enabled to enable the logging of accepted messages.

   The Connection Logger logs successful connections and connection data in the server. You can use this information to debug problems relating to server connections.

5. In the Connection Filter field, specify the connection filter class to be used in the domain.
- To configure the default connection filter, specify `weblogic.security.net.ConnectionFilterImpl`.

- To configure a custom connection filter, specify the class that implements the network connection filter. Note that this class must also be present in the CLASSPATH for WebLogic Server.

6. In the Connection Filter Rules field, enter the syntax for the connection filter rules. For example:

```plaintext
<webtier IP>/0 * * allow
0.0.0.0/0 * * deny
```

which says: allow all traffic coming from the local host and disallow all traffic from any other IP address. You should, of course, write the network filter(s) that are relevant to your environment. For more information about writing connection filters, see Developing Custom Connection Filters in Developing Applications with the WebLogic Security Service.

7. Click Save and activate the changes.

8. Restart all the managed servers and the Administration server.

9. Verify that all direct traffic to the WebLogic Server is blocked by attempting to navigate to:

   `http://host:WLS_port/webcenter`

   This should produce the following error:

   "The Server is not able to service this request: [Socket: 000445]Connection rejected, filter blocked Socket, weblogic.security.net.FilterException: [Security:090220]rule 3"

   You should, however, still be able to access WebCenter Portal through the OHS port:

   `http://host:OHS_port/webcenter`

### 28.2.6.9 Configuring Portlet Producers and Additional Components

If you have set up your Portlet Producer applications to route through OHS, be sure to use the OHS host and port when specifying producer URLs for registration. This applies to out-of-the-box producers like wsrp-tools, services-producer, pagelet producers and any other producer you have explicitly configured.

### 28.2.7 Testing Your OAM Installation

After installing and configuring OAM 11g, check that you can access all of the configured applications below (as they apply to your environment), and that the global login and logout is giving you access to all of your configured applications without prompting you to sign in again. Also test global logout where available and make sure you are logged out of all other related applications.

- **WebCenter Portal**: Access any protected WebCenter Portal URL (a protected portal, for example), and make sure that you see the SSO login challenge. If you are already logged into another related application that uses the same SSO, you should automatically be shown content.
- **REST:** Access [http://ohshost:ohsport/rest/api/resourceIndex](http://ohshost:ohsport/rest/api/resourceIndex). You should see the BASIC authentication challenge. If you are already logged into another related application that uses the same SSO, you should automatically be shown content.

- **REST:** Access [http://ohshost:ohsport/rest/api/cmis/....](http://ohshost:ohsport/rest/api/cmis/....) (retrieve this from resourceIndex access output in the previous step). You should not see a login challenge and should be able to see public content. When you access this after you’ve logged in, then you should see all content to which you have access rights.

- **Content Server:** Go to the profile UI and check that you can see Content Server screens embedded in iFrames without challenging you to log in. You should also be able to access Site Studio content in Content Presenter templates without logging in as you are already logged into WebCenter Portal.

- **SOA:** Access links in a workflow task flow and make sure that you are not challenged to log in.

- **Discussion forums:** Access the discussions application at [http://host:port/owc_discussions](http://host:port/owc_discussions) and log in. Check that the login is the SSO login challenge. Similarly, the Administration login to the discussions server at [http://host:port/owc_discussions/admin](http://host:port/owc_discussions/admin) should also go through the SSO login challenge.

### 28.3 Configuring SAML-based Single Sign-On

Security Assertion Markup Language (SAML) enables cross-platform authentication between web-based applications or web services running in a WebLogic Server domain, and web browsers or other HTTP clients. WebLogic Server supports single sign-on (SSO) based on SAML for WebCenter Portal (Pagelet Producer applications are not supported).

When users are authenticated at one site that participates in a single sign-on configuration, they are automatically authenticated at other sites in the SSO configuration and do not need to log in separately. Note that since Pagelet Producer applications do not participate in SAML SSO, users are required to log in explicitly if they accesses the Pagelet Producer application.

**Note:**

Although SAML-based single sign-on provides support for logging users onto subsequent applications after initial sign-on, global logout is not supported. Consequently, users must log out of each individual application they open.

Note also that if you set up SAML-based single sign-on with WebCenter Portal as the source application and discussions as the destination application, administrators can access the discussions administration pages from WebCenter Portal Administration (Configuration > Services) and Portal Settings (Services page). However, since discussions administration pages do not participate in SSO, if you access administration pages directly, you are required to log in to the discussions server again.

Finally, SAML-based single sign-on is not available for the sdpmessaging userprefs-ui application. As an application administrator, if you click Manage Configuration in the Preferences > Messaging dialog in WebCenter Portal, you will need to log in again.
This SSO mechanism can be used for departmental installations for which there is no existing Oracle SSO or Oracle Access Manager single sign-on infrastructure, but single sign-on between only WebCenter Portal and its components or services is required. For High Availability and large enterprise deployments, Oracle Access Manager SSO is recommended.

This section describes how to set up SAML 1.1-based single sign-on for WebCenter Portal and SOA running on different managed servers within the same domain.

This section includes the following topics:

- SAML Components and Topology
- Configuring SAML-based Single Sign-On

### 28.3.1 SAML Components and Topology

Figure 28-5 shows the components and their interaction in a SAML-based single sign-on configuration that includes WebCenter Portal and discussions.

A SAML-based single sign-on solution consists of the following components:

- **SAML Credential Mapper** – The SAML Credential Mapping provider acts as a producer of SAML security assertions, allowing WebLogic Server to act as a source site for using SAML for single sign-on. The SAML Credential Mapping provider generates valid SAML 1.1 assertions for authenticated subjects based on the configuration of the target site or resource.

- **Inter Site Transfer Service (ITS)** – an addressable component that generates identity assertions and transfers the user to the destination site.

- **Assertion Retrieval Service (ARS)** – an addressable component that returns the SAML assertion that corresponds to the artifact. The assertion ID must have been allocated at the time assertion was generated.

- **SAML Identity Asserter** – The SAML Identity Assertion provider acts as a consumer of SAML security assertions, allowing WebLogic Server to act as a destination site for using SAML for single sign-on. The SAML Identity Assertion provider processes valid SAML 1.1 assertions for authenticated subjects obtained from the source site or resource.

- **Assertion Consumer Service (ACS)** – an addressable component that receives assertions and/or artifacts generated by the ITS and uses them to authenticate users at the destination site

- **SAML Relying party** – A SAML Relying Party is an entity that relies on the information in a SAML assertion produced by the SAML source site. You can configure how WebLogic Server produces SAML assertions separately for each Relying Party or use the defaults established by the Federation Services source site configuration for producing assertion.

- **SAML Asserting party** – A SAML Asserting Party is a trusted SAML Authority (an entity that can authoritatively assert security information in the form of SAML Assertions).

Figure 28-4 shows the components and flow for a POST-configured SAML SSO configuration that includes both a WebCenter Portal and SOA domain. The flow is similar for other destination applications participating in single sign-on such as and discussions.
Figure 28-4  Detailed SAML Single Sign-on Components and Topology (POST Profile Configured)

Figure 28-5 shows a simplified version of the components and flow for a POST-configured SAML SSO configuration, including the SAML SSO flow between WebCenter Portal and the discussions application.

Figure 28-5  SAML Single Sign-on Components and Topology (POST Profile Configured)

The steps in the flow are:

1. The user’s browser accesses WebCenter Portal (source site), hosted on a WebLogic managed server (WC_Portal) in the WebCenter Portal domain (wc_domain), by supplying user credentials.

2. WebCenter Portal passes the user credentials to the authentication service provider.

3. If authentication is successful, the authenticated session is established, and the WebCenter Portal welcome page is displayed.
4. From the welcome page, the user then clicks on a link on the page to access a secured web page of the discussions destination site, hosted on a different WebLogic Server (WC_Collaboration) in the same domain. This triggers a call to the Inter-Site Transfer Service (ITS) servlet configured. In this case, the ITS servlet is hosted within the source site (that is, on the WebCenter Portal application on the WC_Portal managed server) that shares the same JSESSIONID cookie as WebCenter Portal.

5. The ITS servlet calls the SAML Credential Mapper configured in the WebCenter Portal domain (wc_domain) to request a caller assertion. The SAML Credential Mapper returns the assertion. It also returns the URL of the destination site application Web page (a secured Web page for discussions) and path to the appropriate POST form (if the source site is configured to use the POST profile).

6. The SAML ITS servlet generates a SAML response containing the generated assertion, signs it, base-64 encodes it, embeds it in the HTML form, and returns the form to the user’s browser.

7. The user’s browser POSTs the form to the destination site’s Assertion Consumer Service (ACS). In this case, the ACS Servlet is hosted in destination site (discussions) and shares its login cookie.

8. The assertion is validated.

9. If the assertion is successful, the user is redirected to the target (the secured Web page for discussions).

10. The user is logged in on the destination site (discussions) without having to reauthenticate.

28.3.2 Configuring SAML-based Single Sign-On

This section describes how to configure WebCenter Portal and associated services and components for SAML-based single sign-on using a set of automated scripts.

This section includes the following topics:

- SAML Single Sign-on Prerequisites
- Configuring SAML-based SSO
- Configuring SAML SSO for RSS Using External Readers
- Checking Your Configuration
- Disabling Your SAML SSO Configuration
- Removing Your SAML SSO Configuration

28.3.2.1 SAML Single Sign-on Prerequisites

This section describes a set of steps that should be carried out prior to configuring SAML-based single sign-on. Note that these steps assume that WebCenter Portal and associated components are already installed and the relevant connections have been configured and tested.

The prerequisites for SAML-based SSO are described in the following topics:

- Configuring WebCenter Content Server for SAML SSO
28.3.2.1.1 Configuring WebCenter Content Server for SAML SSO

If your instance uses a Documents connection that requires the use of OHS to surface the Content Server user interface in WebCenter Portal, you need to configure WebCenter Portal and related applications with a web tier.

When configuring SAML SSO for a configuration that includes Content Server, all HTTP URLs should point to the web tier host and port. Additionally, when Content Server is front-ended with OHS, the following entries must appear in `mod_wl_ohs.conf`, apart from the usual configuration for WebCenter Portal:

```
<Location /cs>
  SetHandler weblogic-handler
  WebLogicHost ucm.example.com
  WebLogicPort 16200
</Location>

<Location /adfAuthentication>
  SetHandler weblogic-handler
  WebLogicHost ucm.example.com
  WebLogicPort 16200
</Location>

<Location /samlacs/acs>
  SetHandler weblogic-handler
  WebLogicHost ucm.example.com
  WebLogicPort 16200
</Location>
```

See Installing and Configuring the Oracle HTTP Server for more information about installing OHS and editing `mod_wl_ohs.conf`.

Additionally, when a custom login page is used for WebCenter Portal the following HTML comment must be added to the head section of the HTML page generated for Content Server for Site Studio Designer to work:

```
<!--IdcClientLoginForm=1-->
```

This HTML comment appears in the out-of-the-box log in pages in WebCenter Portal, but if you configure a new page to be the login page in a SAML SSO setup, then the comment must be added by hand, or in generated HTML as shown in the following example for a JSF page:

```
<af:document id="d1">
  <f:facet name="metaContainer">
    <f:verbatim>
    ${cb.commentText}
    </f:verbatim>
  </f:facet>
  ..........  

where cb is a managed bean containing the method:

```java
public String getCommentText(){
    return "<!--IdcClientLoginForm=1-->";
}
```
After checking that the comment text is added verbatim in the `metaContainer` facet of `af:document`, check the generated HTML page using View Source and confirm that `<!--IdcClientLoginForm=1-->` is in the `<head>` section of the HTML page.

### 28.3.2.1.2 Configuring the Discussions Server for SAML SSO

By default, the .EAR file that is deployed for the Oracle WebCenter Portal’s Discussion Server Server supports form-based Oracle SSO or Oracle Access Manager SSO. Therefore, before you can configure the Oracle WebCenter Portal’s Discussion Server for SAML-based single sign-on, you must also first deploy the SAML SSO version of the discussion server .EAR file.

**Note:**

Before configuring the discussions server for SSO, ensure that it is configured to use the same identity store LDAP as WebCenter Portal, as described in Reassociating the Identity Store with an External LDAP Server. If you’ve chosen not to move the default administrator account to an external LDAP, be sure to also follow the instructions in Migrating the Discussions Server to Use an External LDAP.

To deploy and configure the SAML SSO version of the Oracle WebCenter Portal’s Discussion Server:

1. Log in to the WebLogic Server Administration Console as an administrator.

   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, click **Deployments**.

   The Deployments Summary pane displays.

3. On the Deployment Summary page, select `<woc_discussions>` stop and delete and click **Install**.

4. Using the Install Application Assistant **Path** field, locate the SSO enabled `woc_discussions` .EAR file (`woc_discussions_samlsso.ear`, typically in `WCP_ORACLE_HOME/discussionserver`).

5. Select the `woc_discussions_samlsso.ear` file and click **Next**.

6. Select **Install this deployment as an application** and click **Next**.

7. Set the **Name** to `woc_discussions`.

8. Deploy the .EAR file.

9. Log in to the Discussions Server Administration Console as an administrator (see Configuring the Discussions Server for SSO for more information on logging in to the Discussions Server Administration Console).

10. Open the System Properties page and edit (if it already exists) or add the `woc_discussions.sso.mode` property, setting its value to `true`.

11. Restart the **WC_Collaboration** managed server (where the discussions server is deployed).
28.3.2.1.3 Configuring and Exporting the Certificates

To secure communication between the SAML source and destination sites, communication should be encrypted. Additionally, certificates should be used to verify the identity of the other party during SAML interaction.

Using the `getOpssService`, `listKeyStoreAliases`, and `exportKeyStoreCertificate` WLST commands, get and export the certificate you have chosen to use to encrypt SAML assertions as shown in the following example. Be sure to run the `exportKeyStoreCertificate` command on the keystore that is configured for `WC_Portal` and the Administration server for the WebCenter Portal domain. For more information, see Managing Keys and Certificates with the Keystore Service in *Securing Applications with Oracle Platform Security Services*. For syntax for these commands, see Keystore Service Command Reference in *Securing Applications with Oracle Platform Security Services*.

The following example demonstrates how to export DemoIdentity certificate, which is available in the demoidentity keystore configured for a weblogic server by default. Use this as a guideline to list and export the certificate from the keystore configured in your environment that you wish to use for SAML configuration.

```java
connect()
svc = getOpssService(name='KeyStoreService')
svc.listKeyStoreAliases(appStripe='system', name='demoidentity', password='DemoIdentityKeyStorePassPhrase', type='*')
svc.exportKeyStoreCertificate(appStripe='system', name='demoidentity', password='DemoIdentityKeyStorePassPhrase', alias='DemoIdentity', type='Certificate', filepath='/tmp/demoidentity.der')
```

**Note:** The path used in `filepath` above should match the `certPath` value in `wcsamlsso.properties`. Note also that the certificate must be exported only in PEM/DER format.

28.3.2.1.4 Setting Up SSL

If the WebCenter Portal installation requires SSL for providing transport-level security, then SSL should be configured before configuring single sign-on as described in *Configuring SSL*. Note that setting up SSL is not related to enabling SSO.

28.3.2.2 Configuring SAML-based SSO

After installing WebCenter Portal and services and components as required for your environment, continue by configuring SAML-based single sign-on using the scripts as described in this section.

The scripts set up SAML-based single sign-on in a WebLogic environment by configuring:

- SAML Credential Mapping Provider
- Necessary relying parties
- Source Site Federation Services
- SAML Identity Asserter
- Necessary asserting parties
• Destination Site Federation Services

This section includes the following topics:

• The Single Sign-on Script

• Using the Scripts

28.3.2.2.1 The Single Sign-on Script

The single sign-on script to configure SAML 1.1 SSO for WebCenter Portal and related applications is located in the WCP_ORACLE_HOME/webcenter/scripts/samlsso folder. The following files are relevant for SAML configuration:

• wcsamlsso.properties

• configureSpaces.py

• configureCollab.py

• configureUtilities.py

• configureSOA.py

• configureUCM.py

• configureREST.py

• configureForum.py

• configureWorklistIntegration.py

• configureCS.py

wcsamlsso.properties

This properties file (WCP_ORACLE_HOME/webcenter/scripts/samlsso/wcsamlsso.properties) encapsulates the necessary configuration information for the SAML SSO setup. Copy the properties file to the WCP_ORACLE_HOME/common/bin folder, change directories to that folder and edit wcsamlsso.properties as described below before running the configuration scripts.

The properties file has the following sections:

spaces_config

This section captures the login information, WebLogic Admin URL, WebCenter Portal server and URL, and so forth, of the WebCenter Portal domain required for the Credential Mapper and Source Site Federation Services configuration. All properties in this section must be completed.

• configFile - Config file containing the weblogic user account and password for the WebCenter Portal domain

• keyFile - Key file to decrypt the weblogic user account and password for the WebCenter Portal domain

• adminURL - WebLogic Admin URL to connect to WLST

• usesSSL - Indicates whether WebCenter Portal is configured to use SSL
- **url** - WebCenter Portal URL. If `usesSSL` is "true", then change "http" to "https". If WebCenter Portal is front-ended with a web tier, then specify the web tier host and port here.

- **serverName** - Server where WebCenter Portal is deployed, typically `WC_Collaboration`

- **certAlias** - Alias of certificate to sign SAML assertions

- **certPassword** - Encrypted password of certificate to sign SAML assertions

### **collab_config**

This section captures the login information, admin URL, certificate file path, and so forth, of the Collaboration domain required for the Identity Asserter and Destination Site Federation Services configuration. Only complete this section if your setup has discussions configured.

- **configFile** - Config file containing `weblogic` user account and password for the Services domain

- **keyFile** - Key file to decrypt `weblogic` user account and password for the Services domain

- **adminURL** - WebLogic Admin URL to connect to WLST

- **usesSSL** - Indicates whether discussions is configured to use SSL

- **serverName** - Server where discussions is deployed (typically the `WC_Collaboration` managed server)

- **certAlias** - Alias of certificate to verify SAML assertions

- **certPath** - Path to exported certificate to verify SAML assertions. Note that the certificate path should be a valid path on the machine that hosts the domain (i.e., the one specified in `adminURL`)

### **utilities_config**

This section captures the login information, admin URL, and certificate file path of the Utilities domain required for the Identity Asserter and Destination Site Federation Services configuration. Complete this section out only if your setup is configured with the Activity Graph application.

- **configFile** - Configuration file containing `weblogic` user account and password for the Utilities domain

- **keyFile** - Key file to decrypt `weblogic` user account and password for the Utilities domain

- **adminURL** - WebLogic Admin URL to connect to WLST

- **usesSSL** - Indicates whether Utilities applications are configured to use SSL

- **serverName** - Server where Utilities applications are deployed (typically the `WC_Utilities` managed server)

- **certAlias** - Alias of certificate to verify SAML assertions
• **certPath** - Path to exported certificate to verify SAML assertions. Note that the certificate path should be a valid path on the machine that hosts the domain (i.e., the one specified in **adminURL**)

**soa_config**

This section captures the login information, admin URL, certificate file path, and so forth, of the SOA domain required for the Identity Asserter and Destination Site Federation Services configuration. Only complete this section if your setup has SOA configured.

• **configFile** - Configuration file containing the **weblogic** user account and password for the SOA domain

• **keyFile** - Key file to decrypt the **weblogic** user account and password for the SOA domain

• **adminURL** - WebLogic admin URL to connect to WLST

• **usesSSL** - Indicates whether SOA applications are configured to use SSL

• **serverName** - Server where SOA applications are deployed (typically **soa_server1**)

• **certAlias** - Alias of certificate to verify SAML assertions

• **certPath** - Path to exported certificate to verify SAML assertions. Note that the certificate path should be a valid path on the machine that hosts the domain (i.e., the one specified in **adminURL**)

**ucm_config**

This section captures the login information, admin URL, certificate file path, and so forth, of the Content Server domain required for the Identity Asserter and Destination Site Federation Services configuration. Only complete this section if your installation has the Documents service configured.

• **configFile** - Configuration file containing the **weblogic** user name and password for the Content Server (UCM) domain

• **usesSSL** - Indicates whether Content Server applications are configured to use SSL

• **keyFile** - Key File to decrypt the **weblogic** user account and password for the Content Server (UCM) domain

• **adminURL** - WebLogic Administration URL to connect to WLST

• **serverName** - Server where Content Server applications are deployed (typically **UCM_server1**)

• **certPath** - Path to exported certificate to verify SAML assertions. Note that the certificate path should be a valid path on the machine that hosts the domain (i.e., the one specified in **adminURL**)

**rss_config**

This is mandatory
• url - RSS URL. If `usesSSL` in `spaces_config` is "true", then change "http" to "https". If RSS is front-ended with web tier, then specify the web tier host and port here.

**rest_config**

This section must be completed.

• url - REST URL. If `usesSSL` in `spaces_config` is "true", then change "http" to "https". If REST is front-ended with a web tier, then specify the web tier host and port here.

**forum_config**

Complete this section if your configuration has discussions installed.

• url - OWC discussions URL. If `usesSSL` in `collab_config` is "true", then change "http" to "https". If discussions is front-ended with a web tier, then specify the web tier host and port here.

**worklist_config**

Complete this section if SOA is installed and portal workflows is enabled for WebCenter Portal. For more information, see Specifying the BPEL Server Hosting WebCenter Portal Workflows.

• `worklist_integration` - Worklist Integration application URL. If `usesSSL` in `soa_config` is "true", then change "http" to "https". If Worklist Detail application is front-ended with a web tier, then specify the web tier host and port here.

**cs_config**

Complete this section if your configuration has Content Server installed and you have a documents connection configured for the WebCenter Portal application.

• url - Content Server URL. If `usesSSL` in `spaces_config` is "true", then change "http" to "https". If Content Server is front-ended with a web tier, then specify the web tier host and port here. Note that if both WebCenter Portal and Content Server are configured for your environment, then they must both be accessed using the same web tier.

**configureSpaces.py**

Executable script (`WCP_ORACLE_HOME/webcenter/scripts/samlsso/configureSpaces.py`) to configure SAML 1.1 Credential Mapper, SAML 1.1 Identity Asserter and Source and Destination site federation services on the WebCenter Portal domain

**configureCollab.py**

Executable script (`WCP_ORACLE_HOME/webcenter/scripts/samlsso/configureCollab.py`) to configure SAML 1.1 Identity Asserter and Destination site federation services on the Collaboration domain

**configureUtilities.py**

Executable script (`WCP_ORACLE_HOME/webcenter/scripts/samlsso/configureUtilities.py`) to configure SAML 1.1 Identity Asserter and Destination site federation services on the Utilities domain

**configureSOA.py**
Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureSOA.py}) to configure SAML 1.1 Identity Asserter and Destination site
federation services on the SOA domain

\texttt{configureUCM.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureUCM.py}) to configure SAML 1.1 Identity Asserter and Destination site
federation services on the Content Server domain

\texttt{configureREST.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureREST.py}) to configure asserting and relying parties for the REST
application

\texttt{configureRSS.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureRSS.py}) to configure asserting and relying parties for the RSS application

\texttt{configureForum.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureForum.py}) to configure asserting and relying parties for discussions

\texttt{configureWorklistIntegration.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureWorklistIntegration.py}) to configure asserting and relying parties
for the Worklist Integration application

\texttt{configureWorklistDetail.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureWorklistDetail.py}) to configure asserting and relying parties for the
Worklist Community Detail application

\texttt{configureWorklistSDP.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureWorklistSDP.py}) to configure asserting and relying parties for the
Worklist SDP application

\texttt{configureCS.py}

Executable script (\texttt{WCP\_ORACLE\_HOME/webcenter/scripts/samlssso/}
\texttt{configureCS.py}) to configure asserting and relying parties for the Content Server
application.

\textbf{28.3.2.2.2 Using the Scripts}

Follow the steps below to use the scripts to configure SAML-based single sign-on:

\textbf{Note:}

If you encounter errors when running the scripts due to configuration errors,
the SAML SSO configuration may be left in an incomplete state. The
configuration scripts provided are not re-runnable; you must clean up the
SAML SSO artifacts before you retry the configuration as described in
\textbf{Removing Your SAML SSO Configuration}. 
1. Ensure that the Administration server for all the domains used in this configuration are up and running.

2. Generate the configuration and key files containing the connection information for the various domains using the `storeUserConfig` WLST command from the WCP_ORACLE_HOME/common/bin so that the properties file is picked up. Use the command-line help (help ('storeUserConfig')) for usage and syntax details.
   a. Connect using WLST to the WebCenter Portal domain using the admin username and password, and run the following command:

      ```
      storeUserConfig('spacesconfig.secure', 'spaceskey.secure')
      ```

      This creates a user configuration file and an associated key file. The user configuration file contains an encrypted username and password. The key file contains a secret key that is used to encrypt and decrypt the username and password. The above command stores the configuration and key files in the directory from where WLST was invoked, or you can optionally specify a more secure path.

   b. Repeat step 2a after connecting to the Collaboration domain using the admin username and password. Even if the Utilities server is in the same domain as WebCenter Portal (wc_domain), you must connect to the WebCenter Portal domain and run this command:

      ```
      storeUserConfig('collabconfig.secure', 'collabkey.key.secure')
      ```

   c. Repeat step 2a after connecting to the Utilities domain using the admin username and password. Even if the Utilities server is in the same domain as WebCenter Portal (wc_domain), you must connect to the WebCenter Portal domain and run this command:

      ```
      storeUserConfig('utilitiesconfig.secure', 'utilitieskey.key.secure')
      ```

   d. Repeat step 2a after connecting to the SOA domain using the admin username and password. Even if SOA is installed on the same domain as WebCenter Portal, you must connect to the WebCenter Portal domain and run this command:

      ```
      storeUserConfig('soaconfig.secure', 'soakey.key.secure')
      ```

   e. Repeat step 2a after connecting to the Content Server domain using the admin username and password.

      ```
      storeUserConfig('ucmconfig.secure', 'ucmkey.key.secure')
      ```

3. Launch WLST and run the WLST `encrypt` command to encrypt the certificate password. Use the command-line help (help ('encrypt')) for usage and syntax details.

   ```
   print encrypt(obj='<certificatePassword>', domainDir='<full path to the WebCenter Portal domain directory>')
   ```

   This displays the encrypted certificate password. The encrypt command uses the encryption for a specified WebLogic Server domain root directory. The encrypted output needs to be set as the `certPassword` value in wcsamlsso.properties mentioned in the next step. Since this password will be set onto the credential
mapper and source site federation services in the WebCenter Portal domain, ensure that you run the encryption utility from the WebCenter Portal domain.

4. Edit `WCP_ORACLE_HOME/common/bin/wcsamlsso.properties` and complete the sections applicable to your setup. Refer to The Single Sign-on Script for a detailed description of the sections in the properties file.

5. Launch WLST from `WCP_ORACLE_HOME/common/bin` and execute the scripts in the order shown below.

---

**Note:**

Run the scripts in the WLST offline mode as the scripts include an explicit connect command.

---

a. execfile('<WCP_ORACLE_HOME>/webcenter/scripts/samlss0/ configureSpaces.py')

   Restart all servers including the Administration server in the WebCenter Portal domain.

b. If you have a discussions server set up, execute the `configureCollab.py` script:

   execfile('<WCP_ORACLE_HOME>/webcenter/scripts/samlss0/ configureCollab.py')

   If discussions belongs to the same domain as WebCenter Portal, then only restart the WC_Collaboration managed server. Otherwise, restart all servers including the Administration server in the Collaboration domain.

c. If you have a Utilities server set up, execute the `configureUtilities.py` script:

   execfile('<WCP_ORACLE_HOME>/webcenter/scripts/samlss0/ configureUtilities.py')

   If the Utilities server belongs to the same domain as WebCenter Portal, then only restart the WC_Utilities server. Otherwise, restart all servers including the Administration server in the Utilities domain.

d. If you have SOA server connections configured for WebCenter Portal, execute the `configureSOA.py` script:

   execfile('<WCP_ORACLE_HOME>/webcenter/scripts/samlss0/ configureSOA.py')

   Restart all servers including the Administration server in the SOA domain.

e. If you have documents configured for WebCenter Portal, run the `configureUCM.py` script as shown below:

   execfile('WCP_ORACLE_HOME/webcenter/scripts/samlss0/configureUCM.py')

   Restart all servers including the Administration server in the Content Server domain.

6. Run the individual commands below as required for your environment.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - No restart is required.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - No restart is required.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - Do this if you have discussions installed in your setup. No restart is required.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - Do this if you have Worklist installed in your setup. No restart is required.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - Do this if you have Worklist installed in your setup. No restart is required.
execfile('©<WCP_ORACLE_HOME>/webcenter/scripts/samlssologin.py') - Do this if you have Content Server installed in your setup. No restart is required.

7. Check your installation using the steps provided in Checking Your Configuration.

---

**Note:**

Since the properties file contains sensitive information, delete it from <WCP_ORACLE_HOME>/common/bin after you have configured and verified the SAML SSO setup. Also delete the config and key files you generated in step 2 above.

---

**Note:**

If you encounter errors when running the scripts, you must remove the asserting and relying parties set up by the scripts before running the scripts again as described in Removing Your SAML SSO Configuration.

After removing your old SAML SSO configuration, continue by re-running the scripts.

**28.3.2.3 Configuring SAML SSO for RSS Using External Readers**

By default, WebCenter Portal RSS feeds are protected by SSO. However, they will not work well with external readers if left protected. If access using external readers is important, Oracle recommends that the WebCenter Portal RSS resource be unprotected so that the authentication for the RSS Servlet is handled by WebLogic Server’s BASIC authentication that external readers can handle.

Follow the steps below to unprotect the RSS feeds:

1. Log onto the WLS Administration Console for the WebCenter Portal domain.
2. Open the security realm and select Providers > Credential Mapping > wcsamlcm > Management > Relying Parties.

3. Disable or delete the relying party for RSS.

4. Open the security realm and select Providers > Authentication > wcsamlia > Management > Asserting Parties.

5. Disable or delete the asserting party for RSS.

28.3.2.4 Checking Your Configuration

Follow the steps below to check that your single sign-on configuration is working correctly.

To test your single sign-on configuration:

1. Using a new browser, log in to WebCenter Portal and check that you’re not challenged for credentials when you click Forum Administration from Portal Settings > Services > Discussions (assuming this service is provisioned for the portal).

2. Access the RSS link from the discussions or worklist task flow and check that you are not challenged to log in.

3. For Content Server, go to the Profile user interface and make sure you see Content Server screens embedded in iFrames without being challenged to log in. You should also be able to access Site Studio content in Content Presenter templates without being challenged to log in as you are already logged into WebCenter Portal.

4. Access http://host:port/rest/api/resourceIndex and make sure you see the BASIC authentication challenge. If you are already logged in to another related application that uses the same SSO, you should shown content without being challenged to log in.

5. To test SOA, access links in the Workflow task flow and make sure you are not challenged to log in.

If while testing SAML SSO you encounter 404 or 403 errors, check the SAML configuration and also turn on debug logging for SAML on the AdminServer. Also turn on logging for the WC_Portal server and the server hosting your destination site. The logs will be available in $domain.home/servers/<server>/logs/<server>.log. For information on how to turn on logging for WC_Portal and other application servers, see Viewing and Configuring WebCenter Portal Logs. Before re-running the scripts, remove your SAML SSO configuration as described in Removing Your SAML SSO Configuration.

28.3.2.5 Disabling Your SAML SSO Configuration

This section describes how to temporarily disable your SAML SSO configuration for testing or other purposes.

To disable your SAML SSO configuration:

1. Log onto the WLS Administration Console for the WebCenter Portal domain.

2. Open the security realm and select Providers > Credential Mapping > wcsamlcm > Management > Relying Parties and disable all the relying parties shown there.
3. Open the security realm and select Providers > Authentication > wcsamlia > Management > Asserting Parties and disable all the asserting parties shown there.

4. If there are other WLS domains, such as SOA or Content Server, that have been configured with SAML SSO, remove the SAML SSO configuration from these domains as well:
   a. Log in to the WLS Administration Console for the WLS domain.
   b. Open the security realm and select Providers > Authentication > wcsamlia > Management > Asserting Parties and disable all the asserting parties shown there.

5. Confirm that the SAML SSO configuration has been disable by opening your applications and checking that you are not prompted to sign in.

28.3.2.6 Removing Your SAML SSO Configuration

Since the SAML SSO configuration scripts do not include a cleanup facility, if you have made errors while updating the wcsamlssoproperties file or running the scripts, the configuration could be in an invalid state. At this point, it's better to clean up all the SAML SSO configurations and start over. This section describes the steps to remove the SAML SSO configuration.

Note that if you have fully set up SAML SSO (i.e., the script ran to completion), then all the instructions below will be valid. However, if you encountered errors while running the script, then the configuration may be incomplete and only some of the artifacts below will be present and will need to be removed.

To remove your SAML SSO configuration:

1. Log onto the WLS Administration Console for the WebCenter Portal domain.

2. Open the security realm and select Providers > Credential Mapping > wcsamlcm > Management > Relying Parties and delete all the relying parties shown there.

3. Open the security realm and select Providers > Authentication > wcsamlia > Management > Asserting Parties and delete all the asserting parties shown there.

4. Go to Providers > Authentication > wcsamlia > Management > Certificates and delete the certificate there.

5. Go to Providers > Credential Mapping > wcsamlcm and delete the SAML Credential Mapper.

6. Go to Providers > Authentication > wcsamlia and delete the SAML Identity Asserter.

7. Restart the entire WebCenter Portal WLS domain.

8. If there are other WLS domains, such as SOA or Content Server, that have been configured with SAML SSO, remove the SAML SSO configuration from these domains as well:
   a. Log in to the WLS Administration Console for the WLS domain.
b. Open the security realm and select Providers > Authentication > wcsamlia > Management > Asserting Parties and delete all the asserting parties shown there.

c. Go to Providers > Authentication > wcsamlia > Management > Certificates and delete the certificate there.

d. Go to Providers > Authentication > wcsamlia and delete the SAML Identity Asserter.

e. Restart the entire WLS domain.

9. Confirm that the SAML SSO configuration has been removed by opening your applications and checking that you are not prompted to sign in. You can now safely use the scripts again to reconfigure SAML SSO.

28.4 Configuring SSO for Microsoft Clients

This section describes how to set up single sign-on (SSO) for Microsoft clients, using Windows authentication based on the Simple and Protected Negotiate (SPNEGO) mechanism and the Kerberos protocol, together with the WebLogic Negotiate Identity Assertion provider for WebCenter Portal. This SSO approach enables Microsoft clients (such as browsers), authenticated in a Windows domain using Kerberos, to be transparently authenticated to web applications (such as WebCenter Portal) in a WebLogic domain based on the same credentials, and without the need to type in their password again. For more information about using Microsoft Office clients with WebCenter Portal, see Chapter 25, “Managing Microsoft Office Integration.”

Cross-platform authentication is achieved by emulating the negotiate behavior of native Windows-to-Windows authentication services that use the Kerberos protocol. In order for cross-platform authentication to work, non-Windows servers (in this case, WebLogic Server) must parse SPNEGO tokens in order to extract Kerberos tokens, which are then used for authentication.

This section contains the following subsections:

- Microsoft Client SSO Concepts
- System Requirements
- Configuring Microsoft Clients

28.4.1 Microsoft Client SSO Concepts

Understanding Kerberos

Kerberos is a secure method for authenticating a request for a service in a network. The Kerberos protocol comprises three parties: a client, a server and a trusted third party to mediate between them, known as the KDC (Key Distribution Center). Under Kerberos, a server allows a user to access its service if the user can provide the server a Kerberos ticket that proves its identity. Both the user and the service are required to have keys registered with the KDC.

The diagram below describes the basic exchanges that must take place before a client connects to a server.
SPNEGO (Simple and Protected GSSAPI Negotiation Mechanism) is a GSSAPI "pseudo mechanism" that is used to negotiate one of several possible real mechanisms. SPNEGO is used when a client application wants to authenticate to a remote server, but neither end is sure what authentication protocols the other supports. The pseudo-mechanism uses a protocol to determine what common GSSAPI mechanisms are available, selects one, and then dispatches all further security operations to it. This can help organizations deploy new security mechanisms in a phased manner.

SPNEGO's most visible use is in Microsoft's HTTP Negotiate authentication extension. The negotiable submechanisms include NTLM and Kerberos, both used in Active Directory.

This feature enables a client browser to access a protected resource on WebLogic Server, and to transparently provide the WebLogic Server with authentication information from the Kerberos database using a SPNEGO ticket. The WebLogic Server can recognize the ticket and extract the information from it. WebLogic Server then uses the information for authentication and grants access to the resource if the authenticated user is authorized to access it. (Kerberos is responsible for authentication only; authorization is still handled by WebLogic Server.)
28.4.2 System Requirements

To use SSO with Microsoft clients you need:

A host computer with:

- Windows 2000 or later installed
- Fully-configured Active Directory authentication service. Specific Active Directory requirements include:
  - User accounts for mapping Kerberos services
  - Service Principal Names (SPNs) for those accounts
  - Key tab files created and copied to the start-up directory in the WebLogic Server domain
- WebLogic Server installed and configured properly to authenticate through Kerberos, as described in this section

Client systems with:

- Windows 2000 Professional SP2 or later installed
- One of the following types of clients:
  - A properly configured Internet Explorer browser. Internet Explorer 6.01 or later is supported.
  - .NET Framework 1.1 and a properly configured Web service client.

Note:
Clients must be logged on to a Windows 2000 domain and have Kerberos credentials acquired from the Active Directory server in the domain. Local logins will not work.

28.4.3 Configuring Microsoft Clients

Configuring SSO with Microsoft clients requires configuring the Microsoft Active Directory, the Microsoft client, and the WebLogic Server domain shown in Figure 28-8. For detailed configuration steps and troubleshooting, see Configuring Single Sign-On with Microsoft Clients in Administering Security for Oracle WebLogic Server 12c (12.2.1).
To configure Microsoft clients for SSO:

1. Configure your network domain to use Kerberos.

2. Create a Kerberos identification for WebLogic Server.
   a. Create a user account in the Active Directory for the host on which WebLogic Server is running.
   b. Create a Service Principal Name for this account.
   c. Create a user mapping and keytab file for this account (see Configuring Single Sign-On with Microsoft Clients in Administering Security for Oracle WebLogic Server 12c (12.2.1)).

3. Choose a browser client (Internet Explorer or Mozilla Firefox) and configure it to use Kerberos tokens (see “Enabling the Browser to Return Kerberos Tokens” in Oracle Argus Insight Installation Guide).

4. Set up the WebLogic Server domain (wc_domain in this case) to use Kerberos authentication.
   a. Create a JAAS login file that points to the Active Directory server in the Microsoft domain and the keytab file created in Step 2 (see the "Creating a JAAS Login File in Administering Security for Oracle WebLogic Server 12c (12.2.1)).
   b. Configure a Negotiate Identity Assertion provider in the WebLogic Server security realm (see Configuring the Negotiate Identity Assertion Provider).
   c. Configure the WebLogic Server domain to use the Active Directory Authenticator so that the WebLogic domain uses the same Active Directory of the domain as the identity store. You could also use a different identity store and match the users in this store with the Active Directory users of your domain, but using the Active Directory authenticator is recommended as maintaining two different identity stores risks them getting out of sync (see Configuring an Active Directory Authentication Provider).
5. Add the following system properties to the JAVA_OPTIONS in setDomainEnv.sh for each WebCenter Portal machine, changing the values below for the values of the particular host (on one line):

- `Dnon_sso_protocol=http` (the protocol to access WebCenter Portal directly through the WC_Portal server without going through OHS)
- `Dnon_sso_host=example.com` (the host for the WLS WC_Portal server)
- `Dnon_sso_port=8888` (the port for the WLS WC_Portal server)
- `Dsso_base_url=http://example.com:7777` (the URL for accessing the WC_Portal server through OHS)

The `non_sso` values are the value on the machine for protocol, host, and port. The `sso` values are the value that the user would see when directed through OHS.

6. For WebCenter Portal, configure the web tier OHS so that it forwards requests to the Oracle WebLogic Server for WebCenter Portal, as described in Configuring SSO with Virtual Hosts.

7. Restart the WebLogic Servers (Administration Server and managed servers) using the startup arguments specified in step 5. Repeat steps 4, 5, and 6 for the SOA domain to enable single sign-on for SOA applications.

8. Restart the OHS for the changes to take effect.

9. Configure the discussions server (see Configuring the Discussions Server for SSO).

28.4.3.1 Configuring the Negotiate Identity Assertion Provider

This section provides instructions for creating and configuring a Negotiate Identity Assertion provider. The Negotiate Identity Assertion provider enables single sign-on (SSO) with Microsoft clients. The identity assertion provider decodes Simple and Protected Negotiate (SPNEGO) tokens to obtain Kerberos tokens, validates the Kerberos tokens, and maps them to WebLogic users. The Negotiate Identity Assertion provider uses the Java Generic Security Service (GSS) Application Programming Interface (API) to accept the GSS security context through Kerberos.

To configure the Negotiate Identity Assertion provider:

1. Log in to the WebLogic Server Administration Console.

   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. From the Domain Structure pane, click Security Realms.

   The Summary of Security Realms pane displays.

3. Click your security realm.

   The Settings page for the security realm displays.

4. Open the Providers tab and select the Authentication subtab.

   The Authentication Settings pane displays.
5. Click New.

The Create a New Authentication Provider pane displays.

6. Enter a Name for the identity asserter, and select NegotiateIdentityAsserter as the Type.

7. Click OK.

28.4.3.2 Configuring an Active Directory Authentication Provider

Follow the steps below to configure an Active Directory authentication provider using the WebLogic Administration Console.

To configure an Active Directory Authentication provider:

1. Log in to the WebLogic Server Administration Console.

   For information on logging in to the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. From the Domain Structure pane, click Security Realms.

   The Summary of Security Realms pane displays.

3. Click your security realm.

   The Settings page for the security realm displays.

4. Open the Providers tab and select the Authentication subtab.

   The Authentication Settings pane displays.

5. Click New.

   The Create a New Authentication Provider pane displays.

6. Enter a Name for the authentication provider, and select ActiveDirectoryAuthenticator as the Type.

7. Click OK.

8. Click the authentication provider you just created in the list of providers.

   The Settings page for the provider displays.

9. Open the Configuration tab and the Common subtab.

10. Set the Control Flag to SUFFICIENT and click Save.

    **Note:**

    The Control Flag settings of any other authenticators must also be changed to SUFFICIENT. If there is a pre-existing Default Authenticator that has its Control Flag set to REQUIRED, it must be changed to SUFFICIENT.

11. Open the Provider Specific subtab.

    The Provider Specific Settings pane displays.

12. Complete the fields as shown in the table below. Leave the rest of the fields set to their default values.
Table 28-2  Active Directory Authenticator Settings

<table>
<thead>

</tbody>
</table>

13. Click Save.

14. On the Provider Summary page, reorder the providers in the following order, making sure that their Control Flags are set to SUFFICIENT where applicable:

   a. Negotiate Identity Asserter
   b. ActiveDirectoryAuthenticator (SUFFICIENT)
   c. DefaultAuthenticator (SUFFICIENT)
d. Other authenticators...

28.4.3.3 Configuring WebCenter Portal

Once you have completed the steps for configuring the Negotiate Identity Assertion Provider and Active Directory Authenticator, and all applications on your WebLogic domain are configured for single sign-on with Microsoft clients in the required domain, a final step is required to provide a seamless single-sign-on experience for your users when accessing WebCenter Portal. There are two options for doing this:

- Turn off public access, by logging in to WebCenter Portal as an administrator and removing View access from the Public-User role. When public access is turned off, accessing the URL http://host:port/webcenter takes the user directly to the authenticated view rather than the default public page which has a login section. This is recommended when users are accessing WebCenter Portal only using Internet Explorer, and are confined to the domain where WNA is set up.

- If you must retain public access to WebCenter Portal, then the recommendation is to use the oracle.webcenter.spaces.osso=true flag when starting the WC_Portal server. This flag tells WebCenter Portal that SSO is being used and no login form should be displayed on the default landing page. A Login link is displayed instead that the user can click to invoke the SSO authentication where the user will be automatically logged in. If Firefox is used to access WebCenter Portal within the Windows network configured for WNA, or any browser is used to access WebCenter Portal from outside the Windows network domain, users see the login page after clicking the Login link.

28.4.3.4 Configuring the Discussions Server for SSO

This section describes how to configure the discussions server for single sign-on. Before configuring the discussions server for SSO, ensure that it has been configured to use the same identity store LDAP as WebCenter Portal, as described in Migrating the Discussions Server to Use an External LDAP.

To set up the discussions server for SSO:

1. Log in to the Oracle WebCenter Portal’s Discussion Server Server Admin Console at:

   http://host:port/owc_discussions/admin

   Where host and port are the host ID and port number of the WC_Collaboration managed server.

2. Open the System Properties page and edit (if it already exists) or add the owc_discussions.sso.mode property, setting its value to true.

28.5 Configuring SSO with Virtual Hosts

This section describes the OHS configuration required for an environment containing applications that use "/" as the context root, and the additional configuration required in OHS when single sign-on is involved.

This section contains the following subsections:

- Understanding the Need for a Virtual Host
- Configuring Virtual Hosts for OAM 11g
28.5.1 Understanding the Need for a Virtual Host

The term virtual host refers to the practice of running more than one web site (such as www.company1.com and www.company2.com) on a single machine. Virtual hosts can be IP-based, meaning that you have a different IP address for each web site, or name-based, meaning that you have multiple names running on each IP address. The fact that they are running on the same physical server is not apparent to the end user. For more information about virtual hosts, refer to your Apache documentation.

28.5.2 Configuring Virtual Hosts for OAM 11g

To configure OAM 11g for virtual hosts requires bypassing single sign-on for applications that only support BASIC authorization or do not require single sign-on.

Prior to completing these steps you should already have completed the steps for configuring OAM 11g in Configuring Oracle Access Manager.

Follow the steps below to configure virtual hosts for OAM 11g.

1. Locate and comment out the following configuration in webgate.conf:

```
#Comment out this and move to VirtualHost configuration
#<LocationMatch "/*">
#AuthType Oblix
#require valid-user
#</LocationMatch>
```

This entry causes the WebGate to intercept all requests and process it.

2. Move this entry into the virtual host configuration in httpd.conf where single sign-on is required. as shown in the example below:

```xml
<VirtualHost *:7777>
  ServerName webtier.example.com
  <LocationMatch "/*">
    AuthType Oblix
    require valid-user
  </LocationMatch>
</VirtualHost>

<VirtualHost *:7777>
  ServerName webtier-spaces.example.com
  <Location>
    SetHandler weblogic-handler
    WebLogicHost webcenter.example.com
    WebLogicPort 8888
  </Location>
  <Location /webcenter>
    Deny from all
  </Location>
  <Location /webcenterhelp>
    Deny from all
  </Location>
  <Location /rest>
    Deny from all
  </Location>
</VirtualHost>
```
The idea is to provide a single sign-on experience for the default virtual host (webtier.example.com), but not for the WebCenter Portal virtual host (webtier-spaces.example.com) as some applications do not support it.

3. Restart OHS. Also be sure to update the DNS with entries for webtier-spaces.example.com.

---

**Note:**

In the webtier-spaces.example.com virtual host that bypasses single sign-on, only some applications need to bypass single sign-on. For other applications like WebCenter Portal, however, we need single sign-on so we deny access to these applications from this virtual host.
This chapter describes how to secure Oracle WebCenter Portal and components with SSL.

This chapter includes the following topics:

- Securing the Browser Connection to WebCenter Portal using SSL
- Securing the Connection from Oracle HTTP Server to WebCenter Portal with SSL
- Securing the Browser Connection to Discussions with SSL
- Securing the WebCenter Portal Connection to Portlet Producers with SSL
- Securing the WebCenter Portal Connection to the LDAP Identity Store
- Securing the WebCenter Portal Connection to Content Server with SSL
- Securing the WebCenter Portal Connection to IMAP and SMTP with SSL
- Securing the Connection to Oracle SES with SSL
- Securing the WebCenter Portal Connection to an External BPEL Server with SSL

**Note:**

The following can use WS-Security with message protection, and consequently have no hard requirement for SSL:

- BPEL servers - Oracle BPM Worklist
- WSRP Producers
- Discussions and announcements

**Permissions:**

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also Understanding Administrative Operations, Roles, and Tools.

### 29.1 Securing the Browser Connection to WebCenter Portal using SSL
This section presents an overview of how to configure the Oracle Platform Security Services (OPSS) Keystore Service for use with WebCenter Portal. It is possible to use Fusion Middleware Control as well for this, but the scope of this document is restricted to usage of WLST.

**Note:**
The default Java Keystore Service (JKS) has been replaced with the Oracle Platform Security Services (OPSS) Keystore Service. Use WC_Portal as the server and OPSS as the keystore service.

For detailed information and step-by-step instructions to configure SSL in the WebLogic Server environment, see Managing Keys and Certificates with the Keystore Service in Securing Applications with Oracle Platform Security Services.

The OPSS Keystore Service provides an alternate mechanism to manage keys and certificates for message security. The OPSS Keystore Service makes using certificates and keys easier by providing central management and storage of keys and certificates for all servers in a domain. You use the OPSS Keystore Service to create and maintain keystores of type KSS.

Securing the browser connection to WebCenter Portal with SSL consists of the following steps:

- Creating the Custom Keystore
- Configuring the Custom Identity and Custom Trust Keystores
- Configuring the SSL Connection

**Note:**
An overview of the configuration process is described in this section. For detailed information and step-by-step instructions, see Configuring SSL with Keystore Service in Securing Applications with Oracle Platform Security Services.

### 29.1.1 Creating the Custom Keystore

The first step is to generate a custom keystore for WebCenter Portal.

To configure the Keystore Service:

1. Connect to WebLogic Server using the WLST console:
   ```
   connect('username','password','hostname:port')
   ```
2. Get the OPSS Service reference name.
   ```
   svc = getOpssService(name='KeyStoreService')
   ```
3. Create a new keystore:
   ```
   Note: Create a keystore in the system stripe and the permission must be set to false.
   ```
Enter the following command:

```java
svc.createKeyStore(appStripe='system', name='webcenter_wls', password='password', permission=false)
```

where:
- `svc` = the service command object obtained through a call to `getOpssService()`
- `appStripe` = the name of the stripe in which the keystore is created
- `name` = the name of the keystore
- `password` = password of the keystore
- `permission` = false if protected by both permission and password (true if keystore is protected by permission only)

4. Generate key pair.

Use your actual alias, domain name, and credentials. The following example also uses a default CA signed certificate.

```java
svc.generateKeyPair(appStripe='system', name='webcenter_wls', password='password', dn='cn=webcenteridentity,dc=example,dc=com', keysize='2048', alias='webcenter_wls', keypassword='password')
```

where:
- `svc` = the service command object obtained through a call to `getOpssService()`
- `appStripe` = the name of the stripe containing the keystore
- `name` = the name of the keystore where the key pair is generated
- `password` = password of the keystore
- `dn` = the distinguished name of the certificate wrapping the key pair
- `keysize` = the key size
- `alias` = the alias of the key pair entry
- `keypassword` = the key password

5. (Optional) List the keystores and aliases inside the keystore, using the following command:

```java
svc.listKeyStores(appStripe='*')
```

This will list the `system/webcenter_wls`.

where:
- `svc` = the service command object obtained through a call to `getOpssService()`
- `appStripe` = the name of the stripe whose keystores are listed

Enter:
svc.listKeyStoreAliases(appStripe="system", name="webcenter_wls", password="password", type="*")

This will list the alias webcenter_wls.

where:

- `svc` = the service command object obtained through a call to `getOpssService()`
- `appStripe` = the name of the stripe containing the keystore
- `name` = the name of the keystore
- `password` = password of the keystore
- `type` = the type of entry for which aliases are listed. Valid values are 'Certificate', 'TrustedCertificate', 'SecretKey' or '*'

6. Run the `syncKeyStores` command:

```
syncKeyStores(appStripe='system', keystoreFormat='KSS')
```

7. Restart the WC_Portal managed server.

### 29.1.2 Configuring the Custom Identity and Custom Trust Keystores

For an overview of on how to configure the Identity and Trust keystores, see Configuring the OPSS Keystore Service for Custom Identity and Trust: Main Steps in Administering Security for Oracle WebLogic Server 12c (12.2.1).

The next step is to configure the Custom Identity and Custom Trust keystores on the WebCenter Portal server.

To configure the identity and trust keystores:

1. Log in to the WebLogic Server Administration Console.
   
   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. Click the WebCenter Portal server (WC_Portal) to configure the identity and trust keystores.

   The Settings pane for the WebCenter Portal server opens.

3. Open the Configuration tab, and then the Keystores subtab.

   The Keystores pane opens.

4. Click Change.

5. For Keystores, select Custom Identity and Custom Trust and click Save.

6. Under Identity, enter the path and filename of the Custom Identity Keystore you created in Securing the Browser Connection to WebCenter Portal using SSL.

   If you use the example in Securing the Browser Connection to WebCenter Portal using SSL, enter `kss://system/webcenter_wls`

   where
• alias = system
• keystore_alias_name = webcenter_wls

7. Enter KSS as the Custom Identity Keystore Type.
8. Enter and confirm the Custom Identity Keystore password.
10. For Custom Trust Keystore Type, enter KSS, then click Save to save your entries.
11. Open the SSL tab.
12. Enter the Private Key Alias (for example, webcenter_wls) and the Private Key Passphrase (for example, welcome1), then click Save to save your entries.

29.1.3 Configuring the SSL Connection

For an overview to configure the SSL connection, see Specifying a Client Certificate for an Outbound Two-Way SSL Connection in Administering Security for Oracle WebLogic Server 12c (12.2.1).

To configure the SSL Connection:

1. On the Settings pane for the WebCenter Portal server, open the Configuration tab and then the General subtab.
   
   The General Configuration pane displays.

2. Check SSL Listen Port Enabled.

3. Enter an SSL Listen Port number and click Save.

4. On the Configuration tab, open the SSL subtab, and then expand the Advanced options at the bottom of the page.

   The SSL advanced options are displayed.

5. Set the Two Way Client Cert Behavior option to Client Certs Not Requested and click Save.

6. Open the Control tab on the Settings pane, and select the Start/Stop subtab.

7. Click Restart SSL.

8. Restart the WebLogic Server and open the SSL WebCenter Portal URL.

   For a development or test environment only (that is, not for a production environment), if the hostname in the certificate does not match the host name, then the server must be started with the following command:

   -Dweblogic.security.SSL.ignoreHostnameVerification=true

9. Accept the certificate for the session and log in.
29.2 Securing the Connection from Oracle HTTP Server to WebCenter Portal with SSL

Securing the connection between the Oracle HTTP Server (OHS) and WebCenter Portal is described in the following sections:

- Configuring the Custom Identity and Custom Trust Keystores
- Configuring the SSL Connection
- Wiring the WebCenter Portal Ports to the HTTP Server
- Configuring the SSL Certificates

29.2.1 Wiring the WebCenter Portal Ports to the HTTP Server

To wire the WebCenter Portal ports to the HTTP server:

1. Install and configure OHS 12c (see Installing the Oracle HTTP Server Software in Installing and Configuring Oracle HTTP Server).
   
   By default, it comes configured with the SSL port.

2. Open the file `DOMAIN_HOME/config/fmwconfig/components/OHS/instances/ohs1/mod_wl_ohs.conf`

3. Add the WebCenter URL to `mod_wl_ohs.conf` to make WebCenter Portal work with OHS:

   ```
   <Location/webcenter>
   SetHandler weblogic-handler
   WebLogicHost host_id
   WebLogicPort port
   </Location>
   
   Replacing `host_id` and `port` with the WebLogic server ID and port number.
   ```

   **Note:** When using `mod_wl_ohs`, you need to complete the prerequisites mentioned in Preparing for Configuring the Oracle WebLogic Server Proxy Plug-In in Using Oracle WebLogic Server Proxy Plug-Ins 12.2.1.

4. Start the node manager:

   ```
   DOMAIN_HOME/bin/startNodeManager.sh &
   
   See Starting the Node Manager in Installing and Configuring Oracle HTTP Server.
   ```

5. Restart the OHS server:

   ```
   DOMAIN_HOME/bin/stopComponent.sh ohs1 &
   DOMAIN_HOME/bin/startComponent.sh ohs1
   ```

6. Verify if the following URLs are working:

   ```
   http://OHS_12c_installation_host:port
   http://OHS_12c_installation_host:OHS_12c_installation_port/webcenter
   ```
7. Configure the WebCenter SSL port with the OHS SSL:
   a. Verify that the OHS SSL port is working by checking the following URL.
      
      https://ohs_ssl_host:ohs_ssl_port
   b. To configure the WebCenter SSL port, open the file OHS ssl.conf file
      
      (DOMAIN_HOME/config/fmwconfig/components/OHS/instances/ohs1/ssl.conf.
   c. Add the following entry (WebCenter SSL host and port) to ssl.conf to make
      WebCenter Portal run on the OHS SSL port:

      Note: This snippet needs to be inserted just before the </VirtualHost> tag,
      that is, where the virtual host tag ends.

      <Location /webcenter>
      SetHandler weblogic-handler
      WebLogicHost host_id
      WebLogicPort port
      SecureProxy ON
      WlSSLWallet /filepath/ohs12c/user_projects/domains/base_domain/config/
      fmwconfig/components/OHS/instances/ohs1/keystores/default
      </Location>

8. Restart OHS.

29.2.2 Configuring the SSL Certificates

For OHS to trust WebCenter Portal’s certificate, the WC_Portal certificate must be
imported into the OHS trust store.

To configure the SSL certificates:

1. Export the WC_Portal certificate from the WC_Portal identity keystore, using the
   following WLST:

   svc = getOpssService(name='KeyStoreService')
   svc.exportKeyStoreCertificate(appStripe='system', name='webcenter_wls',
   password='password', alias='webcenter_wls', type='TrustedCertificate', filepath='/
   filepath/certificate/webcenter.cer')

   where:
   
   • svc = the service command object obtained through a call to
     getOpssService()
   • appStripe = the name of the stripe containing the keystore
   • name = the name of the keystore
   • password = password of the keystore
   • type = the type of entry for which aliases are listed. Valid values are
     'Certificate', 'TrustedCertificate', or 'CertificateChain'
   • filepath = absolute path of the file where certificate, trusted certificate or
certificate chain is exported
2. Import this certificate into the wallet on the OHS side.

Navigate to /domain_home/config/fmwconfig/components/OHS/instances/ohs1/keystores/default and run the following orapki command (typically located in IDM_HOME):

setenv JAVA_HOME /Java_install_location/jdk1.8.0_40/
/OHS_install_location/oracle_common/bin/orapki wallet add -wallet . -trusted_cert -cert <webcenter_wls.cer location> -auto_login_only

3. For WebCenter Portal to trust OHS certificates, export the user certificate from OHS wallet and import it as a trusted certificate in the WebLogic trust store.

/OHS_install_location/oracle_common/bin/orapki wallet display -wallet . 
/OHS_install_location/oracle_common/bin/orapki wallet export -wallet . -cert cert.txt -dn 'dn_value'

Where, dn_value refers to the output returned by the wallet display -wallet command.

4. Import the OHS certificate into the WC_Portal managed server trust store:

keytool -importcert -alias ohs_cert -file wls_java_home/jre/lib/security/cacerts

Where, wls_java_home refers to the WebLogic Java home directory, and keytool is installed in wls_java_home/jre/bin/keytool. For finding out the wlsJavaHome path, you can run domain_home/bin/setDomainEnv.sh (on UNIX) or domain_home\bin\setDomainEnv.cmd (on Windows).

5. In WebCenter, log in to the WebLogic Console and check if the WebLogic Plugin checkbox is enabled:

   a. Log in to the WebLogic Console.
   b. Click the domain name on the left hand navigation.
   c. Click the Web Applications tab.
   d. Select the option WebLogic Plugin Enabled, then click Save.

You should now be able to access the SSL OHS URL (https://<ohs ssl host>:<ohs ssl port>/webcenter).

7. After accessing the URL, accept the certificate.

### 29.3 Securing the Browser Connection to Discussions with SSL

Securing the browser connection to discussions with SSL is described in the following sections:

- Creating the Custom Keystore for Discussions
- Configuring the Identity and Trust Keystore for Discussions
- Configuring and Securing the SSL Connection for Discussions

#### 29.3.1 Creating the Custom Keystore for Discussions
The first step in securing the connection to Discussions is to generate a custom keystore as shown below:

1. Connect to WebLogic Server using the WLST console:
   
   ```
   connect('weblogic','password','host:port')
   ```

2. Get OPSS service reference:
   
   ```
   svc = getOpssService(name='KeyStoreService')
   ```

3. Create a new keystore:

   ```
   Note: Create the keystore in the system stripe and the permission must be set to false
   ```

   ```
   svc.createKeyStore(appStripe='system', name='collab_wls', password='password', permission=false)
   ```

   where:
   - `svc` = the service command object obtained through a call to `getOpssService()`
   - `appStripe` = the name of the stripe in which the keystore is created
   - `name` = the name of the keystore
   - `password` = password of the keystore
   - `permission` = true if keystore is protected by permission only; false if protected by both permission and password

4. Using keytool, generate a key pair:

   ```
   svc.generateKeyPair(appStripe='system', name='collab_wls', password='password',
   dn='cn=collabidentity,dc=example,dc=com', keysize='2048', alias='collab_wls',
   keypassword='welcome1')
   ```

   where:
   - `svc` = the service command object obtained through a call to `getOpssService()`
   - `appStripe` = the name of the stripe containing the keystore
   - `name` = the name of the keystore where the key pair is generated
   - `password` = password of the keystore
   - `dn` = the distinguished name of the certificate wrapping the key pair
   - `keysize` = the key size
   - `alias` = the alias of the key pair entry
   - `keypassword` = the key password

5. Optionally, list the keystores and aliases inside the keystore:

   ```
   svc.listKeyStores(appStripe='*')
   ```
This will list the system/collab_wls.

where:

- **svc** = the service command object obtained through a call to getOpssService()
- **appStripe** = the name of the stripe whose keystores are listed

Enter:

```
svc.listKeyStoreAliases(appStripe="system",name="collab_wls",
password="password", type="*")
```

This will list the alias collab_wls

where:

- **svc** = the service command object obtained through a call to getOpssService()
- **appStripe** = the name of the stripe containing the keystore
- **name** = the name of the keystore
- **password** = password of the keystore
- **type** = the type of entry for which aliases are listed. Valid values are 'Certificate', 'TrustedCertificate', 'SecretKey' or '*'

6. Run `syncKeyStores`:

```
syncKeyStores(appStripe='system', keystoreFormat='KSS')
```

### 29.3.2 Configuring the Identity and Trust Keystore for Discussions

The next step is to configure the Custom Identity and Custom Trust keystores on the WebCenter Collaboration server.

To configure the identity and trust keystores for discussions:

1. Log in to the WebLogic Server Administration Console.

   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, expand Environment and click Servers.

   The Summary of Servers pane displays.

3. Click the WebCenter Collaboration server (WC_Collaboration) to configure the identity and trust keystores.

   The Settings pane for the Collaboration server displays.

4. Open the Configuration tab, and then the Keystores subtab.

   The Keystores pane displays.

5. Click Change.

6. For Keystores, select Custom Identity and Custom Trust, then click Save.
7. Under **Identity**, enter the path and filename of the Custom Identity Keystore you created in `kss://system/collab_wls` *(Creating the Custom Keystore for Discussions).*

8. Enter **KSS** as the **Custom Identity Keystore Type**.

9. Enter and confirm your custom identity keystore password, (for example, welcome1).

10. Under **Trust**, set the **Custom Trust Keystore** to `kss://system/trust` and click **Save**.

11. Enter **KSS** as the **Custom Trust Keystore Type**, and enter and confirm your custom trust keystore password, then click **Save**.

12. From the WLS Administration console, go to **Servers -> WC_Collaboration** and open the Configuration tab, and then the **SSL** subtab.

13. Enter the private key alias (for example, `collab_wls`), and set the private key password (for example, welcome1).

14. Click **Save** to have your entries.

15. On the Settings pane for the WebCenter Collaboration server (WC_Collaboration), open the Configuration tab and then the General subtab.

   The General Configuration pane opens.

16. Check **SSL Listen Port Enabled**.

17. Enter an **SSL Listen Port** number and click **Save**.

18. On the **Configuration** tab, open the **SSL** subtab, and then expand the Advanced options at the bottom of the page.

19. Check that the **Two Way Client Cert Behavior** option is set to **Client Certs Not Requested** and click **Save**.

20. Open the Control tab.

   The Control Settings pane opens.

21. Click **Restart SSL**.

### 29.3.3 Configuring and Securing the SSL Connection for Discussions

To configure the SSL connection for Discussions:

1. Restart the WebCenter Collaboration server (WC_Collaboration) server and open the SSL collaboration URL: `https://host:port/owc_discussions`.

   The certificate should be generated when you access the URL, and stored in your browser.

2. Download and store the certificate in .PEM or .CRT format.

3. Import the certificate into **cacerts** in `JDK_HOME`, using the following command:
keytool -importcert -alias collab_cert -file /filepath/sslcertificate/collabcert.crt -keystore../oracle_common/jdk/jre/lib/security/cacerts

4. Enter the password changeit when asked, then enter YES.

5. Register the https://jive URL in Oracle Enterprise Manager for Announcements and Discussions.

6. Restart the WC_Portal managed server.

7. Test announcements and discussions.

29.4 Securing the WebCenter Portal Connection to Portlet Producers with SSL

Securing the connection to WSRP with SSL is described in the following sections:

• Creating the Custom Keystores for Portlet Producers
• Configuring the Identity and Trust Keystores for Portlet Producers
• Configuring the SSL Connection for Portlet Producers
• Registering the SSL-enabled WSRP Producer and Running the Portlets

29.4.1 Creating the Custom Keystores for Portlet Producers

The following steps are required to configure WebCenter Portlet with SSL using the KSS keystore.

1. Connect to WebLogic Server using the WLST console:
   ```java
   connect('weblogic', 'password', 'host:port')
   ```

2. Get the OPSS service reference:
   ```java
   svc = getOpssService(name='KeyStoreService')
   ```

3. Create a new keystore:
   ```java
   svc.createKeyStore(appStripe='system', name='portlet_wls', password='password', permission=false)
   ```

   where:
   - `svc` = the service command object obtained through a call to `getOpssService()`
   - `appStripe` = the name of the stripe in which the keystore is created
   - `name` = the name of the keystore
   - `password` = password of the keystore
permission = false if protected by both permission and password (true if keystore is protected by permission only)

4. Generate keypair:

```
svc.generateKeyPair(appStripe="system", name="portlet_wls", password="password", dn="cn=customidentity,dc=example,dc=com", keysize='2048', alias='portlet_wls', keypassword='password')
```

where:

- svc = the service command object obtained through a call to `getOpssService()`
- appStripe = the name of the stripe containing the keystore
- name = the name of the keystore where the key pair is generated
- password = password of the keystore
- dn = the distinguished name of the certificate wrapping the key pair
- keysize = the key size
- alias = the alias of the key pair entry
- keypassword = the key password

5. Optionally, list the keystores and aliases inside the keystore.

This will list the system/portlet_wls:

```
svc.listKeyStores(appStripe='system')
```

- svc = the service command object obtained through a call to `getOpssService()`
- appStripe = the name of the stripe whose keystores are listed

This will list the alias portlet_wls:

```
svc.listKeyStoreAliases(appStripe="system", name="portlet_wls", password="password", type="*"
```

- svc = the service command object obtained through a call to `getOpssService()`
- appStripe = the name of the stripe containing the keystore
- name = the name of the keystore
- password = password of the keystore
- type = the type of entry for which aliases are listed. Valid values are 'Certificate', 'TrustedCertificate', 'SecretKey' or '*'

6. Run `syncKeyStores`:

```
syncKeyStores(appStripe='system', keystoreFormat='KSS')
```

### 29.4.2 Configuring the Identity and Trust Keystores for Portlet Producers
The next step is to configure the Custom Identity and Trust Keystores for the WebCenter Portlet server (for example, WC_Portlet).

For an overview of how to configure the Identity and Trust keystores, see Securing the Browser Connection to WebCenter Portal using SSL.

To configure the identity and trust keystores for the Portlet server:

1. Log in to the WebLogic Server Administration Console.
   For information on logging into the WebLogic Server Administration Console, see Oracle WebLogic Server Administration Console.

2. In the Domain Structure pane, expand Environment and click Servers.
   The Summary of Servers pane displays.

3. Click the WebCenter Portlet server (for example, WC_Portlet) to configure the identity and trust keystores.
   The Settings pane for the Portlet server displays.

4. Open the Configuration tab, and then the Keystores subtab.
   The Keystores pane displays.

5. Click Change.

6. For Keystores, select Custom Identity and Custom Trust, and click Save

7. Under Identity, enter the path and filename of the Custom Identity Keystore you created in kss://system/portlet_wls (Creating the Custom Keystores for Portlet Producers).

8. Enter KSS as the Custom Identity Keystore Type.

9. Enter and confirm your custom identity keystore password, (for example, welcome1).

10. Under Trust, set the Custom Trust Keystore to kss://system/trust and click Save.

11. Enter KSS as the Custom Trust Keystore Type, and enter and confirm your custom trust keystore password, then click Save.

12. Open the SSL tab.

13. Enter the private key alias (for example, portlet_wls), and set the private key password (for example, welcome1).

14. Click Save to save your entries.

---

**Note:**

For the Pagelet Producer, Custom Identity and Java Standard Trust keystore type should be used for SSL configuration. For more info on how to configure Java standard keystore (JKS), see Configuring Keystores in Administering Security for Oracle WebLogic Server 12c (12.2.1).
29.4.3 Configuring the SSL Connection for Portlet Producers

To configure SSL, see Overview of Configuring SSL in WebLogic server in Administering Security for Oracle WebLogic Server 12c (12.2.1) guide.

To configure the SSL connection for Portlet Server:

1. On the Settings pane for the WebCenter Portlet server (WC_Portlet), open the Configuration tab and then the General subtab.

2. Select SSL Listen Port Enabled.

3. Enter an SSL listen port number.

4. Click Save.

5. Select Configuration > SSL, and then open the Advanced options at the bottom of the page.

6. Check that the Two Way Client Cert Behavior option is set to Client Certs Not Requested.

7. Click Save.

8. Open the Control tab.

   The Control Settings pane opens.

9. Click Restart SSL.

10. Restart the Portlet Server (WC_Portlet) and open the SSL WSRP Portlet URL:
    https://host:port/<context-root>/portlets/wsrp2?WSDL.

11. Accept the certificate for the session and WSDL will get loaded.

29.4.4 Registering the SSL-enabled WSRP Producer and Running the Portlets

Configure the WC_Portal managed server to register portlets with WebCenter Portal. This also uses the certificates in JAVA_HOME trust store (/jdk/jre/lib/security/cacerts).

To register the SSL-enabled WSRP producer and run the portlets:

1. When you accessed the SSL WSRP Portlet URL (https://host:port/<context-root>/portlets/wsrp2?WSDL), the certificate was generated and stored in your browser.

2. Download the certificate and save it in .PEM or .crt format.

   Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server der2pem tool to convert to PEM format. For more information about using the der2pem tool, see der2pem in Command Reference for Oracle WebLogic Server.

3. Import the certificate into the cacerts file in the /jdk/jre/lib/security using the following keytool command:

   keytool -importcert -alias portlet_cert -file portlet_pem -keystore cacerts
Where:

- `portlet_cert` is the portlet certificate alias
- `portlet_pem` is the portlet certificate file (for example, `portlet_cert.pem`)

4. Restart `WC_Portal`.

5. Register the SSL enabled portlet URL — Run the `registerWSRPProducer` WLST command to register the producer:

   ```
   registerWSRPProducer('webcenter', 'sslwsrpprod', 'producer_wsdl')
   ```

   Where:

   - `sslwsrpprod` is the name of the SSL-enabled WSRP producer
   - `producer_wsdl` is the WSDL URL of the SSL-enabled WSRP producer

   For example:

   ```
   registerWSRPProducer('webcenter', 'sslwsrpprod', 'https://example.com:7004/richtextportlet/portlets/wwsrp2?WSDL')
   ```

6. Navigate to the HTTP or HTTPS WebCenter Portal URL.

7. Create a page and go to the Portlets link.

8. Go to the registered WSRP producer.

9. Add the portlet to the page.

10. Go to the view mode of the page and check that the WSRP portlet renders correctly.

### 29.5 Securing the WebCenter Portal Connection to the LDAP Identity Store

To configure the LDAP server port for SSL, refer to the appropriate administration documentation for the LDAP server. For Oracle Internet Directory (OID), an SSL port is installed by default. To use this port for LDAP communication from WebCenter Portal, the identity store should be configured for authentication with the appropriate authenticator. See Configuring the Identity Store for the steps to do this for the identity store.

If the CA is unknown to the Oracle WebLogic server, complete this additional step described in the following subsection:

- Exporting the OID Certificate Authority (CA)

### 29.5.1 Exporting the OID Certificate Authority (CA)

Secure the WebCenter Portal connection to OID in the following way:

1. Enable SSL in OID (note that OID needs to be configured in `server auth` mode)

   a. Create an Oracle wallet:

   ```
   <OID_INSTALL_LOC>/oracle_common/bin/orapki wallet create -wallet wal -auto_login
   ```
b. Configure the SSL parameters:

```bash
ldapmodify -h OID_host -p OID_port -D cn=OID_admin -w password
  dn:cn=oid1,cn=osidldapd,cn=subconfigsubentry
  changetype: modify
  replace: orclsslauthenticaion
  orclsslauthenticaion: 32
  -
  replace: orclsslwalleturl
  orclsslwalleturl: file://OID_install_LOC/wal
```

where

- `OID_install_LOC/wal` = location where the wallet is created in step 1 (create a new directory or use the existing one)
- `cn` = DN of the OID user having `ldapmodify` permissions
- `password` = OID password

c. Restart the OID server.

2. Export the OID certificate

```bash
<OID_INSTALL_LOC>/oracle_common/bin/orapki wallet export -wallet /OID_install_LOC/wal -dn "cn=any_alias" -cert oid_trust.cer
```

- `OID_install_LOC/wal` = location where the wallet is created in step 1 (create a new directory or use the existing one)

3. Import the OID certificate into the WebLogic Server Trust Store:

```bash
keytool -importcert -v -trustcacerts -alias oid_server_trust -file oid_trust.cer
  -keystore cacerts -storepass changeit
```

cacerts path can be retrieved as follows:

a. Log in to the WebCenter WebLogic console, navigate to Servers and click WC_Portal server.

b. Click Configurations, then click the Keystores subtab.

c. Select Keystore Types as Demo Identity and Demo Trust.

d. Check the path mentioned in the Java Standard Trust Keystore — this will be your cacert path.

---

**Note:** If you have configured your instance to use Custom Identity and Custom Trust, revert the changes made above as they were done for retrieving the cacert path only.

4. Restart all servers.

5. Configure OID with WLS: Use OID SSL host and port and select the option SSL Enabled
6. Restart the WLS server and the managed servers.

7. Access WebCenter and log in using the OID user name. You should be able to login.

29.6 Securing the WebCenter Portal Connection to Content Server with SSL

If Content Server and the WebCenter Portal application in which you intend to create a repository connection are not on the same system or the same trusted private network, then identity propagation is not secure. To ensure secure identity propagation you must also configure SSL on Content Server.

Securing Content Server with SSL involves the following tasks:

- Configuring a Keystore and Key on the WebCenter Portal (Client) Side
- Configuring a Keystore and Key on the Content Server Side
- Verifying Signatures of Trusted Clients
- Securing Identity Propagation

In a production environment, Oracle recommends that you use only real certificates. For information about how to configure keystores when using real certificates, see Understanding Content Server Security Providers in Administering Oracle WebCenter Content.

29.6.1 Configuring a Keystore and Key on the WebCenter Portal (Client) Side

For an overview of on how to configure the Identity and Trust keystores, see Securing the Browser Connection to WebCenter Portal using SSL. For detailed information and step-by-step instructions, see Securing the Connection to WebCenter Portal using SSL in Administering Security for Oracle WebLogic Server 12c (12.2.1) guide.

To configure a keystore on the (client) side:

1. Go to the location, for example jdk/bin, where the keytool is located, and open the command prompt.

2. Generate the client keystore by running the following keytool command:

   ```
   svc.generateKeyStore(appStripe='©stripe1©', name='©keystore1©', password='©password©', alias=Client private key alias dn='©cn=client')
   ```

3. To verify that the keys have been correctly created, you can optionally run the following keytool command:

   ```
   svc.listKeyStoreAliases(appStripe='stripe1', name='keystore1', password='©©', type='*')
   ```

   This should list the alias Client private key alias
4. To use the key, sign it by running the following keytool command:

5. Export the client public key by running the following keytool command:

```
exportKeyStore(appStripe='stripe1', name='keystore',
password='password', alias='Client private key alias', keypassword='keypass1',
filepath='client.pubkey')
```

29.6.2 Configuring a Keystore and Key on the Content Server Side

For an overview of how to configure the Identity and Trust keystores, see Securing the Browser Connection to WebCenter Portal using SSL. For detailed information and step-by-step instructions, see Securing the Connection to WebCenter Portal using SSL in Administering Security for Oracle WebLogic Server 12c (12.2.1) guide.

To configure a keystore on the Content Server side:

1. Go to the location, for example jdk/bin, where the keytool is located, and open the command prompt.

2. Generate the server keystore by running the following keytool command:

```
svc.generateKeyPair(appStripe='stripe1', name='keystore', password='password',
dn='cn=server', keysize='2048', alias='Server public key alias',
keypassword='keypass1')
```

3. To verify that the key has been correctly created, run the following keytool command:

```
svc.listKeyStoreAliases(appStripe="stripe1",name="keystore",
password='',
type='*')
```

This should list the alias `Server private key alias`

4. To use the key, sign it by running the following keytool command:

5. Export the server public key to the server keystore by running the following keytool command:

```
svc.exportKeyStore(appStripe='stripe1', name='keystore1', password='password',
alias='Server public key alias', keypassword='keypass1',
type='TrustedCertificate', filepath='server.pubkey')
```

29.6.3 Verifying Signatures of Trusted Clients

To verify signatures of trusted clients, import the client public key into the server keystore:

1. Go to the location, where the keytool is located, and open the command prompt.

2. To verify the signature of trusted clients, import the client’s public key in to the server keystore by running the following keytool command:

```
importKeyStore(appStripe='stripe1', name='keystore1', password='password',
aliases='Client public key alias', keypasswords='keypass1',
type='TrustedCertificate', filepath='client.pubkey')
```

3. Import the server public key into the client keystore by running the following keytool command:
importKeyStore(appStripe='stripe1', name='keystore1', password='password',
aliases='Server public key alias', keypasswords='keypass1',
type='TrustedCertificate', filepath='server.pubkey')

When the tool prompts you if the key is self-certified, you must enter Yes. The following shows a sample output that is generated after this procedure is completed successfully.

**Sample Output Generated by the Keytool**

```
[user@server]$ keytool -import -alias client -file client.pubkey
-keystore server-keystore.jks -keypass Server private key password -storepass
Keystore password
Owner: CN=client
Issuer: CN=client
Serial number: serial number, for example, 123a19cb
Valid from: Date, Year, and Time until: Date, Year, and Time
Certificate fingerprints:
...
Trust this certificate? [no]: yes
Certificate was added to keystore.
```

### 29.6.4 Securing Identity Propagation

To secure identity propagation, you must configure SSL on Content Server.

1. Log on to Content Server as an administrator.
2. From Administration, select Providers.
3. On the Create a New Provider page, click Add for sslincoming.
4. On the Add Incoming Provider page, in **Provider Name**, enter a name for the provider, for example, sslincomingprovider.
   
   When the new provider is set up, a directory with the provider name is created as a subdirectory of the `CONTENT_SERVER_HOME/data/providers` directory.

5. In **Provider Description**, briefly describe the provider, for example, SSL Incoming Provider for securing the Content Server.

6. In **Provider Class**, enter the class of the sslincoming provider, for example, `idc.provider.ssl.SSLSocketIncomingProvider`.

   **Note:**
   
   You can add a new SSL keepalive incoming socket provider or a new SSL incoming socket provider. Using a keepalive socket improves the performance of a session and is recommended for most implementations.

7. In **Connection Class**, enter the class of the connection, for example, `idc.provider.KeepaliveSocketIncomingConnection`.

8. In **Server Thread Class**, enter the class of the server thread, for example, `idc.server.KeepaliveIdcServerThread`.

9. In **Server Port**, enter an open server port, for example, 5555.
10. Select the **Require Client Authentication** checkbox.

11. In **Keystore password**, enter the password to access the keystore.

12. In **Alias**, enter the alias of the keystore.

13. In **Alias password**, enter the password of the alias.

14. In **Truststore password**, enter the password of the trust store.

15. Click **Add**.

   The new incoming provider is now added.

16. Go to the new provider directory that was created in step 4.

17. To specify the trust store and keystore, create a file named `sslconfig.hda`.

18. Copy the server keystore to the server.

19. Configure the `sslconfig.hda` file. The following shows how the `.hda` file should look after you include the trust store and keystore information.

   **Sample sslconfig.hda File**

   ```properties
   @Properties LocalData
   TruststoreFile=/tmp/ssl/server_keystore
   KeystoreFile=/tmp/ssl/server_keystore
   @end
   ```

**29.7 Securing the WebCenter Portal Connection to IMAP and SMTP with SSL**

Before reconfiguring the mail server connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store and configure WebCenter Portal to use the trust store.

To secure the WebCenter Portal connection to IMAP and SMTP with SSL:

1. Open a browser and connect to your IMAP server with the following command:

   ```
   https://imapserver:ssl_port
   ```

   For example:

   ```
   https://mailserver.example:993
   ```

2. Place your cursor on the page, right-click, and select **Properties**.

3. Click **Certificate**.

4. In the popup window, click the **Details** tab and click **Copy to File**...

   Be sure to use the **DER** encoded binary (X.509) format and copy to a file.

5. Convert the **.DER** format certificate to **.PEM** format.

   Use Firefox 3.0 or later to download the certificate directly to **.PEM** format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see `der2pem` in **Command**
Reference for Oracle WebLogic Server. Note that WebLogic does not recognize any other format other than .PEM format.

6. Import the certificate into the cacerts in the JDK_HOME using the following command:

   keytool -import -alias imap_cer -file cert_file.cer -keystore cacerts -storepass changeit

   Where cert_file is the name of the certificate file you downloaded.

7. Register the mail server connection as described in Registering Mail Servers.

9. Log into WebCenter Portal and provide your mail credentials.

29.8 Securing the Connection to Oracle SES with SSL

There are two scenarios in which you may want to configure SSL for SES: The first scenario is where WebCenter Portal has already been protected with SSL but SES has not; the second scenario is where SES has been protected with SSL, but WebCenter Portal has not. These two scenarios are described in the following subsections:

- Securing Oracle SES with SSL
- Securing the Connection to Oracle SES with SSL

29.8.1 Securing Oracle SES with SSL

Follow the steps below to secure SES with SSL.

Before registering the SES connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store and register the Oracle Secure Enterprise Search (SES) connection.

To download the certificate of the HTTPS URL and save it:

1. Configure SSL on the WebCenter side using the following certificate name:

   cn=<myhost>

   where <myhost> is the fully qualified name of the host where WebCenter is installed.

   For more information about configuring SSL on WebCenter Portal, see Securing the Browser Connection to WebCenter Portal using SSL.

2. Export the WebCenter certificate in PEM format (i.e., <myhost>.crt).

   You can use Firefox 3.0 or later to download the certificate directly to .PEM format. For other browsers, follow the steps below and then use the WebLogic Server der2pem tool to convert to PEM format.
a. Click **Certificate**.

b. In the popup window, open the Details tab, and click **Copy to File**...

   Use **DER encoded binary** (X.509) format and copy the certificate to a file.

c. Convert the .DER format certificate to .PEM format.

   For more information about using the der2pem tool, see **der2pem** in *Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than .PEM format.

3. In SES, import the certificate into the following keystores:

- `<SES Installation Directory>/jdk6/jre/lib/security/cacerts`
- `<SES Installation Directory>/seshome/jdk/jre/lib/security/cacerts`

   using the following command:

   ```bash
   keytool -importcert -trustcacerts -alias webcenter_wls -file <myhost>.crt -keystore cacerts -storepass changeit
   ```

4. For the handshake to be successful, the following steps are required:

   a. Restart WebCenter Portal with the command:

   ```bash
   -Dweblogic.security.SSL.minimumProtocolVersion=TLSv1
   ```

   b. Apply the 10.3.6 patch to your SES server:

   ```http
   ```

   **Note:**

   - The WebLogic Server server version of SES is 10.3.6 and WebLogic Server version of WebCenter is 12.2.1.
   - By default only TLSv1.1 & TLSv1.2 are supported in 12.2.1. In 10.3.6 and JDK 1.6_29 (SES environment), only SSLv3 & TLSv1 are supported.

5. In SES, create a source for Oracle WebCenter in which the crawl and authorization endpoints point to the WebCenter Portal application’s HTTPS ports.

6. Create a schedule and source group for the crawl (see Configuring Search Parameters and Crawlers Using Fusion Middleware Control).

7. Finish the WebCenter-side configuration for SES and restart SES and WebCenter Portal.

8. Create some objects in WebCenter Portal and start the crawl.

9. After the crawl has been completed, search for a keyword and the results should appear in WebCenter Portal.
29.8.2 Securing the Connection to Oracle SES with SSL

Note: In this scenario, WebCenter Portal is not protected with SSL, but SES is protected.

To import the SES certificate to the WebCenter Portal Trust Store:

1. Enable SSL on SES:
   a. In the Oracle SES Administration Console, keep the default setting of Demo Identity and Demo Trust.
   b. Access the search server, for example search_server1 and enable SSL on SES by setting the SSL Listen Port Enabled to True on the General page.
   c. Restart the server

2. Register Oracle SES with WebCenter (see Registering Oracle Secure Enterprise Search Servers and register the SSL-enabled SES instance with WebCenter Portal.

3. Use your browser to navigate to the Web Services URL that Oracle Secure Enterprise Search exposes to enable search requests at:

   \[ http://host:port/search/query/OracleSearch \]

   For example:

   \[ https://example.com:7777/search/query/OracleSearch \]

4. Place your cursor on the page, right-click with your mouse, and select Properties.

5. Click Certificate.

6. In the popup window, open the Details tab, and click Copy to File...

   Use DER encoded binary(X.509) format and copy the certificate to a file.

7. Convert the .DER format certificate to .PEM format.

   Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server der2pem tool to convert to PEM format. For more information about using the der2pem tool, see der2pem in Command Reference for Oracle WebLogic Server. Note that WebLogic does not recognize any other format other than .PEM format.

8. Import the certificate into WebCenter Portal cacerts in JDK_HOME using the following command:

   `keytool -import -alias ses_cer -file cert_file.cer -keystore cacerts -storepass changeit`

   where \textit{cert\_file} is the name of the certificate file you downloaded.

9. Register the SES connection as described in Registering Oracle Secure Enterprise Search Servers.
29.9 Securing the WebCenter Portal Connection to an External BPEL Server with SSL

This section describes how to secure the WebCenter Portal connection to a BPEL server when the BPEL server resides in an external SOA domain.

**Note:**

When SOA is installed in an external domain, the Identity Asserter and Authenticator should be configured exactly as for WebCenter Portal. For more information on configuring the Identity Asserter and Authenticator for an external LDAP identity store, see Reassociating the Identity Store with an External LDAP Server.

To secure the WebCenter Portal connection to an external BPEL server with SSL:

1. Install and configure Oracle SOA 12c.
   

2. From WebCenter, create a connection to SOA in WebCenter, by running the following commands:

   ```java
   createBPELConnection('webcenter','WebCenter-Worklist'
   setSpacesWorkflowConnectionName('webcenter','WebCenter-Worklist','SOA_host:port','oracle/wss10_saml_token_client_policy')
   ```

3. From WebCenter, enable SSL.

   Follow the steps in Securing the Browser Connection to WebCenter Portal using SSL.

4. From SOA, enable SSL.

   Follow the steps in Securing the Browser Connection to WebCenter Portal using SSL, but instead of webcenter_wls, you will use soa_wls and instead of webcenteridentity, you will use soaidentity.

5. Configure the keystores for WebCenter Portal and SOA.

   See Creating the WebCenter Portal Domain Keystore and Creating the SOA Domain Keystore.

6. Wire WebCenter WebLogic server and SOA WebLogic server to the same OID.

7. From WebCenter, import the SOA public and CA certificate to the WebCenter Trust store:

   ```bash
   keytool -importcert -trustcacerts -alias soa_cert -file filepath/certificate/bpel.cer -keystore filepath/cacerts -storepass changeit
   keytool -importcert -trustcacerts -alias soa_trust -file filepath/certificate/democabpel.cer -keystore filepath/cacerts -storepass changeit
   ```
8. From SOA, import the WebCenter public and CA certificate to the SOA Trust Store:

   keytool -importcert -trustcacerts -alias webcenter_cert -file /filepath/certificate/webcenter.cer -keystore /filepath/cacerts -storepass changeit

   keytool -importcert -trustcacerts -alias webcenter_trust -file /filepath/certificate/democaprod.cer -keystore /filepath/cacerts -storepass changeit

9. From WebCenter, change the SOA connection details to use the SOA HTTPS host and port in Oracle Enterprise Manager.

10. Add -Dweblogic.security.SSL.ignoreHostnameVerification=true as EXTRA_JAVA_PROPERTIES in setDomainEnv.sh for Webcenter.

11. Restart the WC_Portal server and the SOA managed server.
This chapter describes how to set up Web Services Security (WS-Security) for WebCenter Portal and related services and components.

WS-Security, using an OPSS Key Store Service (KSS) keystore, provides a mechanism for retrieving and managing the security credentials of a WebCenter Portal application and ancillary applications and components across one or more domains. The KSS keystore provides information about available public and private keys that can be used for authentication and data integrity.

The following topics show how to configure a typical topology with WS-Security (where the WebCenter Portal application and the WSRP producers share the same domain, but the BPEL server is in an external SOA domain), and how to extend that configuration for more complex environments (where, for example, a second discussions server is in a separate domain, a BPEL server is in a separate SOA domain, and one WSRP producer is in an external portlet domain):

- Configuring WS-Security for a Typical Topology
- Configuring WS-Security for Multiple Domains
- Securing WebCenter Portal for Applications Consuming WebCenter Portal Client API with WS-Security

Permissions:
To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

### 30.1 Configuring WS-Security for a Typical Topology

This section describes how to configure WS-Security for a topology where the WebCenter Portal application, WSRP producers, and discussions server share the same domain, but the BPEL (SOA) server is in an external domain.

**Typical Topology**

- Domain 1: WebCenter Portal, Discussions, Portlet Producers
- Domain 2: SOA

The steps to configure WS-Security for a typical two-domain topology are described in the following topics:
30.1.1 Creating the WebCenter Portal Domain Keystore

This section describes how to use the OPSS Keystore Service (KSS) to create the WebCenter Portal keystore and keys. A keystore is a file that provides information about available public and private keys. Keys are used for a variety of purposes, including authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the keystore. After creating the keystore, the security credentials of WebCenter Portal, discussions server, BPEL servers, and WSRP producers can be retrieved and managed using the KSS. For more information about the OPSS Keystore Service, see Managing Keys and Certificates with the Keystore Service in Securing Applications with Oracle Platform Security Services.

To create the WebCenter Portal domain keystore:

1. Run the following WLST commands:
   ```java
   svc = getOpssService(name='KeyStoreService')
   svc.createKeyStore(appStripe='owsm', name='keystore', password='')
   svc.generateKeyPair(appStripe='owsm', name='keystore', password='', dn='CN=RESTOWSMKEY, OU=KEYS FOR REST, O=Oracle, L=CA, ST=CA, C=US', keysize='2048', alias='orakey', keypassword='')
   svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate', filepath='/scratch/certificate/prodtrust.cer')
   svc.importKeyStoreCertificate(appStripe='owsm', name='keystore', password='', alias='democa', keypassword='', type='TrustedCertificate', filepath='/scratch/certificate/prodtrust.cer')
   svc.listKeyStoreAliases(appStripe='owsm', name='keystore', password='', type='*')
   ```

2. Create the keystore using the following WLST command:
   ```java
   svc.createKeyStore(appStripe='appStripe', name='producer', password='password', permission=true/false)
   ```

   Where:
   - **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
   - **name** — Keystore name
• **password** — Keystore password

• **permission** — false if protected by both permission and password (true if keystore is protected by permission only)

For example:

```java
svc.createKeyStore(appStripe='WCPortalStripe', name='producer', password='welcome1', permission=true)
```

3. **Generate the key pair for this newly created keystore:**

```java
svc.generateKeyPair(appStripe='appstripe', name='name', password='password', dn='CN=Producer, OU=Producer, O=MyOrganization, L=MyTown, ST=MyState, C=US', keysize='2048', alias='producer', keypassword='keypassword')
```

Where:

• **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

• **name** — Keystore name

• **password** — Keystore password

• **dn** — Domain name (for example, dn='CN=webcenter_certificate')

• **alias** — Public Key Alias

• **keypassword** — Password for new public key

For example:

```java
svc.generateKeyPair(appStripe='WCPortalStripe', name='producer', password='welcome1', dn='CN=Producer, OU=Producer, O=MyOrganization, L=MyTown, ST=MyState, C=US', keysize='2048', alias='producer', keypassword='welcome1')
```

4. **Import the public certificate of the CA into newly created stripe for OWSM**

(“Producer” is not a self-signed certificate, but signed by Internal CA):

```java
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate', filepath='filepath')
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', keypassword='keypassword', type='TrustedCertificate', filepath='filepath')
```

**Note:**

The keypair generated in the previous step was signed by the Internal CA that ships with KSS, and the validation of the certificate on the service side will fail as OWSM Agent is unable to validate the Certificate path for the signing certificate. Although you will not run into this issue if you use self-signed certificates, since we have used a CA-signed certificate (albeit an Internal CA signed certificate) you must import the CA certificate into the OWSM keystore (that is, import the public certificate of the CA into the OWSM stripe).

Where:
- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named.

- **name** — Keystore name

- **password** — Keystore password

- **alias** — Public Key Alias

- **keypassword** — Password for new public key

- **filepath** — Certificate path

**Note:**
The only parameter that you can change for `svc.exportKeyStoreCertificate` is the *filepath*. All other values must be entered as above. Note also that

For example:
```
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate', filepath='/workplace/certificate/trustwebcenter.crt')
svc.importKeyStoreCertificate(appStripe='WCPortalStripe', name='producer', password='welcome1', alias='democa', keypassword='welcome1', type='TrustedCertificate', filepath='/workplace/certificate/trustwebcenter.crt')
```

5. Export the producer certificate (which will be used by the consumer):

```
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', type='TrustedCertificate', filepath='filepath')
```

Where:

- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named.

- **name** — Keystore name

- **password** — Keystore password

- **alias** — Public Key Alias

- **keypassword** — Password for new public key

- **filepath** — Certificate path

For example:
```
svc.exportKeyStoreCertificate(appStripe='WCPortalStripe', name='producer', password='welcome1', alias='producer', type='TrustedCertificate', filepath='/scratch/certificate/webcenter.cer')
```

6. Export the trusted certificate along with public certificate:

```
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', filepath='filepath', type='TrustedCertificate')
```
Where:

- **appstripe** — The keystore stripe name. Keys and certificates created in the
  keystore reside in an application stripe or product, and each stripe in a domain
  is uniquely named

- **name** — Keystore name

- **password** — Keystore password

- **alias** — Public Key Alias

- **filepath** — Certificate path

For example:

```python
svc.exportKeyStoreCertificate(appStripe='WCPortalStripe', name='producer',
password='welcome1', alias='democa', filepath='/scratch/certificate/
democaprod.cer', type='TrustedCertificate')
```

### 30.1.2 Creating the SOA Domain Keystore

This section describes how to create a SOA domain keystore and keys using an OPSS
keystore (KSS). For syntax and reference information about the KSS commands, see
OPSS Keystore Service Commands in Oracle Fusion Middleware Infrastructure Security
WLST Command Reference.

To create the SOA domain keystore:

1. Using the following WLST command, get an OPSS service command object:

   ```python
   svc = getOpssService(name='KeyStoreService')
   ```

2. Create the keystore:

   ```python
   svc.createKeyStore(appStripe='appStripe', name='name', password='password',
   permission='true/false')
   ```

   Where:

   - **appstripe** — The keystore stripe name. Keys and certificates created in the
     keystore reside in an application stripe or product, and each stripe in a domain
     is uniquely named

   - **name** — Keystore name

   - **password** — Keystore password

   - **permission** — false if protected by both permission and password (true if
     keystore is protected by permission only)

   For example:

   ```python
   svc.createKeyStore(appStripe='SOAStripe', name='bpel', password='welcome1',
   permission='true')
   ```

3. Generate key pair for the newly created keystore:

   ```python
   svc.generateKeyPair(appStripe='appstripe', name='name', password='password',
dn='CN=Producer, OU=Producer, O=MyOrganization, L=MyTown, ST=MyState, C=US',
keysize='2048', alias='producer', keypassword='keypassword')
   ```

   Where:
- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

- **name** — Keystore name

- **password** — Keystore password

- **dn** — Domain name (for example, `dn='CN=webcenter_certificate'`)

- **alias** — Public Key Alias

- **keypassword** — Password for new public key

For example:

```
svc.generateKeyPair(appStripe='SOAStripe', name='bpel', password='welcome1',
                    dn='CN=BPEL, OU=Consumer, O=MyOrganization, L=MyTown, ST=MyState, C=US',
                    keysize='2048', alias='bpel', keypassword='welcome1')
```

4. Import the public CA certificate to the bpel stripe:

```
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='1', alias='democa', type='TrustedCertificate', filepath='filepath')
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', type='TrustedCertificate',
                              filepath='filepath')
```

Where:

- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

- **name** — Keystore name

- **password** — Keystore password

- **alias** — Public Key Alias

- **filepath** — Certificate path

For example:

```
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate',
                              filepath='/workplace/certificate/trustbpel.crt') svc.importKeyStoreCertificate(appStripe='SOAStripe', name='bpel',
                                                                                     password='welcome1', alias='democa', keypassword='welcome1',
                                                                                     type='TrustedCertificate', filepath='/workplace/certificate/trustbpel.crt')
```

5. Import the certificate exported by the producer:

```
svc.importKeyStoreCertificate(appStripe='appStripe', name='name',
                               password='password', alias='webcenter_spaces_ws', keypassword='keypassword',
                               filepath='filepath', type='TrustedCertificate')
```

Where:

- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
• name — Keystore name
• password — Keystore password
• keypassword — Password for new public key
• filepath — Certificate path

Note:
The alias for the importKeyStoreCertificate command must always be set to webcenter_spaces_ws. Do not attempt to change this alias or creating the keystore will fail.

For example:
```
svc.importKeyStoreCertificate(appStripe='SOAStripe', name='bpel',
password='welcome1', alias='webcenter_spaces_ws', keypassword='welcome1',
filepath='/workplace/certificate/webcenter.cer',type='TrustedCertificate')
```

6. Import the producer ‘democa’ certificate:
```
svc.importKeyStoreCertificate(appStripe='appstripe', name='bpel',
password='password', alias='alias', keypassword='keypassword',
filepath='filepath',type='TrustedCertificate')
```
Where:
• appstripe — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
• name — Keystore name
• password — Keystore password
• alias — Public Key Alias
• keypassword — Password for new public key
• filepath — Certificate path
For example:
```
svc.importKeyStoreCertificate(appStripe='SOAStripe', name='bpel',
password='welcome1', alias='democal', keypassword='welcome1',
filepath='/workplace/certificate/democaprod.cer',type='TrustedCertificate')
```

7. Export the public certificate that will be imported by the producer:
```
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name',
password='password', alias='alias', filepath='filepath',type='TrustedCertificate')
```
Where:
• appstripe — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
• name — Keystore name
• **password** — Keystore password

• **alias** — Public Key Alias

• **filepath** — Certificate path

For example:

```python
svc.exportKeyStoreCertificate(appStripe='SOAStripe', name='bpel',
password='welcome1', alias='bpel', filepath='/scratch/certificate/
bpel.cer',type='TrustedCertificate')
```

8. Export the demo certificate that will be used by the producer:

```python
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name',
password='password', alias='alias', filepath='filepath',type='TrustedCertificate')
```

Where:

• **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

• **name** — Keystore name

• **password** — Keystore password

• **alias** — Public Key Alias

• **filepath** — Certificate path

For example:

```python
svc.exportKeyStoreCertificate(appStripe='SOAStripe', name='bpel',
password='welcome1', alias='democa', filepath='/scratch/certificate/
democabpel.cer',type='TrustedCertificate')
```

9. Register the newly created stripe:

```python
configureWSMKeystore('/WLS/base_domain','KSS', 'kss://appstripe/bpel',
signAlias='bpel', cryptAlias='bpel',
signAliasPassword='signAliasPassword',cryptAliasPassword='cryptAliasPassword')
```

Where:

• **cryptAlias** — The public key alias

• **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

• **signAliasPassword** — The password for the public key

• **cryptAlias** — The public key alias

• **cryptAliasPassword** — The password for the public key

For example:

```python
configureWSMKeystore('/WLS/base_domain','KSS', 'kss://SOAStripe/bpel',
signAlias='bpel', cryptAlias='bpel',
signAliasPassword='signAliasPassword',cryptAliasPassword='cryptAliasPassword')
```
10. Grant keystore permission to newly created bpel stripe:

```java
grantPermission(permClass="oracle.security.jps.service.keystore.KeyStoreAccessPermission", permTarget="stripeName=SOAStripe,keystoreName=bpel,alias=", permActions="read")
```

11. Import the consumer certificate and consumer democa certificate to WebCenter:

```java
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='bpel', keypassword='keypassword', filepath='filepath', type='TrustedCertificate')
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='democa1', keypassword='keypassword', filepath='filepath', type='TrustedCertificate')
```

Where:

- **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named.
- **name** — Keystore name
- **password** — Keystore password
- **alias** — Public Key Alias
- **keypassword** — Password for new key
- **filepath** — Certificate path

For example:

```java
svc.importKeyStoreCertificate(appStripe='SOAStripe', name='producer', password='welcome1', alias='bpel', keypassword='welcome1', filepath='/scratch/certificate/bpel.cer', type='TrustedCertificate')
svc.importKeyStoreCertificate(appStripe='SOAStripe', name='producer', password='welcome1', alias='democa1', keypassword='welcome1', filepath='/scratch/certificate/democa1bpel.cer', type='TrustedCertificate')
```

12. Register the producer stripe:

```java
configureWSMKeystore('/WLS/wc_domain','KSS', 'kss://appstripe/producer', signAlias='producer', signAliasPassword='signAliasPassword', cryptAlias='cryptAlias', cryptAliasPassword='cryptAliasPassword')
```

Where:

- **wc_domain** — The WebCenter Portal domain
- **signAliasPassword** — The password for the public key
- **cryptAlias** — The public key alias
- **cryptAliasPassword** — The password for the public key

13. Grant KeystorePermission for the newly created stripe:

```java
grantPermission(permClass="oracle.security.jps.service.keystore.KeyStoreAccessPermission", permTarget="stripeName=SOAStripe,keystoreName=producer,alias=", permActions="read")
```
30.1.3 Configuring the Discussions Server

If the discussions server for your topology is in the same domain as the WC_Portal server and is not being used in a production environment, then no extra keystore configuration is needed since the keystore configured for the WebCenter Portal domain is used for the discussions server as well. However, for production environments, you should protect the discussions web service endpoints with an OWSM policy and configure the discussions server connection settings. These configuration steps are described in the following topics:

- Securing the Discussions End Points
- Configuring the Discussions Server Connection Settings

Note:
Discussions-specific web services messages sent by WebCenter Portal to the discussions server are not encrypted. For message confidentiality, the discussions server URL must be accessed over Secure Socket Layer (SSL). For more information, see Configuring SSL.

30.1.3.1 Attaching Security Policies for WebCenter Portal and Discussions Web Service Endpoints

In a new or patched WebCenter Portal instance, the assigned security policy configuration is set to "no security policy." You must attach Oracle Web Services Manager (OWSM) security policies for the WebCenter Portal web service endpoint and the discussions authenticated web service endpoint. For a production environment, continue by hardening the security by following the steps in Securing the Discussions End Points.

Note:
In a patched WebCenter Portal instance, you must determine the policy names before you patch, then attach the policies after you patch. For required steps, see Patching Oracle WebCenter in Patching Guide for Oracle Identity and Access Management.

To attach the web service security policy configuration in a new instance:

Note:
For clustered environments, repeat these steps for each of the managed servers where WebCenter Portal and discussions are deployed.

1. Ensure that the WC_Portal and WC_Collaboration managed servers are running.
2. Run the following WLST command to attach an OWSM policy on the discussions web service endpoint:

   attachWebServicePolicy(application='owc_discussions', moduleName='owc_discussions', moduleType='web', serviceName='OWCDiscussionsServiceAuthenticated', subjectName='OWCDiscussionsServiceAuthenticated', policyURI='oracle/wss10_saml_token_service_policy')

3. Restart the WC_Portal and WC_Collaboration managed servers.

30.1.3.2 Securing the Discussions End Points

The discussions web service endpoints require user identity to be propagated for calls originating from WebCenter Portal. For a production environment, the web service endpoints must be secured with OWSM policies to ensure that messages are not tampered with, and can’t be viewed by others while in transit. To do this, both the public access web service endpoint and authenticated user access endpoint should be secured with the appropriate OWSM policies using either Fusion Middleware Control or WLST.

This section contains the following topics:

- Securing the Discussions Server End Points Using Fusion Middleware Control
- Securing the Discussions Server End Points Using WLST

30.1.3.2.1 Securing the Discussions Server End Points Using Fusion Middleware Control

To secure the discussions end points using Fusion Middleware Control, follow the steps below:

1. Log in to Fusion Middleware Control and from the Navigation pane, expand WebCenter> Portal> Discussions and click Discussions (WC_Collaboration).

   The discussions home page displays (see Figure 30-1).
2. Click the owc_discussions target.

The home page for the owc_discussions application displays (see Figure 30-2).
3. From the Application Deployment menu, select **Web Services**.

The Web Services page for the **owc_discussions** application displays (see **Figure 30-3**).
4. Open the Web Services tab, and click the OWCDiscussionsServiceAuthenticated web service end point.

The Web Service Endpoint page for owc_discussions displays (see Figure 30-4).
5. Click Attach/Detach.

The Attach Policy page displays (see Figure 30-5).

**Figure 30-5  Attach Policy Page**
6. Use the **Attach** and **Detach** buttons to attach oracle/wss11_saml_token_with_message_protection_service_policy and detach oracle/wss10_saml_token_service_policy.

7. Click OK.

### 30.1.3.2.2 Securing the Discussions Server End Points Using WLST

To secure the discussions server endpoints using WLST, detach the wss10_saml_token_service_policy and attach the wss11_saml_token_with_message_protection_service_policy using the following WLST commands:

```java
detachWebServicePolicy(application='owc_discussions', moduleName='owc_discussions', moduleType='web', serviceName='OWCDiscussionsServiceAuthenticated', subjectName='OWCDiscussionsServiceAuthenticated', policyURI='oracle/wss10_saml_token_service_policy')
```

```java
attachWebServicePolicy(application='owc_discussions', moduleName='owc_discussions', moduleType='web', serviceName='OWCDiscussionsServiceAuthenticated', subjectName='OWCDiscussionsServiceAuthenticated', policyURI='oracle/wss11_saml_token_with_message_protection_service_policy')
```

### 30.1.3.3 Configuring the Discussions Server Connection Settings

You must supply the WS-Security client certificate information within the discussions server connection that is configured for your WebCenter Portal application, as described in *Registering Discussions Servers*. Figure 30-6 shows example connection detail settings for the Edit Discussions and Announcement Connection page.

*Figure 30-6    Edit Discussions and Announcement Connection Page*

### 30.2 Configuring WS-Security for Multiple Domains

This section describes how to extend the WS-security configuration for a typical topology for topologies where, for example, the WebCenter Portal application, BPEL (SOA) server, discussions server, and a WSRP producer server are each in their own domain.
Multiple Domain Topology

- Domain 1: WebCenter Portal
- Domain 2: SOA (BPEL) server
- Domain 3: Discussions server
- Domain 4: WSRP producers

The steps to configure WS-Security for a topology with multiple domains are described in the following topics:

- Setting Up the WebCenter Portal Domain Keystore
- Creating the SOA Domain Keystore
- Configuring an External Discussions Server
- Creating the External Portlet Domain Keystore

30.2.1 Setting Up the WebCenter Portal Domain Keystore

To create the WebCenter Portal domain keystore, follow the steps for configuring WS-security for a typical topology as described in Creating the WebCenter Portal Domain Keystore. After creating the keystore, the security credentials of WebCenter Portal, discussions server, BPEL servers, and WSRP producers can be retrieved and managed using the KSS. For more information about the OPSS Keystore Service, see Managing Keys and Certificates with the Keystore Service in Securing Applications with Oracle Platform Security Services.

30.2.2 Creating the SOA Domain Keystore

Create the SOA domain keystore and keys using an OPSS keystore (KSS) as described in Creating the SOA Domain Keystore. For syntax and reference information about the KSS commands, see OPSS Keystore Service Commands in Oracle Fusion Middleware Infrastructure Security WLST Command Reference.

30.2.3 Configuring an External Discussions Server

If the discussions server is in a different domain than WebCenter Portal, you will need to create and configure a keystore for the discussions server and export the certificate containing the public key and import it into the WebCenter Portal domain. For production environments you will also need to protect the discussions web service end points with an OWSM policy and configure the discussions server connection settings. These configuration steps are described in the following subsections:

- Securing the Discussions Service End Points
- Creating the Discussions Server Keystore
- Configuring the Discussions Server Connection Settings

30.2.3.1 Securing the Discussions Service End Points

The discussions web service end points require user identity to be propagated for calls originating from WebCenter Portal. Follow the steps in Securing the Discussions End Points to secure the endpoints using either Fusion Middleware Control or WLST.
30.2.3.2 Creating the Discussions Server Keystore

This section describes how to create a keystore for the discussions server that contains the key pair used by OWSM, and export the certificate containing the public key so it can be imported into the WebCenter Portal domain.

To create the owc_discussions keystore:

1. From the discussions server, run the following WLST command:

   ```java
   svc = getOpssService(name='KeyStoreService')
   ```

2. Create the keystore:

   ```java
   svc.createKeyStore(appStripe='appStripe', name='producer', password='password',
                      permission=true/false)
   ```

   Where:
   - `appstripe` — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
   - `name` — Keystore name
   - `password` — Keystore password
   - `permission` — false if protected by both permission and password (true if keystore is protected by permission only)

   For example:

   ```java
   svc.createKeyStore(appStripe='dfstripe', name='discussions', password='welcome1',
                      permission=false)
   ```

3. Generate key pair for the newly created keystore:

   ```java
   svc.generateKeyPair(appStripe='appStripe', name='name', password='password',
                       dn='CN=Producer, OU=Producer, O=MyOrganization, L=MyTown, ST=MyState, C=US',
                       keysize='2048', alias='discussions', keypassword='keypassword')
   ```

   Where:
   - `appstripe` — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
   - `name` — Keystore name (in this case "discussions").
   - `password` — Keystore password
   - `dn` — Domain name (for example, `dn='CN=webcenter_certificate'`)
   - `alias` — Public Key Alias (in this case "discussions")
   - `keypassword` — Password for new public key

   For example:

   ```java
   svc.generateKeyPair(appStripe='dfstripe', name='discussions',
                       password='welcome1', dn='CN=DISCUSSIONS, OU=Consumer, O=MyOrganization, L=MyTown,
                       ST=MyState, C=US', keysize='2048', alias='discussions', keypassword='welcome1')
   ```
4. Import the public CA certificate to the discussions stripe:

```java
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate', filepath='filepath')
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', type='TrustedCertificate', filepath='filepath')
```

Where:

- `appstripe` — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
- `name` — Keystore name
- `password` — Keystore password
- `alias` — Public Key Alias
- `filepath` — Certificate path

For example:

```java
svc.exportKeyStoreCertificate(appStripe='system', name='castore', password='', alias='democa', type='TrustedCertificate', filepath='/workplace/certificate/trustdiscussions.crt')
svc.importKeyStoreCertificate(appStripe='dfstripe', name='discussions', password='welcome1', alias='democa', keypassword='welcome1', type='TrustedCertificate', filepath='/scratch/certificate/trustdiscussions.crt')
```

5. Import the certificate exported by the producer:

```java
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='webcenter_df_ws', keypassword='keypassword', filepath='filepath', type='TrustedCertificate')
```

Where:

- `appstripe` — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named
- `name` — Keystore name (in this case “discussions”)
- `password` — Keystore password
- `keypassword` — Password for new public key
- `filepath` — Certificate path

**Note:**

The alias for the `importKeyStoreCertificate` command must always be set to `webcenter_df_ws`. Do not attempt to change this alias or creating the keystore will fail.

For example:
6. Import the producer ‘democa’ certificate:

```java
svc.importKeyStoreCertificate(appStripe='appstripe', name='discussions',
password='password', alias='alias', keypassword='keypassword',
filepath='filepath',type='TrustedCertificate')
```

Where:

- `appstripe` — The keystore stripe name. Keys and certificates created in the
keystore reside in an application stripe or product, and each stripe in a domain
is uniquely named
- `name` — Keystore name (in this case “discussions”)
- `password` — Keystore password
- `alias` — Public Key Alias
- `keypassword` — Password for new public key
- `filepath` — Certificate path

For example:

```java
svc.importKeyStoreCertificate(appStripe='dfstripe', name='discussions',
password='welcome1', alias='webcenter_df_ws', keypassword='welcome1', filepath='/scratch/certificate/webcenter.cer',type='TrustedCertificate')
```

7. Export the public certificate that will be imported by the producer:

```java
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name',
password='password', alias='alias', filepath='filepath',type='TrustedCertificate')
```

Where:

- `appstripe` — The keystore stripe name. Keys and certificates created in the
keystore reside in an application stripe or product, and each stripe in a domain
is uniquely named
- `name` — Keystore name
- `password` — Keystore password
- `alias` — Public Key Alias
- `filepath` — Certificate path

For example:

```java
svc.exportKeyStoreCertificate(appStripe='dfstripe', name='discussions',
password='welcome1', alias='discussions', filepath='/workplace/certificate/discussions.cer',type='TrustedCertificate')
```

8. Export the demo certificate that will be used by the producer:

```java
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name',
password='password', alias='alias', filepath='filepath',type='TrustedCertificate')
```

Where:
• **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

• **name** — Keystore name

• **password** — Keystore password

• **alias** — Public Key Alias

• **filepath** — Certificate path

For example:

```python
svc.exportKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', filepath='filepath', type='TrustedCertificate')
```

9. Register the newly created stripe:

```python
configureWSMKeystore('/WLS/base_domain', 'KSS', 'kss://appstripe/discussions', signAlias='signAlias', cryptAlias='cryptAlias', signAliasPassword='signAliasPassword', cryptAliasPassword='cryptAliasPassword')
```

Where:

• **signAliasPassword** — Password for the signature key alias

• **cryptAliasPassword** — Password for the encryption key alias

10. Grant keystore permission to newly created discussions stripe:

```python
grantPermission(permClass="oracle.security.jps.service.keystore.KeyStoreAccessPermission", permTarget="stripeName=stripe2,keystoreName=discussions,alias=*", permActions="read")
```

11. Restart the managed servers and admin servers.

12. Import the consumer certificate and consumer democa certificate to WebCenter:

```python
svc.importKeyStoreCertificate(appStripe='appstripe', name='name', password='password', alias='alias', keypassword='keypassword', filepath='filepath', type='TrustedCertificate')
```

Where:

• **appstripe** — The keystore stripe name. Keys and certificates created in the keystore reside in an application stripe or product, and each stripe in a domain is uniquely named

• **name** — Keystore name

• **password** — Keystore password

• **alias** — Public Key Alias

• **keypassword** — Password for new key

• **filepath** — Certificate path
For example:

```java
svc.importKeyStoreCertificate(appStripe='stripe2', name='producer', password='welcome1', alias='discussions', keypassword='welcome1', filepath='/workplace/certificate/discussions.cer', type='TrustedCertificate')
svc.importKeyStoreCertificate(appStripe='stripe2', name='producer', password='welcome1', alias='democa2', keypassword='welcome1', filepath='/workplace/certificate/democadiscussions.cer', type='TrustedCertificate')
```

### 30.2.3.3 Configuring the Discussions Server Connection Settings

You must supply the WS-Security client certificate information within the discussions server connection that is configured for WebCenter Portal, as described in Registering Discussions Servers. Figure 30-7 shows example connection detail settings for the Edit Discussions and Announcement Connection page.

**Figure 30-7  Edit Discussions and Announcement Connection Page**

### 30.2.4 Creating the External Portlet Domain Keystore

To create the external portlet domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.

2. Using keytool, generate the keystore by importing the WebCenter Portal domain’s public certificate:

   ```bash
tool -importcert -alias webcenter_public -file webcenter_public.cer -keystore producer.jks -storepass keystore_password
   ```

   Where:

   - `keystore_password` is the keystore password

   **Example: Importing the Certificate**

   ```bash
tool -importcert -alias webcenter_public -file webcenter_public.cer -keystore producer.jks -storepass MyPassword
   ```

3. Using keytool, generate a key pair:
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias producer -keypass key_password -keystore producer.jks -storepass keystore_password -validity days_valid

Where:

- **consumer_dname** is the name of the consumer (for example, cn=producer,dc=example,dc=com)
- **key_password** is the password for the new public key, (for example, MyPassword)
- **keystore** is the keystore name, (for example, webcenter.jks)
- **keystore_password** is the keystore password, (for example, MyPassword)
- **days_valid** is the number of days for which the key password is valid (for example, 1064).

**Example: Generating the Keypair**

```
keytool -genkeypair -keyalg RSA -dname "cn=producer,dc=example,dc=com" -alias producer -keypass MyPassword -keystore producer.jks -storepass MyPassword -validity 1064
```

**Note:**

You must use the -keyalg parameter and specify RSA as its value as shown above as the default algorithm (DSA) used by keytool for generating the key is incompatible with Oracle Web Services Security Manager requirements.

4. Export the certificate containing the public key so that it can be imported into the WebCenter Portal domain's keystore:

```
keytool -exportcert -v -alias producer -keystore producer.jks -storepass keystore_password -rfc -file producer_public_key.cer
```

Where:

- **keystore_password** is the keystore password, (for example, MyPassword)

**Example: Exporting the Certificate Containing the Public Key**

```
keytool -exportcert -v -alias producer -keystore producer.jks -storepass MyPassword -rfc -file producer_public_key.cer
```

5. Import the certificate to the WebCenter Portal domain with a different alias (choose Yes when prompted whether to overwrite the existing certificate with the alias producer_public_key):

```
keytool -importcert -alias producer_public_key -file producer_public_key.cer -keystore webcenter.jks -storepass keystore_password
```

Where:

- **keystore_password** is the keystore password (for example, MyPassword)

**Example: Importing the Certificate**

```
keytool -importcert -alias producer_public_key -file producer_public_key.cer -keystore webcenter.jks -storepass MyPassword
```
30.3 Securing WebCenter Portal for Applications Consuming WebCenter Portal Client API with WS-Security

This section describes the administrator tasks required to configure WS-Security for WebCenter Portal so that the communication between an application exposing the WebCenter Portal API (the consumer) and WebCenter Portal (the producer) is secure, and that the identity of the user invoking the API is protected.

This section includes the following topics:

- Configuring a Typical Topology for Applications Consuming WebCenter Portal Client API
- Configuring a Multiple Domain Topology for Applications Consuming the WebCenter Portal Client API

30.3.1 Configuring a Typical Topology for Applications Consuming WebCenter Portal Client API

If your client application is part of the same domain as WebCenter Portal, you only need to specify the following for the \texttt{GroupSpaceWSContext}:

\begin{verbatim}
GroupSpaceWSContext context = new GroupSpaceWSContext();
context.setRecipientKeyAlias("webcenter");
\end{verbatim}

\textbf{Note:}

The alias here should always be the public key.

If your client application is JDeveloper and you have access to the WebCenter Portal server's configured keystore, copy the same keystore to JDeveloper's \texttt{DefaultDomain/config/fmwconfig/dir} and configure the JDeveloper domain to use this keystore. The steps are exactly same as those in \texttt{Creating the WebCenter Portal Domain Keystore}, and you would then also need to specify the following on your client stub:

\begin{verbatim}
GroupSpaceWSContext context = new GroupSpaceWSContext();
context.setRecipientKeyAlias("webcenter");
\end{verbatim}

30.3.2 Configuring a Multiple Domain Topology for Applications Consuming the WebCenter Portal Client API

If your client application is part of the same domain as WebCenter Portal, you only need to specify the following for the \texttt{GroupSpaceWSContext}:

\begin{verbatim}
GroupSpaceWSContext context = new GroupSpaceWSContext();
context.setRecipientKeyAlias("webcenter");
\end{verbatim}

\textbf{Note:}

The alias here should always be the public key.
If your client application is JDeveloper, copy the same keystore to JDeveloper's DefaultDomain/config/fmwconfig/dir and configure the JDeveloper domain to use this keystore. The steps are exactly same as those in Creating the WebCenter Portal Domain Keystore, and you would then also need to specify the following on your client stub:

```java
GroupSpaceWSContext context = new GroupSpaceWSContext();
context.setRecipientKeyAlias("webcenter");
```

### 30.4 JKS Command Summary for a Typical Topology

Use the following command summary to quickly configure the keystore for a typical topology.

#### Generate the Keystore

Use the following `keytool` commands to generate the keystore, replacing the values in bold with those for your local environment:

```bash
keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass MyPassword -rfc -file webcenter_public.cer
keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer -keystore bpel.jks -storepass MyPassword

When prompted that the certificate already exists, say yes.

```bash
keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=example,dc=com" -alias bpel -keypass MyPassword -keystore bpel.jks -storepass MyPassword -validity 1024
keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass MyPassword -rfc -file orakay.cer
keytool -importcert -alias orakey -file orakay.cer -keystore webcenter.jks -storepass MyPassword

When prompted to trust the certificate, say yes.
```

```bash
keytool -importcert -alias df_webcenter_public -file webcenter_public.cer -keystore owc_discussions.jks -storepass MyPassword

When prompted to trust the certificate, say yes.
```

Copy the `webcenter.jks` file to your `domain_home/config/fmwconfig` directory, and the `bpel.jks` file to your `soa_domain_home/config/fmwconfig` directory.

#### Configure the SOA Domain Keystore

Run the following WLST command to register the keystore:

```bash
configureWSMKeystore('/WLS/wc_domain','JKS', 'kss://appstripe/producer', signAlias='producer', signAliasPassword="signAliasPassword", cryptAlias='cryptAlias', cryptAliasPassword="cryptAliasPassword")
```

Where:

- `wc_domain` — The WebCenter Portal domain
- `signAliasPassword` — The password for the public key
30.5 JKS Command Summary for Extensions to a Typical Topology

Use the following command summary to quickly configure the keystore and DF properties for a multi-domain topology.

**Generate the Keystore**

Use the following `keytool` commands to generate the keystore, replacing the values in bold with those for your local environment:

```plaintext

keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass MyPassword -rfc -file webcenter_public.cer

keytool -importcert -alias df_webcenter_public -file webcenter_public.cer -keystore owc_discussions.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer -keystore bpel.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=example,dc=com" -alias bpel -keypass MyPassword -keystore bpel.jks

keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass MyPassword -rfc -file orakay.cer

keytool -importcert -alias orakey -file orakay.cer -keystore webcenter.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

keytool -importcert -alias webcenter_public -file webcenter_public.cer -keystore producer.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

keytool -exportcert -v -alias producer -keystore producer.jks -storepass MyPassword -rfc -file producer_public_key.cer

keytool -importcert -alias webcenter_public -file webcenter_public.cer -keystore external_webcenter_custom.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

keytool -genkeypair -keyalg RSA -dname "cn=external_webcenter_custom,dc=example,dc=com" -alias external_webcenter_custom -
keypass MyPassword -keystore external_webcenter_custom.jks -storepass MyPassword -
validity 1024

keytool -importcert -alias producer_public_key -file producer_public_key.cer -keystore webcenter.jks -storepass MyPassword

When prompted to trust the certificate, say yes.

When prompted to trust the certificate, say yes.

Copy webcenter.jks to your domain_home/config/fmwconfig directory,
bpel.jks to your SOA1_domain_home/config/fmwconfig directory,
producer.jks to your External_Portlet_domain_home/config/fmwconfig directory, and external_webcenter_custom.jks to your External_WebCenter_domain_home/config/fmwconfig directory.

Configure the External Discussions Server Domain Keystore

Run the following WLST command to register the keystore:

configureWSMKeystore('/WLS/wc_domain','JKS', 'kss://appstripe/producer',
signAlias='producer', signAliasPassword='signAliasPassword',
cryptAlias='cryptAlias', cryptAliasPassword='cryptAliasPassword')

Where:
• wc_domain — TheWebCenter Portal domain
• signAliasPassword — The password for the public key
• cryptAlias — The public key alias
• cryptAliasPassword — The password for the public key

Configure the SOA Domain Keystore

Run the following WLST command to register the keystore:

configureWSMKeystore('/WLS/wc_domain','JKS', 'kss://appstripe/producer',
signAlias='producer', signAliasPassword='signAliasPassword',
cryptAlias='cryptAlias', cryptAliasPassword='cryptAliasPassword')

Where:
• wc_domain — TheWebCenter Portal domain
• signAliasPassword — The password for the public key
• cryptAlias — The public key alias
• cryptAliasPassword — The password for the public key

Configure the External Portlet Producer Domain Keystore
Run the following WLST command to register the keystore:

```java
configureWSMKeystore('/WLS/wc_domain', 'JKS', 'kss://appstripe/producer',
signAlias='producer', signAliasPassword='signAliasPassword',
cryptAlias='cryptAlias', cryptAliasPassword='cryptAliasPassword')
```

Where:
- `wc_domain` — The WebCenter Portal domain
- `signAliasPassword` — The password for the public key
- `cryptAlias` — The public key alias
- `cryptAliasPassword` — The password for the public key

**Configure the Discussions Server Connection**

Supply the WS-Security client certificate information within the discussions server connection that is configured for WebCenter Portal, as described in Registering Discussions Servers. Also see Configuring the Discussions Server Connection Settings for example connection detail settings for the Edit Discussions and Announcement Connection page.
This chapter describes how to configure WebCenter Portal to handle security for WSRP and JPDK portlet producers.

This chapter includes the following topics:

- Securing a WSRP Producer
- Securing a PDK-Java Producer

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

31.1 Securing a WSRP Producer

The following sections describe how to secure access to JSR-168 standards-based WSRP portlets from WebCenter Portal:

- Deploying the Producer
- Attaching a Policy to the Producer Endpoint
- Setting Up the Keystores

31.1.1 Deploying the Producer

Before you configure the producer for WS-Security, you must first deploy your standards-compliant portlet producer to an Oracle WebLogic managed server by performing the steps described in Deploying Portlet Producer Applications.

31.1.2 Attaching a Policy to the Producer Endpoint

This section describes how to attach a security policy to a WSRP producer endpoint. The following policies are supported for WSRP producers:

- Username token with password

  wss10_username_token_with_message_protection_service_policy
This policy enforces message-level protection (message integrity and confidentiality) and authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security’s Basic 128 suite of asymmetric key technologies (specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption). The keystore is configured through the security configuration. Authentication is enforced using credentials in the WS-Security UsernameToken SOAP header. The user’s Subject is established against the currently configured identity store.

- Username token without password

wss10_username_id_propagation_with_msg_protection_service_policy

This policy enforces message level protection (message integrity and confidentiality) and identity propagation for inbound SOAP requests using mechanisms described by the WS-Security 1.0 standard. Message protection is provided using WS-Security’s Basic 128 suite of asymmetric key technologies (specifically, RSA key mechanisms for confidentiality, SHA-1 hashing algorithm for integrity, and AES-128 bit encryption). Identity is set using the user name provided by the UsernameToken WS-Security SOAP header. The Subject is established against the currently configured identity store.

- SAML token

There are four SAML token policies:

- WSS 1.0 SAML token Policy:

wss10_saml_token_service_policy

This policy authenticates users using credentials provided in SAML tokens in the WS-Security SOAP header. The credentials in the SAML token are authenticated against a SAML login module. This policy can be applied to any SOAP-based endpoint.

- WSS 1.0 SAML token with message integrity:

wss10_saml_token_with_message_integrity_service_policy

This policy provides message-level integrity protection and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security’s Basic 128 suite of asymmetric key technologies, specifically SHA-1 hashing algorithm for message integrity.

- WSS 1.0 SAML token with message protection:

wss10_saml_token_with_message_protection_service_policy

This policy enforces message-level protection and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security’s Basic 128 suite of asymmetric key technologies, specifically RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.

- WSS 1.1 SAML token with message protection:

wss11_saml_token_with_message_protection_service_policy

This policy enforces message-level protection (that is, message integrity and message confidentiality) and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.1 standard. Messages are
protected using WS-Security’s Basic 128 suite of symmetric key technologies, specifically RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption. The keystore is configured through the security configuration. It extracts the SAML token from the WS-Security binary security token, and uses those credentials to validate users against the configured identity store. This policy can be attached to any SOAP-based endpoint.

The keystore is configured through the security configuration. It extracts the SAML token from the WS-Security binary security token, and uses those credentials to validate users against the configured identity store.

To attach a policy to a producer endpoint

1. Open Fusion Middleware Control and log into the target domain.
   
   For information on logging into Fusion Middleware Control, see Starting Enterprise Manager Fusion Middleware Control.

2. In the Navigation pane, expand the Application Deployments node, and click the producer to attach a policy to.

3. From the Application Deployment menu, select Web Services.
   
   The Web Services Summary page for the producer displays.

4. Open the Web Service Endpoint tab and click the endpoint to which to attach a policy.
   
   The WSM Policy Subject Configuration page displays (see Figure 31-1).
Figure 31-1  WSM Policy Subject Configuration

Note:
Only the markup service ports should be secured (WSRP_V2_Markup_Service and WSRP_V1_Markup_Service).

The Web Service Endpoints page for the producer displays.

5. Open the Policies tab to display the currently attached policies for the producer.

6. Click **Attach/Detach** to add or remove a policy.

   The Attach/Detach Policies page is shown listing the available policies and their descriptions.

7. Under Available Policies, select **Category** and **Security** as the policy category to search, and click the Search icon to list the security policies.

8. Select the policies to attach and click **Attach**. Use the **Ctrl** key to select multiple policies.
The policies appear in the list under Attached Policies.

9. When finished adding policies to attach to the producer endpoint, click **OK**.

### 31.1.3 Setting Up the Keystores

The steps to create and configure keystores for a WSRP producer depend on the topology of your WebCenter Portal environment, and are covered in the following sections:

- Configuring WS-Security for a Typical Topology
- Configuring WS-Security for Multiple Domains

Refer to these sections for more complete instructions for setting up the keystores, and other WS-Security aspects of configuring WSRP producers.

### 31.2 Securing a PDK-Java Producer

A shared key can be defined for message integrity protection and should be used with SSL. The steps to store a shared key as a password credential are:

- Define a shared key as a password credential in the credential store of the administration server instance. This can be done using either Fusion Middleware Control or WLST.
- Restart the web producer and access the test page. Confirm that the shared key has been picked up correctly by checking the application logs.

**Note:**

Using a shared key provides only message integrity protection. For complete message protection SSL is required. For more information on securing PDK-Java portlets using SSL, see *Securing the WebCenter Portal Connection to Portlet Producers with SSL*.

### 31.2.1 Defining a Shared Key as a Password Credential

You can define a shared key as a password credential in the credential store of the administration server instance using either Fusion Middleware Control or WLST commands, as described in the following subsections:

- Defining a Shared Key Using Fusion Middleware Control
- Defining a Shared Key Using WLST

#### 31.2.1.1 Defining a Shared Key Using Fusion Middleware Control

To define a shared key using Fusion Middleware Control:

1. Log into Fusion Middleware Control.

For information on logging into Fusion Middleware Control, see *Starting Enterprise Manager Fusion Middleware Control*. 
2. In the Navigation pane, expand the WebLogic Domain node and click the target domain (for example, wc_domain).

3. From the WebLogic Domain menu, select Security > Credentials.

   The Credentials pane displays.

4. Click Create Map and enter PDK as the Map Name and click OK.

5. Click Create Key and select the map (PDK) you just created.

6. Enter a User Name (this value is not used so it could be anything), a Key in the form pdk.<service_id>.sharedKey (where <service_id> is the name of the producer), and a 10 to 20 hexadecimal digit Password and click OK.

   The new key is displayed in the Credential pane.

31.2.1.2 Defining a Shared Key Using WLST

You can also define a shared key using WLST as described in the following steps:

1. Start WLST as shown in Running Oracle WebLogic Scripting Tool (WLST) Commands, and connect to the Administration Server instance for the target domain.

2. Connect to the Administration Server for the target domain with the following command:

   ```
   connect('user_name','password', 'host_id:port')
   ```

   Where:
   - `user_name` is the name of the user account with which to access the Administration Server (for example, weblogic)
   - `password` is the password with which to access the Administration Server
   - `host_id` is the host ID of the Administration Server
   - `port` is the port number of the Administration Server (for example, 7001).

3. Add a shared key credential for a producer to the credential store using the WLST `createCred` command:

   ```
   createCred(map='PDK', key='pdk.service_id.sharedKey.user_name', user='user_name', password='password')
   ```

   Where:
   - `service_id` is the name of the producer to create the key for (for example, omniPortlet)
   - `user_name` is the name of the user. This value is not used so it could be anything.
   - `password` is a 10 to 20 hexadecimal digit value.

   For example,

   ```
   createCred(map='PDK', key='pdk.omniPortlet.sharedKey', user='sharedKey', password='1234567890abc')
   ```
Note:
After creating a credential, you can use the WLST `updateCred` command with the same parameters as above to update it.

4. Restart the producer.

Web producers pick up properties the first time they handle a request (for example, a browser test page request or when they are first registered), so producers should be restarted once a shared key credential has been set up.

31.2.1.3 Registering an Oracle PDK-Java Producer with a Shared Key

Registering a PDK-Java producer is described in Registering an Oracle PDK-Java Portlet Producer. When you register an Oracle PDK-Java producer with a shared key, you must be sure to also do the following:

- Select the Enable producer session option when registering the producer.
- In the Add Portlet Producer Connection section, enter the password used when creating the credential map as the Shared Key.
This chapter describes how to manage and configure WebCenter Portal Impersonation, which lets designated WebCenter Portal users impersonate other users and perform operations as those users.

For instructions on how to initiate an impersonation session (by the impersonator) and how to allow an Impersonation session (by the impersonatee), see Using WebCenter Portal Impersonation in Using Oracle WebCenter Portal. For information about impersonation ELs and APIs, see ELs Related to Impersonation in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

This chapter includes the following topics:

- Introduction to WebCenter Portal Impersonation
- Preparing WebCenter Portal for Impersonation
- Configuring WebCenter Portal for Impersonation
- Configuring Impersonators
- Disabling Impersonation
- Turning off the Session Indicator
- Overriding the Impersonation Hotkey
- Managing Audit Logs for WebCenter Portal Impersonation

Permissions:

To perform the tasks in this chapter, you must be granted the WebLogic Server Admin role through the Oracle WebLogic Server Administration Console. Users with the Monitor or Operator roles can view security information but cannot make changes.

See also, Understanding Administrative Operations, Roles, and Tools.

32.1 Introduction to WebCenter Portal Impersonation

This section includes the following topics:

- About WebCenter Portal Impersonation
- Best Practices for Using WebCenter Portal Impersonation
32.1.1 About WebCenter Portal Impersonation

WebCenter Portal Impersonation lets a WebCenter Portal administrator or system administrator assign impersonation rights to a group of users ("impersonators"), such as support representatives or application administrators, so that they can perform operations as other users ("impersonatees"). Note that this is subject to the impersonatee granting the impersonator additional rights to impersonate them. This may be useful in the following instances:

- A customer support representative may want to perform actions as another user in order to understand the issues being faced by that user.
- An administrator may want to perform operations on behalf of a user.
- A company executive may need to delegate someone to act on his or her behalf while away.

32.1.2 Best Practices for Using WebCenter Portal Impersonation

All applications participating in Oracle Access Manager (OAM) from an impersonatee's system will also be accessible to an impersonator. The only exception to this is that an impersonator will not be able to access the Impersonation task flow and grant or modify impersonation rights. Consequently, administrators should exercise extreme caution when granting impersonation rights because of what an impersonator could potentially access. Impersonators should be a very limited group.

Audit logging should be turned on for impersonation and the administrator should monitor the audit logs periodically to review the impersonation activities. For more information about audit logging, see Managing Audit Logs for WebCenter Portal Impersonation.

To initiate an impersonation session the impersonatee and impersonator should agree on an appropriate time slot for the impersonation session. The impersonatee should then grant impersonation rights for that time slot only. The impersonatee should revoke impersonation rights immediately after the impersonator is done.

Note that an impersonation session will end if the impersonator logs out. An impersonation session will also end when the specified impersonation time duration end point is reached. For example, if a user grants impersonation rights to an impersonator between 1:00 and 2:00 in the afternoon, although the impersonator can start an impersonation session anytime between 1:00 and 2:00, the session will end at 2:00.

Also note that if a user revokes an impersonation grant explicitly while the impersonator is in the middle of an impersonation session, the revoke will not affect any existing impersonation session for that user. It will only take effect the next time the impersonator tries to impersonate the user. The user will then not appear in the list of available impersonatees.

32.2 Preparing WebCenter Portal for Impersonation

WebCenter Portal impersonation relies on OAM 11.1.2.0. Before you can enable impersonation for a WebCenter Portal instance you must first install and configure OAM 11g (Oracle’s single sign-on solution), and then turn on impersonation in OAM. For information about installing and configuring OAM 11g, see Configuring Oracle Access Manager.
This section includes the following topics:

- WebCenter Portal Impersonation Requirements
- Turning on Impersonation in OAM
- Adding Impersonation Attributes to the Identity Store

### 32.2.1 WebCenter Portal Impersonation Requirements

To prepare WebCenter Portal for impersonation you must first install and configure OAM 11.1.2.0 and then turn on impersonation in OAM. You will also need to add impersonation attributes for each participating user.

**Note:**

WebCenter Portal Impersonation requires that OAM 11.1.2.0 be installed and configured as the single sign-on solution, and that OID 11.1.2.0 is installed and configured as the identity store.

- Install and configure OAM 11.1.2.0 with either the 10g or 11g WebGate (see Configuring Oracle Access Manager)
- Turn on impersonation
- Add impersonation attributes to each participating user in the identity store
- Configure each participating WebCenter Portal instance for impersonation
- Configure the people who have impersonation rights by adding them to a WebCenter application role

### 32.2.2 Turning on Impersonation in OAM

After installing and configuring OAM 11.1.2.0 (with either the 10g or 11g WebGate) as described in Configuring Oracle Access Manager, continue by enabling impersonation in OAM using `idmConfigTool` as shown below

To enable impersonation:

1. Use `idmConfigTool` to configure OAM as shown in Configuring Access Manager by Using the IDM Configuration Tool in Oracle. Fusion Middleware Enterprise Deployment Guide for Oracle Identity Management.

2. Create the properties file as shown, but set the `OAM11G_IMPERSONATION_FLAG` to `true`.

### 32.2.3 Adding Impersonation Attributes to the Identity Store

For users to be available as impersonators or impersonatees they need to have the following attributes available for storing the impersonation grants in OID:

- `orclImpersonationGrantee`
- `orclImpersonationGranter`

These attributes are a part of the `orclIDXPerson` object class that is available by default in OID. This object class must be added to the list of object classes for each
user's user record that you want to participate as an impersonator or impersonatee. You can do this either by adding the object class to individual users, or as a bulk update for multiple users as described in the following topics:

- Adding Impersonation Attributes for Individual Users
- Adding Impersonation Attributes for Multiple Users

### 32.2.3.1 Adding Impersonation Attributes for Individual Users

Follow the steps below to add the attributes for storing the impersonation grants in OID for individual users:

To add the object class to individual users:

2. Connect to the directory that is configured for OAM and WebCenter.
3. For each participating user:
   a. Locate the user you want to change by drilling down in the DataBrowser, or by using the DataBrowser's search field.
   b. Open the Attributes screen and add the `orclIDXPerson` object class to the list of existing object classes as shown in Figure 32-1.

   **Figure 32-1  ODSM Attributes Tab**

   ![ODSM Attributes Tab](image)

   c. Click Apply.

### 32.2.3.2 Adding Impersonation Attributes for Multiple Users

You can add the attributes available for storing the impersonation grants in OID as a bulk update using the `bulkmodify` tool. Note that to use this tool you need to be able to access the machine where OID is installed, have system administrator rights, and need to know the OID database password.

To add the attributes for storing impersonation grants in OID for multiple users:

1. Stop OID.
2. Go to `$ORACLE_HOME/ldap/bin` and run the `bulkmodify` tool.
Specify basedn as the DN under which all users you wish to add the object class reside. The connect string is the OID DB connect string, which is typically OIDDB (determined from $ORACLE_INSTANCE/config/tnsnames.ora). Provide the DB password when prompted. The following shows a sample run of the command:

```bash
cdmody connect="OIDDB" basedn="cn=Users,dc=us,dc=oracle,dc=com" attribute="objectclass" value="orclIDXPerson" add=true
```

This tool can only be executed if you know database user password for OID

```
Enter OID Password ::
```

```
------------------------------------------------------------
Modifying entries under "cn=users,dc=us,dc=oracle,dc=com" ...
------------------------------------------------------------

------------------------------------------------------------
Total 72 Entries are modified.
```

3. Restart OID.

All users under the specified DN should now have the orclIDXPerson object class configured. For more information about the bulkmodify tool, see Reference for Oracle Identity Management.

### 32.3 Configuring WebCenter Portal for Impersonation

After installing and configuring OAM and enabling Impersonation in OAM, you need to configure the OAM Impersonation trigger end points in your WebCenter Portal instance as shown below:

1. Using WLST, connect as administrator to the Weblogic Administration Server and run the following command replacing oamhost and oamserverport with the corresponding host ID and port for OAM:

   ```bash
   addOAMSSOProvider(loginuri="/${app.context}/adfAuthentication", logouturi="/oamssologin/logout.html",
   beginimpuri="http://oamhost:oamserverport/oam/server/impersonate/start",
   endimpuri="http://oamhost:oamserverport/oam/server/impersonate/end")
   ```

2. Restart all servers in the WebCenter Portal domain, including the Admin Server.

3. You may also need to account for any time difference between your WebCenter Portal server and OAM. Although Impersonation start and end times are accepted in WebCenter Portal, they are enforced by OAM so the time settings must be consistent. To account for time differences:

   a. Log into WebCenter Portal as an administrator.

   b. Select Administration > Attributes.

      The Attributes page displays.

      **Tip:**

      You can also access the Attributes page directly by opening the page in your browser:

      ```bash
      http://host:port/webcenter/faces/oracle/webcenter/webcenterapp/view/pages/admin/WebCenterAdmin-CustomAttributes.jspx
      ```

      where host and port are the host and port IDs of the WC_Portal server.
c. Specify the Impersonation time Delta in seconds using a + sign if the WebCenter Portal server is behind the OAM server, or a - sign if it is ahead. For example:

```
oracle.webcenter.security.impersonation.timedelta = -480
```

would indicate that there is a time difference of eight minutes between OAM and WebCenter Portal with the WebCenter Portal server being ahead.

**Tip:**
You can also add the setting to the `$domain.home/bin/setDomainEnv.sh` file:

```
EXTRA_JAVA_PROPERTIES="-Doracle.webcenter.spaces.osso=true
-Doracle.webcenter.security.impersonation.timedelta=-480"
export EXTRA_JAVA_PROPERTIES
```

d. Restart the WebCenter Portal managed server (`WC_Portal`).

### 32.4 Configuring Impersonators

After configuring OAM and WebCenter Portal, you must configure the users to whom you want to grant impersonation privileges by adding those users or groups to the `webcenter#-#impersonators` role. Out-of-the-box, no users are granted this role. Only users belonging to this role either by direct membership or through an enterprise role membership are eligible to impersonate users in a WebCenter Portal instance.

**Caution:**
Use caution when granting rights to users that would allow them to impersonate other users. Only users that have a business need for this feature should be granted impersonation rights. For information about best practices, see [Best Practices for Using WebCenter Portal Impersonation](#).

Use the `grantAppRole` WLST command to grant the `webcenter#-#impersonators` role to one or more enterprise roles or users. For example:

- To grant the impersonators role to an enterprise role called `SupportRepresentatives`:
  ```
  grantAppRole(appStripe="webcenter", appRoleName="webcenter#-#impersonators",
  principalClass="weblogic.security.principal.WLSGroupImpl",
  principalName="SupportRepresentatives")
  ```

- To grant the impersonators role to a user named `weblogic`:
  ```
  grantAppRole(appStripe="webcenter", appRoleName="webcenter#-#impersonators",
  principalClass="weblogic.security.principal.WLSUserImpl",
  principalName="weblogic")
  ```

Use the `revokeAppRole` WLST to revoke impersonator permission from an enterprise role or user. For example:

- To revoke the impersonators role from an enterprise role called `SupportRepresentatives`:
revokeAppRole(appStripe="webcenter", appRoleName="webcenter#-#impersonators", principalClass="weblogic.security.principal.WLSGroupImpl", principalName="SupportRepresentatives")

- To revoke the impersonators role from a user named weblogic:
  revokeAppRole(appStripe="webcenter", appRoleName="webcenter#-#impersonators", principalClass="weblogic.security.principal.WLSUserImpl", principalName="weblogic")

**Note:**
Changes to role assignments are available immediately. You do not need to restart the managed server.

### 32.5 Disabling Impersonation

WebCenter Portal Impersonation is disabled by default, so unless you have already enabled impersonation there is nothing that needs to be done to turn it off. However, if you have enabled it and now want to disable it, follow the steps below to turn it off in WebCenter Portal and OAM.

Note that turning off impersonation in WebCenter Portal only disables it for that particular instance. Any other WebCenter Portal instances for which impersonation was enabled will not be affected until you turn off impersonation in OAM.

To disable impersonation for WebCenter Portal:

1. Log into Fusion Middleware Control as an administrator.
3. Navigate to the Properties section and click **Configure**.
4. Under **PropertySets**, locate the property set that defines the impersonation start and stop URIs (typically "props.auth.uri.0").
5. Delete the properties `imp.begin.url` and `imp.end.url`.
6. Restart all servers in the WebCenter Portal domain, including the Admin server.
   Note that until you disable impersonation in OAM, impersonation in other WebCenter Portal domains will continue to be enabled.

To disable impersonation in OAM and turn off impersonation altogether:

1. Back up the `DOMAIN_HOME/config/fmwconfig/oam-config.xml` file.
2. Open the `oam-config.xml` file for editing.
3. Set `ImpersonationConfig` to `false` as shown below:
   ```xml
   <Setting Name="ImpersonationConfig" Type="htf:map">
   <Setting Name="EnableImpersonation" Type="xsd:boolean">false</Setting>
   </Setting>
   
   4. Save `oam-config.xml`.
5. Restart OAM and all of its components.
32.6 Turning off the Session Indicator

The session indicator is an overlay that appears on the impersonator’s screen by default during an impersonation session. Although the overlay provides a visual clue that the impersonation session is active, and also provides a quick way to stop the session by clicking Stop Impersonation, it may obstruct a view of part of the user’s (impersonatee’s) screen as shown in Figure 32-2.

**Note:**

When the impersonation session notification toolbar is turned off, users must use the Impersonation page to stop an impersonation session since the Stop Impersonation button will no longer be visible.

![Impersonation Session - Session Indicator Overlay](image)

You can turn off the session indicator overlay as shown below:

To turn off the session indicator:

1. Log into WebCenter Portal as an administrator.

2. Select Administration > Attributes.

   The Attributes page displays.

   **Tip:**

   You can also access the Attributes page directly by opening the page in your browser:

   
   ```
   http://host:port/webcenter/faces/oracle/webcenter/webcenterapp/view/pages/admin/WebCenterAdmin-CustomAttributes.jspx
   ```

   where host and port are the host and port IDs of the WC_Portal server.

3. Set the notification property to false as shown below:

   ```
   oracle.webcenter.security.impersonation.notification=false
   ```

   Note that impersonators will now need to end impersonation sessions using the Impersonation Preferences screen. For more information about using the Impersonation Preferences screen, see Using WebCenter Portal Impersonation in Using Oracle WebCenter Portal.

4. Restart the WC_Portal managed server for the change to take effect.

32.7 Overriding the Impersonation Hotkey

The default Ctrl+Shift+I hotkey sequence used by the impersonator to view the list of impersonatees can be overridden, if needed.

To change the hotkey sequence:
1. Log into WebCenter Portal as an administrator.

2. In the portal browser, click the **Administration** tile, then click **Attributes** in the left pane.

   **Tip:**
   You can also access the Attributes page directly by opening the page in your browser:

   http://host:port/webcenter/faces/oracle/webcenter/webcenterapp/view/pages/admin/WebCenterAdmin-CustomAttributes.jspx

   where host and port are the host and port IDs of the WC_Portal server.

3. On the **Attributes** page, click **Add Attribute**, and set the new hotkey sequence as follows:

   oracle.webcenter.security.impersonation.key=new key

   where new key is a single character to be appended to Ctrl+Shift. Note that you can only override the default I with another single character. The Ctrl+Shift sequence is predefined and will always precede the key. Be sure to check that the overridden character is not already used by other components, tools or plug-ins. For example, Ctrl+Shift+M is used by menus, and Ctrl+Shift+K and Ctrl+Shift+J are sometimes used by browser plug-ins such as developer tools and the error console.

4. Restart the WC_Portal server for the change to take effect.

### 32.8 Managing Audit Logs for WebCenter Portal Impersonation

WebCenter Portal Impersonation, when enabled, activates logging for Impersonation-related events as part of the Fusion Middleware Audit Service. Audit log events are stored in a file (the Audit Bus-stop) by default, but can also be uploaded to a database for persistency.

---

**Note:**
If you enable WebCenter Portal Impersonation, it is highly recommended that you also enable audit logging. When Impersonation is enabled, audit logging tracks the impersonator, impersonatee, and the context surrounding each impersonation event.

The Audit Bus-stop file has a limited capacity so storing log information in a database where events can be queried long after their occurrence is also recommended.

---

Impersonation audit logging provides the following key benefits:

- Events that alter the security settings of Portal, Portal Server, and major Portal Server artifacts are traceable
- Auditable events contain all relevant event payload to help define the impersonator, impersonatee and the context surrounding an event
- Definable logging levels
• Events logged are available in perpetuity when uploaded to a database
• Reports on audit events are available through the Audit Service

For more information about managing audit logging for WebCenter Portal, see Managing Oracle WebCenter Portal Audit Logs. For information about configuring the Audit Service to use a database, see Configuring and Managing Auditing in Securing Applications with Oracle Platform Security Services.
This part of *Administering Oracle WebCenter Portal* provides information about the WebCenter Portal lifecycle operations.

- Understanding WebCenter Portal Life Cycle
- Deploying Portals, Templates, Assets, and Extensions
- Managing WebCenter Portal Backup, Recovery, and Cloning
This chapter discusses tasks, tools, and techniques for managing WebCenter Portal throughout its life cycle.

This chapter includes the following topics:

- What Is the WebCenter Portal Life Cycle?
- What Are the Major WebCenter Portal Life Cycle Tasks?
- Permissions Required to Perform WebCenter Portal Life Cycle Operations
- Managing Security Through the WebCenter Portal Life Cycle

### Permissions:

To perform the tasks in this chapter, you must be granted the following roles:

- **WebLogic Server**: `Admin` role granted through the Oracle WebLogic Server Administration Console.
- **WebCenter Portal**: `Administrator` role granted through WebCenter Portal Administration.

See also, Understanding Administrative Operations, Roles, and Tools.

### 33.1 What Is the WebCenter Portal Life Cycle?

The portal life cycle describes the process of creating a portal using WebCenter Portal through deployment to a production instance. Many actors participate in the life cycle including software developers, content modelers, content contributors, IT administrators, and portal site administrators. The phases of the life cycle typically include development, testing, staging, and production. Each phase requires certain tasks to be performed. Some tasks are performed only once, like setting up a content repository. Others are performed more frequently, like creating backups and performing nightly builds. The phases of the portal life cycle are described in Table 33-1.

<table>
<thead>
<tr>
<th>Table 33-1</th>
<th>WebCenter Portal Life Cycle Phases</th>
</tr>
</thead>
</table>

Understanding WebCenter Portal Life Cycle 33-1
## Table 33-1  (Cont.) WebCenter Portal Life Cycle Phases

<table>
<thead>
<tr>
<th>Life Cycle Phase</th>
<th>Primary Actors/Roles</th>
<th>Description</th>
</tr>
</thead>
</table>
| Development      | • Portal Developers  
• Web Developers  
• Content Modelers  
• Content Contributors  
• Application Specialists | Developers can use WebCenter Portal’s browser-based tooling for developing new portals. For advanced requirements, developers can use JDeveloper to further develop and deploy portal assets and shared libraries (containing custom portal components). The development portal typically employs test data and content. Some of the features that are developed in this phase of the life cycle include:  
• Portals  
• Portal assets such as skins, page templates, and Content Presenter display templates  
• Visualization and custom visualization templates  
• shared libraries  
• data transfer and interportlet communication  
• initial security  
• Portlets |
| Testing          | • Developers  
• QA Engineers  
• System Administrators | The development portal is deployed to an independent testing environment. The test environment typically includes its own Metadata Service (MDS) and policy store that are database-based, and has a dedicated Oracle WebCenter Content instance. The testing environment may contain test data and test content that will not become part of the production portal. Components such as application data sources and portlet producers may be shared between the test and development environments. |
| Staging          | • Application Specialists  
• System Administrators  
• Content Contributors | The staging environment provides a stable environment where final configuration and testing takes place before the portal is moved to production. Content contributors add content and refine the portal structure. Typically, the staging environment includes a dedicated Oracle WebCenter Content server, as well as a dedicated portlet producer server (WC_Portal), and a collaboration server for discussions and announcements (WC_Collaboration). Also, an external LDAP-based identity store, such as Oracle Internet Directory, must be set up for the staging environment. The staging server is often maintained as a mirror of the production site. Occasional updates from development to portlets, task flows, and portal assets will need to be deployed to the stage environment. WebCenter Portal administration enables you to import portal asset updates from development to stage. If you want to update portlets and task flows on the staging environment then you redeploy them in the usual way. |
Table 33-1  (Cont.) WebCenter Portal Life Cycle Phases

<table>
<thead>
<tr>
<th>Life Cycle Phase</th>
<th>Primary Actors/Roles</th>
<th>Description</th>
</tr>
</thead>
</table>
| Production       | • Application Specialists  
• System Administrators  
• Content Contributors  
• Knowledge Workers | A production portal is live and available to end users. Individual users with proper authorization can also customize their view. You can use WebCenter Portal administration to move portals and content to the production environment. Some back-end data must be moved manually. You can also use WLST commands for moving portals and content. Administrators can propagate portal changes in staging to production provided that the two environments are kept "in sync", that is, by always making changes in stage first and then pushing the changes to production using deployment or propagation. A portal in production can be modified whilst online in WebCenter Portal. However, changes made directly on the production server must be minimal. |

33.2 What Are the Major WebCenter Portal Life Cycle Tasks?

Each phase of the life cycle requires actors (developers, administrators, content contributors, and others) to perform certain tasks. This section provides an overview of the kinds of tasks that are performed during the portal life cycle.

• One-Time Setup Tasks
• Understanding WebCenter Portal Staging and Production Environments
• Lifecycle Tasks

33.2.1 One-Time Setup Tasks

You must perform certain preparatory steps to set up development, test, stage, and production environments for WebCenter Portal. Table 33-2 provides a general list of these preliminary setup tasks and the environments to which they apply.

Table 33-2  Typical One-Time Setup Tasks

33.2.2 Understanding WebCenter Portal Staging and Production Environments

This section discusses the staging and production phases of portal life cycle. Figure 33-1 illustrates the general flow from staging to production environments. Once the staging environment is fully provisioned and tested, it can be moved to the production environment and made accessible to users. When you copy the staging environment to production for the first time, you migrate the entire stage WebCenter Portal instance to the production environment. This also involves migration of the policy store, MDS data (application integration, REST endpoints, SQL data sources), and all WebCenter Portal data stored on the Content Server repository.

Subsequently, and once the production environment is live, you can propagate portal changes on production as and when required. Any new portals that are developed on stage can be individually deployed to production. Also, if required, you can redeploy existing portals.

You can manually move connections separately for all portals from one WebCenter Portal instance to another.

For information about the various lifecycle tasks that you perform on stage and production environments, see Lifecycle Tasks.

Note:

Figure 33-1 does not depict all possible portal features.
33.2.3 Lifecycle Tasks

Table 33-3 describes the tasks that you may need to perform in the WebCenter Portal life cycle.

<table>
<thead>
<tr>
<th>Lifecycle Task</th>
<th>Description</th>
<th>Tools Used</th>
<th>How To Do?</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
</tbody>
</table>
| **Migrate the entire portal instance**              | Once both staging and production environments are set up and configured, copy your WebCenter Portal instance on stage to the target for the first time.                                                        | • Enterprise Manager Fusion Middleware Control Console  
• WLST                              |
| **Deploy portals**                                  | Deploy portals directly to the target or create a portal archive and import it on the target. You can also export individual production portals to an archive and import them back to your staging site.       | • WebCenter Portal  
• WLST                              |
| **Deploy individual assets**                        | You can share assets or migrate assets to other WebCenter Portal instances. You can also download assets and edit and extend them in tools such as Oracle JDeveloper, and then deploy them back to WebCenter Portal. Developers can deploy portal assets/extensions to WebCenter Portal directly from JDeveloper if they have the required permissions. | • WebCenter Portal  
• WLST                              |
| **Propagate portal changes**                        | You can propagate portal changes made in staging to production if your stage and production environments are connected and kept "in sync". In portal propagation, only the incremental changes made to a portal on the source are pushed to the target server. | • WebCenter Portal  
• WLST                              |

### 33.4 Managing Security Through the WebCenter Portal Life Cycle

This section discusses techniques for migrating portal security policies and credentials from one WebCenter Portal environment to another.

**Security Policy for a Single Portal**

Each portal has its own security policy. When you deploy a portal on a WebCenter Portal instance for the first time you must include the portal’s security policy. On redeployment, the security policy is optional. For example, if you redeploying a portal from staging to production, often it is important not to overwrite policy changes made on the production system. See also, Deploying Portals.

**Security Policy for an Entire WebCenter Portal Application (all portals, including the Home portal)**

When you back up (or export) an entire WebCenter Portal application, security policies for the Home portal and individual portals are included in the archive so you
can move/restore the security information on one instance to another. For details, see Migrating Entire WebCenter Portal to Another Target.

**Back-end Identity Store and Credential Store for WebCenter Portal**

When you migrate to another instance, you must migrate the back-end components for security, such as Identity Store, Credential Store, Policy Store. For details, see Backing Up and Restoring Policy Stores (LDAP and Database) and Backing Up and Restoring Credential Stores (LDAP and Database).
Deploying Portals, Templates, Assets, and Extensions

WebCenter Portal provides a set of utilities that enable administrators to deploy, backup or move information between WebCenter Portal installations, and stage or production environments.

This chapter includes the following topics:

- Deploying Portals
- Deploying Portal Templates
- Deploying Assets, Devices, and Device Groups
- Deploying Custom Shared Library Extensions
- Moving Connections Details from Staging to Production
- Migrating Discussions and Pagelet Producer Resources for a Portal
- Propagating and Redeploying Portals in Production

Permissions:

The content of this chapter is intended for system administrators.

For more information on which roles and permissions are required to deploy portals, templates, assets, connections, and extensions, see Permissions Required to Perform WebCenter Portal Life Cycle Operations.

See also Understanding Administrative Operations, Roles, and Tools.

34.1 Deploying Portals

This section includes the following topics:

- About Portal Deployment
- Directly Deploying Portals Using WebCenter Portal
- Directly Deploying Portals Using WLST
- Deploying Portal Archives
34.1.1 About Portal Deployment

When you deploy a portal to another portal server, you make a copy of the source portal on the target server and you can choose to include all or some of the source portal’s data.

After initial deployment of a portal, you can choose to redeploy the portal or propagate only portal changes to the target. When you redeploy a portal, it is simply deleted and re-created as a new portal. In portal propagation, only the incremental changes made to a portal on the source are pushed to the target server.

You can deploy a portal in the following ways:

- **Direct portal deployment** - If a direct connection to the target server exists, you can deploy a portal to the target server by using WebCenter Portal Administration. You can also use the `deployWebCenterPortal` WLST command to deploy portals directly to the target server. For details, see Directly Deploying Portals Using WebCenter Portal and Directly Deploying Portals Using WLST.

- **Portal archive deployment** - You can export the archive (.par file) of the source portal and import the archived portal on the target server by using WebCenter Portal Administration. You can also use WLST commands to export portals to an archive and then import portals from the file.

  For details, see Exporting and Importing Portal Archives.

**Information Always Deployed with a Portal**

When a portal is deployed, the following details are always included:

- Portal pages

- Portal assets: Page templates, resource catalogs, skins, page styles, Content Presenter display templates, task flow styles, task flows, layouts, pagelets, data controls, visualization templates, data visualizations (including dependent business objects and data sources), business objects, data sources (including their connections)

- Portal activity/usage data: Activity streams, calendar events, feedback, lists, links, message boards, people connections, profiles, and surveys

- Portal security data: Portal roles and permissions and member details and their role assignments

**Information that can be Optionally Deployed with a Portal**

When deploying a portal, you can optionally choose to include the following as part of portal deployment:

- Portal’s content: A portal’s documents and associated content are placed in the portal’s content folder on Content Server. If you choose not to move the content folder during portal deployment, you can manually move the folder to the target using WebCenter Content Server migration tools. For details, see System Migration and Archiving in Administering Oracle WebCenter Content.

  Portal deployments do not include the content that is stored outside a portal’s own content folder. If your portal contains portal assets, portal pages, Content Presenter display templates, or other components that reference content outside the portal’s content folder, you must either manually move such content to the target or ensure that the target can access the same content as the source. When you move a portal
to a different target, Content Presenter data references are maintained only if Content Server connection names and root folder names are the same in both the source and the target.

• Shared assets: While deploying your portal you can choose to deploy all shared assets used by the portal.

• Shared library: While deploying your portal you can choose to deploy the shared libraries used by the portal. When you choose to deploy shared libraries, the main shared library that gets deployed is `extend.spaces.webapp`, which in turn may be dependent on other libraries. As part of deployment, all new versions (newly created or updated) of the dependent libraries of the main shared library are also included. However, this is done only for the first level of dependent libraries. For example, suppose `extend.spaces.webapp` is dependent on `CustomSharedLibrary1`, and `CustomSharedLibrary1` is dependent on `CustomSharedLibrary2`. If an updated version is available for both `CustomSharedLibrary1` and `CustomSharedLibrary2`, only `CustomSharedLibrary1` is included as part of shared library deployment.

Information Not Included During Portal Deployment

Some portal information is stored externally and cannot be deployed at the same time as the portal, for example:

• content used by portal assets, Content Presenter or Site Studio stored outside of the portal’s content folder

• portal discussions

• portal mail

• portal analytics

• Pagelet producer resources

---

**Note:**

Connections are exported and imported separately. For more information, see Understanding Connection Property Files.

---

Figure 34-1 illustrates the different ways in which you can move a portal (and its associated data) to another server.
If your source and target WebCenter Portal installations are connected to different external servers and information associated with the source portal is required on the target, the external portal data must be moved separately.

In some situations the source and target both use the same external server, for example, a portlet producer server or Oracle Internet Directory server might be shared across both environments.

**Note:** While exporting or deploying a portal if the server goes down and fails over to another server in the cluster, the operation will fail. You need to refresh the page and perform the export or deployment operation again.

If you want to deploy a portal larger than 50 MB, ensure that you modify the maximum file upload size on the target server as per your requirements. For information, see **Modifying the File Upload Size in Content Manager**.

For information about troubleshooting portal deployment issues, see **Troubleshooting Oracle WebCenter Portal**.
34.1.2 Directly Deploying Portals Using WebCenter Portal

Using WebCenter Portal administration, you first create a connection to the target server and then directly deploy your portals to the target server. After a portal is deployed, you can view its deployment status and deployment history.

This section includes the following topics:

- Creating a Portal Server Connection
- Deploying a Portal Using WebCenter Portal
- Viewing Portal Deployment History

34.1.2.1 Creating a Portal Server Connection

Before you can deploy a portal, you need to set up a connection to the target portal server.

To create a portal server connection:

1. Log on to WebCenter Portal, and navigate to Portal administration.
2. Click Tools and Services.
3. Select Portal Server Connections from the list of tools and services.
4. Click Create to create a portal server connection.
5. In the Create Portal Server Connection section, specify the following details:
   a. In the Name box, specify the name of the connection. Note that only alphanumeric characters can be used.
   b. In the URL box, specify the URL of the target portal server in the following format:
      \[http://targetserverhost:port\]
      Where, targetserverhost:port refer to the host name and port number of the portal server where you want to deploy your portals.
   c. In the Username box, type the user name used for connecting to the target server.
   d. In the Password box, type the password for the specified user name.
6. Click Test to make sure the connection works.
7. Click Create.

Note that if the connection test fails due to the portal server being offline, the connection will still be set up, and can be used once the server is available.
34.1.2.2 Deploying a Portal Using WebCenter Portal

**Note:**

Deploying a portal is primarily a system administrator task; however, you can assign the Portal Server: Deploy permission to another custom role. It is recommended that you create a custom role and assign this permission to the custom role in order to restrict the user roles that can deploy portals.

Only the Portal Manager (or Delegated Manager) of the portal can deploy the portal, and in addition, must be in a role that has the Portal Server: Deploy permission. For more information about creating a custom application role and adding users to the role, see Defining Application Roles and Assigning Users (and Groups) to Application Roles.

To deploy a portal using WebCenter Portal:

1. In WebCenter Portal, access portal administration as described in Accessing Portal Administration in Building Portals with Oracle WebCenter Portal.

2. Click the **Deploy** icon.

3. From the **Server Name** list under **Target Portal Server**, select the portal server connection you want to use to deploy your portal. You created this connection as described in Creating a Portal Server Connection.

4. In the **Comments** box, specify comments, if any, about portal deployment.

5. In the Options section, select the deployment options:

   - **Include Portal Content**: Select to specify that the portal content stored on Content Server must be included in portal deployment on the target server.

   - **Include Shared Assets**: Deploys the shared assets used by the portal. Clear the check box if you do not want to deploy shared assets.

   - **Include Shared Libraries**: Deploys the shared libraries used by the portal. Clear the check box if you do not want to deploy shared libraries. If you include shared libraries in portal deployment, you must restart the target server after deploying the portal for the shared library changes to be picked up.

If this is the first time the portal is being deployed, the **Redeploy instead of propagating changes** check box appears disabled. Expanding the **Change Details** section displays a message that the portal is being deployed (for the first time) and hence all the data will be carried over to the target server. When you propagate a portal, this section displays the changes made to the portal since the last deployment.
6. Click Deploy.

The Deploy Portals dialog displays the progress and status of portal deployment. While the portal is being deployed, you can choose to close the dialog and continue to work on the portal if required.

7. Click Close.

Once a portal is deployed, you can view its deployment history and status. For information, see Viewing Portal Deployment History.

8. If you included shared libraries in portal deployment, restart the target server where the portal is deployed. For information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.
34.1.2.3 Viewing Portal Deployment History

To view portal deployment history using the WebCenter Portal Administration:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), click Portal Deployments.

   The Recent Deployments tab displays the deployment status of the portals deployed in the last one day.

2. Click the Details link next to a portal to view deployment details.

   The Portal Deployment Details dialog displays the name of the target server and the date and time of deployment. It also shows the comments, if any, added while deploying the portal.

   ![Portal Deployment Details](image)

3. Click Close.

4. Click the Deployment History tab.

   The tab displays each portal’s deployment status.

   ![Deployment History](image)

5. Click the deployment status link for a portal.

   This displays all the deployment operations for the selected portal. Figure 34-6 shows the two records for the portal named MyPortal, one for initial deployment and the other for propagation.
Figure 34-6  Deployment Operations

6. Click Details next to a deployment operation.
   This will display all the details related to the deployment operation.

34.1.3 Directly Deploying Portals Using WLST

You can use the WLST command `deployWebCenterPortal` to deploy a single, online portal directly to another target server. If you want to propagate portal changes in the source to the target using WLST, then you must use `deployWebCenterPortal` to deploy your portal.

Before deploying a portal you must complete a few prerequisite tasks. The overall process is as follows:

- **Step 1: Complete Prerequisites for Direct Portal Deployment**
- **Step 2: Run `deployWebCenterPortal` in the Source Environment**
- **Step 3: Verify Newly Deployed Portal in the Target Environment**

34.1.3.1 Step 1: Complete Prerequisites for Direct Portal Deployment

Before running the WLST command `deployWebCenterPortal`, complete the following:

1. Verify that the name of the managed server on which WebCenter Portal is deployed is the same in both the source and target environments. For example, WC_Portal.
   You can only run `deployWebCenterPortal` if the managed server names match. If the managed server name is different, use portal archive deployment instead, as described in Exporting Portals to an Archive.

2. Verify that you have at least the WebLogic Server Monitor role and the WebCenter Portal permission Portals: Manage Security and Configuration.

3. Ensure a connection exists between the source and target WebCenter Portal. If a connection created using WebCenter Portal Administration already exists, you can use it to deploy portals or you can use the UI to create a new one.
   If a connection to the target from the source environment does not exist and you want to create one using WLST, use the WLST command `adf_createHttpURLConnection`.
   For example, in the source environment run:
34.1.3.2 Step 2: Run deployWebCenterPortal in the Source Environment

In the source WebCenter Portal:

1. Start the WLST tool from your source WebCenter Portal Oracle home directory, and connect to the Administration Server for WebCenter Portal.
   
   For details, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Run the WLST command `deployWebCenterPortal` to deploy the portal on the target server.

   `deployWebCenterPortal(appName, portalName, targetConnectionName
    [deployCustomizations, deployPortalContent, deploySecurity, deployData,
    deployActivities, deploySharedAssets, deployConnections, overwrite, savePortal,
    deployLog, server,
    applicationVersion)`

   For detailed command syntax and descriptions, see `deployWebCenterPortal` in WebCenter WLST Command Reference. The options that you set depend on your specific deployment requirements.

   The following example deploys a new portal named `myPortal` for the first time on the target server. It also deploys all its associated content and specifies a name and location for the deploy log file:

   `deployWebCenterPortal(appName='webcenter', portalName='myPortal',
    targetConnectionName='MyWebCenterPortalTarget',
    deployPortalContent=1,deployActivities=1,
    deployLog='/mydeploylogs/myPortal_deploy.log')`

   **Note:**
   
   Always set `deploySecurity=1` when importing a brand new portal as you cannot import a new portal without a security policy.

   Redeploying a portal that exists on the target

   If you want to redeploy a portal that already exists on the target server, you use the `deployWebCenterPortal` command, with `overwrite=1`. The following example backs up a portal named `myExistingPortal` on the target and then overwrites the target portal (`overwrite=1`) with the source portal. The content associated with the target portal is preserved:

   `deployWebCenterPortal(appName='webcenter',portalName='myExistingPortal',
    targetConnectionName='MyWebCenterPortalTarget',
    deployPortalContent=0,overwrite=1,savePortal=1)`

   3. Examine the deployment log file.

   This file is either available at the location you specified (`deployLog`) or in a file named `PortalDeploy_<timestamp>.log` in your temporary directory.
34.1.3.3 Step 3: Verify Newly Deployed Portal in the Target Environment
In the target WebCenter Portal:

1. Log in to the target WebCenter Portal.
2. Navigate to the new portal deployment.
3. Verify that the portal works as expected.

34.1.4 Deploying Portal Archives

Administrators can use WebCenter Portal or WLST commands to deploy portal archives (.par files) to any WebCenter Portal installation. The target portal server must be up and running when you deploy (or import) one or more portals from a file.

Figure 34-7 Deploying Portal Archives

This section includes the following topics:

- Understanding Portal Archives
- Securing Archives
- Exporting and Importing Portal Archives
- Exporting Portals to an Archive
- Importing Portals from an Archive
- Viewing and Extracting Portal Archives

Note:
When you deploy a portal to another server from an archive you cannot use portal propagation to make incremental updates to the portal later on. The portal propagation feature is only possible when used in conjunction with direct portal deployment. See Propagating and Redeploying Portals in Production.
34.1.4.1 Understanding Portal Archives

You can create a portal archive (.par file) for a single portal or you can archive multiple portals in the same .par file.

Portal archives can contain:

- One or more portal data archive (.pdr) files: Portal archives include a PDR for each portal that you add to the archive. A PDR includes the security policy for the portal and a metadata archive that captures metadata, data, and content for the portal.

- An export log file (.log): An export log file lists all the portals, MDS metadata files, and data (names of database tables that contain portal data) included in the archive.

- The connections.xml file For more information, see Understanding Connection Property Files.

- A WebCenter Portal connection properties file (connection.properties)

---

**Note:**
You can extract any portal archive (.par file) using the listWebCenterPortalArchive WLST command.

---

34.1.4.1.1 Understanding Connection Property Files

If you plan to import, deploy, propagate, or restore a portal on a WebCenter Portal target where all or some connections do not exist, Oracle recommends that you use the WLST command exportWebCenterPortalConnections to generate the connection.properties file from the source environment, and then use the WLST command importWebCenterPortalConnections to import missing connections.
configured in that file on the target environment. For detailed steps, see Importing New WebCenter Portal Connections from a File.

**Note:**

- A `connection.properties` file is also generated when you run the WLST command `exportWebCenterPortalConnections`. For details, see, Exporting WebCenter Portal Connections Details to a File.
- All connections configured in the source WebCenter Portal environment are exported to `connection.properties`. The connection information in this file is not specific to the portals in the archive.
- Only new connections are imported on the target. Connections that exist on the target are ignored.

**Modifying Connection Details**

If some connection information, such as server names, ports, and so on, varies between the source and target environments, you can isolate and modify connection details in the file before importing, deploying, propagating, or restoring the portal.

Table 34-1 shows examples where a different URL parameter is required on the target because the source and target do not use the same host.

<table>
<thead>
<tr>
<th>Connection Type</th>
<th>Source Connection: URL parameter</th>
<th>Target Connection: URL parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Web Service</td>
<td><a href="http://source.example.com/getEmployee?empId=20+deptId=10">http://source.example.com/getEmployee?empId=20+deptId=10</a></td>
<td><a href="http://target.example.com/getEmployee?empId=20+deptId=10">http://target.example.com/getEmployee?empId=20+deptId=10</a></td>
</tr>
</tbody>
</table>

Figure 34-9 illustrates how you can edit connection details in `connection.properties` when source and target parameters vary before new connections are created on the target.
Connection Types and Connection Properties

Table 34-2 lists all the connections captured in the connection.properties file together with the properties that are exported for the various connection types. The table also shows which properties you can edit before deployment, and which properties you must set on the target.

Note:

- For detailed information about individual connection properties, including which ones are mandatory or optional for a particular connection type, refer to the chapter for that connection type. For a list of chapters, see Administering Tools and Services.

- Oracle strongly recommends that you only edit properties in connection.properties that are marked Edit on Deployment? = Yes in Table 34-2. If for some reason you want to edit any of the properties marked Edit on Deployment? = No, you may do so after migrating the connection on the target using either Fusion Middleware Control or WLST commands.
### Table 34-2  (Cont.) Connection Properties Exported to connection.properties

1 Security related configuration: Only policy information is included with the connection. The Override set for the security policy is not included so you must configure these parameters post deployment.

To find out how to deploy connection information in to another server, see Moving Connections Details from Staging to Production.

34.1.4.2 Securing Archives

This section includes the following topics:

- About Securing Archive Files
- Securing Archive Files

34.1.4.2.1 About Securing Archive Files

WebCenter Portal supports validation checks to be performed when portal archives are exported or imported. This secures portal archives by preventing corrupt or arbitrary files from being included on Portal Server.

You can choose to set any of the following security levels for lifecycle operations:
- High-security mode: Set the `ExternallySecureLifecycleOperations` custom attribute, mapped against an external application that stores the credentials to encrypt or decrypt the file storing the checksum value.

- Moderate-security mode: Set the `SecureLifecycleOperations` custom attribute, mapped against the value `enable`. If the value is not set to `enable` or left blank, lifecycle operations will run in the default, non-secure mode. If the value is set to `enable`, lifecycle operations are secured, and checksum acts as the credentials for the encrypt or decrypt process.

- Non-secure mode: By default, lifecycle operations run without any security restriction on archives.

During the export operations, a checksum is calculated and added to all the lifecycle archives - portal archives, application archives, and asset archives. The checksum is stored in a file named `lifecycle.chk` inside the `.par` or `.aar` files and the file is encrypted. During archive import, the file is decrypted to fetch the checksum value. In moderate security mode, the checksum (calculated internally) acts as the password to encrypt or decrypt the file. In high-security mode, the external application with shared credentials is used as the password, and the `ExternallySecureLifecycleOperations` custom attribute is used to fetch the password.

Consider the following while configuring a secure mode for lifecycle operations:

- If an archive is exported in a secured source environment, and the target environment is not secured, security validations are not performed on the archive.

- If lifecycle operations are secured, and during archive import if the `lifecycle.chk` file is missing from the archive, it is a security violation and the import operation is not allowed.

- If lifecycle operations need to be secured, the same level of security must be set on the target and the source instances. Different levels of security modes are not supported.

- If the high-security mode is set, both the source and the target instances must use the same password for the encryption and decryption to work.

### 34.1.4.2.2 Securing Archive Files

To secure application, portal, and asset archives:

1. Log on to WebCenter Portal.

2. Configure the desired security mode to secure your archives:

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
</table>
| To enable the high-security mode | a. Create a custom global attribute named `ExternallySecureLifecycleOperations`.  
|                               | b. Set the value of the custom attribute to `enable`. For information about creating a custom global attribute, see `Adding a Global Attribute`. |
To enable the moderate-security mode

a. Register an external application and specify shared credentials. For information, see Registering External Applications.

b. Create a custom global attribute named SecureLifecycleOperations. Specify the name of the external application as the value. For information about creating a custom attribute, see Adding a Global Attribute.

34.1.4.3 Exporting and Importing Portal Archives

If a direct connection to the target server does not exist, you can first export a portal to an archive (.par file) and then import the archive on the target server to deploy the portal. You can also create a portal archive if you want to create a backup of the portal and restore it on the same instance later.

Note:

When you deploy a portal to another server from an archive you cannot use portal propagation to make incremental updates to the portal later on. The portal propagation feature is only possible when used in conjunction with direct portal deployment. See Propagating and Redeploying Portals in Production.

To export and then import a portal archive:

1. Complete the portal archive prerequisites described in Portal Export Prerequisites.

2. Export the source portal:
   - To use WebCenter Portal, see Exporting Online Portals to an Archive Using WebCenter Portal Administration.
   - To use WLST, see Exporting Online Portals to an Archive Using WLST.
   - To use REST API, see Exporting a Portal Using REST APIs

3. (Optional) Migrate externally stored data and content to the target:
   For details, see Migrating Discussions and Pagelet Producer Resources for a Portal.

4. Import the portal on the target:
   - To use WebCenter Portal, see Importing a Portal from an Archive Using WebCenter Portal Administration.
   - To use WLST, see Importing a Portal from an Archive Using WLST.
   - To use REST API, see Importing a Portal Using REST APIs

34.1.4.4 Exporting Portals to an Archive

You can generate an archive (.par file) for any portal that is running on WebCenter Portal. You can create a portal archive by using WebCenter Portal, the exportWebCenterPortals WLST command, or REST APIs.
To find out how to create portal archives, see:

- Portal Export Prerequisites
- Exporting Online Portals to an Archive Using WebCenter Portal Administration
- Exporting Online Portals to an Archive Using WLST
- Exporting a Portal Using REST APIs

34.1.4.4.1 Portal Export Prerequisites

Before exporting a portal to an archive (.par file), verify the following:

- **Portal content stored on Content Server** - If you want to include the portal content stored on Content Server in the portal archive, ensure Content Server is up and running.

- **Web service data controls** - If any of the portals you want to export contain web service data controls, all the associated web services must be up and accessible for the export to succeed.

- **Portlet producers** - If any of the portals you want to export contain portlets, all associated portlet producers must be up and accessible for all portlet metadata to be included in the archive.

- **Content outside portal folder** - Content stored outside the portal folder (such as files, images and icons) that is used by portal assets, portal pages, Content Presenter, and Site Studio are not automatically included in the archive. You must copy all dependent files to appropriate locations on the target content server.

---

**Note:**

If you are managing legacy portals with assets that store artifacts in MDS, Oracle recommends that you relocate all dependent artifacts from MDS to your content server. If you choose not to move artifacts stored in MDS, you can use MDS WLST commands `exportMetadata`/`importMetadata` to move the MDS content to another target. For example:

```bash
exportMetadata(application='webcenter', server='WC_Portal',
fromLocation='/tmp/content',
docs='/oracle/webcenter/siteresources/scopedMD/shared/**')

importMetadata(application='webcenter', server='WC_Portal',
fromLocation='/tmp/content',
docs='/oracle/webcenter/siteresources/scopedMD/shared/**')
```

---

34.1.4.4.2 Exporting Online Portals to an Archive Using WebCenter Portal Administration

With Portal Server-Manage Configuration permission, you can export portals to an archive using WebCenter Portal administration, saving the portal archive to a local file system or to a remote server file system.
Note:
You can export portal templates too, but this is a separate process. You cannot export portals and portal templates into a single archive. For more information, see Exporting Portal Templates to an Archive Using WebCenter Portal.

To export one or more portals through WebCenter Portal Administration:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the portal you want to export by highlighting the row in the table.

   Press Ctrl+click to select more than row.

   Note:
   To prevent data conflict during the export process, Oracle recommends that all the portals you select are offline during the export process, even if only temporarily. For details, see Taking Any Portal Offline.

   Members with the Portals: Manage Security and Configuration permission can still access a portal when it is offline, so ask them not make changes while you complete the export.

2. Click Export in the toolbar.

   The Export Portals pane opens (Figure 34-10). All the portals that you select are listed.

   If you want to exclude a portal, click the Delete icon next to the portal's name (a blue cross in Figure 34-10).

   Figure 34-10  Exporting Portals

3. Enter a name for the Portal Archive with the file extension .par or accept the default name.

   The default filename for the portal archive includes a random number to ensure uniqueness: webcenter_random_number.par
4. Select **Include Portal Content** to export each portal’s content folder.

A folder is automatically created in WebCenter Portal’s content repository for portals that use document services to create, manage, and store portal documents (files, folders, wikis, blogs). Only content that is stored in this folder can be exported with the portal. The export does not, for example, include web content/pages displayed through Content Presenter since this information is not stored in the portal’s content folder.

---

**Note:**

- Including content folders increases the size of the portal archive. If you are exporting a large number of portals or large content folders, take care that your archive does not exceed the maximum upload size for files (2 GB by default). If necessary, you can increase this setting, as described in [Changing the Maximum File Upload Size](#).

- If you are managing legacy portals with assets that store artifacts in MDS, Oracle recommends that you relocate all dependent artifacts from MDS to your content server. If you choose not to move artifacts stored in MDS and do not include MDS content within the asset archive, you can use MDS WLST commands `exportMetadata/importMetadata` to move the MDS content another time. For example:

  ```
  exportMetadata(application='webcenter', server='WC_Portal',
  toLocation='/tmp/content',
  docs='/oracle/webcenter/siteresources/scopedMD/shared/**')
  
  importMetadata(application='webcenter', server='WC_Portal',
  fromLocation='/tmp/content',
  docs='/oracle/webcenter/siteresources/scopedMD/shared/**')
  ```

---

5. Select **Include Shared Assets** to export the shared assets used in the portal.

6. Click **Export**.

7. Progress information is displayed during the export process (Figure 34-11).

When the export process is complete, specify a location for the export archive (.par file).
Select either of the following:

- **Download** - Saves the export .par file to your local file system.  
  
  Your browser downloads and saves the archive locally. The actual download location depends on your browser settings.
  
  Some browsers have settings that restrict the size of downloads. If your export archive is large and does not download, check your browser settings.

- **Save to Server** - Saves the export .par file to a server location. The .par file is saved to the default path `DOMAIN_HOME/WC_Archives`, where `DOMAIN_HOME` refers to the domain location where WebCenter Portal is installed.
  
  When the file is saved, click **OK** to close the Information dialog.

8. Click **Close** to close the Export Portals dialog.

### 34.1.4.4.3 Exporting Online Portals to an Archive Using WLST

Use the WLST command `exportWebCenterPortals` to export one or more portals to a portal archive (.par file). When you create a portal archive using WLST you can choose whether or not to include the portal's content folder and connection information in the archive:

```java
exportWebCenterPortals(appName, fileName, [names, offlineDuringExport, exportPortalContent, exportConnections, exportSharedAssets, server, applicationVersion])
```

The options that you set depends on your specific archive requirements. For command syntax, see `exportWebCenterPortals` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

Here are a few examples:

**Example 1 - Exporting two portals**

This example exports two portals named *Sales* and *Finance*, plus all content, data, security, customizations, and connection information:

```java
exportWebCenterPortals(appName='webcenter', fileName='MyPortalExport.par', names='Sales,Finance', exportPortalContent=1, exportConnections=1)
```
Deploying Portals

Example 2 - Exporting a single, offline portal without its content folder or
connection details
This example takes MySales offline and exports the portal to
MyPortalExport.par:
exportWebCenterPortals(appName='webcenter', fileName='MyPortalExport.par',
names='Sales', offlineDuringExport=1)

34.1.4.4.4 Exporting a Portal Using REST APIs
You can generate a portal archive (.par file) for your portals using the REST API
support.
To export a portal using REST API, use the following URL format:
http://host:port/rest/api/v1/portal/portals/portal_shortId/archive?
utoken=utoken_value

Where host: port are the hostname and port number for the server where the portal
is running, and portal_shortId is the short ID of the portal to be exported.
If you want to export the portal content as well, include the
includePortalContentValue parameter in the URL as follows:
http://host:port/rest/api/v1/portal/portals/portal_shortId/
archive?
includePortalContent=includePortalContentValue&utoken=utoken_val
ue
The default value for includePortalContent is 0. Any value greater than 0 will be
treated as true, and the portal content will be included in the portal archive.
To export the portal, in wpfas/modules/rest-service/servlet/src/java/
oracle/webcenter/jaxrs/services/portal/controller/
PortalsResource.java, add a GET operation in the following format:
@GET
@Path("{portalId}/archive")
public Response exportPortal(@PathParam("portalId") String portalId,
@DefaultValue(START_INDEX_DEFAULT)
@QueryParam("includePortalContent") int includePortalContent);

The GET operation will call the API to perform the portal export. You can then
download the PAR file to the local client. Response code 200 represents the successful
export of a portal.

34.1.4.5 Importing Portals from an Archive
Administrators can deploy archived portals (.par files) to any WebCenter Portal
Server. You can use the WLST command importWebCenterPortals to import
portal archives or you can use WebCenter Portal Administration.
On import, all portals included in the archive are created or re-created on the target
server. Existing portals are deleted then replaced, and new portals are created. If you
intend to import portals with names identical to those available on the target server,
ensure that those portals are offline in the target application as it is not possible to
overwrite portals that are online. For details, see Taking Any Portal Offline.

Deploying Portals, Templates, Assets, and Extensions 34-25


When importing portals using WLST, you can set the option `forceOffline=1` to automatically take any online portals offline. Any portals taken offline in this way, remain offline at the end of the import process.

Portals are locked during an import operation to prevent simultaneous imports/exports of the same portal. If someone else is importing a particular portal, all subsequent attempts to import (or export) the same portal are blocked.

After importing one or more portals, consider initiating an Oracle Secure Enterprise Search crawl to index the newly imported data.

**Portal Archive Content (Optional on Import)**

Portal archives sometimes contain the portal’s content folder. If included, you can choose whether or not to import this information too. On import, the content folder in the archive overwrites the folder on the target (if one exists).

**Note:**

Portal archives do not include web content/pages displayed through Content Presenter since this information is not stored in the portal’s content folder.

**External Portal Data (Import Separately)**

Externally stored data, such as discussions can be migrated for individual portals but this is a separate process. See Migrating Discussions and Pagelet Producer Resources for a Portal.

To find out how to import portal archives, see:

- Portal Import Prerequisites
- Importing a Portal from an Archive Using WebCenter Portal Administration
- Importing a Portal from an Archive Using WLST
- Importing a Portal Using REST APIs

**34.1.4.5.1 Portal Import Prerequisites**

Before importing a portal archive (.par file), verify the following:

- **Shared identity store** - Verify that the users in the source and target environments are the same. If a shared identity store is not used, your system administrator must migrate users to the target. Refer to Back Up (Export) WebCenter Portal Schema Data and Restore (Import) WebCenter Portal Data.

- **Portals exist on the target** - Check whether any portals in the archive already exist on the target. If required, take existing portals offline during the import process, as described in Taking Any Portal Offline.

- **Web service data controls** - If any of the portals you want to import contain web service data controls, all the associated web services must be up and accessible for the import to succeed.
• **Portlet producers** - Any portlet producers used by the portal must be up and running when you import the portal.

• **Connections to external servers, applications, web services, and portlet producers** - Portals that rely on certain external connections to be configured will not work if a similar connection does not exist in the target. Before importing the portal, ensure that all the required connections exist on the target. If you create or reconfigure connections on the target you may need to restart the target managed server. For details, see Moving Connections Details from Staging to Production.

• **Archive version** - If you want to import portal archives from a WebCenter Portal 11g release, you must first upgrade to the current WebCenter Portal 12c release, re-create the portal export archive (.par file), and then import it.

  For upgrade, see Upgrading Oracle WebCenter

### 34.1.4.5.2 Importing a Portal from an Archive Using WebCenter Portal Administration

With Portal Server-Manage Configuration permission, you can import portals from a portal archive through WebCenter Portal Administration.

To import one or more portals from a .par file:

1. Ensure that you meet the portal import prerequisites listed in Portal Import Prerequisites.

2. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), click **Import** in the toolbar.

   The Import Portals dialog opens (Figure 34-12).

   ![Figure 34-12 Importing Portals](image)

3. Specify the location of your portal archive (.par file). Select one of:

   - **Look on My Computer** - Enter the location in the text box. Alternatively, click **Browse** to locate the directory on your local file system where the .par file is stored.

   - **Look on WebCenter Portal Server** - Enter the path on the server where WebCenter Portal is deployed, including the archive filename, in the text box. For example, /tmp/MyPortalExport.par. You can specify any shared location accessible from WebCenter Portal.

4. Click **Browse Archive** to review the content available for import (Figure 34-13).
The names of all the portals in the specified archive display in the table. The **Type** column indicates when there is a difference between the portals in the archive and those that exist on the target:

- **New** - A portal with this name does not exist on the target. On import, a new portal is created.

- **Replace** - A portal with this name and the same GUID exists on the target. The existing portal is deleted on import and replaced with the version in the portal archive.

- **Conflict** - A portal with this name exists on the target but the portal on the target has a different GUID to the portal you are trying to import. Or similarly, this portal has the same GUID as one of the portals in the target but the portal names do not match.

If the import process detects a conflict between the portals you are trying to import and those which exist on the target, you must resolve the issue. For example, if the conflict is due to matching names but different GUIDs you could either change the name of the source portal and create a new export archive, or rename the conflicting portal in the target application and import the same archive.

5. Set import options as required. For details, see **Table 34-3**:

**Table 34-3  Portal Import Options**
Table 34-3  (Cont.) Portal Import Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Include Portal Content       | (Only displays if the archive specified includes a content folder for one or more portal.) Select to import all content folders included in the archive. Folders that exist on the target are overwritten on import. Deselect this option to exclude portal content folders (if any). This option is useful when migrating between stage and production environments where test content is no longer required.  
**Note:** Portal archives that contain large content folders may exceed the maximum upload size for files (2 GB by default). Oracle recommends that you use the `importWebCenterPortals` WLST command to import any portal archive that exceeds the current upload size. See Importing a Portal from an Archive Using WLST. If necessary, you can increase the upload setting, see Changing the Maximum File Upload Size. |
| Include Shared Assets        | Select to import shared assets, like skin and page templates, used in the portal.                                                                 |
Note:

- If you are working with legacy portals with assets that store artifacts in MDS, Oracle recommends that you relocate all dependent artifacts from MDS to your content server. If you choose not to move artifacts stored in MDS and do not include MDS content within the asset archive, you can use MDS WLST commands `exportMetadata/importMetadata` to move the MDS content another time. For example:

  ```
  exportMetadata(application='webcenter', server='WC_Portal',
  toLocation='/tmp/content',
  docs='oracle/webcenter/siteresources/scopedMD/shared/**')
  ```

  ```
  importMetadata(application='webcenter', server='WC_Portal',
  fromLocation='/tmp/content',
  docs='oracle/webcenter/siteresources/scopedMD/shared/**')
  ```

An information message displays.

7. Click **Yes** to confirm that you want to import the portals.

   An information message displays when all portals import successfully (Figure 34-14).

   **Figure 34-14   Portal Import Successful**

   ![Portal Import Successful](image)

8. Click **Close** to dismiss the Import Portals window.

   Typically, some additional work is required before new portals are ready for general use so initially, all newly imported portals are **offline**. For example, you may want to:

   - Migrate data associated with back-end components. For details, see Migrating Discussions and Pagelet Producer Resources for a Portal.

   - Add or invite members.
• Enable or disable tools and services.

Once portal content and membership details are finalized you can bring the portal online, see Bringing Any Portal Back Online.

34.1.4.5.3 Importing a Portal from an Archive Using WLST

Use the WLST command importWebCenterPortals to import one or more archived portals into WebCenter Portal:

```
importWebCenterPortals(appName, fileName, [names, parentPortal, 
importCustomizations, importPortalContent, importSecurity, importData, 
importActivities, overwrite, savePortals, forceOffline, importLog, 
importConnections, connPropertiesFile, importSharedAssets, server, 
applicationVersion])
```

When you import portals using WLST, you do not have to import everything inside the archive. If the archive contains multiple portals you can specify only those portals that you want to import. You can also specify how much information is imported along with the portals. For example you can choose whether or not to import the portal’s content folder or shared assets. These options are useful as in some circumstances, such as moving a portal from a test environment to a stage or production environment, test-related data/content is not always required.

The options that you set depend on your specific requirements. For command syntax, see importWebCenterPortals in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are a few examples:

**Example 1 - Importing two portals on the target for the first time**

This example imports two portals named Sales and Finance, plus all content, and security, and also specifies a name and location for the import log file:

```
importWebCenterPortals(appName='webcenter', fileName='MyPortalExport.par', 
names='Sales,Finance', importLog='/myimportlogs/myPortal_import.log')
```

**Example 2 - Importing a portal that exists on the target**

This example backs up a portal named myExistingPortal on the target and then overwrites the target portal with the archived version (excluding all possible data):

```
importWebCenterPortals(appName='webcenter', fileName='MyPortalExport.par', 
names='myExistingPortal', importPortalContent=0, importActivities=0, overwrite=1, 
savePortals=1)
```

34.1.4.5.4 Importing a Portal Using REST APIs

You can import portals into WebCenter Portal using REST API.

To import a portal using REST API, use the following URL format:

```
http://host:port/rest/api/v1/portal/portals?utoken=<utoken_value>
```

where `host:port` are the hostname and port number of the server into which you want to import the portal.

To import the portal, add the POST operation in the following format in the `wpfas/modules/rest-service/servlet/src/java/oracle/webcenter/jaxrs/services/portal/controller/PortalsResource.java`:
For performing portal imports using the POST operation the content type must be specified as `multipart/form-data`. In a multipart format, each part is a contiguous portion of the object’s data. You can upload each object part independently and in any order. If transmission of any part fails, you can retransmit that part without affecting other parts. The POST operation also requires the filename of the portal archive to be mapped to the `fileName` key.

### 34.1.4.6 Viewing and Extracting Portal Archives

Use the WLST command `listWebCenterPortalArchive` to view the content of a portal archive (.par file). You can also extract the portal archive content to a location of your choice, if required. For command syntax, see `listWebCenterPortalArchive` in *WLST Command Reference for WebLogic Server*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 34.2 Deploying Portal Templates

Administrators can export portal templates from WebCenter Portal and deploy them on another portal server. Out-of-the-box templates cannot be exported.

While export and import utilities are primarily used to move information between WebCenter Portal instances, the portal template export feature is also useful as a backup service, and for sharing and exchanging templates with others.

Portal templates can contain pages, documents, portal assets, and security information such as custom roles and member details. As all the template data is included in the portal template archive, you do not need to manually migrate any template data to the target when you deploy a portal template to another WebCenter Portal Server.

Portal templates that use document services (files, folders, wikis, blogs) automatically own a content folder on WebCenter Portal's back-end content repository. When you use WebCenter Portal Administration to export portal templates, the content stored in this folder is automatically included in the portal template archive for easy deployment to another target server.

If you export the portal template using the WLST command `exportWebCenterPortalTemplates` the content folder is optional.

---

**Note:**

Portal template archives do not include web content/pages referenced by the portal template that is stored at any other location, for example, information displayed through Content Presenter that is not stored in the portal template’s content folder. Only the folder assigned to the portal template on WebCenter Portal's back-end content repository is included with the portal template archive.
This section includes the following topics:

- Exporting Portal Templates
- Importing Portal Templates

### 34.2.1 Exporting Portal Templates

Administrators can use the WLST command `exportWebCenterPortalTemplates` to export one or more portal templates to an archive. Alternatively, administrators and application specialists can use WebCenter Portal Administration to export portal templates to an archive.

This section includes the following topics:

- Exporting Portal Templates to an Archive Using WebCenter Portal
- Exporting Portal Templates to an Archive Using WLST

#### 34.2.1.1 Exporting Portal Templates to an Archive Using WebCenter Portal

Application specialists (and other users with the Portal Templates: Manage All permission) can export portal templates from WebCenter Portal. For information, see Exporting Portal Templates in *Building Portals with Oracle WebCenter Portal*.

**Note:**

You cannot export portals and portal templates into a single archive. Exporting portals is a separate process. For more information, see Exporting Online Portals to an Archive Using WebCenter Portal Administration.

#### 34.2.1.2 Exporting Portal Templates to an Archive Using WLST

Use the WLST command `exportWebCenterPortalTemplates` to export one or more portal templates to an archive (.par file). When you create a portal template archive using WLST you can choose whether or not to include the portal's content folder in the archive:

```
exportWebCenterPortalTemplates(appName, fileName, [names, exportPortalTemplateContent, exportConnections, server, applicationVersion])
```

The options that you set depends on your specific archive requirements. For command syntax, see `exportWebCenterPortalTemplates` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are a few examples:

**Example 1 - Exporting two portal templates**

This example exports two templates named `SalesTargetTemplate` and `NewProjectTemplate`, plus their associated content folders:

```
exportWebCenterPortalTemplates(appName='webcenter',
    fileName='MyTemplateExport.par', names='SalesTargetTemplate,NewProjectTemplate',
    exportPortalTemplateContent=1)
```

**Example 2 - Exporting a single portal template without its content folder**
This example exports the **New Hire** template. Documents are not enabled in this template so the template does not have a content folder:

```java
exportWebCenterPortals(appName='webcenter', fileName='MyTemplateExport.par', names='NewHire')
```

### 34.2.2 Importing Portal Templates

Administrators can use the WLST command `importWebCenterPortals` to deploy one or more portal templates on a WebCenter Portal Server. Alternatively, administrators and application specialists can use WebCenter Portal Administration to import portal templates from an archive.

On import, **all** portal templates included in the archive are re-created on the target application. If a portal template exists on the target, then it is deleted and replaced. If a portal template does not exist, then it is created.

Newly imported portal templates are not immediately available for general use. You must publish newly imported templates to make them available to everyone. See Publishing or Hiding Portal Templates in *Building Portals with Oracle WebCenter Portal*.

This section includes the following topics:

- Importing Portal Templates from an Archive Using WebCenter Portal
- Importing Portal Templates from an Archive Using WLST

#### 34.2.2.1 Importing Portal Templates from an Archive Using WebCenter Portal

Application specialists (and other users with Portal Templates: Manage All permission) can import portal templates into WebCenter Portal. For more information, see Importing Portal Templates in *Building Portals with Oracle WebCenter Portal*.

#### 34.2.2.2 Importing Portal Templates from an Archive Using WLST

Use the WLST command `importWebCenterPortals` to import one or more portal templates from an archive (.par file). When you import a portal template archive using WLST you can choose whether or not to import template content folders:

```java
importWebCenterPortals(appName, fileName, [names], [parentPortal], [importCustomizations], [importPortalContent], [importSecurity], [importData], [importActivities], [overwrite], [savePortals], [forceOffline], [importLog], [importConnections], [connPropertiesFile], [importSharedAssets], [server], [applicationVersion])
```

The options that you set depend on your specific archive requirements. For command syntax, see `importWebCenterPortals` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are a few examples:

**Example 1 - Importing a new portal template without content**

The following example imports the **New Hire** portal template archived in `myPortalTemplateExport.par` and specifies a name and location for the import log file. Documents are not enabled in this template so the template does not have a content folder.

```java
importWebCenterPortals(appName='webcenter', fileName='myPortalTemplateExport.par', names='NewHire', importLog='newHireTemplate_import.log')
```
Example 2 - Imports two existing portal template with content:

This example backs up portal templates named SalesTargetTemplate and NewProjectTemplate on the target, and then overwrites the existing templates and their content folders with information in myPortalTemplateExport.par:

importWebCenterPortals(appName='webcenter', fileName='myPortalTemplateExport.par', names='SalesTargetTemplate,NewProjectTemplate', importPortalContent=1, overwrite=1, savePortals=1, importLog='myPortalTemplate_import.log')

34.3 Deploying Assets, Devices, and Device Groups

Authorized users can download assets, such as skins and page templates, while WebCenter Portal is running, edit and extend them in tools such as Oracle JDeveloper, and then deploy them back to WebCenter Portal. Users who want to share assets or migrate assets to other WebCenter Portal instances can use the download/upload feature too.

WebCenter Portal users can download and upload the following assets through WebCenter Portal and administrators can perform the same tasks using WLST commands:

- Page templates
- Resource catalogs
- Skins
- Page styles
- Content Presenter display templates
- Visualizations
- Pagelets
- Business objects
- Task flow styles
- Task flows
- Layout
- Data controls
- Data sources

Note:
While you cannot upload or download individual pagelets, all assets (including pagelets) are included when you migrate individual portals or an entire WebCenter Portal instance.

When you download (or export) a WebCenter Portal asset, the asset details are saved to an export archive (.aar file). You can save the export archive to your local file system or a remote server file system using a filename of your choice. Artifacts, such as icons and images, used or referenced by assets are not included in the export or
import archive unless they are stored in the portal's content folder on Content Server and the contents folder is in sync on the source and the target servers.

**Devices and Device Groups**

Administrators can export device groups and devices to a file (.aar file), and then import (deploy) them to another WebCenter Portal instance. For example, if you want to move devices or device groups developed on stage to a production server or share your devices and device groups with another WebCenter Portal installation.

---

**Note:**

You cannot export or import out-of-the-box device groups or devices. You can only export and import device groups or devices that you and other administrators create or copy.

---

This section includes the following topics:

- Exporting Assets, Devices, and Device Groups to an Archive
- Importing Assets from an Archive

### 34.3.1 Exporting Assets, Devices, and Device Groups to an Archive

This section describes the various ways you can create an asset, device, and device group archive. It includes the following topics:

- Exporting Assets to an Archive from WebCenter Portal
- Exporting Devices and Device Groups to an Archive
- Exporting an Asset, Device, or Device Group to an Archive Using WLST
- Exporting Assets Using REST API

See also, About Permissions Required to Import (or Export) Assets.

### 34.3.1.1 Exporting Assets to an Archive from WebCenter Portal

Administrators, application specialists, and portal managers can export assets from WebCenter Portal. For details, see Downloading an Asset in *Building Portals with Oracle WebCenter Portal*.

### 34.3.1.2 Exporting Devices and Device Groups to an Archive

This section includes the following topics:

- Exporting Devices and Device Groups Using WebCenter Portal
- Exporting Devices and Device Groups Using WLST

### 34.3.1.2.1 Exporting Devices and Device Groups Using WebCenter Portal

Administrators can export one or more devices and device groups to a file (.par file) from WebCenter Portal Administration. For details, see Managing Device and Device Group Life Cycles.
34.3.1.2 Exporting Devices and Device Groups Using WLST

Administrators can use the WLST command `exportWebCenterResource` to export a single device or device group from WebCenter Portal to an export archive (.aar file):

```java
exportWebCenterResource{appName, fileName, resourceType, [resourceGUID, resourceName, spaceName, exportContentDirectory, server, applicationVersion]}
```

For command syntax, see `exportWebCenterResource` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

Here are a few examples:

**Example 1 - Exporting a device group**

The following example exports a device group named "MyMobileDeviceGroup" from WebCenter Portal:

```java
exportWebCenterResource{appName='webcenter', fileName='myDeviceGroupExport.aar', resourceType='deviceGroup', resourceName='MyMobileDeviceGroup'}
```

**Example 2 - Exporting a device**

The following example exports a device named "MyMobileDevice" from WebCenter Portal:

```java
exportWebCenterResource{appName='webcenter', fileName='myDeviceExport.aar', resourceType='device', resourceName='MyMobileDevice'}
```

34.3.1.3 Exporting an Asset, Device, or Device Group to an Archive Using WLST

Administrators can use the WLST command `exportWebCenterResource` to export a single asset, device, or device group from WebCenter Portal:

```java
exportWebCenterResource{appName, fileName, resourceType, [resourceGUID, resourceName, spaceName, exportContentDirectory, server, applicationVersion]}
```

The options that you set depends on the asset, device, or device group you want to export. For command syntax, see `exportWebCenterResource` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

Here are a few examples:

**Example 1 - Exporting a page template belonging to the "Sales" portal**

The following example exports a page template from the Sales portal to a file named mySalesPageTemplateExport.aar:

```java
exportWebCenterResource{appName='webcenter', fileName='mySalesPageTemplateExport.aar', resourceType='pageTemplate', resourceGUID='gsr47d9a5ac_7398_439a_97d2_8b54ce905f7e', spaceName='SalesPortal'}
```

**Example 2 - Exporting a shared portal skin identified by GUID**

The following example exports a shared portal skin to a file named mySharedSkinExport.aar:

```java
```
Deploying Assets, Devices, and Device Groups

exportWebCenterResource(appName='webcenter', fileName='mySharedSkinExport.aar',
resourceType='skin', resourceGUID='gsr5a8c2fcc_bc7f_4cba_9254_36df58d66e60)

Example 3 - Exporting a shared portal skin identified by name
The following example exports the same shared portal skin but specifies the skin's
display name rather than the GUID:
exportWebCenterResource(appName='webcenter', fileName='mySharedSkinExport.aar',
resourceType='skin', resourceName='MyCompanySkin)

Example 4- Exporting a device group
The following example exports a device group named "MyMobileDeviceGroup" from
WebCenter Portal:
exportWebCenterResource(appName='webcenter', fileName='myDeviceGroupExport.aar',
resourceType='deviceGroup', resourceName='MyMobileDeviceGroup)

Example 5- Exporting a device
The following example exports a device named "MyMobileDevice" from WebCenter
Portal:
exportWebCenterResource(appName='webcenter', fileName='myDeviceExport.aar',
resourceType='device', resourceName='MyMobileDevice)

34.3.1.4 Exporting Assets Using REST API
Oracle WebCenter Portal provides REST APIs to download a specific asset to an
archive (.aar) from a portal or the shared assets area.
To export an asset using REST API, use the following URL format:
http://host:port/rest/api/v1/portal/typeOfAsset/assetId/archive?utoken=utokenvalue

Where typeOfAsset refers to the asset you want to export, such as page templates,
skins, visualization templates, or resource catalogs.
To export an asset, add the GET operation in the following format in wpfas/
modules/rest-service/servlet/src/java/oracle/webcenter/jaxrs/
services/portal/controller/AssetTypeResource.java
@GET
@Path("{id}/archive")
public Response exportPortal(@PathParam("id") String id);

Where, PathParam's id is the short ID of the asset to be exported.

34.3.2 Importing Assets from an Archive
You can only import an asset previously saved to a WebCenter Portal asset export
archive (.aar file). For details, see Exporting Assets, Devices, and Device Groups to
an Archive.
On import:
• Existing assets are overwritten, that is, assets with the same internal ID.
• Portal assets are always imported back into the same portal. You cannot import a
resource into a different portal.

34-38 Administering Oracle WebCenter Portal


This section describes the various ways you can import an asset to WebCenter Portal from an archive. It includes the following topics:

- About Permissions Required to Import (or Export) Assets
- Importing Assets from an Archive using WebCenter Portal
- Importing Assets from an Archive using WLST

34.3.2.1 About Permissions Required to Import (or Export) Assets

Table 34-4 describes the roles/permission required to import (or export) assets using the WebCenter Portal Administration.

**Note:**

If you want to import (or export) assets using WLST, you must also have the WebLogic Server Monitor role (or higher).

<table>
<thead>
<tr>
<th>Asset</th>
<th>Required WebCenter Portal Role or Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared asset</td>
<td>• Administrator</td>
<td>• This role includes the required permissions for importing and exporting shared assets (Create, Edit, Delete Assets and Manage Configuration). See also, Managing Application Roles and Permissions.</td>
</tr>
<tr>
<td></td>
<td>OR</td>
<td></td>
</tr>
<tr>
<td>Shared asset</td>
<td>• Create, Edit, Delete &lt;resourcetype&gt;</td>
<td>• This permission enables you to create and manage shared assets for WebCenter Portal.</td>
</tr>
<tr>
<td></td>
<td>• Manage Configuration</td>
<td>• This application-level permission (Manage Configuration) gives you access to WebCenter Portal Administration pages.</td>
</tr>
<tr>
<td>Portal asset</td>
<td>• Portal Manager</td>
<td>• This role includes the required permissions (Create, Edit, Delete Assets and Manage Configuration). See also, Managing Roles and Permissions for a Portal in Using Oracle WebCenter Portal.</td>
</tr>
<tr>
<td></td>
<td>OR</td>
<td></td>
</tr>
<tr>
<td>Portal asset</td>
<td>• Create, Edit, Delete Resources (standard) OR Create, Edit, Delete &lt;resourcetype&gt; (advanced)</td>
<td>• These permissions enable you to create and manage assets for a particular portal. Either standard or advanced permissions will apply, depending on the portal.</td>
</tr>
<tr>
<td></td>
<td>• Manage Configuration</td>
<td>• This portal-level permission (Manage Configuration) gives you access to the asset administration page for a particular portal.</td>
</tr>
</tbody>
</table>
34.3.2.2 Importing Assets from an Archive using WebCenter Portal

Administrators, application specialists, and portal managers can import assets from WebCenter Portal. For details, see Uploading an Asset in Building Portals with Oracle WebCenter Portal.

34.3.2.3 Importing Devices and Device Groups Using WebCenter Portal

Administrators can import one or more devices and device groups from a file (.par file) using WebCenter Portal Administration. For details, see Managing Device and Device Group Life Cycles.

34.3.2.4 Importing Assets from an Archive using WLST

Administrators can use the WLST command `importWebCenterResource` to deploy a single asset, device, or device group to WebCenter Portal.

```python
importWebCenterResource(appName, fileName, [resourceType, spaceName, overwriteContentDirectory, server, applicationVersion])
```

The options that you set depends on the asset, device, or device group you want to deploy. For command syntax, see `importWebCenterResource` in WebCenter WLST Command Reference. For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are a few examples:

**Example 1 - Deploying a page template to the "Sales" portal**

The following example imports a page template archived in `mySalesPageTemplateExport.aar` into the Sales portal:

```python
importWebCenterResource(appName='webcenter',
fileName='mySalesPageTemplateExport.aar', resourceType='pageTemplate',
spaceName='SalesPortal')
```

**Example 2 - Deploying a shared portal skin**

The following example imports a shared portal skin archived in `mySharedSkinExport.aar`:

```python
importWebCenterResource(appName='webcenter', fileName='mySharedSkinExport.aar', resourceType='skin')
```

**Example 3 - Deploying a device group**

The following example imports a device group exported to `myDeviceGroupExport.aar`:

```python
importWebCenterResource(appName='webcenter', fileName='myDeviceGroupExport.aar', resourceType='deviceGroup')
```

**Example 4 - Deploying a device**

The following example imports a device archived in `myDeviceExport.aar`:

```python
importWebCenterResource(appName='webcenter', fileName='myDeviceExport.aar', resourceType='device')
```
Deploying Custom Shared Library Extensions

34.3.2.5 Importing Assets Using REST API
Oracle WebCenter Portal provides REST APIs to download a specific asset to an
archive (.aar file) from a portal or the shared assets area.
To export an asset using REST API, use the following URL format:
http://host:port/rest/api/v1/portal/portals/portalShortId/typeOfAsset?
utoken=utokenvalue

Where typeOfAsset is the asset you want to export, such as page templates, skins,
visualization templates, or resource catalogs, and portalShortId refers to the short
ID of the portal into which the asset will be imported.
To import an asset into a portal or the shared assets area, add the POST operation in
the following format in wpfas/modules/rest-service/servlet/src/java/
oracle/webcenter/jaxrs/services/portal/controller/
PortalsReosurce.java:
@POST
@Consumes({MediaType.MULTIPART_FORM_DATA, MediaType.APPLICATION_OCTET_STREAM})
@Path("{portalId}/<typeOfAsset>")
@ResourceType("urn:oracle:webcenter:portal:<assetType>")
public Response importPortal(@PathParam("portalId") String portalId,
MultiPart multiPartData);

Where, PathParam's portalId is the short ID of the portal into which asset will be
imported, multipartData is the multipart data with the file to be consumed for
upload.
For importing assets using the POST operation, the content type must be specified as
multipart/form-data. In a multipart format, each part is a contiguous portion of
the object's data. You can upload each object part independently and in any order. If
transmission of any part fails, you can retransmit that part without affecting other
parts. The POST operation also requires the filename of the asset archive to be mapped
to the fileName key.
For importing a shared asset, you can also use the following URL format:
http://host:port/rest/api/v1/portal/typeOfAsset?utoken=utokenvalue

To import a shared asset, add the POST operation in the following format in wpfas/
modules/rest-service/servlet/src/java/oracle/webcenter/jaxrs/
services/portal/controller/AssetTypeResource.java:
POST
@Consumes({MediaType.MULTIPART_FORM_DATA, MediaType.APPLICATION_OCTET_STREAM})
@ResourceType("urn:oracle:webcenter:portal:<assetType>")
public Response importPortal(MultiPart multiPartData)

34.4 Deploying Custom Shared Library Extensions
Developers can use JDeveloper to build custom ADF library components for portals,
such as managed beans, task flows, and data controls, and deploy them as shared
library extensions to the portal server.
See also, the Developing Components for WebCenter Portal Using JDeveloper in
Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Deploying Portals, Templates, Assets, and Extensions 34-41


If shared libraries are used by a portal, you can choose to push them to another instance while deploying or propagating the portal.

### 34.5 Moving Connections Details from Staging to Production

Administrators can use the WLST commands `exportWebCenterPortalConnections` and `importWebCenterPortalConnections` to migrate connections details from one WebCenter Portal installation to another. These commands are useful if you import or restore a portal and connections used in the source server, such as portlet producer connections and web service connections, do not exist on the target server.

For more information on the types of connections you can migrate, see Understanding Connection Property Files.

This section includes the following topics:

- Exporting WebCenter Portal Connections Details to a File
- Importing New WebCenter Portal Connections from a File

#### 34.5.1 Exporting WebCenter Portal Connections Details to a File

If you have WebLogic Server Operator role (or higher) you can use the WLST command `exportWebCenterPortalConnections` to export connection information currently configured for a particular WebCenter Portal installation to a file:

```java
exportWebCenterPortalConnections(appName, fileName, [connectionType, connectionName, logFile, server, applicationVersion])
```

**Note:**

You cannot export connections for a specific portal. Connections are shared across all the portals.

The options that you set depends on the connection information you want to export. For command syntax, see `exportWebCenterPortalConnections` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are a few examples:

**Example 1 - Deploying all WSRP producer and external application connections to a file**

The following example only exports WSRP producer and external application connections to a file named `myconnection.properties`:

```java
exportWebCenterPortalConnections(appName='webcenter',
                              fileName='/myConnections/myconnection.properties',
                              connectionType='wsrpProducerConnection,externalAppConnection')
```

**Example 2 - Deploying specific WSRP producer connections to a file**

The following example exports connection configuration information for two WSRP producer connections named `MyWSRP1` and `MyWRSP2`:
exportWebCenterPortalConnections(appName='webcenter', fileName='/myConnections/connection.properties', connectionType='wsrpProducerConnection', connectionName='MyWSRP1,MyWSRP2')

34.5.2 Importing New WebCenter Portal Connections from a File

If you have WebLogic Server Operator role (or higher) you can use the WLST command importWebCenterPortalConnections to deploy connection information exported from one WebCenter Portal installation to another.

importWebCenterPortalConnections(appName, fileName, [promptForPassword, logFile, server, applicationVersion])

Only new connections are imported on the target. Connections that already exist on the target are ignored. The source connection information must be exported using the WLST command exportWebCenterPortalConnections. To find out how, see Exporting WebCenter Portal Connections Details to a File.

If required, you can edit the file that contains the connection information before you deploy the connection information on the target. See also Understanding Connection Property Files.

Example 1 - Importing connections from a file

The following example imports connections defined in a file named myconnection.properties located in /myConnections. Detailed information about the import connection operation is also logged to importConnection.log:

importWebCenterPortalConnections(appName='webcenter', fileName='/myConnections/myconnection.properties', logFile='importConnection.log')

Example 2 - Importing connections that require credentials

The following example imports connections defined in a file named myconnection.properties located in /myConnections and prompts you for credentials if required:

importWebCenterPortalConnections(appName='webcenter', fileName='/myConnections/myconnection.properties', promptForPassword=1)

For command syntax, see importWebCenterPortalConnections in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

34.6 Migrating Discussions and Pagelet Producer Resources for a Portal

After you move/migrate one or more portals to another server, you can (optionally) migrate portal data that is stored by various back-end components. This includes migrating discussions and pagelet producer resources if they are used in the portal.

Discussions:

• Exporting Portal Discussions to an Archive
• Importing Portal Discussions from an Archive

Pagelets:

• Exporting and Importing Pagelet Producer Resources
Exporting and Importing Pagelet Producer Metadata Using WLST

After importing one or more portals, consider initiating an Oracle Secure Enterprise Search crawl to index the newly imported data.

34.6.1 Exporting Portal Discussions to an Archive

Use the discussions server’s Admin Console to export discussions associated with a particular portal.

Portal discussions are exported to an .xml file, and saved to a .zip file in the DOMAIN_HOME/config/fmwconfig/servers/<target_server_name>/owc_discussions/data/ directory.

Where DOMAIN_HOME is the path to the Oracle WebLogic Server domain. For example, MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WC_Collaboration/owc_discussions/data/.

To export discussions for a portal:

1. Login to the Admin Console for the discussions server.
   You can login directly if you know the console's URL. For example: http://example.com:8890/owc_discussions/admin
   Alternatively, log in through WebCenter Portal as follows:
   a. Open WebCenter Portal administration.
      For details, see Exploring the Settings Pages in WebCenter Portal Administration.
   b. Click Portals.
   c. Select the portal whose discussions you want to export, then select Administer.
   d. Click Tools and Services, then Discussions.
   e. Note down the Forum Name/Forum ID or Category Name/Category ID associated with the portal.
      WebCenter Portal’s discussions server generates discussion category and forum IDs sequentially. If this ID exists on the target system, the imported forum (or category) will be assigned a new, unique ID, and therefore you must reconfigure the imported portal, to point to the new ID. For details, see Step 11 below.
   f. Click Administer Forums, and login to the Discussions Server Admin Console.

2. In the Admin Console, select the System menu and select XML Import & Export in the sidebar.

3. Select Data Export.

4. Set the following options (Figure 34-15):
   a. Export Options - Select Custom Options, and select all the check boxes.
   b. Export Content - Select Export Specific Content, and select the name of the forum or category required.
Note: Portals that support multiple forums use a category to store discussions. Other portal use a single forum.

c. **Export location, Export filename, Export file encoding** - Keep the default values.

**Figure 34-15  Exporting Discussions for an Individual Portal**

5. **Click Start Export.**

6. Once complete, copy the .zip file (that contains the export .xml file) from the MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/<server_name>/owc_discussions/data directory to same location on the target discussions server.

For example: MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WC_Collaboration/owc_discussions/data

Before importing discussions on the target system, the portal you are migrating must exist on the target. See Importing a Portal from an Archive Using WebCenter Portal Administration.
34.6.2 Importing Portal Discussions from an Archive

Use the discussions server’s Admin Console to import discussions exported from another WebCenter Portal environment.

Ensure that the associated portal exists on the target before you import the discussion data. See Exporting and Importing Portal Archives or Directly Deploying Portals Using WLST.

**Note:**

WebCenter Portal’s discussions server generates discussion category and forum IDs sequentially. Therefore, when importing discussion data between two targets (or source to target), there is a chance that the same IDs exist on both systems. When ID clashes occur, the imported forum (or category) is assigned a new, unique ID and therefore you must reconfigure the portal to point to the new ID. See Step 11 below for details.

To import discussions for a particular portal:

1. Log into the Admin Console for the target discussions server.
   
   You can login directly if you know the console’s URL. For example: http://example.com:8890/owc_discussions/admin
   
   Alternatively, log in through WebCenter Portal as follows:
   
   a. Open WebCenter Portal administration.
      
      For details, see Exploring the Settings Pages in WebCenter Portal Administration.
   
   b. Click Portals.
   
   c. Select the portal for which you want to import data, and then select Administer.
   
   d. Click Tools and Services, then Discussions.
   
   e. Click Administer Forums (on the far right), and log into the Admin Console.

2. In the Admin Console, select the System menu and then select XML Import & Export in the sidebar.

3. Select Data Import.

4. Select the appropriate import file from the list available (Figure 34-16).
   
   If the file you want is not listed, copy the export .zip file from the source directory DOMAIN_HOME/config/fmwconfig.servers/<target_server_name>/owc_discussions/data/ to same location on this target. See also, Exporting Portal Discussions to an Archive.
   
   Where DOMAIN_HOME is the path to the Oracle WebLogic Server domain. For example: MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WC_Collaboration/owc_discussions/data/
5. **Click Start Import.**

   On import, the discussions data is copied to the discussions server. In the next step you reassociate the portal you migrated earlier with this newly imported data.

6. **Select the Content menu, and then select Content Summary in the sidebar.**

   All the categories and forums in the system are listed here.

7. **Select WebCenter, and then click the Move button for the newly imported forum or category.**

8. **Select the root category for the target WebCenter Portal, and click Move Categories.**

   The Category Summary page shows the new location.

9. **Click Permissions in the sidebar.**

10. **Deselect all the permissions for the User Types: Anyone and Registered Users, and click Save Changes (Figure 34-17).**
11. In WebCenter Portal, navigate to Discussions Forum Settings for the portal to reassociate the portal with the discussion data that you just imported:

   a. Open WebCenter Portal administration.
      For details, see Exploring the Settings Pages in WebCenter Portal Administration.
   
   b. Click Portals.
   
   c. Select the portal for which you want to import data, and then select Administer.
   
   d. Click Tools and Services, then Discussions.
   
   e. Click the Search icon besides Category ID or Forum ID, select the imported category (or forum) from the list, and click Select.
   
   f. Click Save.

34.7 Propagating and Redeploying Portals in Production

This section includes the following topics:

- Understanding Portal Propagation
- Propagating Portal Changes Using WebCenter Portal
- Directly Deploying Portals Using WLST
- Propagating Portal Changes Using WLST
- Redeploying a Portal Using WebCenter Portal
34.7.1 Understanding Portal Propagation

Administrators can propagate portal changes made in staging to production if the stage and production environments are connected and kept "in sync". For example, you can propagate portal changes such as new pages and assets added or modified. Oracle strongly recommends that you always make changes in stage first and then push your portal changes to production using deployment or propagation. Propagation does not require the production server to be restarted or incur any downtime.

For lists of changes propagated from staging to production, see Table 34-5

<table>
<thead>
<tr>
<th>Portal Changes Propagated</th>
<th>Yes / No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal pages</td>
<td>Yes</td>
</tr>
<tr>
<td>Assets</td>
<td>Yes</td>
</tr>
<tr>
<td>Portlets</td>
<td>Yes</td>
</tr>
<tr>
<td>Portal folder content changes</td>
<td>Yes</td>
</tr>
<tr>
<td>Portal activity/usage data (activity streams, calendar events, feedback, list, links, message boards, people connections, profiles, surveys)</td>
<td>No</td>
</tr>
<tr>
<td>Portal security data excluding custom page security (portal roles and permissions, member details and their role assignments)</td>
<td>No</td>
</tr>
<tr>
<td>External content referenced by the portal (through portal pages, portal assets, Content Presenter display templates, Site Studio, and so on...)</td>
<td>No</td>
</tr>
<tr>
<td>Data stored on external servers (discussions, mail, announcements, analytics, custom task flows and shared libraries)</td>
<td>No</td>
</tr>
</tbody>
</table>

Any structural changes to a portal require redeployment.

- Custom security can be set for portal pages. During portal propagation, custom page security changes are propagated. However, only portal-level security changes for existing roles (roles that are present on both the source and target servers) are propagated. If you created a new role and added new page permissions or added or removed members, changes are not propagated as the new role is not present on the target server. To migrate such changes, you must redeploy the portal.

- After deploying a portal if you enable a new tool, such as documents, or disable it on the source server and then propagate portal changes, tool-related changes are not reflected on the target server. You must redeploy your portal for the changes to take effect.

34.7.2 Propagating Portal Changes Using WebCenter Portal

To propagate changes made to a portal to the target server:
1. In WebCenter Portal, access portal administration as described in Accessing Portal Administration in *Building Portals with Oracle WebCenter Portal*.

2. Click the **Deploy** icon.

   **Note:** You will see the **Deploy** icon only if you are granted the application-level permission *Portal Server: Deploy*.

3. Under **Target Portal Server**, from the **Server Name** list, select the connection to be used for propagating portal changes. It must be the same connection that was used to deploy the portal.

4. In the **Comments** box, specify any comments related to portal propagation.

5. In the **Options** section, select the propagation options:
   - **Include Portal Content**: Select to specify that the portal content stored on Content Server must be propagated to the target server.
   - **Include Shared Assets**: Propagates the shared assets used by the portal. Clear the check box if you do not want to propagate shared assets.
   - **Include Shared Libraries**: Propagates the shared libraries used by the portal. Clear the check box if you do not want to propagate shared libraries. If you choose to propagate shared libraries, you must restart the target server after propagating portal changes for the shared library changes to be picked up.

6. Expand the **Changed Details** section to view the artifacts or settings that will be propagated.
   - **Portal Assets**: Lists the portal assets that have been added or updated since the last propagation. For example, *Figure 34-18* the Pages category shows that three pages were added since the last propagation.
   - **Shared Assets**: Lists the shared assets used by the portal that were added or updated since the last propagation.
   - **Shared Libraries**: Lists the shared libraries used by the portal that were added or updated since the last propagation.
7. Click **Propagate**.

   The Deploy Portals dialog displays the progress and status of portal propagation. While the portal is being propagated, you can choose to work on the portal if required.

8. Click **Close**.

9. If you propagated shared libraries, restart the target server for the shared libraries changes to take effect. For information, see *Starting and Stopping Managed Servers for WebCenter Portal Application Deployments*. 
34.7.3 Propagating Portal Changes Using WLST

Direct portal propagation is only possible if a connection exists between the source and target environments and the portal was previously deployed directly to the target using `deployWebCenterPortals` WLST command. See Directly Deploying Portals Using WLST.

To propagate metadata changes from staging to production:

1. Run the WLST command `propagateWebCenterPortal` to propagate metadata for the portal.

   ```
   propagateWebCenterPortal(appName, portalName, targetConnectionName, 
   [savePortal, propagateLog, propagateSharedAssets, propagatePortalContent, 
   server, applicationVersion])
   ```

   The options that you set depends on your specific requirements. For command syntax, see `propagateWebCenterPortal` in WebCenter WLST Command Reference.

   For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

Here are some examples:

**Example 1 - Propagating portal metadata changes**

The following commands create a connection to the production server (MyProductionConnection) and then propagates changes for a portal named myPortal to the target server:

```shell
adf_createHttpURLConnection(appName='webcenter', name='MyProductionConnection', 
url='http://example.com:7777', user='myuser', password='mypassword', 
realm='ProductionRealm')

propagateWebCenterPortal(appName='webcenter', portalName='myPortal', 
targetConnectionName='MyProductionConnection')
```

**Example 2 - Backing up the target portal before propagating portal metadata changes**

The following example backs up myPortal on the target, propagates portal changes, including any changes to the portal content and shared assets used in the portal, and also specifies a name and location for the propagation log file:

```shell
propagateWebCenterPortal(appName='webcenter', portalName='myPortal', 
targetConnectionName='MyProductionConnection', savePortal=1 
propagateLog='/mypropagationlogs/myPortal_propagation.log', 
propagateSharedAssets=1, propagatePortalContent=1,)
```

34.7.4 Redeploying a Portal Using WebCenter Portal

In WebCenter Portal, when you redeploy a portal, all information about the existing portal is deleted from the target server and a new portal is created.

To redeploy a portal using WebCenter Portal:

1. In WebCenter Portal, access portal administration as described in Accessing Portal Administration in Building Portals with Oracle WebCenter Portal.

2. Click the Deploy icon.
3. In the Comments box, specify any comments related to portal redeployment.

4. Under Target Portal Server, from the Server Name list, select the connection that was used for deploying deploy the portal.

5. In the Options section, select the options:
   - **Redeploy instead of propagating changes**: Select to specify that the portal needs to be redeployed.
   - **Include Portal Content**: Select to specify that the portal content stored on Content Server must be included in portal redeployment.
   - **Include Shared Assets**: Deploys shared assets used by the portal. Clear the check box if you do not want to deploy shared assets.
   - **Include Shared Libraries**: Deploys the shared libraries used by the portal. Clear the check box if you do not want to deploy shared libraries. If you include shared libraries in portal deployment, you must restart the target server after redeploying the portal for shared library changes to be picked up.

6. Click Deploy.
The Deploy Portals dialog displays the progress and status of portal deployment. While the portal is being redeployed, you can choose to work on the portal if required.

7. Click Close.

8. If you chose to redeploy shared libraries, restart the target server for the shared libraries changes to take effect. For information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.
35

Managing WebCenter Portal Backup, Recovery, and Cloning

This chapter describes techniques and tools for backing up and restoring WebCenter Portal installations.

This chapter includes the following topics:

- Understanding WebCenter Portal Back Up and Recovery
- Comparing Back up, Recovery, and Migration Tools for WebCenter Portal
- Backing Up Individual Portals
- Restoring Portals from a Backup
- Migrating Entire WebCenter Portal to Another Target
- Backing Up an Entire WebCenter Portal Installation
- Restoring an Entire WebCenter Portal Installation
- Using Scripts to Back Up and Restore WebCenter Portal
- Cloning a WebCenter Portal Environment

Permissions:

The content of this chapter is intended for system administrators.

For more information on which roles and permissions are required to deploy portals, templates, assets, connections, and extensions, see Permissions Required to Perform WebCenter Portal Life Cycle Operations.

See also, Understanding Administrative Operations, Roles, and Tools.

35.1 Understanding WebCenter Portal Back Up and Recovery

To recover data from disasters, such as the loss of database hardware, inadvertent removal of data from file or database, it is important to back up individual portals as well as the entire WebCenter Portal instance on a frequent basis. The frequency of your backups depend on how often the underlying information stored by WebCenter Portal changes in your particular environment, and how much time and amount of information could acceptably be lost. Incremental or partial backups may be applied where the data is critical to the business and must be restored due to a failure.

WebCenter Portal provides various backup options. Administrators can back up:

- One more more portals
WebCenter Portal provides export and import WLST commands for backing up and restoring individual portals. For details, see Backing Up Individual Portals and Restoring Portals from a Backup.

- **Entire WebCenter Portal environment**

Back up and recovery of WebCenter Portal as well as various back-end components can be managed through database export and import utilities, and various other tools. For more information, see Backing Up an Entire WebCenter Portal Installation and Using Scripts to Back Up and Restore WebCenter Portal.

**Note:**

This chapter only describes techniques for backing up and restoring WebCenter Portal data. For information about Oracle Fusion Middleware back up and recovery strategies, see Advanced Administration: Backup and Recovery in *Administering Oracle Fusion Middleware*.

### 35.2 Comparing Back up, Recovery, and Migration Tools for WebCenter Portal

Table 35-1 compares the various tools available to back up and restore WebCenter Portal or migrate WebCenter Portal to another target.

<table>
<thead>
<tr>
<th>Category</th>
<th>Backup and Restore (Portals and Portal Templates)</th>
<th>Backup and Restore Scripts (Full WebCenter Portal Install)</th>
<th>Migration / Backup (WebCenter Portal Only)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>How to execute</strong></td>
<td>WLST commands: exportWebCenterPortal</td>
<td>Customizable scripts based on: master_script.sh, wlst_script.py, backup.properties, restore.properties</td>
<td>WLST commands: exportWebCenterApplication</td>
</tr>
<tr>
<td></td>
<td>s exportWebCenterPortal Templates</td>
<td>importWebCenterPortal s</td>
<td>importWebCenterApplication</td>
</tr>
<tr>
<td></td>
<td>importWebCenterPortal s</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Prerequisites</strong></td>
<td>WebCenter Portal must be installed, fully configured, and running on the target.</td>
<td>WebCenter Portal must be installed, fully configured, and running on the target.</td>
<td>WebCenter Portal must be installed, fully configured, and running on the target.</td>
</tr>
<tr>
<td>Category</td>
<td>Backup and Restore (Portals and Portal Templates)</td>
<td>Backup and Restore Scripts (Full WebCenter Portal Install)</td>
<td>Migration / Backup (WebCenter Portal Only)</td>
</tr>
<tr>
<td>----------</td>
<td>--------------------------------------------------</td>
<td>-------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>When to use</td>
<td>Use to back up and restore portals and portal templates. Useful if only one or two portals or portal templates are corrupt.</td>
<td>Use to restore WebCenter Portal from a nightly/weekly backup that was previously taken using a backup script (in case of corruption). Use to restore configuration in <code>adf-config.xml</code>, <code>connections.xml</code>, and credentials in <code>/metadata/security/data/credentials</code>. Use to completely restore an entire WebCenter Portal installation on a new machine or WebLogic Server instance that is already installed and configured for Oracle WebCenter Portal.</td>
<td>Useful in a stage-to-production setup, where the production instance is installed and configured, and you want to copy WebCenter Portal on the stage instance (containing multiple portals, shared assets, security, and so on) to the target for the first time. Suitable for multi-site portals that use a large number of shared assets or other global artifacts that must be moved to the target in a single step. Not recommended for restoring a corrupt WebCenter Portal instance.</td>
</tr>
<tr>
<td>What is backed up / migrated</td>
<td>Content stored in the portal’s content folder on Content Server, portal pages and assets, and portal data stored in persistence Portal security permissions and roles. For details, see: <a href="#">Understanding Portal Archives</a> <a href="#">Deploying Portal Templates</a></td>
<td>MDS metadata for all tools and services, such as discussions, announcements, events, portlets, activities, tags, worklists, and so on. Security roles and permissions for all portals and for global artifacts, as well as user-role assignments. Users and audit data are also migrated. Data stored in the <code>WEBCENTER</code> and MDS database schemas. Optionally, data stored in other schemas such as <code>DISCUSSIONS</code>, <code>DISCUSSIONS_CRAWLER</code>, <code>ACTIVITIES</code>, <code>PORTLET</code>, <code>OCS</code>, and so on.</td>
<td>MDS and data stored in the <code>WEBCENTER</code> schema pages, application integration assets, lightweight content items, and tools and services, such as discussions, announcements, events, portlets, activities, and tags. Security roles and permissions for all portals and for global artifacts, as well as user role assignments Data stored in the <code>WEBCENTER</code> database schema for activity streams, portal events, feedback, lists, links, message boards, people connections, profiles, surveys, and tags.</td>
</tr>
<tr>
<td>What is not backed up / migrated</td>
<td>Any content outside of the portal’s content folder on Content Server and any shared libraries used by the portal WebCenter Portal domain.</td>
<td>Data stored on other back-end systems, such as the content server, discussions server, BPEL server, mail servers, and so on. Application-level settings stored in <code>adf-config.xml</code> (domain/MDS) Credentials (metadata/security/data/credentials). WebCenter Portal domain.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 35-1 (Cont.) Backup, Restore, and Migration Tools for WebCenter Portal

<table>
<thead>
<tr>
<th>Category</th>
<th>Backup and Restore (Portals and Portal Templates)</th>
<th>Backup and Restore Scripts (Full WebCenter Portal Install)</th>
<th>Migration / Backup (WebCenter Portal Only)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pros</strong></td>
<td>Relatively quick as only specific portals or portal templates are backed up and restored. Allows more granular control over what is backed up and restored. Most efficient when only a few portals are corrupt.</td>
<td>Simple, extensible, and reliable way to regularly back up data owned by WebCenter Portal. Multiple, granular backup archives generated rather than a single large archive containing everything.</td>
<td>MDS data, WEBCENTER database data, customizations, and security captured in a single step. Simple to use and quicker than using four separate commands.</td>
</tr>
<tr>
<td><strong>Cons</strong></td>
<td>Cannot back up content outside of the portal’s content folder on Content Server, any shared library used by the portal, and Home portal.</td>
<td>Database schemas WEBCENTER and MDS must be restored together. If not, data may become out-of-sync. If restoring additional schemas, such as OCS, you must restore them at the same time and from the same point to maintain data integrity. Incremental backup/restore is not supported. Domain configuration is not included in the backup script so you must back up the domain separately. See Backup and Recovery Recommendations for Oracle WebLogic Server in <em>Administering Oracle Fusion Middleware</em>. Not recommended if you want to restore on a different instance with different back-end servers configured.</td>
<td>Requires a lot of internal processing. Native tools are not used to extract data from the database.</td>
</tr>
</tbody>
</table>

**Note:**

Use Fusion Middleware test-to-production scripts to replicate a complete Fusion Middleware instance, installed and configured with WebCenter Portal, WebCenter Content, SOA Suite, BI, and so on, to one or more target environments. These scripts avoid you repeating complex install processes on multiple targets. For details, see Moving from a Test to a Production Environment in *Administering Oracle Fusion Middleware*.

Test-to-production scripts are not recommended if the source WebCenter Portal installation has been used, that is, the customer has created metadata/data/security.
35.3 Backing Up Individual Portals

The backup process for portals is simple. You archive the portals and their content folders using the WLST command `exportWebCenterPortals` and then, if required, you back up any additional data that is stored for the portal in back-end components such as the discussions server.

The steps are as follows:

1. **Backup the portal to an export archive (PAR file).**
   
   See Backing Up Portals Using WLST.

2. **Back up discussions and external data for the portal, if required.**

   See Backing Up Discussions and External Data for a Portal.

The information in this section describes how to perform portal backups manually. If you need to back up frequently or want to set up a regular backup schedule, you can create a script that automates the back up process. For details, see Using Scripts to Back Up and Restore WebCenter Portal.

See also, Restoring Portals from a Backup.

---

**Note:**

The simultaneous backup of large numbers of portals is not recommended as, depending on server configuration, it may affect system performance. If a serious deterioration in performance is observed, break down the backup/export process into several smaller groups.

---

35.3.1 Backing Up Portals Using WLST

Use the WLST command `exportWebCenterPortals` to back up a one or more portals to an archive (PAR file).

To find out what information is backed up inside a portal archive (PAR file) and what is not included, see Understanding Portal Archives.

---

**Note:**

Portal archives do not include shared assets or any information relating to the Home portal.

---

To prevent data loss, Oracle recommends that you:

- Take portals offline during the back up process to prevent data conflict (`offlineDuringExport=1`)
- Include portal content folders in the archive (`exportPortalContent=1`)
- Include connection information in the archive (`exportConnections=1`)
Note:
Connection information is not portal specific. All connections configured for the source WebCenter Portal installation are exported. See also, Understanding Connection Property Files.

- If a portal contains web service data controls or portlets, ensure that all associated web services or producers are up and accessible for the export to succeed.

For example, run the WLST command:

```java
exportWebCenterPortals(appName='webcenter',
fileName='BackupSalesPortals_31March2013.par',
names='GlobalSales,MySales', offlineDuringExport=1,
exportPortalContent=1, exportConnections=1)
```

The options that you set depends on your specific archive requirements. For command syntax, see `exportWebCenterPortals` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

To restore the portal at a later date, see Restoring Portals from a Backup.

### 35.3.2 Backing Up Discussions and External Data for a Portal

Use the Discussions Server Admin Console to back up discussion data for a specific portal to a `.zip` file that you restore later on, if required. For details, see Exporting Portal Discussions to an Archive and Importing Portal Discussions from an Archive.

Backup files do not include externally stored data that portals reference through Content Presenter and Site Studio (such as external web content and pages) so you must back up external data separately. Similarly, if your portal references documents and files outside of its own content folder, you must ensure that all storage areas used by the portal are backed up. In both cases, refer to the appropriate product documentation for instructions on how to back up the external data and content.

### 35.4 Restoring Portals from a Backup

You can restore one or more portals from a backup archive using the WLST command `importWebCenterPortals`. Existing portals are deleted and replaced.

The steps are as follows:

1. **Restore the portal, by importing the portal backup archive (PAR file) on the target.**

   See Restoring Portals from an Archive Using WLST.

2. **Restore discussions data and external data for the portal, if required.**

   See Restoring Discussions and External Data for a Portal.

The information in this section describes how to restore portal backups manually. If you prefer, you can create a script that automates the restoration process. For details, see Using Scripts to Back Up and Restore WebCenter Portal.
35.4.1 Restoring Portals from an Archive Using WLST

Use the WLST command `importWebCenterPortals` to restore one or more portals from an archive (PAR file).

To prevent data loss, Oracle recommends that you:

- Import connections used by the portal that are missing on the target, for some reason, before you restore the portal.
  
  See Importing New WebCenter Portal Connections from a File.

- Take portals offline during portal restoration (`forceOffline=1`). Portal managers can bring the portal back online after restoration.

- Import all the information inside the archive (`importCustomizations=1`, `importPortalContent=1`, `importSecurity=1`, `importData=1`, `importActivities=1`).

- If a portal contains web service data controls or portlets, all associated web services and producers must also be up and accessible for the import to succeed.

For example, run the WLST command:

```bash
importWebCenterPortals(appName='webcenter',
  fileName='BackupSalesPortals_31March2013.par', names='GlobalSales,MySales',
  parentPortal='Sales', importCustomizations=1, importPortalContent=1,
  importSecurity=1, importData=1, importActivities=1,
  overwrite=1, savePortals=1, forceOffline=1,
  importLog=/mybackups/RestoreSalesPortals_31March2013.log')
```

The options that you set depend on your specific requirements. For command syntax, see `importWebCenterPortals` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

---

**Note:**

Portal-related data associated with some back-end components, specifically the discussions server, must be migrated after you export or import portals. For information, see Restoring Discussions and External Data for a Portal.

---

35.4.2 Restoring Discussions and External Data for a Portal

Use the Discussions Server Admin Console to restore discussion data for a particular portal from a backup .zip file. For details, see Importing Portal Discussions from an Archive and Exporting Portal Discussions to an Archive.

If you backed up any external data or content that your portal uses, refer to the appropriate product documentation for instructions on how to restore information from your back ups, if required. For example, you may want to regularly back up some externally stored data referenced by a portal through Content Presenter and Site Studio (such as external web content and pages) or documents that are stored outside the portal's own content folder.
35.5 Backing Up an Entire WebCenter Portal Installation

It is important to back up your entire WebCenter Portal installation on a frequent basis to avoid data loss due to database hardware failure or inadvertent removal of data from file or database.

This section outlines the steps required to completely back up all portals in the portal server, all database data, MDS, as well as data stored on other back-end servers. The back up process generates multiple, backup archives rather than a single large archive containing everything which facilitates a granular restore process.

The steps are as follows:

1. **Back up all data in the WebCenter Portal schema.**
   

2. **Back up all data in the MDS schema.**
   
   See Back Up (Export) All MDS Schema Data.

3. **Back up all data for Content Server.**
   
   See Backing Up and Restoring All WebCenter Content Data.

4. **Back up all discussions server data.**
   
   See Back Up (Export) All Discussions Schema Data.

5. **Back up other schema data stored for WebCenter Portal.**
   
   See Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET).

6. **Back up data for portlet producers used by WebCenter Portal.**
   
   See Backing Up and Restoring Portlet Producer Metadata.

7. **Back up pagelet producer metadata.**
   
   See Backing Up and Restoring Pagelet Producer Metadata.

8. **Back up analytics metadata.**
   
   See Backing Up and Restoring Analytics Metadata.

9. **Back up security stores.**
   
   See Backing Up and Restoring LDAP Identity Store, Backing Up and Restoring Policy Stores (LDAP and Database) and Backing Up and Restoring Credential Stores (LDAP and Database).

10. **Back up the WebLogic domain hosting WebCenter Portal.**
    
    See Backing Up and Restoring a WebCenter Portal Domain.

11. **Back up Audit configuration.**
    
    See Backing Up and Restoring Audit Repository Configuration.

The information in this section describes how to back up manually. If you need to back up frequently or want to set up a regular backup schedule, you can create a script that
automates the back up process. For details, see Using Scripts to Back Up and Restore WebCenter Portal.

35.5.1 Backing Up and Restoring All WebCenter Portal Schema Data

WebCenter Portal’s database schema (WEBCENTER) stores data for various tools and services including activity streams, portal events, feedback, lists, links, message boards, people connections, profiles, surveys, and tags.

This section includes the following topics:

- Prerequisites
- Back Up (Export) WebCenter Portal Schema Data
- Restore (Import) WebCenter Portal Data

35.5.1.1 Prerequisites

If you are backing up or restoring an Oracle database schema, use setenv or export to set the following environment variables before backing up or restoring schema data:

- ORACLE_HOME - Database home
- ORACLE_SID - Service ID for the schemas
- TNS_ADMIN - Set to ORACLE_HOME/network/admin

35.5.1.2 Back Up (Export) WebCenter Portal Schema Data

To back up WEBCENTER schema data, use the appropriate utility for your database:

- For non-Oracle databases, refer to the manufacturer’s documentation.
- For an Oracle database, go to DB_ORACLE_HOME/bin of your database and run the command described in the example given below. For detailed expdp command information, see guide.

```sql
sqlplus "sys/password as sysdba"
create or replace directory mydmpdirectory as 'full_path_to_directory_on_file_system';
GRANT read,write ON directory mydmpdirectory TO public;
exit;

DB_ORACLE_HOME/bin/expdp "$sys/password@serviceid as sysdba" directory=mydmpdirectory dumpfile=webcenterportal.dmp SCHEMAS=srcprefix_WEBCENTER EXCLUDE=STATISTICS NOLOGFILE=Y
```

Where:

- DB_ORACLE_HOME is the directory in which the database for WebCenter Portal’s schema (WEBCENTER) is installed.
- password is the password for the system database user.
- serviceid is the unique SID for the database. For example, mydb1234.
- directory is the location on the database machine where the dump file will be created.
- dumpfile is the name of the file that will contain the exported data.
- **SCHEMAS** identifies the target schema to be imported. Schema names include the RCU suffix that was used during installation (_WEBCENTER), along with a user supplied prefix. For example, DEV_WEBCENTER.

- **EXCLUDE=STATISTICS** specifies not to export statistics for the tables.

- **NOLOGFILE=Y** Suppresses the creation of a log file.

See also, *Restore (Import) WebCenter Portal Data*.

### 35.5.1.3 Restore (Import) WebCenter Portal Data

To restore WEBCENTER schema data from a backup, use the appropriate utility for your database. For non-Oracle databases, refer to the manufacturer’s documentation.

To restore the WEBCENTER schema on an Oracle database:

2. Go to `DB_ORACLE_HOME/bin` of the database where the WEBCENTER schema is installed, connect to the database using `sqlplus` as `sysdba` and run the following commands:

   ```
   DB_ORACLE_HOME/bin/sqlplus "sys/password@serviceid as sysdba"
   create or replace directory dmpdir as 'mydmpdirectory';
   GRANT read,write ON directory dmpdir TO public;
   ```

3. Do one of the following:

   - If schema names on the source and target match:
     ```
     drop user tgtprefix_WEBCENTER cascade;
     exit;
     ```
   
   - If schema names on the source and target are different:
     ```
     drop user tgtprefix_WEBCENTER cascade;
     create user tgtprefix_WEBCENTER identified by password default tablespace tgtprefix_IAS_WEBCENTER temporary tablespace name_IAS_TEMP;
     grant connect,resource to tgtprefix_WEBCENTER;
     exit;
     ```

   Where:

   - **tgtprefix_WEBCENTER** is the user name. This is the RCU suffix that was used during installation, _WEBCENTER, along with a user supplied prefix. For example, DEV_WEBCENTER.
   
   - **password** is the password for the target user.
   
   - **tgtprefix_IAS_WEBCENTER** identifies the default tablespace. For example, the RCU suffix that was used during installation, IAS_WEBCENTER, along with a user supplied prefix. For example, DEV_IAS_WEBCENTER.
   
   - **name_IAS_TEMP** identifies the temporary tablespace. For example, DEV_IAS_TEMP.

4. Run the import tool.

   For example, to import WebCenter Portal schema data where source and target schema names match, run the following command:
DB_ORACLE_HOME/bin/impdp "sys/password@serviceid as sysdba"
directory=mydmpdirectory dumpfile=webcenterportal.dmp SCHEMAS=tgtprefix_WEBCENTER

For example, to import WebCenter Portal schema data where source and target schema names are different, run the following command:

DB_ORACLE_HOME/bin/impdp "sys/password@serviceid as sysdba"
directory=mydmpdirectory dumpfile=webcenterportal.dmp remap_schema=srcprefix_WEBCENTER:tgtprefix_WEBCENTER
remap_tablespace=source_tablespace:target_tablespace exclude=user
TABLE_EXISTS_ACTION=REPLACE

Where:

- **DB_ORACLE_HOME** is the directory in which the database for WebCenter Portal’s schema (WEBCENTER) is installed.
- **password** is the password for the system database user.
- **serviceid** is the unique SID for the database. For example, mydb1234.
- **directory** is the location on the database machine where the dump file is located.
- **dumpfile** is the name of the file that contains data to be imported.
- **SCHEMAS** identifies the target schema to be imported. Schema names include the RCU suffix that was used during installation (_WEBCENTER), along with a user supplied prefix. For example, DEV_WEBCENTER. Use this parameter when schema names on the source and target match. For example, both schemas are named DEV_WEBCENTER.
- **REMAP_SCHEMA** identifies the source and target schemas. Use this parameter when schema names on the source and target are different. Schema names include the RCU suffix that was used during installation, _WEBCENTER, along with the user supplied prefix. For example, DEV_WEBCENTER.
- **REMAP_TABLESPACE** identifies the source and target tablespace. Remaps all objects selected for import with persistent data in the source tablespace to be created in the target tablespace. For example, source_tablespace:target_tablespace.
- **TABLE_EXISTS_ACTION=REPLACE** drops the current table and creates the table as it is in the dump file.

For detailed impdp command information, see guide.

### 35.5.2 Backing Up and Restoring All MDS Schema Data

The MDS schema contains customization metadata and data for WebCenter Portal. This section includes the following topics:

- **Prerequisites**
- **Back Up (Export) All MDS Schema Data**
- **Restore (Import) MDS Schema Data**
35.5.2.1 Prerequisites

If you are backing up or restoring an Oracle database schema, use `setenv` or `export` to set the following environment variables before backing up or restoring schema data:

- **ORACLE_HOME** - Database home
- **ORACLE_SID** - Service ID for the schemas
- **TNS_ADMIN** - Set to `ORACLE_HOME/network/admin`

**Note:**

For these back up (export) and restore (import) procedures to work, the schema names on the source and target must match. For example, both schemas must be named `DEV_MDS`.

35.5.2.2 Back Up (Export) All MDS Schema Data

To back up MDS data, use the appropriate utility for your database. For non-Oracle databases, refer to the manufacturer’s documentation.

For an Oracle database, go to `DB_ORACLE_HOME/bin` of your database and run the following command:

```
sqlplus "sys/password as sysdba"
create or replace directory mydmpdirectory as 'full_path_to_directory_on_file_system';
GRANT read,write ON directory mydmpdirectory TO public;
exit;
```

```
DB_ORACLE_HOME/bin/expdp "sys/password@serviceid as sysdba"
directory=mydmpdirectory dumpfile=mds.dmp SCHEMAS=srcprefix_MDS
EXCLUDE=STATISTICS NOLOGFILE=Y
```

Where:

- **DB_ORACLE_HOME** is the directory in which the database for WebCenter Portal’s MDS schema is installed.
- **password** is the password for the system database user.
- **serviceid** is the unique SID for the database. For example, `mydb1234`.
- **directory** is the location on the database machine where the dump file will be created.
- **dumpfile** is the name of the file that will contain the exported data.
- **SCHEMAS** is the schema to be exported. Include the RCU suffix that was used during installation (``_MDS``), along with a user supplied prefix. For example, `DEV_MDS`.
- Schema names on the source and target must match. For example, both schemas must be named `DEV_MDS`.
- **EXCLUDE=STATISTICS** specifies not to export statistics for the tables.
- **NOLOGFILE=Y** Suppresses the creation of a log file.
For detailed expdp command information, see guide.

See also, Restore (Import) MDS Schema Data.

35.5.2.3 Restore (Import) MDS Schema Data

To restore MDS schema data from a backup, use the appropriate utility for your database. For non-Oracle databases, refer to the manufacturer's documentation.

To restore the MDS schema on an Oracle database:

1. Shut down the target MDS instance.

2. Go to DB_ORACLE_HOME/bin of the database where the MDS schema is installed, connect to the database using sqlplus as sysdba and run the following commands:

   `DB_ORACLE_HOME/bin/sqlplus "sys/password@serviceid as sysdba"
   create or replace directory dmpdir as "mydmpdirectory";
   GRANT read,write ON directory dmpdir TO public;

3. Drop the MDS schema and exit sqlplus:

   `drop user tgtprefix_MDS cascade;
   exit;`

4. Run the import tool. For example, run the following command:

   `DB_ORACLE_HOME/bin/impdp "sys/password@serviceid as sysdba"
   directory=mydmpdirectory dumpfile=mds.dmp SCHEMA=tgtprefix_MDS`

   Where:

   - DB_ORACLE_HOME is the directory in which the database for WebCenter Portal's MDS schema is installed.
   - password is the password for the system database user.
   - serviceid is the unique SID for the database. For example, mydb1234.
   - directory is the location on the database machine where the dump file is located.
   - dumpfile is the name of the file that contains data to be imported.
   - SCHEMAS is the schema to be imported. Include the RCU suffix that was used during installation (_MDS), along with the user supplied prefix. For example, DEV_MDS.

   Schema names on the source and target must match. For example, both schemas must be named DEV_MDS.

   For detailed impdp command information, see guide.

35.5.3 Backing Up and Restoring All WebCenter Content Data

To fully back up Oracle WebCenter Content, you must back up data the WebCenter Content database schema (OCS), back up all the WebCenter Content native (vault) and web-viewable (weblayout) files, and also back up other configuration data. For details, see Backup and Recovery Recommendations for Oracle WebCenter Content in Administering Oracle Fusion Middleware.
Optionally, you can back up the root folder for a WebCenter Portal instance to a separate archive. A root folder backup may be useful if the folder becomes corrupt or you want to migrate the entire folder to another target. For detailed instructions, see System Migration and Archiving in *Administering Oracle WebCenter Content*.

---

**Note:**

Consider the following when restoring or migrating root folders for WebCenter Portal:

- **Security data is not archived with the root folder**

- **Root folder migration must take place before you start WebCenter Portal for the first time**

  (WebCenter Portal only). When you start WebCenter Portal for the first time a root folder is automatically created for WebCenter Portal on the Content Server. You cannot later overwrite this folder with a root folder archive exported from a different WebCenter Portal instance as internal root folder IDs will not match. If you plan to migrate root folder content, you must do so before the WebCenter Portal instance starts up for the first time.

- **Folder ID "counter" on source and target must match**

  Every time you create a folder on Content Server, a folder ID counter increments by one. If the counter on the source and target is not in sync you may experience issues when you try to create folders on the target after an import operation. For example, if the folder ID counter on the target is on 4 when you import folders with IDs 5,6,7,8, you will see an error the next time you try to create a folder on the target as it will attempt to create a folder with an ID of 5. The only workaround is to manually alter the counter table on the target using SQL.

As root folder backups are not appropriate for every restoration use case, Oracle recommends full WebCenter Content database schema back ups for your primary back up/restore strategy.

---

After restoring WebCenter Content data, log in to WebCenter Portal and open any portal that utilizes document-related task flows. Verify that document services are enabled in that portal and that imported folders are available as expected.

### 35.5.4 Backing up and Restoring Discussion Schema Data

Discussions and announcements store information in two database schemas:

- **DISCUSSIONS**: stores discussions and announcements data

- **DISCUSSIONS_CRAWLER**: enables Oracle Secure Enterprise Search (SES) to crawl the discussions server

This section includes the following topics:

- **Prerequisites**

- **Back Up (Export) All Discussions Schema Data**

- **Restore (Import) Discussions Schema Data**
35.5.1 Prerequisites

If you are backing up or restoring an Oracle database schema, use `setenv` or `export` to set the following environment variables before backing up or restoring schema data:

- `ORACLE_HOME` - Database home
- `ORACLE_SID` - Service ID for the database
- `TNS_ADMIN` - Set to `ORACLE_HOME/network/admin`

35.5.4.2 Back Up (Export) All Discussions Schema Data

To back up all discussions schema data, use the appropriate utility for your database. For non-Oracle databases, refer to the manufacturer's documentation.

For an Oracle database, go to `DB_ORACLE_HOME/bin` of your database and run the following command:

```
sqlplus "sys/password as sysdba"
create or replace directory mydmpdirectory as 'full_path_to_directory_on_file_system';
GRANT read,write ON directory mydmpdirectory TO public;
exit;

DB_ORACLE_HOME/bin/expdp "sys/password@serviceid as sysdba"
directory=mydmpdirectory dumpfile=discussions.dmp
SCHEMAS=srcprefix_DISCUSSIONS,srcprefix_DISCUSSIONS_CRAWLER EXCLUDE=STATISTICS
NOLOGFILE=Y
```

Where:

- `DB_ORACLE_HOME` is the directory in which the database for WebCenter Portal's discussions schemas are installed.
- `password` is the password for the system database user.
- `serviceid` is the unique SID for the database. For example, `mydb1234`.
- `directory` is the location on the database machine where the dump file will be created.
- `dumpfile` is the name of the file that will contain the exported data.
- `SCHEMAS` identifies the schemas to be exported. Include the RCU suffix that was used during installation (`_DISCUSSIONS` and `_DISCUSSIONS_CRAWLER`), along with a user supplied prefix. For example, `DEV_DISCUSSIONS`.
  To export data from both schemas, separate each schema name with a comma.
- `EXCLUDE=STATISTICS` specifies not to export statistics for the tables.
• NOLOGFILE=Y Suppresses the creation of a log file.
For detailed expdp command information, see guide.
See also, Restore (Import) Discussions Schema Data.

35.5.4.3 Restore (Import) Discussions Schema Data
To restore discussions schema data from a backup, use the appropriate utility for your
database. For non-Oracle databases, refer to the manufacturer's documentation.
To restore DISCUSSIONS and DISCUSSIONS_CRAWLER schemas on an Oracle
database:

1. Shut down the target discussions server.
2. Go to DB_ORACLE_HOME/bin of the database where the DISCUSSIONS and
DISCUSSIONS_CRAWLER schema is installed, connect to the database using
sqlplus as sysdba and run the following commands:

   DB_ORACLE_HOME/bin/sqlplus "sys/password@serviceid as sysdba"
   create or replace directory dmpdir as 'mydmpdirectory';
   GRANT read,write ON directory dmpdir TO public;

3. Do one of the following:
   • If schema names on the source and target match:
     drop user tgtprefix_DISCUSSIONS cascade;
     drop user tgtprefix_DISCUSSIONS_CRAWLER cascade;
     exit;
   • If schema names on the source and target are different:
     drop user tgtprefix_DISCUSSIONS cascade;
     drop user tgtprefix_DISCUSSIONS_CRAWLER cascade;
     create user tgtprefix_DISCUSSIONS identified by password default tablespace
     tgtprefix_IAS_DISCUSSIONS temporary tablespace name_IAS_TEMP;
     grant connect,resource to tgtprefix_DISCUSSIONS
     exit;

Where:
   • tgtprefix_DISCUSSIONS is the user name. This is the RCU suffix that was
     used during installation, _DISCUSSIONS, along with a user supplied prefix.
     For example, DEV_DISCUSSIONS.
   • password is the password for the target user.
   • tgtprefix_IAS_DISCUSSIONS identifies the default tablespace. For example,
     the RCU suffix that was used during installation, IAS_DISCUSSIONS, along
     with a user supplied prefix. For example, DEV_IAS_DISCUSSIONS.
   • name_IAS_TEMP identifies the temporary tablespace. For example,
     DEV_IAS_TEMP.
4. Run the import tool.
   For example, to import the discussions schema data where source and target
   schema names match, run the following command:
For example, to import the discussions schema data where source and target schema names are different, run the following command:

```
DB_ORACLE_HOME/bin/impdp "sys/password@serviceid as sysdba"
directory=mydmpdirectory dumpfile=discussions.dmp
SCHEMAS=tgtprefix_DISCUSSIONS,tgtprefix_DISCUSSIONS_CRAWLER
remap_schema=srcprefix_DISCUSSIONS:tgtprefix_DISCUSSIONS
remap_schema=srcprefix_DISCUSSIONS_CRAWLER:tgtprefix_DISCUSSIONS_CRAWLER
remap_tablespace=source_tablespace:target_tablespace exclude=user
TABLE_EXISTS_ACTION=REPLACE
```

Where:

- **DB_ORACLE_HOME** is the directory in which the database for WebCenter Portal's discussions schemas are installed.
- **password** is the password for the system database user.
- **serviceid** is the unique SID for the database. For example, mydb1234.
- **directory** is the location on the database machine where the dump file is located.
- **dumpfile** is the name of the file that contains data to be imported.
- **SCHEMAS** identifies the schema (or schemas) to be imported. Include the RCU suffix that was used during installation (_DISCUSSIONS and _DISCUSSIONS_CRAWLER), along with a user supplied prefix. The DISCUSSIONS and DISCUSSIONS_CRAWLER schemas have the same user supplied prefix, for example, DEV_DISCUSSIONS and DEV_DISCUSSIONS_CRAWLER.

Use this parameter when schema names on the source and target match. For example, schemas in the source and target database are both named DEV_DISCUSSIONS and DEV_DISCUSSIONS_CRAWLER.

- **REMAP_SCHEMA** identifies the source and target schemas. Use this parameter when schema names on the source and target are different. Schema names include the RCU suffix that was used during installation, _DISCUSSIONS, along with the user supplied prefix. For example, DEV_DISCUSSIONS.

The DISCUSSIONS and DISCUSSIONS_CRAWLER schemas have the same user supplied prefix.

- **REMAP_TABLESPACE** identifies the source and target tablespace. Remaps all objects selected for import with persistent data in the source tablespace to be created in the target tablespace. For example, source_tablespace:target_tablespace.

- **TABLE_EXISTS_ACTION=REPLACE** drops the current table and creates the table as it is in the dump file.

### 35.5.5 Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET)

In addition to the schemas mentioned in the previous topic (WEBCENTER, MDS, DISCUSSIONS, and DISCUSSIONS_CRAWLER), WebCenter Portal can store data in several other schemas:
• ACTIVITIES Stores analytics data
• PORTLET Stores portlet and pagelet data

The backup and restore procedures are common for all schemas. Use the appropriate utility for your database:

• For non-Oracle databases, refer to the manufacturer's documentation.
• For an Oracle database, go to DB_ORACLE_HOME/bin of your database and run the commands described in this section.

For detailed expdp and impdp command information, see guide.

Prerequisites (Oracle Database)
If you are backing up or restoring an Oracle database schema, use setenv or export to set the following environment variables before backing up or restoring schema data:

• ORACLE_HOME - Database home
• ORACLE_SID - Service ID for the schemas
• TNS_ADMIN - Set to ORACLE_HOME/network/admin

Exporting Schema Data (Oracle Database)
The following example shows a sample expdp command for exporting Oracle database schema data. Replace schemadump.dmp and SCHEMA_NAME to match the schema you want to export.

sqlplus "sys/password as sysdba"
create or replace directory mydmpdirectory as
'full_path_to_directory_on_file_system';
GRANT read,write ON directory mydmpdirectory TO public;
exit;

DB_ORACLE_HOME/bin/expdp "sys/password@serviceid as sysdba"
  directory=mydmpdirectory dumpfile=schemadump.dmp SCHEMAS=srcprefix_SCHEMA_NAME
  EXCLUDE=STATISTICS NOLOGFILE=Y

Where:
• DB_ORACLE_HOME is the directory in which the database schema is installed.
• password is the password for the system database user.
• serviceid is the unique SID for the database. For example, mydb1234.
• directory is the location on the database machine where the dump file will be created.
• dumpfile is the name of the file that will contain the exported data.
• SCHEMAS is the schema (or schemas) to be exported. This is the RCU suffix that was used during installation (_SCHEMA_NAME), along with the user supplied prefix. For example, DEV_ACTIVITIES.

If you want to export data from multiple schemas, separate each schema name with a comma.
• EXCLUDE=STATISTICS specifies not to export statistics for the tables.
• **NOLOGFILE=Y** suppresses the creation of a log file.

### Importing Schema Data (Oracle Database)

This section describes sample `impdp` commands for importing schema data. Replace `schemadump.dmp` and `SCHEMA_NAME` to match the schema you want to import.

2. Go to `DB_ORACLE_HOME/bin` of the database where the schema is installed, connect to the database using `sqlplus` as `sysdba` and run the following commands:

   ```bash
   DB ORACLE_HOME/bin/sqlplus "sys/password@serviceid as sysdba"
   create or replace directory dmpdir as 'mydmpdirectory';
   GRANT read,write ON directory dmpdir TO public;
   ```

3. Do one of the following:
   - If schema names on the source and target match:
     ```bash
     drop user tgtprefix_SCHEMA_NAME cascade;
     exit;
     ```
   - If schema names on the source and target are different:
     ```bash
     drop user tgtprefix_SCHEMA_NAME cascade;
     create user tgtprefix_SCHEMA_NAME identified by password default tablespace tgtprefix_IAS_SCHEMA_NAME temporary tablespace name_IAS_TEMP;
     grant connect,resource to tgtprefix_SCHEMA_NAME;
     exit;
     ```

   Where:
   - `tgtprefix_SCHEMA_NAME` is the user name. This is the RCU suffix that was used during installation, `_SCHEMA_NAME`, along with a user supplied prefix. For example, `DEV_ACTIVITIES`.
   - `password` is the password for the target user.
   - `tgtprefix_IAS_SCHEMA_NAME` identifies the default tablespace. For example, the RCU suffix that was used during installation, `IAS_SCHEMA_NAME`, along with a user supplied prefix. For example, `DEV_IAS_ACTIVITIES`.
   - `name_IAS_TEMP` identifies the temporary tablespace. For example, `DEV_IAS_TEMP`.

4. Run the import tool.

   For example, to import schema data where source and target schema names match, run the following command:

   ```bash
   DB ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\"
   directory=mydmpdirectory dumpfile=schemadump.dmp SCHEMAS=tgtprefix_SCHEMA_NAME
   ```

   For example, to import schema data where source and target schema names match, run the following command:

   ```bash
   DB ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\"
   directory=mydmpdirectory dumpfile=schemadump.dmp remap_schema=srcprefix_SCHEMA_NAME:tgtprefix_SCHEMA_NAME remap_tablespace=source_tablespace:target_tablespace exclude=user TABLE_EXISTS_ACTION=REPLACE
   ```
Where:

- **DB_ORACLE_HOME** is the directory in which the database schema is installed.
- **password** is the password for the system database user.
- **serviceid** is the unique SID for the database. For example, mydb1234.
- **directory** is the location on the database machine where the dump file is located.
- **dumpfile** is the name of the file that contains data to be imported.
- **SCHEMAS** is the schema (or schemas) to be imported. This is the RCU suffix that was used during installation (_SCHEMA_NAME), along with the user supplied prefix. For example, DEV_ACTIVITIES.

Use this parameter when schema names on the source and target match. For example, both schemas must be named DEV_ACTIVITIES.

If you want to export data from multiple schemas, separate each schema name with a comma.

- **REMAP_SCHEMA** identifies the source and target schemas. Use this parameter when schema names on the source and target are different. Schema names include the RCU suffix that was used during installation, _SCHEMA_NAME, along with the user supplied prefix. For example, DEV_ACTIVITIES.

- **REMAP_TABLESPACE** identifies the source and target tablespace. Remaps all objects selected for import with persistent data in the source tablespace to be created in the target tablespace. For example, source_tablespace:target_tablespace.

- **TABLE_EXISTS_ACTION=REPLACE** drops the current table and creates the table as it is in the dump file.

### 35.5.6 Backing Up and Restoring LDAP Identity Store

External identity stores, such as Oracle Internet Directory, store data in the underlying database. For information on how to back up and restore database schema data for Oracle Internet Directory, see Backup and Recovery Recommendations for Oracle Internet Directory in *Administering Oracle Fusion Middleware*.

If you are using a different LDAP identity store, refer to the appropriate back up and recovery documentation for that product.

### 35.5.7 Backing Up and Restoring Policy Stores (LDAP and Database)

Use the WLST command `migrateSecurityStore` to back up and then restore the policy store that is configured for WebCenter Portal. In a production environment, Oracle recommends that policies are stored in LDAP or a database. File-based policy stores are not recommended.

Use `migrateSecurityStore` to:

- Back up your LDAP or database-based policy store to a backup file
- Restore your LDAP or database policy store from a backup file
For details, see Migrating Policies Manually in Securing Applications with Oracle Platform Security Services.

See also migrateSecurityStore in WebCenter WLST Command Reference.

---

**Note:**

Security policy data is included when you use WebCenter Portal's export/import utilities (exportWebCenterApplication and importWebCenterApplication) to migrate WebCenter Portal to another instance so there is no need to manually migrate the policy store in this instance. For more information, see Migrating Entire WebCenter Portal to Another Target.

---

### 35.5.8 Backing Up and Restoring Credential Stores (LDAP and Database)

Use the WLST command `migrateSecurityStore` to back up and then restore the credential store that is configured for WebCenter Portal. In a production environment, Oracle recommends that credentials are stored in LDAP or a database. File-based credential stores are not recommended.

Use `migrateSecurityStore` to:

- Back up your LDAP or database-based credential store to a backup file
- Restore your LDAP or database credential store from a backup file

For details, see Migrating All Credentials with `migrateSecurityStore` in Securing Applications with Oracle Platform Security Services.

See also, `migrateSecurityStore` in WebCenter WLST Command Reference.

---

### 35.5.9 Backing Up and Restoring a WebCenter Portal Domain

For information on how to back up and restore your domain configuration, see Backup and Recovery Recommendations for Oracle WebLogic Server in Administering Oracle Fusion Middleware.

---

### 35.5.10 Backing Up and Restoring Portlet Producer Metadata

Portlet producers can store registration handles and portlet preference data as metadata with the consumer application, that is, WebCenter Portal. This section describes how to back up any portlet metadata that is stored by your application using the WLST command `exportPortletClientMetadata` and how to restore the portlet metadata using `importPortletClientMetadata`.

---

**Note:**

Portlet metadata is included when you use WebCenter Portal's export/import utilities (exportWebCenterApplication and importWebCenterApplication) to migrate WebCenter Portal to another instance so there is no need to manually migrate portlet producer metadata in this instance. For more information, see Migrating Entire WebCenter Portal to Another Target.
This section includes the following topics:

- **Backing Up (Exporting) Portlet Client Metadata**
- **Restoring (Importing) Portlet Client Metadata**

For information on how to back up portlet producer data stored on the database, see o Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET).

### 35.5.10.1 Backing Up (Exporting) Portlet Client Metadata

To export portlet client metadata and producer customizations and personalizations, for a single application, such as WebCenter Portal, use the WLST command `exportPortletClientMetadata`. This command exports metadata for all the portlet producers used by the application. You cannot opt to export metadata for specific producers.

For detailed syntax and examples, see `exportPortletClientMetadata` in *WLST Command Reference for WebLogic Server*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 35.5.10.2 Restoring (Importing) Portlet Client Metadata

To import portlet client metadata and producer customizations and personalizations, for WebCenter Portal, use the WLST command `importPortletClientMetadata`. **Prerequisites:**

- The database in which the application metadata or schema is stored and the portlet producers must be up and running.
- Use the WLST command `exportPortletClientMetadata` to export the portlet client metadata and producer customizations and personalizations to an .ear file. See also, **Backing Up (Exporting) Portlet Client Metadata**.

For detailed syntax and examples, see the `importPortletClientMetadata` and `exportPortletClientMetadata` in *WebCenter WLST Command Reference*.

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

### 35.5.11 Backing Up and Restoring Pagelet Producer Metadata

The pagelet producer stores configuration data and content in MDS. You can back up pagelet metadata to a separate archive using the `exportMetadata` and `importMetadata` WLST commands. For details, see *Managing Import, Export, Backup and Recovery of Pagelet Producer Components*.

### 35.5.12 Backing Up and Restoring Analytics Metadata

To back up the entire ACTIVITIES database schema, see **Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET)**.

### 35.5.13 Backing Up and Restoring Audit Repository Configuration

You can back up audit policies and audit repository configuration to a file using the `exportAuditConfig` and `importAuditConfig` WLST commands.
For detailed syntax and examples, see exportAuditConfig and importAuditConfig in WLST Command Reference for WebLogic Server.

### 35.6 Migrating Entire WebCenter Portal to Another Target

Using export and import, system administrators can migrate a WebCenter Portal instance to another target. This is useful in a stage-to-production setup, where the production instance is installed and configured and the entire WebCenter Portal instance on stage (containing multiple portals, shared assets, global artifacts, security, and so on) must be copied to the target for the first time.

You can also use the export and import utilities described in this section to back up global WebCenter Portal artifacts that are not owned by a particular portal, such as shared assets, business role pages, personal pages, and customized system pages.

This section includes the following topics:

- Understanding Import and Export for WebCenter Portal
- Prerequisites for WebCenter Portal Export and Import
- Exporting WebCenter Portal to an Archive
- Importing a WebCenter Portal Archive

#### 35.6.1 Understanding Import and Export for WebCenter Portal

Using export and import, system administrators can migrate an entire WebCenter Portal instance between stage and production environments. You can export WebCenter Portal to a single export archive (.par file) using WLST commands or Fusion Middleware Control, as shown in Figure 35-1.

The WebCenter Portal export archive (.par file) contains several files, as listed in Figure 35-1.
Information Included in a WebCenter Portal Archive

WebCenter Portal archives can include the following information that is stored in the metadata service (MDS) repository:

- **Portals and templates** - All portals and portal templates
- **Assets** - All shared assets and portal assets
- **Lightweight content** - Images from the all portals’ content folder, styled text, and text.
• **Pages** - All pages, including system pages, business role pages, personal pages, and portal pages

In addition, the WebCenter Portal archive (.par file) can contain:

• **Tool/service data** - Database data associated with those tools and services that store data in the WebCenter Portal schema (WEBCENTER)

  Data migration is optional. To migrate data you must set the export option "Include Services Data".

• **Security** - All roles, permissions, and user role assignments:
  – application roles (and permissions assigned to each role)
  – users details and their application role assignments in the Home portal
  – individual portal members (and their role assignments in each portal)

**Information Not Included in WebCenter Portal Archives**

The WebCenter Portal archive (.par file) does not include data associated with tools and services that do not store data in MDS or the WebCenter Portal database schema, such as analytics, announcements, discussions, documents (on content server), instant messaging and presence (IMP), mail, pagelets, calendar events, personalizations, and worklists. To learn how to backup or move data associated with these tools and services, see Backing Up an Entire WebCenter Portal Installation.

Connection information is not included within the WebCenter Portal archive but you can export connection information configured in the source environment to a separate file and then deploy the connection information on the target. If some connection information, such as server names, ports, content management connections, and so on, varies between the two environments, you can isolate and modify the connection details before deploying the connection file. For details, see Moving Connections Details from Staging to Production.

Table 35-2 lists in more detail exactly which information is always included and never included when you migrate WebCenter Portal to another target.

**Table 35-2  Information Exported and Imported with an Entire WebCenter Portal Instance**

**Note:** Connections can be imported or exported based on options.

WebCenter Portal export and import can be performed using Fusion Middleware Control or WLST commands. For details, see:

- Prerequisites for WebCenter Portal Export and Import
- Exporting WebCenter Portal to an Archive
- Importing a WebCenter Portal Archive
35.6.2 Prerequisites for WebCenter Portal Export and Import

Before you export or import a WebCenter Portal instance, complete the following prerequisite tasks:

1. Back up or migrate all the back-end components before you export or import WebCenter Portal.
   Migrate back-end components for the application, such as the LDAP identity store, credential store, policy store, discussions server, content server, portlet producers, and so on. For more information, see Backing Up an Entire WebCenter Portal Installation.

2. Ensure that the database in which WebCenter Portal metadata and schema is stored is up and running otherwise export and import will not work.

3. If your application contains web service data controls or portlets, ensure that all associated web services or producers are up and accessible for export and import to succeed.

4. If you are migrating WebCenter Portal to another target, ensure that the tools and services configured in the target instance are a superset of the tools and services configured in the source instance. That is, the target must be configured with at least the same set of tools and services that the source is configured with. If this is not the case, the import operation fails.

5. Import connections exported from the source on to the target.
   For more information, see Moving Connections Details from Staging to Production.

6. Ensure that the users in both the source and target environment are identical.

   **Note:**
   If a shared identity store is not used, users must be migrated.

   Personal pages, that is, pages users create in the Home portal, are only migrated if the target and source applications both use the same LDAP identity store; this is because personal pages assignments are per user GUID.

   Verify that all users assigned the **Administrator** role in the source, exist in the target identity store. On import, users listed in WebCenter Portal’s security policy are checked against the identity store that is configured for the domain. If a user is not found, any policies associated with that user are removed. See also, Moving the Administrator Account to an External LDAP Server.

7. Back up the `WEBCENTER` and `MDS` database schemas on the target before importing a WebCenter Portal archive.
   See Backing Up an Entire WebCenter Portal Installation.

8. Verify that the WebCenter Portal archive .par file that you want to import was exported from WebCenter Portal 12.2.1.
   You cannot import archives from earlier versions directly into WebCenter Portal 12.2.1. If necessary, you must upgrade your source environment to 12.2.1 before

### 35.6.3 Exporting WebCenter Portal to an Archive

This section describes how to export an entire WebCenter Portal instance using Fusion Middleware Control and WLST commands. WebCenter Portal is exported into a single export archive (*.par file) that you can save to your local file system or to a remote server file system.

**Note:**

For information about what the archive contains, see **Understanding WebCenter Portal Back Up and Recovery**.

This section includes the following:

- Exporting WebCenter Portal Using Fusion Middleware Control
- Exporting WebCenter Portal Using WLST

#### 35.6.3.1 Exporting WebCenter Portal Using Fusion Middleware Control

System administrators can export an entire WebCenter Portal application using Fusion Middleware Control.

To export WebCenter Portal:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Portal. See **Navigating to the Home Page for WebCenter Portal**.

2. From the **WebCenter Portal** menu, select **Application Export** (Figure 35-2).

   **Figure 35-2 WebCenter Portal Menu - Application Export Option**

   ![WebCenter Portal Menu](image)

3. Change the **File Name** for the export archive or accept the default name.
To ensure uniqueness, the default .par filename contains a unique ID—webcenter_wholeapp_ts_unique_ID.par (Figure 35-3).

**Figure 35-3  Naming the Export Archive**

4. Click Export.

5. In the Download dialog (Figure 35-4), click Export to confirm that you want to go ahead.

**Figure 35-4  Downloading an Export Archive**

Progress information is displayed during the export process. The application being exported cannot be accessed during export operations.

6. When the export process is complete, specify a location for the export archive (.par).

**Figure 35-5  Saving an Export Archive**

Select one of:

- **Download** - Saves the export PAR file to your local file system.
  
  Your browser downloads and saves the archive locally. The actual download location depends on your browser set up.

- **Export to Server** - Saves the export PAR file to a server location.
  
  When the Archive Location dialog displays (Figure 35-6), enter a suitable path for Server Location, for example, /tmp, and then click Save. The name of the PAR is not required here.

  Ensure that the server directory you specify has write permissions.

**Figure 35-6  Archive Location**

7. Click Close to dismiss the Export window.

The export archive (.PAR) is saved to the specified location.
Check the diagnostic log file, WC_Spaces-diagnostic.log, for any warnings or errors reported during the export process. To view the log file, select the menu option WebCenter Portal > Logs > View Log Messages. For details, see Viewing and Configuring WebCenter Portal Logs.

See also, Troubleshooting WebCenter Portal Import and Export.

### 35.6.3.2 Exporting WebCenter Portal Using WLST

Use the WLST command `exportWebCenterApplication` to export an entire WebCenter Portal instance.

The following example exports WebCenter Portal together with all customizations in MDS (both application-level and user-level customizations) and database data to a file named `myAppExport.par`. It also exports connections to the `connection.properties` file.

```bash
wls:/weblogic/serverConfig> exportWebCenterApplication(appName='webcenter', fileName='myAppExport.par', connectionFileName='connection.properties')
```

The following example exports a test WebCenter Portal instance. The `.par` file is saved to the location from which you run the WLST command:

```bash
wls:/weblogic/serverConfig> exportWebCenterApplication(appName='webcenter', fileName='myTestAppExport.par')
```

For command syntax and examples, see `exportWebCenterApplication` in WebCenter WLST Command Reference.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

### 35.6.4 Importing a WebCenter Portal Archive

This section describes how to import an entire WebCenter Portal application using Fusion Middleware Control and WLST commands.

Before importing WebCenter Portal, ensure that you complete all the tasks listed in Prerequisites for WebCenter Portal Export and Import.

This section includes the following:

- Importing WebCenter Portal Using Fusion Middleware Control
- Importing WebCenter Portal Using WLST
- Verifying WebCenter Portal After Import

#### 35.6.4.1 Importing WebCenter Portal Using Fusion Middleware Control

System administrators can import an entire WebCenter Portal instance using Fusion Middleware Control.

To import WebCenter Portal using Fusion Middleware Control:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Portal. See Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Application Import.
3. In the Application Import page (Figure 35-7), specify the location of your WebCenter Portal archive (.par).

**Figure 35-7 Application Import Page**

![Application Import Page](image)

Select one of the following:

- **Archive Located on Local File System** - Enter the Archive Location. Alternatively, click **Browse** to locate the directory on the local file system where the .par file is stored.

- **Archive Located on Server File System** - Enter the Archive Location. Any shared location accessible from WebCenter Portal.

The archive you select must contain an entire WebCenter Portal export—you cannot import individual portals or portal templates from here. Refer to Importing Portals from an Archive Importing Portals from an Archive for more information.

4. Click **Import**.

5. In the Application Import dialog (Figure 35-8), click **Import**.

**Figure 35-8 Application Import dialog**

![Application Import dialog](image)

Once the import is complete, a success message displays.

After importing an entire WebCenter Portal instance, log in to WebCenter Portal and verify the imported content. For details, see Verifying WebCenter Portal After Import.

### 35.6.4.2 Importing WebCenter Portal Using WLST

Use the WLST command `importWebCenterApplication` to import an entire WebCenter Portal instance from an archive. For command syntax and examples, see `importWebCenterApplication` in *WebCenter WLST Command Reference*.

The following example imports WebCenter Portal from the export archive `myAppExport.par`:

```
wlst:/weblogic/serverConfig> importWebCenterApplication(appName='webcenter',fileName='myAppExport.par')
```

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
35.6.4.3 Verifying WebCenter Portal After Import

After importing WebCenter Portal from an archive you must:

1. Restart the managed server (WC_Portal) on which the newly imported WebCenter Portal instance is deployed.
   
   In a cluster environment, restart each managed server in the cluster. See also, Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

2. Log in to WebCenter Portal and verify that all portals and portal templates are available as expected.

   If not, see Portals and Portal Templates Not Available After Import.

3. Initiate the Oracle Secure Enterprise Search crawler to index newly imported data.

35.7 Restoring an Entire WebCenter Portal Installation

This section describes how to restore your WebCenter Portal installation after some hardware failure or inadvertent removal of data from file or database. Use the steps in this section to completely restore an entire WebCenter Portal installation on a new machine or WebLogic Server instance that is already installed and configured for Oracle WebCenter Portal.

The steps in this section assume that the back-end servers and connections used in the restored instance are exactly the same as those configured prior to the restoration process.

Note:

Database schemas WEBCENTER and MDS must be restored together to ensure the data is in-sync.

If you need to restore additional schemas, such as OCS, you must restore them at the same time and from the same point to maintain data integrity.

The steps are as follows:

1. Restore WebCenter Portal schema from a backup.

   See Restore (Import) WebCenter Portal Data.

2. Restore MDS schema data from a backup.

   See Restore (Import) MDS Schema Data.

3. (Optional) Restore Content Server data from a backup.

   See Backing Up and Restoring All WebCenter Content Data.
4. (Optional) Restore discussion schema data from a backup.
   See Restore (Import) Discussions Schema Data.

5. (Optional) Restore other schemas data for WebCenter Portal from a backup.
   See Backing up and Restoring Other Schema Data (ACTIVITIES and PORTLET).

6. Restore security store data from backups.
   For details, see:
   - Backing Up and Restoring Policy Stores (LDAP and Database)
   - Backing Up and Restoring Credential Stores (LDAP and Database)
   - (Optional) Backing Up and Restoring LDAP Identity Store

7. (Optional) Restore connections for WebCenter Portal from a backup.
   See Importing New WebCenter Portal Connections from a File.

8. (Optional) Restore audit configuration for WebCenter Portal from a backup.
   See Backing Up and Restoring Audit Repository Configuration.

9. (Optional) Restore the WebLogic Server domain hosting WebCenter Portal from a backup.
   See Backing Up and Restoring a WebCenter Portal Domain.

10. Restart, and verify restored

    In some situations you may need to restore metadata associated with individual tools and services. In this case, refer to the following topic:

    - Restore only portlet producer metadata from a backup.
      See Backing Up and Restoring Portlet Producer Metadata.
    - Restore only pagelet producer MDS metadata from a backup.
      See Backing Up and Restoring Pagelet Producer Metadata.
    - Restore only analytics MDS metadata from a backup.
      See Backing Up and Restoring Analytics Metadata.

The information in this section describes how to restore manually. If you need to restore or migrate data frequently, you can create a script that automates the process. For details, see Using Scripts to Back Up and Restore WebCenter Portal.

35.8 Using Scripts to Back Up and Restore WebCenter Portal

Backing up your WebCenter Portal installation manually can take time. Using scripts to automate and schedule regular back ups is more efficient and saves a great deal of time. To help you get started, Oracle provides a sample backup script that you can customize to suit your installation and back up requirements.

For more information, read the following topics:

- Understanding Back Up and Restore Script Files
Using Scripts to Back Up and Restore WebCenter Portal

Restoring WebCenter Portal from Backups Using Scripts

35.8.1 Understanding Back Up and Restore Script Files

Oracle provides sample scripts to help automate your back up and recovery processes. The sample scripts back up and restore the following information:

- **Database schemas**: Back up all the required schemas for WebCenter Portal.
- **Data in file stores**: Back up and restore WebCenter Portal data stored in the WebCenter Content file system.
- **Security information**: Back up and restore policy store, credential store, and audit configuration for WebCenter Portal.

Table 35-3 describes the sample scripts and files provided for back up and recovery:

<table>
<thead>
<tr>
<th>Sample Scripts and Files</th>
<th>Description</th>
<th>Use to...</th>
</tr>
</thead>
<tbody>
<tr>
<td>master_script.sh</td>
<td>Shell script that executes database export commands, archives WebCenter Content on the file system, and executes WLST export and import commands. See master_script.sh.</td>
<td>Back up and restore</td>
</tr>
<tr>
<td>wlst_script.py</td>
<td>Python script that runs WLST commands for exporting and importing portlet and security metadata. See wlst_script.py.</td>
<td>Back up and restore</td>
</tr>
<tr>
<td>backup.properties</td>
<td>Properties file that contains input parameters to back up WebCenter Portal databases and run WLST export commands in master_script.sh and wlst_script.py. See backup.properties and restore.properties Files.</td>
<td>Back up only</td>
</tr>
<tr>
<td>restore.properties</td>
<td>Properties file that contains input parameters for master_script.sh and wlst_script.py that enable you to restore WebCenter Portal databases and run WLST import commands from backup files. See backup.properties and restore.properties Files.</td>
<td>Restore only</td>
</tr>
</tbody>
</table>

The sample files are starter scripts for you to review and modify. Alternatively, you can create your own scripts from scratch, if preferred.

35.8.1.1 master_script.sh

master_script.sh can back up (export) WebCenter Portal data stored in the following database schemas:

- WEBCENTER
- MDS
During back up, the script executes an export database command `expdp` for each schema you want to back up:

```
DB_ORACLE_HOME/bin/expdp "sys/password@serviceid as sysdba"
directory=backup_directory
dumpfile=dump_file_name.dmp
SCHEMAS=prefix_SCHEMA_NAME
EXCLUDE=STATISTICS
NOLOGFILE=y
```

**Note:**
The `expdp` database command for individual schemas are described in *Backing Up an Entire WebCenter Portal Installation*.

The script also exports or imports WebCenter Content native files (vault folder) and web-viewable files (weblayout folder) stored on the file system.

- To back up WebCenter Content files stored on the file system, the script executes the following:
  ```
tar cvf wcc_vault.tar WCP_ORACLE_HOME/ucm/vault
tar cvf wcc_weblayout.tar WCP_ORACLE_HOME/ucm/weblayout
  ```
- To restore WebCenter Content files on the target file system, the script executes the following:
  ```
tar xvf wcc_vault.tar
tar xvf wcc_weblayout.tar
  ```

Finally, the script calls the WLST command script `wlst_script.py`. For details, see `wlst_script.py`.

The following is a sample `master_script.sh` script:

```
## master_script.sh
## Backs up or restores a WebCenter Portal installation
## Executes database export or import commands and a Python script containing WLST commands.
############ No User Input Required ###############################################

  fi
#Call the WLST commands script.
  cd $wlstlocation
The `wlst_script.sh` script connects to the Admin Console for your WebCenter Portal installation, and then either backs up (exports) or restores (imports) the following:

- Portlet client metadata
- Policy store
- Credential store
- Audit configuration information

**Export WLST Commands Executed During Back Up**

During back up, the script executes the following WLST export commands:

- `exportPortletClientMetadata(appName, fileName, server)`
- `migrateSecurityStore(type='appPolicies', configFile, src, dst, overWrite, srcApp, dstApp)`
- `migrateSecurityStore(type='credStore', configFile, src, dst)`
- `exportAuditConfig(fileName)`

**Import WLST Commands Executed During Restore**

During restore, the script executes the following WLST import commands:

- `importPortletClientMetadata(appName, fileName, server)`
- `migrateSecurityStore(type='appPolicies', configFile, src, dst, overWrite, srcApp, dstApp)`
- `migrateSecurityStore(type='credStore', configFile, src, dst)`
- `importAuditConfig(fileName)`

**Note:**

If you want to back up or restore individual items, refer to the appropriate section in *Back Up an Entire WebCenter Portal Installation* or *Restoring an Entire WebCenter Portal Installation*.

The following is a sample `wlst_script.py` script:

```python
# wlst_script.py
```
## Python script that runs export and import WLST commands.

############ No User Input Required ############

# Get user credentials and other parameters from the properties file
exportOrImport = sys.argv[1]
username = sys.argv[2]
password = sys.argv[3]
adminconsole = sys.argv[4]
fileName = sys.argv[5]
wcpServerName = sys.argv[6]
jpsConfigFile = sys.argv[7]
destination = sys.argv[8]
source = sys.argv[9]
dstCred = sys.argv[10]
sourceCred = sys.argv[11]
auditFileName = sys.argv[12]

# Connect to the given host
connect(username, password, adminconsole)

if (exportOrImport == 'export'):
    # Run export WLST commands
    # Export portlet data
    print 'Exporting portlet data...' exportPortletClientMetadata(appName='webcenter', fileName=fileName, server=wcpServerName)
    if webcenterErrorOccurred(): # COMMAND STATUS
        print "Error while exporting the portlet data."
    else:
        print 'Successfully exported the portlet data.'

    # Export security
disconnect()
    print 'Exporting the policy store...' migrateSecurityStore(type='appPolicies', configFile=jpsConfigFile, src=source, dst=destination, overWrite='true', srcApp='webcenter', dstApp='webcenter')
    print 'Exporting the credential store...' migrateSecurityStore(type='credStore', configFile=jpsConfigFile, src=sourceCred, dst=dstCred)
    print 'Exporting audit configuration...' exportAuditConfig(fileName=auditFileName)

else (exportOrImport == 'import'):
    # Run import WLST commands
    # Import portlet data
    print 'Importing portlet data...' importPortletClientMetadata(appName='webcenter', fileName=fileName, server=wcpServerName)
    if webcenterErrorOccurred(): # COMMAND STATUS
        print "Error while importing portlet data."
    else:
        print 'Successfully imported portlet data.'

    # Import security
disconnect()
    print 'Importing the policy store...' migrateSecurityStore(type='appPolicies', configFile=jpsConfigFile, src=source, dst=destination, overWrite='true', srcApp='webcenter', dstApp='webcenter')
    print 'Importing the credential store...' migrateSecurityStore(type='credStore', configFile=jpsConfigFile, src=sourceCred, dst=dstCred)
importAuditConfig(fileName=auditFileName)

35.8.1.3 backup.properties and restore.properties Files

The backup.properties file contains input parameters for backup commands in 
master_script.sh and wlst_script.py. For example, file names, database home location, 
database connect string, schema names, and so on.

A similar .properties file (restore.properties) is required to define input 
parameters for restore commands.

Table 35-4 lists and describes the input parameters in backup.properties and 
restore.properties files.

<table>
<thead>
<tr>
<th>Back up / Restore Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| OPERATION                   | Determines whether the script backs up WebCenter Portal data (exports) or restores WebCenter Portal data (imports). | For back up: export  
For restore: import |

**Database information**

<table>
<thead>
<tr>
<th>Database information</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| DATA_DIRECTORY       | For back up scripts: Location on the file system under which backup files created by the script are stored. Each time you run the script, a new subdirectory is created under the directory specified here. The name of each subdirectory includes a timestamp, such as 2013.03.18-05.20.28.  
For restore scripts: Directory containing the back up you want to restore from. | For back up: DATA_DIRECTORY=/scratch/aime1/mywebcenterportal_backupscripts/mybackups  
For restore: DATA_DIRECTORY=/scratch/aime1/mywebcenterportal_backupscripts/mybackups/2013.03.18-05.20.28 |
| DB_ORACLE_HOME       | Database home directory. | /scratch/aime1/mywork/db1234 |
| DB_ADMIN_USER        | Database admin user. | mydbadminuser |
| DB_ADMIN_PASSWORD    | Password for the database admin user. | mypassword |
| DB_SID               | Database SID. | db1234 |

35.8.2 Using Scripts to Back Up WebCenter Portal

This section describes how to set up, verify, and schedule WebCenter Portal backups using scripts files:

1. Create Back Up Scripts (first time only).
2. Complete Prerequisite Tasks for Security Store Back Up (first time only).
3. Set Back Up Parameters and Customize Scripts (first time only).
4. Run the Back Up Script.
5. Verify Back Up Archives.

35.8.2.1 Create Back Up Scripts
(First time only)

1. Create a directory on the file system for your scripts and backups.

   For example: /scratch/aimel/mywebcenterportal_scripts/backups

2. Copy the sample code for master_script.sh from master_script.sh, paste into a text editor, and save the file as master_script_backup.sh into the directory you created in step 1.

   **Note:**

   Ensure that the script does not contain any hidden characters or DOS characters if running on Unix/Linux.

3. Copy the sample code for wlst_script.py from wlst_script.py, paste into a text editor, and save the file as wlst_script.py in the same directory.

4. Copy the sample code for backup.properties and restore.properties Files from backup.properties and restore.properties Files, paste into a text editor, and save the file as backup.properties in the same directory.

35.8.2.2 Complete Prerequisite Tasks for Security Store Back Up
(First time only)

In the source environment:
1. Create a copy of your jps-config.xml file for the backup scripts.

   This file is located at:
   SOURCE_DOMAIN_HOME/config/fmwconfig/jps-config.xml

   Name the copy mybackup-jps-config.xml or similar and save it at the same location. For example, /scratch/aime1/mywork/mymw/user_projects/domains/MyDomainHome/config/fmwconfig/mybackup-jps-config.xml

2. Configure source and target information for backing up the policy store as follows:

   a. To point to the target policy store, add the following section (above the closing </serviceInstances> tag):

      <serviceInstance
      name="policystore.backup.xml"
      provider="policystore.xml.provider"
      location="</some_location>/mybackup-system-jazn-data.xml">
      <description>File Based Policy Store Service Instance</description>
   </serviceInstance>

   You can choose any location that the backup scripts can access. For example:
   /scratch/aime1/mywebcenterportal_scripts/backups/backup-system-jazn-data.xml

   Where, backup-system-jazn-data.xml is a copy of system-jazn-data.xml located at:
   /scratch/aime1/mywork/mymw/user_projects/domains/MyDomainHome/config/fmwconfig/

   b. Add and configure the following entries (above the closing </jpsContexts> tag):

      <jpsContext name="mysourcePolicy">
      <serviceInstanceRef ref="policystore.db"/>
   </jpsContext>

      <jpsContext name="mytargetPolicy">
      <serviceInstanceRef ref="policystore.backup.xml"/>
   </jpsContext>

3. Configure source and target information for backing up the credential store as follows:

   a. To point to the target credential store, add the following section (above the closing </serviceInstances> tag):

      <serviceInstance
      name="credstore.backup.xml"
      provider="credstore.xml.provider"
      location="</some_location>">
      <description>File Based Credential Store Service Instance</description>
   </serviceInstance>

   You can choose any location that the backup scripts can access. For example, /scratch/aime1/mywebcenterportal_scripts/backups.

   b. Add and configure the following entries (above the closing </jpsContexts> tag):

      <jpsContext name="mysourcePolicy">
      <serviceInstanceRef ref="credstore.db"/>
   </jpsContext>
35.8.2.3 Set Back Up Parameters and Customize Scripts

(First time only)

1. Open `backup.properties` in a text editor.

2. Ensure `OPERATION=export`.

   Refer to Table 35-4 for a description of each parameter.

   **Note:**
   You can comment out parameters that are not required.

4. Customize the back up scripts, if required.
   To exclude objects, comment out the associated back up command code. To back
   up additional objects using the script, add the required code.

5. Save the changes.

35.8.2.4 Run the Back Up Script

1. Set the following environment variables:
   `ORACLE_HOME`
   `ORACLE_SID`
   `TNS_ADMIN`

2. Verify that you have permissions to read and write to all directories used during
   the backup process.

3. Run the master back up script, specifying the name of the backup properties file
   and a log file name as follow:

   `sh master_backup_script_name backup_properties_file_name log_file_name`

   For example:

   `sh master_script_backup.sh backup.properties mybackup.log`

   The message "Backup completed successfully..." indicates when the
   backup process is complete and the directory in which your backups and the
   `export.log` file are located.

   Each time you run the script, backup data is saved to a different folder under the
   main backup folder (`DATA_DIRECTORY`) so that previous backups are retained.
   Timestamp information is included in backup folder names so its easy to associate
   your backups with a particular date and time.
35.8.2.5 Verify Back Up Archives

1. Navigate to the directory containing your data backups, that is, a timestamped folder under the location you specified for the `DATA_DIRECTORY` parameter in `backup.properties`.

2. Verify the following back up files are available:
   - one or more `.dmp` files
   - `wcc_vault.tar`
   - `wcc_weblayout.tar`
   - `portletdata.ear`
   - `backup-system-jazn-data.xml`
   - `cwallet.sso`
   - `audit.xml`
   - `.log` file

35.8.2.6 Schedule Regular Back Ups Using the Scripts

Once you have verified your backup script configuration by successfully creating data backups with `master_script_backup.sh`, Oracle recommends that you schedule back ups at regular intervals.

Each time you run the script, backup data is saved to a different folder under the main backup folder (`DATA_DIRECTORY`) so that previous backups are retained.

To minimize data-integrity issue during data back up, Oracle recommends that you do not schedule backups during peak usage time.

35.8.3 Restoring WebCenter Portal from Backups Using Scripts

This section describes how to restore a WebCenter Portal installation from backups using scripts files:

1. Create Restore Scripts (first time only).
2. Restore Database Schemas Manually (first time only).
3. Complete Prerequisite Tasks for Security Store Restore (first time only).
4. Set Restore Script Parameters.
5. Run the Restoration Script.
6. Verify Restored Data.

35.8.3.1 Create Restore Scripts

(First time only)

1. Duplicate the backup scripts that you created earlier `master_script.sh` and `wlst_script.py` (following steps in section Using Scripts to Back Up WebCenter Portal) and copy them to a different location.
For example: /scratch/aime1/mywebcenterportal_scripts/restore

2. Copy the sample code for restore.properties from backup.properties and restore.properties Files, paste into a text editor, and save the file as restore.properties in the same directory.

3. Rename the files, if required.
   For example: master_script_restore.sh, wlst_restore_script.py, restore.properties

35.8.3.2 Restore Database Schemas Manually

1. Ensure that all the target schemas were created using RCU and the names of the target schemas match the source schema names.

2. (Optional). If you want to point the default data sources to different schemas, use the WebLogic Server Admin Console to update the schema names, and database details.

3. Stop all the servers.

4. Restore schema data, as required.

---

**Note:**

Database schemas WEBCENTER and MDS must be restored together to ensure the data is in-sync.

If you need to restore additional schemas, such as PORTLET or OCS, you must restore them at the same time, after WEBCENTER and MDS, and from the same point to maintain data integrity.

---

This example shows you commands to restore WEBCENTER and MDS schemas:

```bash
./sqlplus "sys/password@serviceid as sysdba"
cREATE OR REPLACE DIRECTORY dmpdir AS 'mydmpdirectory';
GRANT read,write ON directory dmpdir TO public;

##Drop WEBCENTER and MDS schemas ##
drop user srcprefix_WEBCENTER cascade;
drop user srcpreix_MDS cascade;
exit;
./impdp "sys/password@serviceid as sysdba" directory=dmpdir
dumpfile=webcenterportal.dmp SCHEMAS=srcprefix_WEBCENTER
./impdp "sys/password@serviceid as sysdba" directory=dmpdir dumpfile=mds.dmp
SCHEMAS=srcprefix_MDS
```

Where:

- `password` is the password for the system database user.
- `serviceid` is the unique SID for the database. For example, mydb1234.
- `directory` is the location on the database machine where the dump files are located.
dumpfile is the name of the file that contains data to be imported.

SCHEMAS identifies the target schemas. Schema names include the RCU suffix that was used during installation (_WEBCENTER and _MDS), along with a user supplied prefix. For example, DEV_WEBCENTER.

Schema names on the source and target must match. For example, both schemas must be named DEV_WEBCENTER.

For example:

```
./sqlplus "sys/mypassword@db1234 as sysdba"
create or replace directory dmpdir as '/scratch/mywebcenterportal_scripts/backup/2013.05.04-02.36.48';
GRANT read,write ON directory dmpdir TO public;
##Drop WEBCENTER and MDS schemas ##
drop user DEV_WEBCENTER cascade;
drop user DEV_MDS cascade;
exit;
./impdp "sys/mypassword@db1234 as sysdba" directory=dmpdir dumpfile=wcdmp.dmp
SCHEMAS=DEV_WEBCENTER
./impdp "sys/mypassword@db1234 as sysdba" directory=dmpdir dumpfile=mdsdmp.dmp
SCHEMAS=DEV_MDS
```

**Note:**

If you need to restore other schemas, such as DISCUSSIONS, PORTLETS, ACTIVITIES, and OCS, then do so now before starting the servers.

5. Start all the servers.

### 35.8.3.3 Complete Prerequisite Tasks for Security Store Restore

(First time only)

In the target environment:

1. Create a copy of your jps-config.xml file for the restore scripts.

   This file is located at:

   TARGET_DOMAIN_HOME/config/fmwconfig/jps-config.xml

   Name the copy myrestore-jps-config.xml or similar and save it at the same location. For example, /scratch/aime1/mywork/mymw/user_projects/domains/MyDomainHome/config/fmwconfig/myrestore-jps-config.xml

2. Configure source and target information for restoring the policy store as follows:

   a. To point to the source policy store, add the following section (above the closing </serviceInstances> tag):

   ```
   <serviceInstance
   name="policystore.backup.xml"
   provider="policystore.xml.provider"
   location="<some_location>/mybackup-system-jazn-data.xml">
   <description>File Based Policy Store Service Instance</description>
   </serviceInstance>
   ```
The location you specify must contain a previously backed up policy store that you want to restore. For example, /scratch/aime1/mywebcenterportal_scripts/backups/2013.06.19-09.20.14/backup-system-jazn-data.xml

b. Configure the following entries (above the closing \</jpsContexts\> tag):

```xml
<jpsContext name="targetPolicy">
  <serviceInstanceRef ref="policystore.ldap"/>
</jpsContext>

<jpsContext name="sourcePolicy">
  <serviceInstanceRef ref="policystore.backup.xml"/>
</jpsContext>
```

3. Configure source and target information for restoring the **credential store** as follows:

a. To point to the source credential store, add the following section (above the closing \</serviceInstances\> tag):

```xml
<serviceInstance
  name="credstore.backup.xml"
  provider="credstore.xml.provider"
  location="\<some_location\>"
  ><description>File Based Credential Store Service Instance</description>
</serviceInstance>
```

The location you specify must contain a previously backed up credential store (cwallet.sso) that you want to restore. For example, /scratch/aime1/mywebcenterportal_scripts/backups/2013.06.19-09.20.14.

b. Configure the following entries (above the closing \</jpsContexts\> tag):

```xml
<jpsContext name="targetCred">
  <serviceInstanceRef ref="credstore.ldap"/>
</jpsContext>

<jpsContext name="sourceCred">
  <serviceInstanceRef ref="credstore.backup.xml"/>
</jpsContext>
```

### 35.8.3.4 Set Restore Script Parameters

(First time only)

1. Open restore.properties in a text editor.

2. Ensure that OPERATION=import.

3. Specify values for all parameters in the file.

   Refer to Table 35-4 for a description of each parameter.

4. Save the changes.

### 35.8.3.5 Run the Restoration Script

1. Set the following environment variables:

   ```bash
   ORACLE_HOME
   ```
2. Verify that you have permissions to read and write to all directories used during the restore process.

3. Run the master restoration script, specifying the name of the restore properties file and a log file name as follow:

   `sh master_restore_script_name bestore_properties_file_name log_file_name`

   For example:

   `sh master_script_restore.sh backup.properties myrestore.log`

   The message "Restoration completed successfully..." indicates when the restore process is complete and the directory where the `restore.log` file is located.

### 35.8.3.6 Verify Restored Data

Check your WebCenter Portal installation:

1. If you import one or more database schemas, shut down and restart those databases, and restart all managed servers.

2. Verify the target WebCenter Portal instance includes the restored data.

### 35.9 Cloning a WebCenter Portal Environment

Cloning creates a new WebCenter Portal environment based on existing ones. You can install, configure, customize, and validate your WebCenter Portal installation and when the system is stable, create another environment by copying all the components and their configurations from the source environment. This saves time as you do not need to redo all the changes you incorporated and tested in the source environment. For more information, see Moving Oracle WebCenter Portal to a Target Environment in *Administering Oracle Fusion Middleware*. 
This part of *Administering Oracle WebCenter Portal* provides information about the language and translation topics for Oracle WebCenter Portal.

- Managing a Multilanguage Portal
Managing a Multilanguage Portal

This chapter describes the language support available in WebCenter Portal and how to manage translations at the application and portal level and for specific strings in a portal.

This chapter includes the following topics:

- About Languages in WebCenter Portal
- Modifying and Translating Strings at the Application Level
- Translating Strings for a Portal
- Modifying and Adding Translations for a Specific String of a Portal
- Adding Support for a New Language to WebCenter Portal

Permissions:
To perform the tasks in this chapter, you must be granted the following roles:

- **WebLogic Server**: Admin or Monitor role granted through the Oracle WebLogic Server Administration Console.

- **WebCenter Portal**: Administrator role granted through WebCenter Portal Administration or a custom role that grants the following permission:
  
  Basic Services: Edit Page Access, Structure, and Content permission.

See also, Understanding Administrative Operations, Roles, and Tools.

36.1 About Languages in WebCenter Portal

If your portal must support different languages, you can configure it to display localized content based on the user's selected language and locale.

For example, if you know your page will be viewed by users who speak Italian, you can localize your page so that when Italian is selected (in browser, user preferences, portal, or application settings), text strings in the page appear in Italian.

Additionally, locale selection applies special formatting considerations that are applicable to the selected locale. For example, those considerations may include whether information is typically viewed from left to right or right to left, how numbers are depicted (such as monetary information), and so on.

There are three main types of information that are displayed in WebCenter Portal:
• User interface (UI) elements, like field and button labels and seeded boilerplate text

• User-entered metadata, including page names, the portal name, and the portal description

• Content added by users, including published text and images, documents, announcements, and discussion forum content

Each type of information is handled differently when it comes to modification:

• UI elements:

  Note:
  UI elements include out-of-the-box translations for 28 languages and 100 different locales. You need to change this text only if the default UI text is not suited to your company’s needs or if your company must support additional languages.

  – To change the text for your entire WebCenter Portal application (rather than just one portal), edit the strings in the override bundle, SpacesSeedDataOverrideBundle.xlf.

  – To change the UI text for a particular portal, edit the strings in the portal-specific resource bundle, scope-resource-bundle.xlf.

• User-entered metadata (such as page names, the portal name, and the portal description) is saved as strings in the resource bundle for the portal. Each portal has its own resource bundle. To change the user-entered metadata, edit the strings in the portal-specific resource bundle.

  Note:
  Generally, the user-entered metadata you want to display in multiple languages is company-wide content or customer-facing content that likely has translations available in some form. More specific content (for example, content specific to a particular department or region) is probably necessary in only one language, and therefore does not require translation.

• Content added in content publishing components can be translated, and your system administrator can display translated WebCenter Content items using Content Presenter. Content added in announcements and discussion forums is generally displayed in the language used by the contributing user.

  For information about providing localized content, see the Translating Portals into Other Languages section in Building Portals with Oracle WebCenter Portal.

### 36.1.1 Languages Supported Out-of-the-Box by WebCenter Portal

WebCenter Portal provides runtime translations for 28 languages and 100 different locales.

The list in Table 36-1 includes all the languages available to WebCenter Portal out-of-the-box. Users can also select locales associated with particular languages. For example, a user can change the language to Arabic and, within that language group, select from 20 different locales, including Algeria, Bahrain, Djibouti, and so on.
Table 36-1  Languages Available for WebCenter Portal

<table>
<thead>
<tr>
<th>A to Ge</th>
<th>Gr to Ro</th>
<th>Ru to T</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arabic</td>
<td>Greek</td>
<td>Russian</td>
</tr>
<tr>
<td>Brazilian Portuguese</td>
<td>Hebrew</td>
<td>Simplified Chinese</td>
</tr>
<tr>
<td>Czech</td>
<td>Hungarian</td>
<td>Slovak</td>
</tr>
<tr>
<td>Danish</td>
<td>Italian</td>
<td>Spanish</td>
</tr>
<tr>
<td>Dutch</td>
<td>Japanese</td>
<td>Swedish</td>
</tr>
<tr>
<td>English</td>
<td>Korean</td>
<td>Thai</td>
</tr>
<tr>
<td>Finnish</td>
<td>Norwegian</td>
<td>Traditional Chinese</td>
</tr>
<tr>
<td>French</td>
<td>Polish</td>
<td>Turkish</td>
</tr>
<tr>
<td>French-Canada</td>
<td>Portuguese</td>
<td></td>
</tr>
<tr>
<td>German</td>
<td>Romanian</td>
<td></td>
</tr>
</tbody>
</table>

Note:

Administrative tier that offers services to WebCenter Portal, including Oracle Enterprise Manager, provides a subset of the languages available to WebCenter Portal. These include:

- English
- Brazilian Portuguese
- Simplified Chinese
- Traditional Chinese
- French
- German
- Italian
- Japanese
- Korean
- Spanish

Discussions use WebCenter Portal’s discussions server. Out-of-the-box, the discussions server application supports English and Spanish. It does not support other languages listed in Table 36-1. However, the application is open to your own translation files. For more information, refer to the Jive documentation site. This information is explicit to the discussion server application user interface.
36.2 Modifying and Translating Strings at the Application Level

Whether you are modifying or translating UI text application-wide, UI text for a particular portal, or user-entered metadata in a portal, the process is basically the same: you just modify different files.

To modify seeded UI text application-wide, you edit the override bundle, `SpacesSeedDataOverrideBundle.xlf`.

To modify or translate strings at the application level:

1. Start WLST. For information, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Use the WLST command `exportMetadata` to export the override bundle:

   ```
   exportMetadata(application='webcenter',server='WC_Portal',toLocation='/tmp/metadata',docs='/xliffBundles/SpacesSeedDataOverrideBundle.xlf')
   ```

   This example exports `SpacesSeedDataOverrideBundle.xlf` for WebCenter Portal (webcenter) on the WC_Portal managed server to the /tmp/metadata folder. Always use `webcenter` as the application name.

   Change the `server` value to match the name of the managed server that hosts your installation of WebCenter Portal.

   Change the `toLocation` value to the location into which you want to export the string files.

   For more information, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also exportMetadata in WLST Command Reference for Infrastructure Components.

3. Navigate to the folder into which you exported `/xliffBundles/SpacesSeedDataOverrideBundle.xlf`,

   ```
   Caution:
   Make sure to correctly encode your edited file or you receive an error when you try to import the translations. Oracle recommends using Oracle JDeveloper to edit the file because it automatically encodes special characters correctly.
   ```

4. If you want to modify the strings in the base language, open `/xliffBundles/SpacesSeedDataOverrideBundle.xlf` in a text editor.

   If you want to translate the file into another language, create a language-specific version of the file. For example, to translate the application-wide UI text into Catalina, name the file `SpacesSeedDataOverrideBundle_ca.xlf`. For translation, you will generally need to send this file to the translation team, which will update the file and send it back to you.
5. Find the <trans-unit> blocks you want to modify or translate.

The ID attribute in SpacesSeedDataOverrideBundle.xlf corresponds to the resource key of the UI element displayed in Composer in WebCenter Portal.

For example, here is the <trans-unit> block for the Announcements title in application-wide SpacesSeedDataOverrideBundle.xlf file.

```xml
<trans-unit id="ANNOUNCEMENTS.TITLE">
  <source>Announcements</source>
</trans-unit>
```

6. Edit the text in the <source> block to fit your business needs, then save the file.

7. Use the WLST command importMetadata to import the updated string file back into WebCenter Portal. For example:

```java
importMetadata(application='webcenter',server='WC_Portal',fromLocation='/tmp/metadata',docs='/xliffBundles/SpacesSeedDataOverrideBundle.xlf')
```

This example imports the string file from the /tmp/metadata folder to the webcenter application on the WC_Portal managed server. Change the fromLocation path to the location from which you want to import the string files. Always use "webcenter" as the application name. Change server name to match the server that hosts your installation of WebCenter Portal.

For details, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also importMetadata in WLST Command Reference for Infrastructure Components.

8. Restart the WC_Portal managed server, and confirm that the changes you made appear in the UI.

### 36.3 Translating Strings for a Portal

To translate strings of a particular portal, you edit the portal-specific resource bundle, scope-resource-bundle.xlf. The strings that can be translated are portal display name, description, and page titles.

To translate strings for a portal:

1. Start WLST. For information, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

2. Use the WLST command exportMetadata to export the string files:

   - To export all string files, do not include the docs attribute. For example:

     ```java
     exportMetadata(application='webcenter',server='WC_Portal',toLocation='/tmp/metadata')
     ```

     This example exports all string files for WebCenter Portal (webcenter) on the WC_Portal managed server to the /tmp/metadata folder. Always use webcenter as the application name.

     Change the value for server to match the name of the managed server that hosts your installation of WebCenter Portal.

     Change the toLocation path to the location into which you want to export the string files.

   - To export only specific string files, include the docs attribute. For example:
This example produces similar results to the first example, but exports only a portal-specific resource bundle. Replace PORTAL_GUID with the GUID of the portal for which you are modifying strings.

**Note:**

To export more than one file, separate file locations with commas.

For more information, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also exportMetadata in WLST Command Reference for Infrastructure Components.

3. Navigate to the folder into which you exported the string files.

**Caution:**

Make sure to correctly encode your edited file or you receive an error when you try to import the translations. Oracle recommends using Oracle JDeveloper to edit the file because it automatically encodes special characters correctly.

4. If you want to modify the strings in the base language, open /oracle/webcenter/translations/scopedMD/PORTAL_GUID/scope-resource-bundle.xlf, replacing PORTAL_GUID with the GUID of the portal for which you are modifying strings.

If you want to translate the file into another language, create a language-specific version of the file, and open it in a text editor. For example, to translate the portal UI text into Catalina, name the file scope-resource-bundle_ca.xlf.

5. Find the `<trans-unit>` blocks you want to translate.

The OBJECTGUID attribute in scope-resource-bundle.xlf corresponds to the resource key of the UI element displayed in Portal Composer in WebCenter Portal.

For example, following is the `<trans-unit>` block for the display name of a page in a portal-specific scope-resource-bundle.xlf file:

```
<trans-unit
  id="SCOPEGUID:s2f80d470_6cc4_479a_884c_9feb574b35d6:Pdfed7eed1_13eea02290b__7ff6:
  LAY_NAME">
  <source>Personal25</source>
</trans-unit>
```

6. Edit the text in the `<source>` block to fit your business needs, then save the file.

7. Use the WLST command importMetadata to import the updated string files back into WebCenter Portal. For example:

- To import all string files, do not include the docs attribute. For example:

  ```
  importMetadata(application='webcenter', server='WC_Portal', fromLocation='/tmp/metadata')
  ```
This example imports all string files from the /tmp/metadata folder to the webcenter application on the WC_Portal managed server. Change the fromLocation path to the location from which you want to import the string files. Always use "webcenter" as the application name. Change server name to match the server that hosts your installation of WebCenter Portal.

- To import only specific string files, include the docs attribute:

```java
importMetadata(application='webcenter', server='WC_Portal', fromLocation='/tmp/metadata', docs='/oracle/webcenter/translations/scopedMD/PORTAL_GUID/scope-resource-bundle.xlf')
```

This example produces similar results to the first example, but imports only a portal-specific resource bundle. Replace PORTAL_GUID with the GUID of the portal for which you are modifying strings. It is recommended that you use the docs attribute.

---

**Note:**
To import more than one file, separate file locations with commas.

---

For details, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also importMetadata in WLST Command Reference for Infrastructure Components.

8. Restart the WC_Portal managed server, and confirm that the changes you made appear in the UI.

### 36.4 Modifying and Adding Translations for a Specific String of a Portal

To suit your business needs, you may want to translate only a specific string of a portal. For example, you may want to translate only the title of the Announcements task flow in a specific instance on a page in a portal.

To add translation for a specific instance of a string in a portal:

1. Use the WLST command exportMetadata to export the string file. For example:

```java
exportMetadata(application='webcenter', server='WC_Portal', toLocation='/tmp/metadata', docs='/oracle/webcenter/translations/scopedMD/PORTAL_GUID/scope-resource-bundle.xlf')
```

This example exports a portal-specific resource bundle for Oracle WebCenter Portal (webcenter) deployed on WC_Portal to the /tmp/metadata folder. Replace PORTAL_GUID with the GUID of the portal for which you are modifying strings. If necessary, change the server name to match your WebCenter Portal installation. You must change the toLocation path to the location into which you want to export the string files.

For more information, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also exportMetadata in WebCenter WLST Command Reference.

2. Create a language/locale-specific version of the string file you want to translate.

Copy /oracle/webcenter/translations/scopedMD/PORTAL_GUID/scope-resource-bundle.xlf, replacing PORTAL_GUID with the GUID of the portal. Then save the file with the required name. For example, to translate the portal-wide UI text into Catalina, name the file scope-resource-bundle_ca.xlf.
3. Send the files to be translated to your translation team to edit. Translation will involve the following steps:

   a. Open the string file in JDeveloper or a text editor.

   **Caution:**

   Make sure to correctly encode your edited file or you receive an error when you try to import the translations. Oracle recommends using Oracle JDeveloper to edit the file because it automatically encodes special characters correctly.

   b. Find the `<trans-unit>` blocks you want to modify.

   Here is an example of a `<trans-unit>` block from a portal-specific `scope-resource-bundle.xlf` file. The SCOPEGUID shows the internal ID of the selected portal, and the OBJECTGUID shows the ID of the Announcements task flow.

   ```xml
   <trans-unit id="SCOPEGUID:s7735bad2_2e7d_4d73_a360_423a64bfc111:SERVICEID:oracle.webcenter.peopleconn:OBJECTTYPE:profile:OBJECTGUID:ANNOUNCEMENTS.TITLE">
     <source>Announcements</source>
   </trans-unit>
   ```

   The OBJECTGUID attribute (in `scope-resource-bundle.xlf`) corresponds to the resource key displayed for the required string in Portal Composer. For information about resource key, see Finding the Resource Key for a String in Building Portals with Oracle WebCenter Portal.

   c. Translate the `<source>` text in the specified `<trans-unit>` block as required.

   d. Save the file.

4. Use the WLST command `importMetadata` to import the updated string file back into WebCenter Portal. For example:

   ```bash
   importMetadata(application='webcenter', server='WC_Portal', fromLocation='/tmp/metadata', docs='/oracle/webcenter/translations/scopedMD/PORTAL_GUID/scope-resource-bundle.xlf')
   ```

   This example imports the string file of the specified portal from the `/tmp/metadata` folder to Oracle WebCenter Portal (webcenter) deployed on the WC_Portal managed server. Replace PORTAL_GUID with the GUID of the portal for which you are modifying strings. If necessary, change the managed server name to match your WebCenter Portal installation. Change the `fromLocation` path to the location from which you want to import the string files.

   For details, see Running Oracle WebLogic Scripting Tool (WLST) Commands. See also `importMetadata` in WebCenter WLST Command Reference.

5. Update the resource key of the desired UI element in WebCenter Portal. For example, if you want to translate the title of a specific Announcements task flow in a portal, perform the following steps:
a. Log on to WebCenter Portal, and open the portal page that contains the Announcements task flow in the page editor. See Opening a Page in the Page Editor in *Building Portals with Oracle WebCenter Portal*.

b. In the component toolbar, click the **View Actions menu** and select Display Options to open the Display Options dialog.

c. In the **Text** field, specify a new resource key in the following format:

```
#{o_w_f_t_TranslationsRBBean['trans-unit id']}
```

Where, *trans-unit id* refers to the ID of the Announcements task flow in the `scope-resource-bundle.xlf` file. For example, specify the following resource key:

```
#{o_w_f_t_TranslationsRBBean['SCOPEGUID:s7735bad2_2e7d_4d73_a360_423a64bfc111:SERVICEID:oracle.webcenter.peopleconn:OBJECTTYPE:profile:OBJECTGUID:ANNOUNCEMENTS.TITLE']}
```

d. Click **OK** (Figure 36-1).

**Figure 36-1**  Component Properties Dialog of the Announcements Task Flow

![Component Properties Dialog of the Announcements Task Flow](image)

6. Restart the **WC_Portal** managed server, and verify that your changes appear in WebCenter Portal.

### 36.5 Adding Support for a New Language to WebCenter Portal

You can add support for a new language that is not supported out-of-the-box in WebCenter Portal. To enable WebCenter Portal to support an additional language, you must translate portal strings into the new language within a resource bundle, update two language configuration files (`supported-languages.xml` and `faces-config.xml`), and then deploy your language updates to a custom shared library.

For information about adding support for a new language, see *Using Spaces Extension Samples* white paper on the Oracle WebCenter Portal White Papers and Technical Notes page on Oracle Technology Network.
This part of *Administering Oracle WebCenter Portal* describes how to administer global settings for WebCenter Portal users on the pages in WebCenter Portal Administration.

- Exploring the Settings Pages in WebCenter Portal Administration
- Exploring the Portals Page in WebCenter Portal Administration
- Configuring Global Defaults Across Portals
- Managing Security Across Portals
- Working with Global Attributes Across Portals
- Customizing System Pages
- Managing Business Role Pages
- Managing Personal Pages
- Administering Device Settings
- Customizing Task Flows
- Analyzing Portal Usage
This chapter describes the tasks that are available on the Settings pages in WebCenter Portal Administration.

This chapter includes the following topics:

- About the Settings Pages in WebCenter Portal Administration
- Accessing the Settings Pages in WebCenter Portal Administration
- Working with WebCenter Portal Administration Settings

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the permissions required by the specific tasks that you will perform. For an overview of the permissions required by the Settings pages, see Table 37-1.

Note:

- If you are using Internet Explorer, turn off Compatibility Mode before trying to access WebCenter Portal. In Internet Explorer, from the Tools menu, select Compatibility View Settings. In the Compatibility View Settings dialog, deselect all the options, and click Close.
- WebCenter Portal supports only single browser tab or window viewing. It will not function properly if you try to view WebCenter Portal in multiple browser tabs or windows simultaneously.

37.1 About the Settings Pages in WebCenter Portal Administration

The Settings pages in WebCenter Portal Administration (Figure 37-1) enable system administrators to perform the tasks described in Working with WebCenter Portal Administration Settings.
37.2 Accessing the Settings Pages in WebCenter Portal Administration

Open the Settings pages in WebCenter Portal Administration in the following ways:

- From the Portals menu, select Administration, then click Settings.
- In the portal browser, click the Administration tile (Figure 37-2), then click Settings.

- Enter the following URL in your browser to navigate directly to the Settings pages:
  http://host:port/webcenter/portal/admin/settings

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.
37.3 Working with WebCenter Portal Administration Settings

WebCenter Portal Administration Settings includes the pages shown in Figure 37-3 and described in Table 37-1.

Figure 37-3  WebCenter Portal Administration Settings

Table 37-1 describes the actions system administrators can perform on each of the Settings pages in WebCenter Portal Administration and lists the permissions required to perform them.

Table 37-1  WebCenter Portal Administration Settings Pages

You can create a device group, associate various devices with it, and specify the assets, such as the skin and page template, to be used for the device group. For more information, see Administering Device Settings.</td>
<td>Portal Server: Manage All or Portal Server: Manage Configuration</td>
</tr>
</tbody>
</table>
This chapter describes how to manage portals on the Portals page in WebCenter Portal Administration.

This chapter includes the following topics:

- About the Portals Page in WebCenter Portal Administration
- Accessing the Portals Page in WebCenter Portal Administration
- Sorting the Portals Listing
- Creating a Portal
- Exporting and Importing a Portal
- Viewing Information About Any Portal
- Sharing the Link to a Portal
- Closing Any Portal
- Reactivating Any Portal
- Taking Any Portal Offline
- Bringing Any Portal Back Online
- Deleting a Portal

Permissions:

To perform the tasks in this chapter on any portal, you must have the WebCenter Portal Administrator role or a custom role that grants the following permission:

- Portals: Manage Security and Configuration

If you are a portal manager (or have the Administration: Manage Security and Configuration or Administration: Manage Configuration permission in a portal), you can perform these tasks on that portal alone, as described in Administering a Portal in Building Portals with Oracle WebCenter Portal.

For more information about permissions, see About Application Roles and Permissions.
38.1 About the Portals Page in WebCenter Portal Administration

The Portals page in WebCenter Portal Administration (Figure 38-1) provides access to editing and administering all portals in WebCenter Portal, including exporting and importing portals.

If granted appropriate permissions, users can use this page to edit or administer portals. However, this chapter is addressed to a system administrator, who can perform administrative actions on all portals. Managing individuals portals that you create or have permissions to manage is covered in Administering a Portal in Building Portals with Oracle WebCenter Portal.

Figure 38-1  WebCenter Portal Administration - Portals Page

38.2 Accessing the Portals Page in WebCenter Portal Administration

To manage all portals in WebCenter Portal:

1. Open the Portals page in WebCenter Portal Administration in either of the following ways:
   - From the Portals menu, select Administration, then click Portals.
   - In the portal browser, click the Administration tile (Figure 38-2), then click Portals.
Enter the following URL in your browser to navigate directly to the Portals page:

http://host:port/webcenter/portal/admin/portals

See Also:

WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

The Portals page displays (Figure 38-3).

2. On the Portals administration page, in the left pane, select:

- All Portals to show all portals that are available to you, both public and private.
Note: Hidden portals can be seen on this page by users with the Portal Server: Manage Configuration or Portals: Manage Security and Configuration permission, such as a system administrator. While these users can manage the portal (change settings and membership), they cannot see the portal pages and content unless they are a portal member.

- **Managed** to display portals for which you have portal manager privileges.
- **Joined** to display portals of which you are a member.
- **Public** to display portals accessible by anyone with the portal URL.
- **Discoverable** to display portals that can be found in search results.

### 38.3 Sorting the Portals Listing

To sort the list of portals on the Portals page:

1. On the **Portals** administration page (see Accessing the Portals Page in WebCenter Portal Administration), click the **Sort By** selection list (Figure 38-4).

   **Note:**

   When **All Portals** is selected in the left selection pane, you can sort by only **Display Name** and **Last Accessed**.

2. Choose a display order for the portals on the page:

   - **Created Date** to order from most to least recently created.
   - **Display Name** to order alphabetically by external display name, as specified by its **Title** value in the portal administration.
   - **Last Accessed** to order from most to least recently viewed, whether or not it was updated.
   - **Last Updated** to order from most to least recently updated.
   - **Member Count** to order by greatest to least number of portal members.
   - **Portal Name** to order alphabetically by internal name of the portal, as specified by its **Name** value in the portal administration. The internal name is not visible on the **Portals** page.
38.4 Creating a Portal

To create a new portal:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), click Create Portal in the left pane (Figure 38-5).

   ![Creating a New Portal](image)

The Select a Portal Template page appears.

For information about creating a portal, see Creating and Building a New Portal in Building Portals with Oracle WebCenter Portal.

38.5 Exporting and Importing a Portal

With Portals: Manage Security and Configuration permission, you can export and import portals. For more information, see:

- Exporting Online Portals to an Archive Using WebCenter Portal Administration
- Importing a Portal from an Archive Using WebCenter Portal Administration

See also Troubleshooting Individual Portal and Portal Template Import and Export.

38.6 Viewing Information About Any Portal

On the Portals administration page, you can quickly see whether portals are active, online, offline, how recently a portal was accessed, and membership counts.

To view information about a portal:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select a portal by highlighting its row in the table.

2. From the Actions menu, select About Portal (Figure 38-6).
3. Explore the information in the About Portal dialog (Figure 38-7):

**Figure 38-7  About Portal Dialog**

- **Name**: Internal name of the portal displayed in the portal URL.
- **Display Name**: Display name of the portal. This name displays at the top of the portal and other places where portals are available for selection, such as the Portals page.
- **Internal ID**: ID of the portal, which other applications may use to reference this portal.
- **Description**: A description of the portal, specified when creating the portal or in the portal administration settings.
- **Created By**: User name of the portal creator.
• **Date Created**: Date and time that the portal was created.

• **Direct URL**: URL that provides direct access to the portal.

### 38.7 Sharing the Link to a Portal

If you want to share a portal with others, you can publish a link to the portal that will appear in activity streams of other users. With appropriate permissions, users can directly access a portal by clicking the link that specifies the portal display name.

To publish the direct link to a portal:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the required portal by highlighting its row in the table.

2. From the Actions menu, select **Share Link** (Figure 38-8).

   ![Figure 38-8 Sharing a Link to a Portal](image)

3. In the Share dialog (Figure 38-9), optionally enter a comment to appear with the link.

   ![Figure 38-9 Share Dialog for a Portal](image)
4. In the Share with list, select who you want to share the link with:

- **Everyone** to share the link with all members of the current portal in their activity streams. This is useful to notify members of updates to the portal.

- **Portals** to open the Select a Portal dialog, where you can select a portal to share the link in the activity streams of all members of the selected portal. This is useful for sharing information with members of other portals who may be interested in your portal.

5. Click Publish.

### 38.8 Closing Any Portal

By default, a portal is active. You can close a portal that is no longer being actively used. Closing a portal archives its content. When you close a portal, it is removed from everyone’s Portals menu and displays on the Portals page in the Home portal only when a user selects Closed from the Show list. The content of a closed portal remains accessible and searchable to those who still want to reference it and portal members can continue working in the portal either by displaying closed portals, or by pretty URL (http://host:port/webcenter/portal/portalName).

When a portal is closed, any activities performed in the portal are no longer reflected in the Activity Stream in the Home portal. Only the Home page of the closed portal shows activity in the portal.

If you want to close down a portal temporarily, take the portal offline instead. See Taking Any Portal Offline.

To close a portal:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the required portal by highlighting the row in the table.

   Press Ctrl+click to select more than one portal.

2. From the Actions menu, select Close (Figure 38-10).

   ![Figure 38-10   Closing a Portal](image)
3. Confirm the action by clicking **OK**.

Notice that the **Active** status changes to **Closed** (see Figure 38-11).

![Figure 38-11 Closed Portal Status](image)

### 38.9 Reactivating Any Portal

You may close a portal if it is no longer being used (see Closing Any Portal). If you want to reopen a portal, you can reactivate it.

To reactivate a portal:

1. On the **Portals** administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the required portal by highlighting the row in the table.

   Press **Ctrl+click** to select more than one portal.

2. From the **Actions** menu, select **Activate** (Figure 38-12).

![Figure 38-12 Activating a Portal](image)

3. Confirm the action by clicking **OK**.

   Notice that the **Closed** status changes to **Active**.

### 38.10 Taking Any Portal Offline

By default, a portal is online. You can take a portal temporarily offline for maintenance. For example, if you notice inappropriate content, you can take a portal offline to modify its content, then bring it back online. With **Portals: Manage Security and Configuration** permission, you can access a portal that is offline,
or bring it back online. Without this permission, users see the Portal Unavailable page (see Customizing System Pages).

To permanently close down a portal that is not being used any more, see Closing Any Portal.

To take a portal offline:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the portal you require by highlighting the row in the table.

   Press Ctrl+click to select more than one portal.

2. From the Actions menu, select Take Offline (Figure 38-13).

   ![Taking a Portal Offline](image)

   Figure 38-13    Taking a Portal Offline

3. Confirm the action by clicking OK.

   Notice that the Online status changes to Offline (see Figure 38-14).

   ![Offline Portal Status](image)

   Figure 38-14    Offline Portal Status

38.11 Bringing Any Portal Back Online

To bring any portal back online:

1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the required portal by highlighting the row in the table.

   Press Ctrl+click to select more than one portal.
2. From the Actions menu, select Bring Online (Figure 38-15).

![Figure 38-15 Bringing a Portal Online](image)

3. Confirm the action by clicking OK.

Notice that the Offline status changes back to Online.

### 38.12 Deleting a Portal

When a portal has been closed or inactive for some time, you may want to remove it permanently from WebCenter Portal. Deleting a portal is permanent; it cannot be restored after it is deleted.

When you delete a portal:

- All pages associated with the portal are deleted.
- Links, lists, notes, tags, and events associated with the portal are deleted.
- Portal roles and membership details are deleted.
- Content managed by discussions and announcements is deleted, when it is stored in the default forum or category created by the portal. Content managed by nondefault forums or categories is not deleted (for details, see Modifying Discussion Forum Settings for a Portal in Building Portals with Oracle WebCenter Portal).
- The portal mail distribution list that is automatically created by the Oracle WebCenter Portal is deleted. However, distribution lists that are customized by the portal manager are not deleted (for details, see Configuring the Mail Distribution List for a Portal in Building Portals with Oracle WebCenter Portal).
- Content managed by external services, such as content repositories and mail, is removed.

You cannot delete a portal while the portal manager is editing portal settings, but there are no other restrictions.

To delete a portal:
1. On the Portals administration page (see Accessing the Portals Page in WebCenter Portal Administration), select the portal to delete by highlighting the row in the table.

   Press Ctrl+click to select more than one portal.

2. From the Actions menu, select Delete (Figure 38-16).

   ![Figure 38-16 Deleting a Portal](image)

3. Click Delete to confirm that you want to delete the portal(s).

   If the delete process fails for any reason, the portal is not removed from the Portals page; this sometimes happens when a back-end server cannot be contacted. If you click Delete again, the portal is removed.
This chapter describes the tasks available on the General page in WebCenter Portal Administration (Figure 39-1). The system administrator can modify the default settings to suit the needs of the organization.

This chapter includes the following topics:

- Customizing the Name and Logo in the Home Portal
- Choosing a Default Page Template
- Choosing a Default Skin
- Choosing Default Resource Catalogs
- Customizing Copyright and Privacy Statements
- Customizing the Online Help Link
- Choosing a Default Display Language
- Choosing a Default Start (or Landing) Page
- Specifying Session Timeout Settings
- Enabling Self-Registration
- Choosing a Default Look and Feel for New Pages
- Enabling and Disabling Access to the Home Portal
- Setting Up Defaults for WebCenter Portal Tools and Services

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permission:

- Portal Server: Manage All
- Portal Server: Manage Configuration
39.1 Customizing the Name and Logo in the Home Portal

Out-of-the-box, the Oracle logo and application name WebCenter Portal appear in the banner of the Home portal pages (Figure 39-2). You can change both the logo and name on the Home portal pages to better suit your target audience. For example, you might want to display your company name here or the name of a department within your company.

**Note:** The changes you make to the Application Name and Application Logo on the General page in WebCenter Portal Administration will only affect pages in the Home portal. They will not affect the other WebCenter Portal Administration pages.

To change the logo on portal pages, see Changing the Portal Icon and Changing the Portal Logo in Building Portals with Oracle WebCenter Portal.

The logo you specify will resize according to the application's page template. If you want to adjust the logo size, you can modify the page template. See Editing a Page Template in Building Portals with Oracle WebCenter Portal.

--

**Figure 39-2  WebCenter Portal Name and Logo on the Home Portal**
To change the name or logo for the Home portal:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **General**.

   You can also enter the following URL in your browser to navigate directly to the **General** page:

   http://host:port/webcenter/portal/admin/settings/general

   **See Also:**
   - WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal*.

2. In the **Application Name** field, enter the new name (Figure 39-3).

   **Figure 39-3 Customizing the Application Name and Logo**

3. To change the logo, click **Browse** next to the **Application Logo** field.

4. In the File Upload dialog, navigate to the logo you want to use.

   The logo image file can be up to 150 KB. Supported file formats are .gif or .GIF, .png or .PNG, and .jpg or .JPG. If the file is not uploading, check the size of the file you are trying to upload.

   The logo is uploaded to WebCenter Portal's image directory (/webcenter/images).

5. Click **Save**.

   To see your changes, navigate to the Home portal and the new logo immediately appears in the top left corner of the banner area.

### 39.2 Choosing a Default Page Template

In WebCenter Portal, page templates define how individual pages and groups of pages display on a user's screen. Every page displays within a page template. System administrators can define the **default page template** used to display pages in the following places:

- The Home portal
- New portals, when the portal's template does not specify that a particular page template must be used

Portal managers can override the default selection within their portal, but users cannot override the page template applied to the Home portal.
The Default Page Template for a device group can now also be overridden from Device Settings in WebCenter Portal Administration. Edit the appropriate device group, as described in Editing a Device. Select the default page template from the Assets section for use with devices of the selected group.

Each page template works together with a skin to determine the overall look and feel of the pages in a portal. While the page template controls the location and behavior of components on the page, the skin controls the visual appearance of those components, such as the colors, fonts, and various other aspects.

See Also:
For more information about skins, see Working with Skins in Building Portals with Oracle WebCenter Portal.

Each page template can define a preferred skin to identify the skin that works best with that page template. When the page template is selected as the default page template for a portal or as the system default, the default skin automatically updates to the page template's preferred skin.

See Also:
For more information, see Setting a Page Template's Preferred Skin in Building Portals with Oracle WebCenter Portal.

See also Working with Page Templates in Building Portals with Oracle WebCenter Portal.

To select the default page template for WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

   You can also enter the following URL in your browser to navigate directly to the General page:

   http://host:port/webcenter/portal/admin/settings/general

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Do one of the following:

   • Select a Default Page Template from the available list (Figure 39-4).

   Note:
   [system default] specifies the default page template defined for WebCenter Portal, hardcoded in webcenter-config.xml

   To learn how to add page templates to this list, see Publishing or Hiding a Page Template in Building Portals with Oracle WebCenter Portal.
Click the Advanced Edit Options icon, then select Expression Builder to enter an EL expression that determines the default page template dynamically based on certain criteria. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

For example, you may like the default page template to change depending on which department or organization the logged in user belongs to.

3. Click Save.

39.3 Choosing a Default Skin

As a system administrator, you may customize the default appearance of WebCenter Portal for all users by changing the default skin. A skin changes the way the user interface appears, but does not change the application's behavior. See Applying a Skin for WebCenter Portal.

Users can override the default skin selection through user preferences. However, skins are often created for use with a specific page template. The choice of skin must therefore be compatible with the selected page template. For more information, see Changing the Look and Feel of Your View in Using Oracle WebCenter Portal.

If none of the built-in skins suit your requirements or you want to apply a look and feel that reflects your corporate brand, you can create and apply your own ADF skins. For your own page templates, you can note the preferred skin by setting (select Shared Assets, then copy a Page Template and select Edit Properties from the Actions drop-down list) the custom attribute preferredSkin to the skin family ID value of the skin that is preferred for use with a given page template. Doing this will allow the skin to switch to the preferred skin when your page template is chosen. If the page template is changed, then the skin will be updated (if it is not set to an expression) to match the page template. For more information, see Creating a Skin in Building Portals with Oracle WebCenter Portal.

The Default Skin for a device group can now also be overridden from Device Settings in WebCenter Portal Administration. Select the appropriate Device Group, then select Edit from the Actions drop-down list. Select the default skin from the Assets section for use with devices of the selected group.

If you want, you can reference the default skin in EL expressions. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Individual users can change the skin applied to their Home portal view through user preferences if they do not like the default skin that you specify. See Setting the Default Skin for a Portal in Building Portals with Oracle WebCenter Portal.
39.3.1 Applying a Skin for WebCenter Portal

When you set a skin for WebCenter Portal, the skin is applied to the Home portal and all portals that use the application-level skin setting. The skin is also applied to any new portals that are created.

To apply a skin to WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General. You can also enter the following URL in your browser to navigate directly to the General page:
   
   http://host:port/webcenter/portal/admin/settings/general

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Do one of the following:

   • Select an application skin from the available list (Figure 39-5).

   Warning:
   Changing the default skin to something other than the preferred skin for the selected default page template may produce unexpected results.

   See Also:
   For more information, see Setting a Page Template's Preferred Skin in Building Portals with Oracle WebCenter Portal.
Click the Advanced Edit Options icon, then select Expression Builder to enter an EL expression that determines the default application skin dynamically based on certain criteria.

For example, you may like the default skin to change depending on which department or organization the logged in user belongs to.

3. Click Save.

The skin you select is applied to WebCenter Portal, any new portals that are created, and all portals that use the application-level skin setting. The skin is not applied to the portals that override the application-level skin setting.

### 39.4 Choosing Default Resource Catalogs

In WebCenter Portal, a resource catalog displays when you edit a page, page template, page style, or task flow asset and click Add Content. A resource catalog presents available resources in a series of folders and subfolders, and the content changes dynamically depending on which services are currently available and the permissions of the current user. Available resources include task flows, portlets, and page components, such as images, text, and hyperlinks. WebCenter Portal provides several built-in default resource catalogs, but you can add new task flows, remove task flows, or reorganize the folder hierarchy to better suit your audience or create new custom resource catalog from scratch. For details, see Working with Resource Catalogs in Building Portals with Oracle WebCenter Portal.

System administrators can specify the default resource catalog to be used for pages, page templates, page styles, and task flow assets in:

- New portals
- Home portal
- Business role pages
- Page templates in portals
- Page templates in the Home portal

To select default resource catalogs:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general
2. In the Assets section, select default resource catalogs in the lists shown in Figure 39-6.

To learn how to expose existing resource catalogs in these lists, see Showing and Hiding Portal Assets in Building Portals with Oracle WebCenter Portal.

Figure 39-6 Selecting Resource Catalogs

3. Optionally, click the Advanced Edit Options icon, then select Expression Builder to enter an EL expression that determines the default resource catalog dynamically based on certain criteria. For example, you may like the default resource catalog to change depending on the which role the logged in user belongs to. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

4. Click Save.

39.5 Customizing Copyright and Privacy Statements

System administrators can customize or hide copyright and privacy statements in WebCenter Portal:

- Copyright - Displays a copyright statement for the entire application.
- Privacy URL - Links to a document that contains a privacy policy for the entire application.

In the default page template, the copyright and privacy URL appear in the WebCenter Portal's page footer (Figure 39-7).

Optionally, you can reference your copyright message and privacy document in EL expressions. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.
Individual portals may provide their own copyright and privacy statements. For details, see Customizing the Copyright Statement and Privacy URL in Building Portals with Oracle WebCenter Portal.

To customize or hide copyright and privacy statements:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

   You can also enter the following URL in your browser to navigate directly to the General page:

   http://host:port/webcenter/portal/admin/settings/general

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. In the Options section, select or deselect Display Page Footer to, respectively, display or hide copyright and privacy information in the page footer (Figure 39-8).

   Modify the legal notice and privacy URL as appropriate:
   - Copyright - Enter a suitable copyright statement for WebCenter Portal. If no copyright information is required, leave this field blank.
   - Privacy URL - Specify the location of the application’s privacy policy. Enter a fully qualified URL. If no privacy information is required, leave this field blank.

3. Click Save.

39.6 Customizing the Online Help Link

Online help as well as other helpful resources for WebCenter Portal can be accessed from the Help link (Figure 39-9).
Customizing the Online Help Link

Out-of-the-box, this **Help** link opens Oracle's built-in help. See Global Help in *Building Portals with Oracle WebCenter Portal*. You can also write online help specifically aimed at your users and redirect the Help link to a different help location.

Optionally, you can reference the Help location in EL expressions. If you need EL assistance, an application developer can provide an EL expression; see "Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper."

When you customize the Help link, built-in help for WebCenter Portal is still available through help buttons, help icons, and so on.

To customize the main Help link:

1. **On the Settings page** (see Accessing the Settings Pages in WebCenter Portal Administration), click **General**.

   You can also enter the following URL in your browser to navigate directly to the **General** page:

   http://host:port/webcenter/portal/admin/settings/general

   **See Also:**

   WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal.*

2. **In the Options section**, enter the location of your help in the **Global Help URL** field (Figure 39-10):

   **Figure 39-10   Global Help URL for WebCenter Portal Online Help**

   Options

   ![Global Help URL](webcenterhelp/spages?topic=welcome.m)
Ensure that you enter a fully qualified URL in the format:

http://host:port/helplocation

For example:

http://myhost:8888/myhelp

The default Global Help URL is /webcenterhelp/spaces?topic=welcome_rr. This URL opens Oracle Help for the Web (OHW) and displays Oracle's built-in help for WebCenter Portal. Enter this URL if you want to return to the default setting.

**Note:**

If you leave the Global Help URL field blank, the Help link is not displayed.

3. Click Save.

Click Help in WebCenter Portal to check whether your custom help opens correctly.

### 39.7 Choosing a Default Display Language

Out-of-the-box, WebCenter Portal supports 27 languages and 100 different locales. It is the system administrator's job to choose a default display language for WebCenter Portal. When selecting the default language, consider which language suits the majority of people using the application. Alternatively, enter an EL expression that determines the default language dynamically based on certain criteria. For example, you may prefer the default display language to change according to the location or organization of the user that is logged in. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in *Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper*.

The first time a user logs in to WebCenter Portal the default language displays, but individuals can personalize their display language through user preferences. See Setting a Portal Display Language in *Building Portals with Oracle WebCenter Portal*.

The default display language only applies when users log in to WebCenter Portal. Public pages, such as the welcome page and the login page, display in the browser language. If no default language is provided, the browser language is used. See also Display Language Precedence in *Building Portals with Oracle WebCenter Portal*.

**Note:**

Portal Managers can nominate a display language for a particular portal. When defined, the portal language overrides both the default language and any user language preference. See also Setting a Portal Display Language in *Building Portals with Oracle WebCenter Portal*.

To select the default display language for WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:
See Also:
WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal*.

2. Do one of the following:

   - Select a **Default Language** from the list available (Figure 39-11).
     If the language you want is not available in the drop-down list, click **Customize**, select the check box for the language you require, and click **Save**. See **Customizing the Language List**.

   ![Figure 39-11 Selecting a Default Language](image)

   To add a completely new language, your localization team must translate WebCenter Portal resource bundles into the new language, and then these translations must be deployed to the managed server on which WebCenter Portal is deployed. For details, see **Adding Support for a New Language to WebCenter Portal**.

   - Click the **Advanced Edit Options** icon, then select **Expression Builder** to enter an EL expression that determines the default language dynamically based on certain criteria. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in **Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper**.

3. Click **Save**.

   The display languages that are available for selection here are also offered to users and portal managers through user preferences. As the system administrator, you can reduce the range of languages available to users. For details, see **Customizing the Language List**.

### 39.7.1 Customizing the Language List

Out-of-the-box, WebCenter Portal offers 27 languages and 100 different locales and all these languages are available to users by default. As the system administrator, you can tailor the languages that are offered to suit your audience. For example, you may prefer to remove all the territory language variants in favor of a more simplified language list or only offer European languages if your portal is specifically aimed at a European audience.

To customize the languages available to users:
1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click Customize next to Default Language (Figure 39-12).

3. Select which languages to offer by selecting (or deselecting) each language check box (Figure 39-13).
4. Click Save.

39.8 Choosing a Default Start (or Landing) Page

By default, users see the portal browser when they log in, but you can change the initial landing page to be the Home portal, a specific portal, or a specific page. You can specify a start page for a specific group, for authenticated users, and for public users.

The system administrator can configure the landing page for WebCenter Portal as shown in Table 39-1:

Table 39-1  WebCenter Portal Landing Page Behavior
Table 39-1 (Cont.) WebCenter Portal Landing Page Behavior

<table>
<thead>
<tr>
<th>Landing Page URL</th>
<th>Authenticated Users or Groups</th>
<th>Public Users</th>
</tr>
</thead>
<tbody>
<tr>
<td>/webcenter or /</td>
<td>Directed to the configured authenticated landing page</td>
<td>Directed to an unauthenticated landing page</td>
</tr>
<tr>
<td>webcenter/portal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>/webcenter/</td>
<td>• If the resource is public or user has access</td>
<td>If resource is not public or does not exist,</td>
</tr>
<tr>
<td>portal/</td>
<td>to the resource, directed to the resource page</td>
<td>directed to the login page</td>
</tr>
<tr>
<td>&lt;portal_name&gt;/</td>
<td>• If resource does not exist or user does not</td>
<td></td>
</tr>
<tr>
<td>&lt;page_name&gt;</td>
<td>have access, then Page Not Found error is displayed</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To select the landing page for WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general

See Also:

WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. In the Default Portal section, select what users see first when they log in (Figure 39-14).

Figure 39-14 Choosing a Default Start Page
• To specify a default landing page for selected groups, see Choosing a Default Start Page for Groups.

• To specify a default landing page for all other authenticated users who do not belong to any of the specified groups, see Choosing a Default Start Page for Authenticated Users.

• To specify a default landing page for all public users, see Choosing a Default Start Page for Public Users.

3. Click Save.

### 39.8.1 Choosing a Default Start Page for Groups

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general

---

**See Also:**

WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

---

2. In the Default Portal section, click Add Group if you want selected enterprise groups to see a specific start page.

**Note:**

For the default portal to be visible to a group member, the group itself should be a member of the portal, if the portal is hidden or private.

3. From the Add Group dialog, search for a group or select a group from the list, then click OK.

The selected group is added to the table (Figure 39-15).

**Figure 39-15 Specifying a Landing Page for a Group**

Any user belonging to the group will be directed to the default landing page upon logging in to WebCenter Portal. Note that by default, the landing page is set to the portal browser.

4. To change the Location of the landing page, select the group name and click Edit.
The Edit dialog opens (Figure 39-16)

**Figure 39-16   Landing Page Options**

5. Select whether the group will first see the Home portal, or a specific portal or page:

- **Open the Home Portal.** Select to specify that users see the Home portal when they first log in.
- **Open a Specific Portal.** Select to specify that a particular portal displays, and enter the portal name or click **Browse** to select from a list of portals. Select an option from the **Show Portals** list, and click **OK**. For example,
  
  `http://host:port/webcenter/portal/portalName`

- **Open a Specific Page URL.** Select to specify that a particular page displays, and enter the page location.
  
  Typically this is an internal page. You can enter a full or relative page URL as shown in these examples:
  
  `http://mywebcenter.com:8888/webcenter/portal/page/landingpage`
  
  `/portals/portalname/page/landingpage`
  
  If you specify an external page, make sure that you specify the full URL.

6. Click **Save**.

### 39.8.2 Choosing a Default Start Page for Authenticated Users

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **General**.

   You can also enter the following URL in your browser to navigate directly to the **General** page:

   `http://host:port/webcenter/portal/admin/settings/general`
2. In the **Authenticated Users** section, specify what authenticated users, who are not in any of the groups, specified in Choosing a Default Start Page for Groups, see when they first log in (Figure 39-17).

![Figure 39-17 Selecting a Landing Page for Authenticated Users](image)

- **Open the Portal Browser.** Selected by default. Users see the portal browser when they first log in.
- **Open the Home Portal.** Select to specify that users see the Home portal when they first log in.
- **Open a Specific Portal.** Select to specify that a particular portal displays, and enter the portal name. For example:
  
  http://host:port/webcenter/portal/portalName

  Or click **Browse** to select from a list of portals (Figure 39-18). Select an option from the **Add Portal** list, and click **OK**, or enter the portal name in the **Search** field and click **Search**.

![Figure 39-18 Add Portal Dialog](image)

- **Open a Specific Page URL.** Select to specify that a particular page displays, and enter the page location.
Note:
Make sure that the specified page is available to all users (see Setting Page Security in Building Portals with Oracle WebCenter Portal). If a user does not have access to the specified page, the Page Not Found message displays.

Typically this is an internal page. You can enter a full or relative page URL as shown in these examples:

http://mywebcenter.com:8888/webcenter/portal/page/landingpage
http://mywebcenter.com:8888/webcenter/portal/portalname/page/landingpage
/portals/portalname/page/landingpage

If you specify an external page, make sure that you specify the full URL.

3. Click Save.

39.8.3 Choosing a Default Start Page for Public Users

Any user with access to WebCenter Portal who is not logged in assumes the Public-User role. For more information, see Managing Roles and Permissions for a Portal in Building Portals with Oracle WebCenter Portal.

You can make a portal available to anyone with access to the WebCenter Portal instance that contains the portal. Registering for a WebCenter Portal account is not required. The public information provided allows the portal to be shared with non-members and people outside of the WebCenter Portal community. For more information, see Granting Public Access to a Portal in Building Portals with Oracle WebCenter Portal.

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. In the Default Login Settings section, specify what public users see when they first log in (Figure 39-19).
Figure 39-19  Selecting a Landing Page for Public Users

- **Open the Welcome Page.** Selected by default. Users see the WebCenter Portal welcome page when they first log in.

- **Open a Specific Portal.** Select to specify that a particular portal displays, and enter the portal name. For example,

  http://host:port/webcenter/portal/portalName

  Or click **Browse** to select from a list of portals (Figure 39-18). Select an option from the **Add Portal** list, and click **OK**, or enter the portal name in the **Search** field and click **Search**.

- **Open a Specific Page URL.** Select to specify that a particular page displays, and enter the page location.

  Typically this is an internal page. You can enter a full or relative page URL as shown in these examples:

  http://mywebcenter.com:8888/webcenter/portal/page/landingpage

  http://mywebcenter.com:8888/webcenter/portal/portalname/page/landingpage

  /portals/portalname/page/landingpage

  If you specify an external page, make sure that you specify the full URL.

3. Click **Save**.

### 39.9 Specifying Session Timeout Settings

When there is no activity for an extended period of time in a WebCenter Portal session, it times out. Out-of-the-box, the WebCenter Portal session timeout is set to 20 minutes. When deploying shared libraries, additional paths might be added to the /webcenter root context (for example, /webcenter/images/). In such instances where URLs based on the /webcenter root context are not handled by WebCenter Portal, the HTTP session timeout is set to 24 hours.

You can modify the default number of minutes that can elapse before a session times out, and select whether you want to display a popup or a window when the session times out.

---

**Note:**

The value for session timeout can also be seen on the **Attributes** page with the attribute name **wcSessionTimeoutPeriod**.
To modify the session timeout settings for WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

   You can also enter the following URL in your browser to navigate directly to the General page:
   
   http://host:port/webcenter/portal/admin/settings/general

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. In the Session Timeout section, select the desired result when WebCenter Portal times out (Figure 39-20).

   ![Figure 39-20  Session Timeout Options](image)

   - **Display Timeout Page.** Select to display the WebCenter Portal timeout page in the browser (Figure 39-21), where the user can click the provided link to log in again and restart at the default start page (see also Choosing a Default Start (or Landing) Page).
• **Display Timeout Popup.** Select to display an Expiration Warning notification popup (Figure 39-22) when the Session Timeout value is reached. The user can click **OK** within 2 minutes to prevent the timeout. If the user does not respond to the Expiration Warning within 2 minutes, then the session times out. In the Timeout notification popup (Figure 39-23), the user can click **OK** to log in again and restart at the page that was active when the session expired.

The Display Timeout Popup option works if your browser is set to display popups. If your browser is set to block popups, then you see the timeout page.

3. **(Optional)** In the **Session Timeout (minutes)** field, enter a new value.

   The default value is 45 minutes, the minimum value is 5, and the maximum value is 1440 (24 hours). If this field is left blank, the default value (45) applies.
Note:
If the WebCenter Portal is configured for single sign-on (SSO), Oracle recommends that the Session Timeout value set here is no higher than the SSO timeout value. The session timeout is a factor of the physical memory available and the number of concurrent users that have to be supported. If the Session Timeout value is less than the SSO session timeout, then the WebCenter HTTP session times out after the duration specified here, but a new WebCenter session will be automatically created as long as the SSO timeout is not reached.

4. Click **Save**.

39.10 Enabling Self-Registration

A system administrator can enable WebCenter Portal self-registration. Through self-registration, users can create their own login and password. A user who self-registers is immediately and automatically granted access to WebCenter Portal and a new user account is created in the identity store.

This section includes the following information:

- About Self-Registration
- Enabling Anyone to Self-Register
- Enabling Self-Registration By Invitation-Only

39.10.1 About Self-Registration

Self-registration allows users to create their own login and password for WebCenter Portal. A user who self-registers is immediately and automatically granted access to WebCenter Portal and a new user account is created in WebCenter Portal's identity store.

If any public user is allowed to self-register, a **Register for an account** link displays on the WebCenter Portal sign in page. To enable this feature, see Enabling Anyone to Self-Register.

Self-registration by invitation is available too. This feature allows portal managers to send out membership invitations to people who are not currently registered with WebCenter Portal but might be interested in their portal. Before accessing the portal, invitees must create an account with WebCenter Portal and their account details are added to WebCenter Portal's identity store. If approval is required, the portal manager must approve their subscription request before gaining access to the portal. If the portal is public or further approval is not required, the new user gains access to the portal immediately. See Enabling Self-Registration By Invitation-Only.

Note:
If self-registration is not enabled for WebCenter Portal, identity store management takes place through the WLS Administration Console (or directly into embedded LDAP identity stores using LDAP commands) and is the responsibility of the system administrator. See also Adding Users to the Embedded LDAP Identity Store.
A self-registration page is supplied with WebCenter Portal. Users with the Administrator role can add new components to the page and change the page layout if required. See Customizing System Pages.

Note:
While you can access the Self-Registration page using a pretty URL, the fields on the page are not active when accessed in this way. Fields are active only when non-registered users access the page by clicking the Register link on the WebCenter Portal Sign In page.

The self-registration page provided with WebCenter Portal offers to send a user name reminder mail message to anyone who tries to register with an email address that has already been used (Figure 39-24).

Figure 39-24   Email Address Already Registered

This feature only works if public credentials are defined for the external application that is providing authentication for the mail service in WebCenter Portal. If users experience issues with this feature, check the mail server connection and its associated external application connection are configured correctly and that public credentials are defined. See also Registering Mail Servers.

- For more information about setting up public credentials using Enterprise Manager, see Table 20-6 in Managing External Applications.
- For more information about setting up public credentials using WLST, see addExtAppCredential in Oracle WebLogic Scripting Tool.

39.10.2 Enabling Anyone to Self-Register
When any public user is allowed to self-register, a Register for an account link displays on the WebCenter Portal sign in page (Figure 39-25).
New users must create an account before gaining access to Oracle WebCenter Portal. Users who self-register are added directly to the WebCenter Portal identity store and assigned the Authenticated-User role. By default, users with Authenticated-User role have access to the Home portal, pages that they create, and public pages. They are also allowed to view public portals, join any portal that allows self-subscription, and create portals of their own. If you enable self-registration, consider modifying Authenticated-User permissions to suit your exact requirements. See Modifying Application Role Permissions.

To allow anyone to self-register with WebCenter Portal:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

   You can also enter the following URL in your browser to navigate directly to the General page:

   http://host:port/webcenter/portal/admin/settings/general

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Select Allow Public Users to Self-Register (Figure 39-26).

   When you deselect this option, public users cannot self-register with WebCenter Portal. If you want to enable self-registration on an invitation-only basis, see Enabling Self-Registration By Invitation-Only.
3. Click Save.

Anyone with internet access can now register themselves as a user of the WebCenter Portal application, as described in Registering Yourself with WebCenter Portal in Using Oracle WebCenter Portal. If users experience no response when they attempt to register with WebCenter Portal, they should refresh their browser and try again.

39.10.3 Enabling Self-Registration By Invitation-Only

By default, only registered WebCenter Portal users are candidates for portal membership. While this might meet the needs of most WebCenter Portal users, some portals will want to recruit members outside of the WebCenter Portal community.

A system administrator can extend portal membership to users outside of WebCenter Portal by allowing them to self-register on an invitation-only basis. When this option is enabled, portal managers can invite anyone to join their portal by sending them a customized invitation by mail. The invitation includes a secure, self-registration URL which the invited party clicks to accept portal membership.

New members recruited in this way must create an account with WebCenter Portal before gaining access to the portal. Users who self-register by invitation are added to the identity store, and to the portal’s member list.

---

**Note:**

Users who self-register by invitation will also be assigned the default application role Authenticated-User. By default, users with the Authenticated-User role have access to the Home portal, pages that they create, and public pages. They are also allowed to view public portals, join any portal that allows self-subscription, and create portals of their own. When you enable self-registration, consider modifying Authenticated-User permissions to suit your exact requirements. See also Modifying Application Role Permissions.

---

To allow anyone to self-register with WebCenter Portal through invitations:

1. Ensure that the prerequisite configuration is set up, as described in Configuring Self-Registration By Invitation in WebCenter Portal.

2. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click General.

You can also enter the following URL in your browser to navigate directly to the General page:

http://host:port/webcenter/portal/admin/settings/general
3. Select **Allow Self-Registration Through Invitations** (Figure 39-27).

When you deselect this option, only existing users are candidates for portal membership.

![Figure 39-27 Allowing Self-Registration Through Invitations](image)

4. Click **Save**.

After you enable this option, portal managers can invite anyone to become a member of their portal. See Inviting a Non-Registered User in *Building Portals with Oracle WebCenter Portal*.

### 39.11 Choosing a Default Look and Feel for New Pages

Administrators can set up a default look and feel for system, business role, and personal pages to simplify page creation for first-time users or to steer users toward a particular page scheme and style.

For more information:

- [Customizing System Pages](#)
- [Managing Business Role Pages](#)
- [Managing Personal Pages](#)

Individuals may personalize the default settings in their Home portal view. For more information, see Setting Application-Level Page Creation Defaults for Personal Pages.

### 39.12 Enabling and Disabling Access to the Home Portal

Access to the Home portal is optional—it is not mandatory to provide users with a private work area where they can store personal content and perform personal tasks. Users can fully participate in collaborative projects without access to the Home portal.

Users who do not have access to the Home portal cannot use personal productivity tools (such as favorites), create personal pages, or see personal pages that other users might share.

The **Portal Server: View** permission controls whether users have access to the Home portal. Administrators can disable access to everyone using WebCenter Portal or to specific users only. Use Table 39-2 to determine which permission settings are required for the different roles.

To enable or disable access to the Home portal:
1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.

You can also enter the following URL in your browser to navigate directly to the Security page:

http://host:port/webcenter/portal/admin/settings/security

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Roles tab, select a role from the Role list, then under Portal Server, select or deselect the View check boxes for the roles (see Figure 39-28), as appropriate (see Table 39-2).

![Figure 39-28 Portal Server: View Permissions]

Table 39-2 Portal Server: View Permissions

<table>
<thead>
<tr>
<th>Role</th>
<th>Select Portal Server: View</th>
<th>Deselect Portal Server: View</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Users assigned this role can always access the Home portal.</td>
<td>Not applicable for administrators.</td>
</tr>
<tr>
<td>Application Specialist</td>
<td>Users assigned this role can always access the Home portal.</td>
<td>Users with this role cannot access the Home portal. (Assumes the Portal Server: View permission is disabled for the Authenticated-User and the Public-User.)</td>
</tr>
<tr>
<td>Portal Creator User</td>
<td>Users assigned this role can always access the Home portal.</td>
<td>Users with this role cannot access the Home portal. (Assumes the Portal Server: View permission is disabled for the Authenticated-User and the Public-User.)</td>
</tr>
<tr>
<td>Public User</td>
<td>Unauthenticated users can see personal pages and content marked public.</td>
<td>Unauthenticated users only see the login page.</td>
</tr>
</tbody>
</table>
### Table 39-2 (Cont.) Portal Server: View Permissions

<table>
<thead>
<tr>
<th>Role</th>
<th>Select Portal Server: View</th>
<th>Deselect Portal Server: View</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authenticated User</td>
<td>Everyone can access the Home portal.</td>
<td>Users cannot access the Home portal unless you grant them another role that specifies otherwise.</td>
</tr>
<tr>
<td>Any Custom Role</td>
<td>Users assigned the custom role have access to the Home portal.</td>
<td>Users with the custom role cannot access the Home portal. (Assumes the Portal Server: View permission is disabled for the Authenticated-User and the Public-User.)</td>
</tr>
</tbody>
</table>

3. Click **Save** to save your changes.

New permissions are effectively immediately.

### 39.13 Setting Up Defaults for WebCenter Portal Tools and Services

The system administrator is also responsible for setting up tools and services options for WebCenter Portal. For more information, see Managing Tools and Services.
Managing Security Across Portals

This chapter describes the tasks available on the Security page in WebCenter Portal Administration. The system administrator can modify the default settings to assign suitable permissions to the custom application user roles, assign users to these application roles, and also create new custom roles, if required by the organization.

This chapter includes the following topics:

- About WebCenter Portal Security
- About Users
- About Application Roles and Permissions
- About Roles and Permissions Within a Portal
- Managing Users
- Managing Application Roles and Permissions

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permission:

- Portal Server: Manage All

40.1 About WebCenter Portal Security

WebCenter Portal provides a comprehensive security model that enables you to control what users can see and change in WebCenter Portal. Using the Security page in WebCenter Portal Administration (Figure 40-1), you can control which users (and groups) have access to individual portals and the Home portal and you can also control exactly what users and groups can see and do by enabling and disabling various permissions.
Within a particular portal you can restrict user and group access to individual pages, page content (such as task flows, portlets, documents, and folders), and assets (such as page templates, page styles, skins, resource catalogs, and so on).
User and Groups

A user is a single person in the identity store, and a group contains multiple users. In WebCenter Portal you can grant permissions to individual users and to groups of users.

Unregistered Users and Self-Registration

Self-registration allows unregistered users to create their own login and password for WebCenter Portal. A user who self-registers is immediately and automatically granted access to WebCenter Portal and a new user account is created in WebCenter Portal's identity store.

Application Roles and Portal Roles
Application roles determine what a user (or group) can see and do in the Home portal which, for some administrative functions, can impact all of WebCenter Portal. Portal roles control actions within a particular portal.

**Portals**

Portals support the formation and collaboration of project teams and communities of interest by providing a dedicated and readily accessible area for relevant services, pages, and content and by supporting the inclusion of specified members.

**Home Portal**

The Home portal is a shared portal that, by default, is accessible to everyone who is logged in. Application roles apply while a user is working within the Home portal. In most applications, the Home portal focuses on social networking and personal content.

**Assets**

Various portal resources help define the overall structure, look and feel, and content in portals, and these include page templates, page styles, skins, resource catalogs, Content Presenter display templates, task flow styles, data controls, and task flows. Users with appropriate privileges can build and customize resources for the entire application or individual portals.

**Pages**

Anyone authorized to edit a page can grant access and permissions to other users and groups. For example, you might grant view-only permission to everyone in the sales group, edit permission to sales managers, and manage permission to a single user. Alternatively, you can specify that the page inherits its access from the application.

**Page Content, Files, and Folders**

Some pages might contain content that you want only a select set of users, or even only one other user, to see. For example, a page aimed at sales people might include two Announcement task flows; one aimed at all sales people and the other at only sales managers. By restricting access to the second Announcement task flow, you can hide management-level announcements from anyone who is not a sales manager.

### 40.2 About Users

A WebCenter Portal user has a login account for WebCenter Portal—provisioned directly from an existing identity store. See also, Adding Users to the Embedded LDAP Identity Store.

All users in the identity store are assigned minimal privileges in WebCenter Portal through the Authenticated-User role. The only exception is the system administrator (weblogic by default); out-of-the-box, the system administrator is the only user assigned full administrative privileges through the Administrator role. For more information, read the next section Default Application Roles.

It is the system administrator’s job to assign each user an appropriate application role. Alternatively, the system administrator may choose to assign the Administrator role to another user and delegate this responsibility.

**Table 40-1 Default Administrator in WebCenter Portal**
40.3 About Application Roles and Permissions

Application roles control the level of access a user has to information and services in WebCenter Portal.

This section includes:

- About Application Roles
- About Application Permissions

40.3.1 About Application Roles

Application role assignment is the responsibility of the WebCenter Portal administrator. Administrators can assign users a default application role or create additional, custom roles specific to their application deployment. For more details, see:

- Default Application Roles
- Custom Application Roles

Application roles apply when users are working in the Home portal or on application-level tasks. A different set of roles and permissions apply when a user is working within a particular portal. It is the portal manager's responsibility to determine suitable role assignments for each of its members. See also Managing Application Roles and Permissions, and Administering Security in a Portal in Building Portals with Oracle WebCenter Portal.

Note:

Application roles and permissions defined within WebCenter Portal are stored in its policy store and, consequently, apply to this WebCenter Portal only. Enterprise roles are different; enterprise roles are stored within the application's identity store and do not imply any permissions within WebCenter Portal. See Application Roles and Enterprise Roles.

40.3.1.1 Default Application Roles

WebCenter Portal provides several default application roles (Table 40-2). You cannot delete the default application roles of Administrator, Public-User, and Authenticated-User, but you can modify the default permission assignments for each role. For more information, see Modifying Application Role Permissions.

Table 40-2 Default Application Roles for WebCenter Portal
### Table 40-2 (Cont.) Default Application Roles for WebCenter Portal

<table>
<thead>
<tr>
<th>Application Role</th>
<th>Description</th>
<th>Modify?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Users with the Administrator role can set application-wide properties for WebCenter Portal, create business role pages, configure defaults for discussion forums, mail, and people connection services, register producers and external applications, as well as perform other administrative duties such as editing the login page and the self-registration page. Administrators can also manage users and roles for the WebCenter Portal, delegate or revoke privileges to/from other users, manage portals and portal templates, and also import and export portal as well as deploy and propagate portal. Out-of-the-box, the system administrator is the only user assigned full administrative privileges for the WebCenter Portal through the Administrator role.</td>
<td>Yes*</td>
</tr>
<tr>
<td></td>
<td>*Except for Application permissions which are read-only</td>
<td></td>
</tr>
<tr>
<td>Note:</td>
<td>The Administrator role allows administration permissions on a private portal (such as managing membership), but does not allow access to a private portal’s page contents.</td>
<td></td>
</tr>
<tr>
<td>AppConnectionManager</td>
<td>Users with this role can manage (create, update, and delete) portlet producers and external applications through corresponding task flows. Initially, only users with the Administrator role is a member of the AppConnectionManager role. In order to manage membership of AppConnectionManager role, use the following options: • WLST commands: – grantAppRole: To add a user or role to the Connection Manager (For command syntax and examples, see grantAppRole in Infrastructure Security WLST Command Reference). – revokeAppRole: To remove the member from the Connection Manager (For command syntax and examples, see revokeAppRole in Infrastructure Security WLST Command Reference). • Enterprise Manager (see Managing Application Roles in Securing Applications with Oracle Platform Security Services. Note: You cannot view AppConnectionManager role in Oracle WebCenter Portal UI.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Table 40-2  (Cont.) Default Application Roles for WebCenter Portal

<table>
<thead>
<tr>
<th>Application Role</th>
<th>Description</th>
<th>Modify?</th>
</tr>
</thead>
</table>
| AppConnectionViewer  | Users with this role can view portlet producers and external applications through corresponding task flows. Initially, any user who is logged in (that is, has authenticated-role) is a member of the AppConnectionViewer role. In order to manage membership of AppConnectionViewer role, use the following option:  
- WLST commands:  
  - grantAppRole: To add a user or role to the Connection Manager (For command syntax and examples, see grantAppRole in Infrastructure Security WLST Command Reference).  
  - revokeAppRole: To remove the member from the Connection Manager (For command syntax and examples, see revokeAppRole in Infrastructure Security WLST Command Reference).  
- Enterprise Manager (see Managing Application Roles in Securing Applications with Oracle Platform Security Services).  
  **Note:** You cannot view AppConnectionViewer role in Oracle WebCenter Portal UI. | No     |
| Application Specialist | Users with the Application Specialist role can create portals; manage portal templates; create, edit, and delete pages, page styles, page templates, Content Presenter templates, data controls, pagelets, resource catalogs, skins, task flow styles, and task flows; update People Connections data, and connect with people. | Yes    |
| Portal Creator       | Users with the Portal Creator role are assigned the Portals: Create Portals and Portal Server: View permission by default. Users in this role do not have the ability to manage or create portal templates. This role is provided to make sure that only a select few portal users have the ability to create portals.  
Upon creating a portal, the Portal Creator role inherits the permissions inherent in the portal-level Portal Manager role. Users in this role have the ability to import, export, and deploy portals (only if they are in a role that has the application level Portal Server: Deploy permission) that they are members of and those portals that they manage. | Yes    |
### Table 40-2  (Cont.) Default Application Roles for WebCenter Portal

<table>
<thead>
<tr>
<th>Application Role</th>
<th>Description</th>
<th>Modify?</th>
</tr>
</thead>
</table>
| Authenticated-User | Authenticated users of WebCenter Portal are granted the Authenticated-User role. Users who log in are assigned this role and, by default, have access to the Home portal, pages that they create, and public pages. These users can also view public portals. By default, the Authenticated-User role is granted minimal privileges, through the following permissions:  
  • Portal Server: View  
  • Portals: Create Portals  
  • Portal Templates: Create Portal Templates  
  • Pages: Create Pages  
  • People Connections: Update People Connections Data  
  • People Connections: Connect with People  
The Authenticated-User role also has permissions to create portals and portal templates. This role inherits permissions from the Public-User role. All custom application roles inherit permissions from the Authenticated-User role. In the WebCenter Portal, the Authenticated-User role is equivalent to authenticated-role—a standard OPSS (Oracle Platform Security Services) role. | Yes     |
| Public-User        | Anyone with access to the WebCenter Portal who is not logged in, is granted the Public-User role. Such users are anonymous, unidentified, and can see public content only. By default, the Public-User role is granted minimal privileges, that is, only the Portal Server: View permission. In the WebCenter Portal, the Public-User role is equivalent to anonymous-role—a standard OPSS (Oracle Platform Security Services) role. **Caution:** Take care when granting permissions to the Public-User role. Avoid granting administrative permissions such as Portal Server: Manage All, Portal Server: Manage Configuration, or any permission that might be considered unnecessary. See also About Application Permissions. If you do not want unauthenticated users to see WebCenter Portal content that is marked 'public', do not grant the Portal Server: View permission to the Public-User role. When public access is disabled, public content cannot be seen by unauthenticated users. Also, the Welcome page for WebCenter Portal is not displayed; public users are directed straight to a login page. Administrators may customize the default login page, if required. See Customizing System Pages for All Portals. | Yes     |

### 40.3.1.2 Custom Application Roles

Custom application roles (sometimes known as user-defined roles) are specific to your WebCenter Portal. When setting up WebCenter Portal, it is the WebCenter Portal administrator’s job to identify which application roles are required, select suitable role names, and define the responsibilities of each role.

For example, an education environment might require roles such as Teacher, Student, and Guest. While roles such as Finance, Sales, Human Resources, and Support would be more appropriate for a corporate environment.
In WebCenter Portal, custom application roles inherit permissions from the Authenticated-User role.

To learn how to set up application roles for WebCenter Portal users, see Defining Application Roles.

40.3.2 About Application Permissions

Every application role has specific, defined capabilities known as permissions. These permissions allow individuals to perform specific actions in the Home portal. Permissions are categorized and listed individually in the subsequent tables:

- Table 40-3 lists the available application permissions in WebCenter Portal.
- Table 40-4 lists the application roles and default permissions assigned to these roles in WebCenter Portal.

No permission, except for Manage All, inherits privileges from other permissions.

40.3.2.1 Understanding Application Permissions

Table 40-3 lists the application-level permissions available in WebCenter Portal.

<table>
<thead>
<tr>
<th>Category</th>
<th>Application Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Server</td>
<td><strong>Manage All</strong> - Enables access to all WebCenter Portal Administration pages: Settings, Portals, Shared Assets, Attributes, and Portal Templates. Through these pages, users can manage application security (users/roles), configure application-wide properties and services, manage resources, create business role pages, manage everyone's personal pages, customize system pages, view portals accessible to them, as well as export/import portals and portal templates. Some administrative tasks are exclusive to the out-of-the-box Administrator role and cannot be performed by granting the Portals: Manage Security and Configuration permission. These tasks include editing the login page, the self-registration page, and profile gallery pages, as well as the ability to manage all portals, all portal templates, external applications, and portlet producers. <strong>Manage Configuration</strong> - Same as the Portal Server: Manage All permission but excludes security privileges. Users with this permission cannot access the Security page. <strong>View</strong> - Enables users to view WebCenter Portal, and gives them access to the Home portal. See Table 40-2. <strong>Deploy</strong> - Enables users to deploy and propagate a portal. For more information, see Deploying Portals, Templates, Assets, and Extensions.</td>
</tr>
<tr>

<td>Application Permissions</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Portals           | **Manage Security and Configuration** - Enables access to all portal administration pages (Overview, Settings, Attributes, Security, Tools and Services), except Assets. Through these pages users can manage portal membership, assign permissions and roles, manage, delete, and deploy and export portals and resources, set portal properties, and manage service availability.  
  - To access portal pages, page and asset permissions must be granted.  
  - To access portal assets, asset permissions must be granted.  
  Includes Manage Configuration and Manage Membership permissions.  
  **Manage Configuration** - Same as the Manage Security and Configuration permission but excludes security privileges. Users with this permission cannot access the Security pages unless they are a portal manager. Users with this permission cannot access the Roles and Members pages.  
  - To access portal pages, page and asset permissions must be granted.  
  - To access portal assets, asset permissions must be granted.  
  Users with this permission must be allowed to view the portal.  
  **Manage Membership** - Enables access to the Roles and Members pages in the portal administration settings. On these pages, users can create, edit, and delete members and roles for the portal.  
  **Create Portals** - Enables users to create portals.  
  See Managing Roles and Permissions for a Portal in *Building Portals with Oracle WebCenter Portal*. |
| Portal Templates  | **Manage All** - Enables users to manage any portal template (through the Portal Templates page) and delete templates accessible to them. See Managing All Portal Templates in *Building Portals with Oracle WebCenter Portal*.  
  **Create Portal Templates** - Enables users to create portal templates.                                                                                     |
| Pages             | **Create, Edit, and Delete Pages** - Enables users to create, edit and delete pages in the Home portal.  
  **Delete Pages** - Enables users to delete pages in the Home portal.  
  **Edit Pages** - Enables users to add or edit personal page content, rearrange content, and set page parameters and properties.  
  **Customize Pages** - Enables users to customize their view of pages in the Home portal by adding, editing, or removing content.  
  **View Pages** - Enables users to view pages in the Home portal.  
  **Create Pages** - Enables users to create a new personal page in the Home portal.  
  **Contribute Page Content** - These permissions apply to pages in the Home portal. The permissions do not apply to pages that are created within a portal. Page permissions within a portal are granted by the portal manager. See Managing Roles and Permissions for a Portal in *Building Portals with Oracle WebCenter Portal*. |
| Application       | **Create, Edit, and Delete Visualization Templates** - Enables users to create, edit and delete visualization templates through WebCenter Portal.  
  **Create Visualization Templates** - Enables users to create visualization templates for the application.  
  **Edit Visualization Templates** - Enables users to edit application-level visualization templates.  
  See Working with Visualization Templates in *Building Portals with Oracle WebCenter Portal*.                                                                    |
| Integration       |                                                                                                           |

40.3.2.3 Understanding Discussion Server Role Mapping

Some WebCenter Portal services that need access to remote (back-end) resources also require role-mapping based authorization, that is, the WebCenter Portal roles that allow users to work with the Discussions service in WebCenter Portal, must be mapped to corresponding roles on WebCenter Portal's discussions server.

WebCenter Portal uses application roles to manage user permissions in the Home portal and portal roles to manage user permissions within a particular portal. On WebCenter Portal's discussions server, a different set of roles and permissions apply.

Users who are working with discussions and announcements in WebCenter Portal automatically map to the appropriate discussions server role, shown in Table 40-5 and Table 40-6.

Table 40-5 Discussions Server Roles and Permissions - Application

<table>
<thead>
<tr>
<th>Discussion Server Role</th>
<th>Discussion Server Permissions</th>
<th>WebCenter Portal Equivalent Application Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Category Admin</td>
<td>Discussions-Create, Edit, and Delete Create, read, update and delete sub categories, forums, and topics inside the category for which permissions are granted.</td>
</tr>
</tbody>
</table>
Table 40-6  Discussions Server Roles and Permissions - For a Portal

<table>
<thead>
<tr>
<th>Discussion Server Role</th>
<th>Discussion Server Permissions</th>
<th>WebCenter Portal Equivalent Permissions in a Portal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Manager</td>
<td>Category Admin</td>
<td>• Discussions-Create, Edit, and Delete Create, read, update and delete forums and topics.</td>
</tr>
<tr>
<td></td>
<td>Forum Admin</td>
<td>• Announcements-Create, Edit, and Delete Create, read, update and delete announcements.</td>
</tr>
<tr>
<td></td>
<td>Create Message</td>
<td>• Discussions-Create and Edit Create and edit topics.</td>
</tr>
<tr>
<td></td>
<td>Create Announcement</td>
<td>• Announcements-Create and Edit Create and edit announcements.</td>
</tr>
<tr>
<td></td>
<td>Read Forum</td>

</tr>
<tr>
<td></td>
<td>Create Thread</td>
<td>• Discussions-View View forums and topics.</td>
</tr>
<tr>
<td></td>
<td>Read Forum</td>
<td>• Announcements-View View announcements.</td>
</tr>
</tbody>
</table>

Any user assigned the Application-Discussions-Create Edit Delete permission in WebCenter Portal is automatically added to WebCenter Portal’s discussions server and assigned the Administrator role with the Category Admin permission. Out-of-the-box, WebCenter Portal assigns the Application-Discussions-Create Edit Delete permission to the Administrator role only.

Similarly, in a given portal, any member assigned discussion and announcement permissions is granted the corresponding permissions on the discussions server.

40.3.2.4 Understanding Enterprise Group Role Mapping

In WebCenter Portal you can assign individual users or multiple users in the same enterprise group to WebCenter Portal roles. Subsequent enterprise group updates in the back-end identity store are automatically reflected in WebCenter Portal. Initially, when you assign an enterprise group to a WebCenter Portal role, everyone in the enterprise group is granted that role. If someone moves out of the group, the role is revoked. If someone joins the group, they are granted the role.

For WebCenter Portal to properly maintain enterprise group-to-role mappings, back-end servers, such as the discussions server and content server, must support enterprise groups too. WebCenter Portal’s Discussion Server and WebCenter Content’s Content Server versions provided with this release both support enterprise groups but previous versions may not. See also, Troubleshooting Issues with Users and Roles.

40.4 About Roles and Permissions Within a Portal

When a user becomes a member of a particular portal, a different set of roles and responsibilities apply. For more information, see Administering Security in a Portal in Building Portals with Oracle WebCenter Portal.
40.5 Managing Users

System administrators must ensure that all WebCenter Portal users have appropriate permissions. To get permissions, users must be assigned to an appropriate application role.

From the Users and Groups page (Figure 40-3), system administrators can manage application roles for all the users who have access to WebCenter Portal, that is, all users defined in the identity store. From here, you can change user role assignments, grant administrative privileges, and revoke user permissions. To access the Users and Groups page, open WebCenter Portal Administration Settings and click Security. For details, see Accessing the Settings Pages in WebCenter Portal Administration.

Only users granted special (non-default) application privileges appear in this table. Initially, all users in the WebCenter Portal identity store are assigned minimal privileges through the Authenticated-User role. Users with the default Authenticated-User role are not listed here. See also Default Application Roles.

Figure 40-3  WebCenter Portal Administration: Users and Groups Page

This section describes how to assign roles and contains the following subsections:

- Adding and Removing Users
- Assigning Users (and Groups) to Application Roles
- Assigning a User to a Different Application Role
- Revoking Application Roles
40.5.1 Adding and Removing Users

WebCenter Portal administrators cannot add new user data directly to the WebCenter Portal identity store or remove user credentials. Identity store management is the responsibility of the systems administrator and takes place through the WLS Administration Console or directly into embedded LDAP identity stores using LDAP commands. See also Adding Users to the Identity Store Using the WLS Administration Console.

WebCenter Portal administrators can, however, enable self-registration for the application. Through self-registration, public users can create their own login and password for WebCenter Portal. A user who self-registers is immediately and automatically granted access to WebCenter Portal and a new user account is created in the identity store. See also Enabling Self-Registration.

40.5.2 Assigning Users (and Groups) to Application Roles

Initially, all users in the WebCenter Portal identity store are assigned minimal privileges through the Authenticated-User role. You can assign individual users (or multiple users in the same enterprise group) to a different application role through WebCenter Portal Administration.

Updates in your back-end identity store, such as new users or someone leaving an enterprise group, are automatically reflected in WebCenter Portal. Initially, when you assign an enterprise group to a WebCenter Portal role, everyone in the enterprise group is granted that role. If someone moves out of the group, the role is revoked. If someone joins the group, they are granted the role.

---

Note:
For WebCenter Portal to properly maintain enterprise group-to-role mappings, back-end servers, such as the discussions server and content server, must support enterprise groups too. When back-end servers do not support enterprise groups, the message "Group [name] not found in the Identity Store" displays. See also Troubleshooting Issues with Users and Roles.

---

To assign a user (or a group of users) to a different application role:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.

You can also enter the following URL in your browser to navigate directly to the Security page:

http://host:port/webcenter/portal/admin/settings/security

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click Users and Groups (Figure 40-3).

This page lists users to whom additional roles are defined.
3. Choose **User** or **Group** from the drop-down list.

   - Select **User** to grant permissions to one or more users defined in the identity store.
   - Select **Group** to grant permissions to a group of users.

4. If you know the exact name of the user or group, enter the name in the text box, separating multiple names with commas.

   If you are not sure of the name you can search your identity store:

   a. Click the **Find** icon (🔍).

      The Find User (or Find Group) dialog box opens (Figure 40-4).

   **Figure 40-4 Finding Users and Groups in the Identity Store**

      ![Find User Dialog Box](image)

   b. Enter a search term for a user or group, then click the **Search** icon.
For tips on searching for a user or group in the identity store, see Searching for a User or Group in the Identity Store in Building Portals with Oracle WebCenter Portal.

Users (or groups) matching your search criteria display in the Select User dialog box. For more details on which fields are searched, see Searching for a User or Group in the Identity Store in Building Portals with Oracle WebCenter Portal.

**Tips:**

- Use * as a wildcard, for example *sales.
- Leave the search field blank to list all users (or groups) in the identity store.
- Enter a space between two search terms to search First Name and Last Name, for example jo sm, searches for jo in First Name and sm in Last Name.

c. Select one or more names from the list.
   To assign roles to multiple users or groups, multi-select all the names required. Ctrl + click rows to select multiple names.

d. Click **OK**.
   The names that you select appear on the User and Groups tab.

5. To assign a role, select a **Role** from the drop-down list.
   Select an appropriate role for the selected users (or groups).

**Note:**

Choose **Administrator** only if you want to assign full, administrative privileges for WebCenter Portal.

- If the role you want is not listed, create a new role that meets your requirements (see Defining Application Roles).
- When no role is selected, the user assumes the Authenticated-User role. See Default Application Roles.

6. Click **Grant Access**.
   User/user group names and new role assignment appear in the table.

**Note:**

Group names are clickable, enabling you to drill down to see user names of the current group members.
40.5.3 Assigning a User to a Different Application Role

From time to time, a user's role in WebCenter Portal may change. For example, a user may move out of sales into the finance department and in this instance, the user's role assignment may change from \textit{Sales} to \textit{Finance}. You can also assign a user to more than one role.

\textbf{Note:}

You cannot modify your own role or the system administrator's role. See \textit{About Application Roles}.

To assign a user to a different role:

1. On the \textit{Settings} page (see \textit{Accessing the Settings Pages in WebCenter Portal Administration}), click \textit{Security}.

   You can also enter the following URL in your browser to navigate directly to the \textit{Security} page:

   \texttt{http://host:port/webcenter/portal/admin/settings/security}

2. Click \textit{Users and Groups} (Figure 40-3).

3. In the \textit{Manage Existing Grants} table, scroll down to the user whose role assignment you want to modify.

   Only users with non-default role assignments are listed in the table. If the user you want is not listed, grant the role required as described in \textit{Assigning Users (and Groups) to Application Roles}.

4. Click the \textit{Actions} icon, then select \textit{Change Role} from the drop-down list.

   The Change Role dialog opens (Figure 40-5).
5. Select roles as follows:

- Select **Administrator** to assign full, administrative privileges for WebCenter Portal.

  Administrators have the highest privilege level and can view and modify anything in WebCenter Portal so take care when assigning the Administrator role.

  Some administrative tasks are exclusive to the Administrator role, such as editing the login page, the self-registration page, and profile gallery pages. See also Default Application Roles.

- Select one or more roles from the list available (you can assign the user or group to one or more roles).

  If the role you want is not listed, create a new role that meets your requirements (see Defining Application Roles).

  At least one role must be selected. To revoke all role assignments, reverting user permissions to the default Authenticated-User role, see Revoking Application Roles.

6. Click **OK**.

New role assignments display in the table.

### 40.5.4 Revoking Application Roles

It is easy to revoke application role assignments that no longer apply. You can revoke roles individually or revoke all application roles assigned to a particular user at once.

Revoking all of a user's application roles does not remove that user from the identity store and the user still has access to Oracle WebCenter Portal through the default Authenticated-User role.
Note:
You cannot revoke your own role assignments or the system administrator’s role. See About Application Roles.

To revoke application roles:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.

   You can also enter the following URL in your browser to navigate directly to the Security page:
   
   http://host:port/webcenter/portal/admin/settings/security

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click Users and Groups (Figure 40-3).

   This page lists users to which additional roles are defined.

3. In the Manage Existing Grants table, scroll down to the user you want.

4. Click the Actions icon:

   • Select Change Role, and deselect the application role or roles you wish to revoke. See also Assigning a User to a Different Application Role.

   • Select Delete Role Assignments to revoke all roles assigned to that user, and then click Delete when asked for confirmation.

   Access for that user is revoked immediately.

When you delete all the roles assigned to a particular user, the user is no longer listed on the Users and Groups page. The user remains in the identity store and still has access to Oracle WebCenter Portal through the Authenticated-User role. See Default Application Roles.

**40.6 Managing Application Roles and Permissions**

WebCenter Portal uses application roles to manage permissions for users working in the Home portal. Administrators manage application roles and permissions on the Roles page (Figure 40-6). See Table 40-4 for more information about built-in application roles and permissions.
This section explains how to manage application roles and their permissions in WebCenter Portal Administration. It contains the following subsections:

- Viewing Application Roles and Permissions
- Defining Application Roles
- Modifying Application Role Permissions
- Deleting Application Roles

### 40.6.1 Viewing Application Roles and Permissions

On the Roles page, use the Roles drop-down to select an application role and view its associated permissions.

To view permissions associated with a role:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.

You can also enter the following URL in your browser to navigate directly to the Security page:

http://host:port/webcenter/portal/admin/settings/security

---

See Also:

WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.
2. Click the Roles tab to open the Roles page (Figure 40-6), showing the Administrator role and its associated permissions by default.

3. From the Role drop-down (Figure 40-7), select a role to view its associated permissions.

4. Do any of the following:
   - To create a new application role, see Defining Application Roles.
   - To change defined permissions for a role, see Modifying Application Role Permissions.
   - To delete an application role, see Deleting Application Roles.

5. Click Save.

40.6.2 Defining Application Roles

Use roles to characterize groups of WebCenter Portal users and determine what they can see and do in the Home portal.

When defining application roles, use self-descriptive role names and try to keep the role policy as simple as possible. Choose as few roles as you can, while maintaining an effective policy.

Take care to assign appropriate access rights when assigning permissions for new roles. Do not allow users to perform more actions than are necessary for the role but at the same time, try not to inadvertently restrict them from activities they must perform. In some cases, users may fall into multiple roles.

To define a new application role:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.
You can also enter the following URL in your browser to navigate directly to the Security page:

http://host:port/webcenter/portal/admin/settings/security

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Roles tab to open the Roles page (Figure 40-6), showing the Administrator role and its associated permissions by default.

3. Click Create Role to define a new role for WebCenter Portal users.

![Create Role](image)

4. Enter a suitable name for the role.

   Ensure the role names are self-descriptive. Make it as obvious as possible which users should belong to which roles. Role names can contain alphanumeric characters, blank spaces, and underscores.

5. (Optional) Choose a Role Template.

   The new role inherits permissions from the role template. You can modify these permissions in the next step.

   Choose Administrator to create a role that inherits full, administrative privileges. Conversely, choose Public-User to create a role that typically provides minimal privileges. Alternatively, choose a custom application role to be your template.

6. Click OK.

   The new role appears in the Role drop-down. The permissions list shows which actions users with this role can perform. Use the Roles drop-down to select another role.

7. To modify user permissions for the role, select or clear each permission check box.

8. Click Save to save any changes that you make to the role’s permissions.

40.6.3 Modifying Application Role Permissions

Administrators can modify the permissions associated with application roles at any time. Application permissions are described in About Application Permissions.
Application role permissions allow individuals to perform specific actions in the Home portal. No permission, except for Manage All, inherits privileges from other permissions.

**Note:**
Application permissions cannot be modified for the Administrator role. See also Default Application Roles.

To change the permissions assigned to a role:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Security.

   You can also enter the following URL in your browser to navigate directly to the Security page:

   http://host:port/webcenter/portal/admin/settings/security

   **See Also:**
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Roles (Figure 40-6) tab.

   The page opens, showing the Administrator role and its associated permissions by default.

3. From the Role drop-down, select the role whose permissions you want to modify.

   The permissions associated with the selected role appear next to the Permissions column.

4. Select or deselect Permissions check boxes to enable or disable permissions for the role.

   For the built-in roles, be cautious about changing permissions. See Table 40-2.

5. Click Save.

   The new permissions are effective immediately.

**40.6.3.1 Granting Permissions to the Public-User**

Anyone who is not logged in to WebCenter Portal assumes the Public-User role. By default, the Public-User role is granted minimal privileges, that is, only the Portal Server: View permission.

**Caution:**
Take care when granting permissions to the Public-User role. Avoid granting administrative permissions such as Portal Server: Manage All, Portal Server: Manage Configuration, or any permission that might be considered unnecessary. See also About Application Permissions.
Granting the Portal Server-View Permission

The Portal Server: View permission allows unauthenticated users to see public WebCenter Portal pages, such as the Welcome page, and also content that individual users choose to make public.

When Portal Server: View permission is granted to the Public-User role:

- Make sure that users understand that any personal page or personal content they choose to make public will become accessible to unauthenticated users outside of the WebCenter Portal community, that is, anyone with Web access.
- Consider customizing the default Welcome page that displays to public users before they log in. See Customizing System Pages.

If you do not want unauthenticated users to see WebCenter Portal content that is marked 'public', do not grant the Portal Server: View permission to the Public-User role. When public access is disabled, public content cannot be seen by unauthenticated users. Also, the Welcome page for WebCenter Portal is not displayed; public users are directed straight to a login page. Administrators may customize the default login page, if required. See Customizing System Pages for All Portals.

Granting Other Permissions

Be careful when assigning permissions to the Public-User role. For security reasons, Oracle recommends that you limit what anonymous users can see and do in WebCenter Portal.

40.6.3.2 Granting Permissions to the Authenticated-User

Anyone who is logged in to WebCenter Portal assumes the Authenticated-User role. By default, the Authenticated-User role is granted minimal privileges, through the following permissions:

- Portal Server: View
- Portals: Create Portals
- Portal Templates: Create Portal Templates
- Pages: Create Pages
- People Connections: Update People Connections Data
- People Connections: Connect with People

Other important notes:

- The Authenticated-User role always inherits permissions from the Public-User role.
- All custom application roles inherit permissions from the Authenticated-User role.

40.6.3.3 Granting Permissions to the Portal Creator

The Portal Creator role is given to a logged in user for specifically creating portals.

Out-of-the-box, this role has minimal privileges, through the following permissions: Portal Server: View and Portals: Create Portals. After creating a portal,
the Portal Creator role assumes the permissions inherent in the Portal Manager role.

### 40.6.4 Deleting Application Roles

When an application role is no longer required, it is recommended that you remove it. This helps maintain a valid and manageable role list, and prevents inappropriate role assignments.

Application roles can be deleted even when users are still assigned to them. As you cannot delete any default roles, WebCenter Portal users will always have the Authenticated-User role.

**Note:**

The default application roles of Administrator, Public-User, and Authenticated-User cannot be deleted (the Application Specialist and Portal Creator roles can be deleted). See Default Application Roles.

To delete an application role:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Security**.

   You can also enter the following URL in your browser to navigate directly to the **Security** page:

   ```
   http://host:port/webcenter/portal/admin/settings/security
   ```

   **See Also:**
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the **Roles** (Figure 40-6) tab.

   The page opens, showing the Administrator role and its associated permissions, by default.

3. From the **Role** drop-down, select the role you want to delete (Figure 40-7).

   **Note:**

   The default application roles of Administrator, Public-User, and Authenticated-User cannot be deleted (the Application Specialist and Portal Creator roles can be deleted).

   The permissions associated with the selected role in WebCenter Portal display in the table.

4. Click **Delete** next to the role you want to delete (Figure 40-9).
5. Click **Delete** to confirm that you want to delete the role.

The role is removed from the table. Any users that were assigned to this role assume the default **Authenticated-User** role.
This chapter describes how a system administrator can manage global attributes, which can be used by any portal in WebCenter Portal. This chapter includes the following topics:

- About Global Attributes
- Adding a Global Attribute
- Editing a Global Attribute
- Deleting a Global Attribute

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants at least the following permission:

- Portal Server: Manage All or Portal Server: Manage Configuration

For more information about permissions, see About Application Roles and Permissions.

41.1 About Global Attributes

Every portal includes built-in attributes such as name, description, date created, icon, and so on. In addition to these built-in attributes, portal managers can add custom attributes that are unique to the portal and its characteristics to specify additional portal information (metadata). Custom attributes are propagated throughout a portal. For information about working with attributes unique to a specific portal, see Working with Portal Pages in Building Portals with Oracle WebCenter Portal.

In addition to portal-specific attributes, system administrators can add and manage global attributes from the Attributes page (Figure 41-1) in WebCenter Portal Administration. Global attributes are available for use by any portal.
A custom attribute is simply a name value pair (such as customerId=400, orderId=11, or userName=Smith). A custom attribute name is unique within a particular portal. For example, you can use a global attribute in a portal for customer analysis purposes with several custom task flows that take the parameter customerId as an input: task flows such as Customer Sales History, Customer Satisfaction Rating, Future Sales Prospects, or Customer Contact Information. With a custom attribute defined named customerId with an appropriate value, all the task flows that can accept a customerId can display information specific to that customer.

A custom attribute can also be retrieved using Expression Language (EL) expressions. For example, an EL expression may read a value that is passed in through the URL that displays a portal (for example, customerId=10). Any portal pages, task flows, or portlets that deliver customized content based on parameter values can accept global custom attribute values and display content accordingly using the following Expression Language (EL) syntax to access the global custom attribute value:

\[\#{WCAppContext.application.applicationConfig.customAttributes[attributeName]}\]

If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper

### 41.2 Adding a Global Attribute

To add a new global attribute for use by any portal:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Attributes**.

   You can also enter the following URL in your browser to navigate directly to the **Attributes** page:

   http://host:port/webcenter/portal/admin/attributes

   **See Also:**

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the **Attributes** page, click **Add Attribute** (Figure 41-2).
3. Enter a unique **Name** for the attribute. Valid names start with an alphabetic character and contain only alphanumeric characters.

4. Optionally, enter a **Value** for the custom attribute. The value you type is treated as a string value.

5. Click **Add** to save the custom attribute and display it in the list on the **Attributes** page.

### 41.3 Editing a Global Attribute

To edit a global attribute:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Attributes**.

   You can also enter the following URL in your browser to navigate directly to the **Attributes** page:

   ```
   http://host:port/webcenter/portal/admin/attributes
   ```

   **See Also:**
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the **Attributes** page, click the **Actions** icon for the attribute and select **Edit Attribute**.

3. In the Edit Attribute dialog, modify the attribute **Value**. The value you type is treated as a string value.

4. Click **OK** to save your changes.
41.4 Deleting a Global Attribute

To delete a global attribute:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Attributes.

   You can also enter the following URL in your browser to navigate directly to the Attributes page:

   http://host:port/webcenter/portal/admin/attributes

   See Also:

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Attributes page, click the Actions icon for the attribute and select Delete Attribute.

3. In the confirmation dialog, click Delete.
This chapter describes the out-of-the-box system pages available in WebCenter Portal and how to customize them.

**Note:**
Any changes made to a system page by the system administrator are reflected in all portals. For example, if the system administrator adds an image to the **Announcements** system page, that image will display in the **Announcements** system page in all portals. It is not possible to modify a system page exclusively for an individual portal.

This chapter includes the following topics:

- About System Pages
- Customizing System Pages for All Portals
- Setting System Page Properties
- Removing All Page Customizations from a System Page

**Permissions:**
To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permissions:

- Portal Server: Manage All or Portal Server: Manage Configuration
- Pages: Create, Edit, and Delete Pages

For more information about permissions, see About Application Roles and Permissions.

### 42.1 About System Pages

System pages are a set of out-of-the-box utility pages that are designed to display in a specific circumstance. For example, users who are not logged in when they visit a portal may see the public **Welcome** page. System pages support rapid deployment of a portal to fulfill a range of immediate needs, from providing an introductory page to pages that provide content that is generated dynamically and tailored to the individual user (for example, the **Activity Stream** page).
System pages are preconfigured with page access settings that target their anticipated audience. For example, the Welcome page is configured to target the anonymous role, the Activity Stream page is targeted to individual users, with dynamic content that is tailored to each user. In view of this preconfiguration, you cannot alter the security settings of a system page.

You can customize system pages to reflect your company brand, to provide useful hints, or to provide additional functionality (such as task flows and portlets). Once you customize a system page, that page displays your customizations along with an updated WebCenter Portal look and feel. Until you customize a system page, WebCenter Portal displays the generic version of the system page with the look and feel used in prior releases of WebCenter Portal.

System pages also make task flow customization possible. The system page Task Flow Editor provides an environment for customizing all instances of a seeded task flow in a given scope in one operation. In other words, authorized users can add a seeded task flow to this page and then customize it to apply the customizations to all instances of the task flow. Note that custom task flows created through the Assets or Shared Assets page cannot be edited using this page. For more information, see Customizing Task Flows.

**Note:**

For a list and description of the system pages, see About Built-In System Pages.

### 42.1.1 About Built-In System Pages

Table 42-1 lists and describes the system pages that are included with WebCenter Portal and provides information about the context in which they appear.

**Table 42-1  Built-In System Pages**

<table>
<thead>
<tr>
<th>Page</th>
<th>Description</th>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>About WebCenter Portal</td>
<td>Provides information about WebCenter Portal, including version and copyright information.</td>
<td>Displays when user clicks the Help menu, and selects About, or click the About WebCenter Portal link in the footer.</td>
</tr>
<tr>
<td>Activities</td>
<td>For the Home portal, displays the Publisher task flow and the Activity Stream task flow from the People Connections service. For more information, see Tracking Portal Activities in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the Home portal for every authenticated (logged-in) user.</td>
</tr>
<tr>
<td>Activity Stream</td>
<td>For a portal, displays the Publisher task flow and the Activity Stream task flow from the People Connections service. For more information, see Tracking Portal Activities in Using Oracle WebCenter Portal.</td>
<td>Appears by default on the Home page in the built-in portal template.</td>
</tr>
</tbody>
</table>
Table 42-1 (Cont.) Built-In System Pages

<table>
<thead>
<tr>
<th>Page</th>
<th>Description</th>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics</td>
<td>Provides information about application usage and performance metrics. For more information, see Analyzing Portal Usage. For Analytics task flows to work, the Analytics schema (ACTIVITIES) must be installed and configured, and a connection set up between WebCenter Portal and the Analytics Collector.</td>
<td>Available for showing in the Home portal. Useful only when configuration requirements are met.</td>
</tr>
<tr>
<td>Announcements</td>
<td>Displays the Announcement Manager task flow. For more information, see Working with Announcements in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the built-in portal template.</td>
</tr>
<tr>
<td>Discussions</td>
<td>Displays the Discussion Forum Manager task flow. For more information, see Viewing and Participating in Discussions in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the built-in portal template.</td>
</tr>
<tr>
<td>Documents</td>
<td>Displays the Content Manager task flow. There are two Documents system pages: for the Home portal, which shows the current user's personal documents; and one for portals, which shows documents uploaded to that portal. For more information, see Adding and Managing Documents in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the built-in portal template.</td>
</tr>
<tr>
<td>Error Encountered</td>
<td>Displays an error page when an error occurs.</td>
<td>Appears when an application error occurs.</td>
</tr>
<tr>
<td>Events</td>
<td>Displays the Events task flow. For more information, see Working with Calendars and Events in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the built-in portal template.</td>
</tr>
<tr>
<td>Lists</td>
<td>Displays the List Manager task flow. For more information, see Working with Lists in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the built-in portal template.</td>
</tr>
<tr>
<td>Members</td>
<td>Provides features for managing the members of a portal. For more information, see Managing Members and Assigning Roles in a Portal in Building Portals with Oracle WebCenter Portal.</td>
<td>Appears in the default navigation as the Members page in some built-in portal templates.</td>
</tr>
<tr>
<td>No Pages Accessible</td>
<td>Displays a message notifying the user that no pages are accessible.</td>
<td>Appears when users navigate to a portal in which they have no access permissions on the portal's pages.</td>
</tr>
<tr>
<td>Page Not Found</td>
<td>Displays a message notifying the user that the page cannot be found.</td>
<td>Appears when users navigate to a page that is no longer available in WebCenter Portal, or a page on which they do not have access permission.</td>
</tr>
</tbody>
</table>
### Table 42-1 (Cont.) Built-In System Pages

<table>
<thead>
<tr>
<th>Page</th>
<th>Description</th>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Page Viewer</strong></td>
<td>Displays an external web site (such as google.com) in a portal, surrounded by the page template. For more information, see Adding Resources to a Navigation Model in <em>Building Portals with Oracle WebCenter Portal</em>.</td>
<td>Used when portal navigation contains an External URL item (with target Same Page). When users click on such links in the navigation, the Page Viewer is used.</td>
</tr>
<tr>
<td><strong>Portal Not Found</strong></td>
<td>Displays a message notifying the user that the portal cannot be found.</td>
<td>Appears when users navigate to a portal that is no longer available.</td>
</tr>
<tr>
<td><strong>Portals</strong></td>
<td>Provides a view of all portals that the current user can access. Additionally provides features for creating, searching for, sorting, and filtering portals. For more information, see Viewing and Accessing Available Portals in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Appears when users select <strong>Portal Browser</strong> from the <strong>Portals</strong> menu.</td>
</tr>
<tr>
<td><strong>Portal Templates</strong></td>
<td>Provides a view of all available portal templates. Includes controls for creating, editing, and filtering portal templates and viewing information about a selected portal template. For more information, see Working with Portal Templates in <em>Building Portals with Oracle WebCenter Portal</em>.</td>
<td>Appears in the administration pages on the <strong>Portal Templates</strong> page.</td>
</tr>
<tr>
<td><strong>Profile</strong></td>
<td>Displays the current user's Profile Gallery, which includes subpages for Activity Stream, Connections, Documents, an organization chart (Organization), and the user's profile details (About). For more information, see Managing Your Profile and Creating and Managing Documents in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Appears by default in the Home portal of every authenticated (logged-in) user.</td>
</tr>
<tr>
<td><strong>Public Portals</strong></td>
<td>Displays all public portals in the Portal Browser.</td>
<td>Appears when users select View Public Portals on the WebCenter Portal Sign In page.</td>
</tr>
<tr>
<td><strong>Resource Viewer</strong></td>
<td>Displays a portlet resource in a portal, surrounded by the page template. For more information, see Adding Items to the Portal Navigation in <em>Building Portals with Oracle WebCenter Portal</em>.</td>
<td>Used when portal navigation contains a link to a portlet resource. When users click on such links in the navigation, the Resource Viewer is used.</td>
</tr>
<tr>
<td><strong>Search</strong></td>
<td>Displays the Search Results page. For more information, see the About Searching in WebCenter Portal in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Renders dynamically to display the results of a search.</td>
</tr>
<tr>
<td><strong>Self-Registration</strong></td>
<td>Provides a means of enabling users to create their own login accounts to your WebCenter Portal. For more information, see Registering Yourself with WebCenter Portal in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Appears when users click <strong>Register</strong> on the WebCenter Portal Sign In page.</td>
</tr>
<tr>
<td>Page</td>
<td>Description</td>
<td>Context</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Self-Service Membership</td>
<td>Provides a means of subscribing to a portal that is configured to allow membership by subscription. For more information, see Joining a Portal in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Appears when users initiate a subscription to a portal.</td>
</tr>
<tr>
<td>Sign In</td>
<td>Provides fields for logging in to your portal.</td>
<td>Appears instead of the WebCenter Portal Sign In page when you disable public access to all application pages and when your current session expires.</td>
</tr>
<tr>
<td>Tag Center</td>
<td>Displays the Tag Center to enable users to manage tags. For more information, see Working with Tags in <em>Using Oracle WebCenter Portal</em>.</td>
<td>Rendered dynamically when users click a tag in a Tags task flow or in search results.</td>
</tr>
<tr>
<td>Task Flow Editor</td>
<td>Provides an environment for customizing all instances of a built-in task flow in a given scope in a single operation. (Custom task flows created through the Assets or Shared Assets page are not supported.) For more information, see <em>Customizing Task Flows</em>.</td>
<td>Allows authorized users to add built-in task flows and then customize all instances of those task flows.</td>
</tr>
<tr>
<td>Task Flow Viewer</td>
<td>Displays a task flow resource in a portal, surrounded by the page template. For more information, see Adding Items to the Portal Navigation in <em>Building Portals with Oracle WebCenter Portal</em></td>
<td>Used when portal navigation contains a link to a task flow resource. When users click on such links in the navigation, the Task Flow Viewer is used.</td>
</tr>
<tr>
<td>Unauthorized</td>
<td>Displays a message notifying users that they are not authorized to access a portal or a page.</td>
<td>Appears when users navigate to a portal or a page on which they do not have access permission.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>Displays a message notifying users that the portal is not available.</td>
<td>Appears when users navigate to a portal that is offline.</td>
</tr>
<tr>
<td>User Profile</td>
<td>Displays the Profile Gallery of a user other than the current user, which, by default, displays the same subpages and task flows as the current user’s Profile Gallery. It differs in that it displays information associated with the other users.</td>
<td>Renders dynamically when the current user accesses another user’s profile.</td>
</tr>
</tbody>
</table>
### 42.2 Customizing System Pages for All Portals

You can customize built-in system pages to bring them in line with your organization’s brand or look and feel. You can remove existing components, add new components, and change the page layout. You cannot, however, edit or delete system page input fields and buttons.

If a page variant of a system page for use by a device group has been created, you can also customize these page variants.

To customize a system page or system page variant:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click System Pages.

   You can also enter the following URL in your browser to navigate directly to the System Pages page:

   http://host:port/webcenter/portal/admin/settings/systempages

---

**See Also:**
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal

2. Click the Customize link next to the system page to open it in Composer (Figure 42-1).
3. To customize a variant of a system page for a device group, expand the system page variant icon, then click **Edit** for the device group you want to customize (Figure 42-2).

4. Edit and then save the page.

---

**See Also:**

For information about editing system pages, see Editing a Page in Structure View in Composer in *Building Portals with Oracle WebCenter Portal*.

---

### 42.2.1 Creating a Page Variant of a System Page for Device Groups

Page variants are alternative views of an existing page for specific device groups to target specific device size and characteristics. The base page and the page variant have the same URL and security settings; however, any content changes to the base page is not reflected in the variant pages and vice versa.
Note:
For more information about managing device settings in WebCenter Portal, see Administering Device Settings.

Only system administrators can create page variants for the application-level system pages. If a page variant is not created for a supported device group, then the base page displays only devices that belong to that device group.

Out-of-the-box, you can create page variants for the following system pages only: Error Encountered, No Pages Accessible, Page Not Found, Portal Not Found, Self-Registration, Sign In, Unauthorized, Unavailable, and WebCenter Portal Welcome Page.

You can create a page variant for each device group that is available. However, you can create only one page variant for a device group per page. In other words, you cannot create two page variant for the iOS Phones device group for the same page, but you can create a page variant for the iOS Phones device group and another page variant for the Android Phones device group for the same page. You can create a page variant for the iOS Phones device group for a different page.

To create a page variant of a system page for device groups:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click System Pages.

   You can also enter the following URL in your browser to navigate directly to the System Pages page:

   http://host:port/webcenter/portal/admin/settings/systempages

   See Also:

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Create Page Variant link next to the system page (Figure 42-3) for which you want to create a page variant.

Note:
Out-of-the-box, you can create page variants for the following system pages only: Error Encountered, No Pages Accessible, Page Not Found, Portal Not Found, Self-Registration, Sign In, Unauthorized, Unavailable, and WebCenter Portal Welcome Page.
3. In the Create Page Variant dialog that opens, select the device group for which you want to create a page variant from the **Device Group** drop-down list (Figure 42-4).

The base page is seeded in the system. The base page is always rendered for devices belonging to the default device group (for more information about the default device group, see **Administering Device Settings**). If a page variant exists for a device group that is also set as default, then the base page will take precedence over the page variant. By default the device group is set to **Desktop Browsers** if you open a page from your desktop browser, so you still see the base page, whether or not the **Desktop Browsers** variant is created. From other devices, you will see the page variant you select.

For example, if you change **iOS Phones** to the default page, the base page is set for that device type. On an iphone, the base page is displayed and not the **iOS Phones** page variant. However, on the desktop, the **Desktop Browsers** variant is displayed, not the base page. If you do not change the default device group, the **Desktop Browsers** variant that is created will not display on desktop browsers. The base page will still display on the desktop.

**Note:**

Use caution if you change the default device group—it will change the default behavior when globally displaying base pages or their page variants.
4. Click Create.

A mobile icon with an expand button appears next to the page, indicating that a page variant for the page is available (Figure 42-5).

5. Click the Expand button to view the device group page variant (Figure 42-6).

You can create another page variant for another device group for the same page. However, you cannot create another page variant for the same device group that already has a page variant.

6. You can do any of the following after creating a page variant:

   - Click Edit next to the device group to edit the system page in Composer. For information about editing system pages, see Editing a Page in Structure View in Composer in Building Portals with Oracle WebCenter Portal.

   - Click Delete next to the device group to delete the page variant. Confirm the deletion by clicking Delete again.
• Click **Edit Source** next to the device group to edit the source code.

For more information, see Viewing and Modifying Page Source Code in *Building Portals with Oracle WebCenter Portal*.

### 42.2.2 Managing a Page Variant of a System Page for Device Groups

For information about page variants for device groups and creating a page variant for a system page, see **Creating a Page Variant of a System Page for Device Groups**.

To manage a page variant of a system page:

1. Click the **Expand** icon to view the device group page variant (Figure 42-7).

**Figure 42-7  Page Variant for a Device Group**

2. To edit the page variant in Composer, click **Edit**.

For information about editing system pages, see **Editing a Page in Structure View in Composer** in *Building Portals with Oracle WebCenter Portal*.

3. To delete the page variant, click **Delete**.

4. Confirm the deletion by clicking **Delete** again.

5. To edit the source code, click **Edit Source**.

For information about editing page source code, see Viewing and Modifying Page Source Code in *Building Portals with Oracle WebCenter Portal*.

### 42.3 Setting System Page Properties

The page properties for system pages provide a means of specifying a page background color and image, applying additional CSS encoding, and setting parameters.

To edit the properties of a system page:

1. On the **Settings** page (see **Accessing the Settings Pages in WebCenter Portal Administration**), click **System Pages**.

You can also enter the following URL in your browser to navigate directly to the **System Pages** page:

http://host:port/webcenter/portal/admin/settings/systempages
See Also:

WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal*.

2. Click the **Customize** link next to a system page to open it in Composer (Figure 42-8).

*Figure 42-8  Customize Link Next to a System Page*

3. Click the **Page Properties** icon (Figure 42-9) to open the Page Properties dialog (Figure 42-10).

See Also:

For information about editing system pages, see Editing a Page in Structure View in Composer in *Building Portals with Oracle WebCenter Portal*. 
4. To change properties on the **Display Options** tab, see Providing Page Background Color, Image, and CSS Encoding in *Building Portals with Oracle WebCenter Portal*.

5. On the **Parameters** tab (**Figure 42-10**), modify existing parameters as required (see **Table 42-2**).

**Figure 42-10  Page Properties Dialog: Parameters**
Note:
All parameter values provide access to an Expression Language (EL) editor, which you can use to select or specify a variable value instead of a constant value. Click the Edit icon next to a value field, then select Expression Builder to open the editor. If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Table 42-2 System Page Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pg_pageTemplateID | Specifies whether to display the system page using the default page template of prior releases, or the default blank template of the current release. The valid value is:  
  • page_template_GUID. Use page template specified by GUID value. |

6. To add a new parameter:
   • Click Add a page parameter.
   • In the Add a Page Parameter dialog, enter a new parameter Name, then click Add Parameter to add the parameter to the Parameters tab, with a value entry field.
   • Optionally, enter a value for the new parameter.

42.4 Removing All Page Customizations from a System Page

You can return a system page to its default, out-of-the-box state, removing all page customizations.

Note:
This process does not remove task flow customizations. To remove task flow customizations, you must revise the given task flow on a system page. For more information, see Customizing Task Flows.

To remove all customizations from a system page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click System Pages.

   You can also enter the following URL in your browser to navigate directly to the System Pages page:
   http://host:port/webcenter/portal/admin/settings/systempages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.
2. Click the **Restore Default** link next to the system page *(Figure 42-11).*

   **Figure 42-11  Restore Default Link Next to a System Page**

3. In the resulting confirmation dialog, click **Restore**. All customizations are permanently removed from the selected system page. When you restore a system page to its default state, page variants are not affected if the system page has variants.
This chapter describes how to create and target business role pages and how to perform other related business role page management tasks.

This chapter includes the following topics:

- About Business Role Pages
- Setting Page Creation Defaults for Business Role Pages
- Creating a Business Role Page
- Specifying the Target Audience for a Business Role Page
- Revoking Access to a Custom Business Role Page
- Showing and Hiding Business Role Pages
- Setting a Default Display Order for Business Role Pages
- Editing a Business Role Page
- Editing the Source of a Business Role Page
- Copying a Business Role Page
- Removing All User Customizations from a Business Role Page
- Deleting a Custom Business Role Page

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permissions:

- Portal Server: Manage All or Portal Server: Manage Configuration
- Pages: Create, Edit, and Delete Pages

For more information about permissions, see About Application Roles and Permissions.

43.1 About Business Role Pages

Business role pages provide a means of exposing highly relevant content to a specific audience. Business role pages are pages targeted to a particular type of group, or user...
(or user role), such as your sales force, your accounting team, your administrative staff, and so on.

A business role page may be available in the Home portal views of all users who share the targeted business role when the WebCenter Portal system administrator publishes business role pages. For example, a business role page that targets all users assigned the HR_ORG role appears in the Home portal views of all users assigned the role HR_ORG.

**Tip:**

Whether or not a business role page is shown in the Home portal navigation, it is always available to targeted users on the Personalize Pages page. For a listing of seeded Business Role Pages, see About Built-In Business Role Pages.

If an individual user who is not assigned the HR_ORG role wants to see the page, the system administrator can grant access to this user. Seeded business role pages (see Table 43-1) have preconfigured access settings that cannot be altered. For information about how to alter access settings on seeded business role pages, see Setting Access on a Seeded Business Role Page.

The system administrator is the only type of user who can create a business role page. Only when a system administrator grants permission to do so, can other users edit, copy, and delete business role pages and change page permissions (for more information, see Specifying the Target Audience for a Business Role Page).

Table 43-1 lists and describes the seeded business role pages included in a default WebCenter Portal installation and provides information about the context in which they appear.

These pages, with the exception of WebCenter Portal Impersonation, also appear on the System Pages page (for more information, see Customizing System Pages).

### 43.1.1 About Built-In Business Role Pages

Table 43-1 lists the built-in Business Role Pages in WebCenter Portal.

<table>
<thead>
<tr>
<th>Page</th>
<th>Description</th>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activities</td>
<td>Displays the Activity Stream from People Connections and a Publisher task flow, which can be used to post content to the stream. For more information, see Tracking Portal Activities and Working with Feedback and the Message Board in Using Oracle WebCenter Portal.</td>
<td>Appears by default in the Home portal views of each authenticated (logged-in) user.</td>
</tr>
<tr>
<td>Analytics</td>
<td>Displays performance metrics related to WebCenter Portal, portals, portlets, and services. For more information, see Understanding Oracle WebCenter Portal Performance Metrics.</td>
<td>Is hidden by default, but can be accessed on the Personalize Pages page in the system administrator's view of the Home portal.</td>
</tr>
<tr>
<td>Documents</td>
<td>Displays the Document Explorer task flow. For more information, see About the Documents Service Task Flows in Building Portals with Oracle WebCenter Portal.</td>
<td>Appears by default in the Home portal views of each authenticated user.</td>
</tr>
</tbody>
</table>
### Table 43-1  (Cont.) Built-In Business Role Pages

<table>
<thead>
<tr>
<th>Page</th>
<th>Description</th>
<th>Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile</td>
<td>Displays the current user's Profile, which includes subpages for Activities, Connections, Documents, organization chart (Organization), and the user's profile details (About). For more information, see Managing Your Profile in Using Oracle WebCenter Portal and About the Documents Service Task Flows in Building Portals with Oracle WebCenter Portal.</td>
<td>Appears by default in the Home portal views of each authenticated user.</td>
</tr>
<tr>
<td>Portals</td>
<td>Displays portals relevant to the current user, such as the portals to which the user belongs or has access, and the portals that the user can search for. Each listed portal has an associated menu with options for performing actions on the portal. This page also provides controls for creating portals and searching for additional portals.</td>
<td>Appears by default in the Home portal views of each authenticated user.</td>
</tr>
<tr>
<td>Portal Templates</td>
<td>Displays a list of default and custom portal templates and provides a means of creating custom portal templates and filtering the template list.</td>
<td>Is hidden by default, but can be accessed on the Personalize Pages page in the Home portal views of each authenticated user.</td>
</tr>
<tr>
<td>Tag Center</td>
<td>Displays the Tag Center to enable users to manage tags. For more information, see Working with Tags in Using Oracle WebCenter Portal.</td>
<td>Rendered dynamically when users click a tag in a Tags task flow or in search results.</td>
</tr>
<tr>
<td>WebCenter Portal Impersonation</td>
<td>Displays a page, from where a WebCenter Portal system administrator can assign impersonation rights to a group of users ('impersonators'), such as support representatives or other portal administrators, so that they can perform operations as other users ('impersonatees'). For more information, see Managing Impersonation. For instructions on how to initiate an impersonation session (by the impersonator) and how to allow an Impersonation session (by the impersonatee), see Using WebCenter Portal Impersonation in Using Oracle WebCenter Portal. For information about impersonation ELs and APIs, see Using WebCenter Portal Impersonation ELs and APIs in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.</td>
<td>WebCenter Portal impersonation relies on OAM 11g 11.1.2.0. Before you can enable impersonation for a WebCenter Portal instance, you must first install and configure OAM 11g (Oracle's single sign-on solution), and then turn on impersonation in OAM. For information about installing and configuring OAM 11g, see Configuring Oracle Access Manager.</td>
</tr>
</tbody>
</table>

### 43.2 Setting Page Creation Defaults for Business Role Pages

As the WebCenter Portal system administrator, you can set page creation defaults to reduce the number of steps required to create business role pages. That is, you can specify the page style that is selected by default when you open the Create Page dialog. You can also select to bypass the Create Page dialog, which enforces the default page style.
To set page creation defaults for business role pages:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Business Role Pages.

   You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

   http://host:port/webcenter/portal/admin/settings/businessrolepages

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click Set Page Defaults to open the Set Page Defaults dialog (Figure 43-1).

   Figure 43-1 Set Page Defaults Dialog

   ![Set Page Defaults Dialog](image)

3. Select a page layout from the Page Style drop-down list.

   See Also:
   For information about the seeded page styles, see About Page Styles in Building Portals with Oracle WebCenter Portal. The list may include additional custom page styles or restrict page styles to a shorter list.

4. Select an option for Enable One-Click Page Creation:

   - **Yes**: Bypass the Create Page dialog, and create all of your personal pages using the specified Page Style.

     **Tip**:
     When you create pages by bypassing the Create Page dialog, the new page has a generic name. For information about renaming pages, see Renaming a Page in Building Portals with Oracle WebCenter Portal.
• **No**: Display the Create Page dialog, with the specified **Page Style** selected as the default in the Create Page dialog for all of your personal pages. You can select a different style for your new personal pages.

5. Click **Save** to save your changes and exit the dialog.

### 43.3 Creating a Business Role Page

**Note:**
You can also select the **Copy Page** action for a Personal Page or a Business Role page and select to copy it as a Business Role page. For more information, see Copying a Personal Page and Copying a Business Role Page.

To create a new business role page:

1. **On the Settings page** (see Accessing the Settings Pages in WebCenter Portal Administration), click **Business Role Pages**.

   You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

   ![http://host:port/webcenter/portal/admin/settings/businessrolepages](http://host:port/webcenter/portal/admin/settings/businessrolepages)

   **See Also:**
   WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal*.

2. **Click Create** (Figure 43-2).

   ![Figure 43-2  Create Option for a Business Role Page](http://host:port/webcenter/portal/admin/settings/businessrolepages

   If you enabled one-click page creation, the new page appears in the list. If you did not enable one-click page creation, continue with the next steps.

3. In the **Create Page** dialog, enter a unique name for the page in the **Page Name** field, and then select a **Page Style** (Figure 43-3).
4. Click Create.

The new page appears in the list of Business Role pages.

Later, you can add content to the page. The next section (Specifying the Target Audience for a Business Role Page) steps you through setting access permissions for the business role page.

5. Next steps:
   - Define the page audience, as described in Specifying the Target Audience for a Business Role Page.
   - Choose the page display order, as described in Setting a Default Display Order for Business Role Pages.
   - Add content to the page, as described in the section Working with Web Development Components on a Page in Building Portals with Oracle WebCenter Portal.

### 43.4 Specifying the Target Audience for a Business Role Page

The target audience for business role pages may change from time to time. For example, you may want the whole Sales team to see a page originally designed for a Product Development team. You may want to provide public access to the Marketing department's page. You may want to provide additional access privileges, such as the Edit Pages permission, to a selected department member.
Note:

As the system administrator, you can set access on the business role pages that you create (for more information, see Setting Access on a Custom Business Role Page).

You cannot alter the default access settings of seeded business role pages (see Table 43-1) through the WebCenter Portal user interface. For information about how to set access on seeded business role pages, see Setting Access on a Seeded Business Role Page.

You can find controls for setting page access on a business role page that you create in WebCenter Portal Administration (Figure 43-4).

**Figure 43-4 Set Page Access Option on a Custom Business Role Page**

This section describes how to set specific access on a business role page as well as how to make such a page public. It includes the following subsections:

- Setting Access on a Custom Business Role Page
- Providing Public Access to a Custom Business Role Page
- Setting Access on a Seeded Business Role Page

### 43.4.1 Setting Access on a Custom Business Role Page

As the system administrator, you can set access on the business role pages that you create. However, you cannot use the WebCenter Portal Administration user interface to set access on seeded business role pages (for information about setting access on seeded business role pages, see Setting Access on a Seeded Business Role Page).

To specify the target audience for a custom business role page that you created:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Business Role Pages.
You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

http://host:port/webcenter/portal/admin/settings/businessrolepages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Select and click the Actions icon for the custom business role page for which you are setting access, and select Set Page Access (Figure 43-4) to open the Set Page Access dialog (Figure 43-5).

Figure 43-5  Set Page Access Dialog

3. Click Add Authenticated Access to add all users who are in the role of Authenticated-user to access the page.

The authenticated-role role is added under Role or User, that is users who are logged in to the WebCenter Portal.

4. To grant access permissions to all public users, that is, users who have not logged in (as well as those who have), click Add Public Access.

The anonymous-role role is added under Role or User.

See Also:
This method of enabling public access to a business role page provides a means of granting more than view access to public users. If you want to give such users view access only, you can set this quickly by following the steps in Providing Public Access to a Custom Business Role Page.

5. To grant access permissions to selected users, groups, and application roles, click Add Access.

The Add Access dialog opens (Figure 43-6).
6. Identify the users, groups, and application roles for whom to expose this business role page in the Home portal.

Choose from all available users, groups, and application roles. Use the Search feature to search your identity store:

a. In the Search field, enter a search term for a user, group, or application role. For tips on searching the identity store, see Searching for a User or Group in the Identity Store in Building Portals with Oracle WebCenter Portal.

Tip:
This search is not case sensitive.

b. Click the Search icon.

Users, groups, and application roles matching your search criteria appear in the Add User dialog.

c. Select one or multiple names from the list.

Press Ctrl+click to select multiple users.

d. Click Select.

The results of your selection appear in the Set Page Access dialog. By default, selected users have the View Page permission.

7. For each user name, group, or application role, select one or more check boxes to grant page privileges:

- **View Page**—Users can view the page, but cannot perform any actions on the page.

- **Edit Page**—Users can edit the page. This includes adding, rearranging, and deleting content, and changing the page scheme.

- **Delete Page**—Users can delete the page.

- **Perform All Page Actions**—Users have full access rights to the page. These users can edit the page, revise the page layout, set additional access privileges for other users, and all other page privileges.
• **Personalize Page**—Users can change their personal view of the page. Such changes do not affect another user’s view of the page.

• To revoke access to the page, select the user or role and click **Delete Access**.

  **Tip:**
  
  To revoke a privilege, deselect the check box.

8. Click **OK** to save your changes.

The page is displayed to its target audience, who can see it in their views of the Home portal the next time they log in to WebCenter Portal.

### 43.4.2 Providing Public Access to a Custom Business Role Page

You can specify that any user, whether logged in or not, can view a particular custom business role page. Such a page can be exposed in a public Home portal, or you can publish the URL to the public business role page to provide all users easy access.

---

**See Also:**

The process described in this section enables all public users to view a selected custom business role page. To provide public users with additional permissions on the page, follow the steps described in Setting Access on a Seeded Business Role Page.

---

To make a custom business role page public:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Business Role Pages**.

   You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

   `http://host:port/webcenter/portal/admin/settings/businessrolepages`

   **See Also:**

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

---

2. Click the **Actions** icon for the business role page for which you are setting access, and select **Make Public** (Figure 43-7).
43.4.3 Setting Access on a Seeded Business Role Page

Out-of-the-box business role pages, such as Activities and Portals, are available to all users by default (see Table 43-1). You cannot modify the security of seeded business role pages through WebCenter Portal. If you want to change the default security settings, for example, you want to hide a seeded business role page from all users, you must modify the default business role page settings in `pages.xml` file, and upload the changes to the MDS repository used by WebCenter Portal using the WLST commands `exportMetadata`/`importMetadata`.

To modify the default security settings for a seeded business role page:

1. Run the WLST command `exportMetadata` to export `pages.xml` for the following user roles: `anonymous-role` and `authenticated-role`.

For example:

```bash
exportMetadata(application='webcenter', server='WC_Portal', toLocation='/scratch/mdsdump', docs='/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/role/anonymous-role/pages.xml')
```

```bash
exportMetadata(application='webcenter', server='WC_Portal', toLocation='/scratch/mdsdump', docs='/oracle/webcenter/page/scopedMD/s8bba98ff_4cbb_40b8_beee_296c916a23ed/role/authenticated-role/pages.xml')
```

Where `toLocation` specifies a target directory on your system for the file you want to export. For detailed syntax, see `exportMetadata` in WLST Command Reference for WebLogic Server.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.
2. Modify the security in both `pages.xml` files as required, that is, mark each business role page as hidden or shown:

```xml
<!-- Business Role Pages -->
<pageDef id="Page_2eb852ac_10f5902cb2f__7ff7" contentMRef="/oracle/webcenter/page/scopedMD/s8bba98ff_4cb8_40b8_beee_296c916a23ed/businessRolePages/ActivityStreamMainView.jspx" shared="true" hidden="true"/>

<pageDef id="Page_2eb852ac_10f5902cb2f__7ff7" contentMRef="/oracle/webcenter/page/scopedMD/s8bba98ff_4cb8_40b8_beee_296c916a23ed/businessRolePages/ASpaceTemplatesMainView.jspx" shared="true" hidden="false"/>

<pageDef id="Page_2eb852ac_10f5902cb2f__7ff7" contentMRef="/oracle/webcenter/page/scopedMD/s8bba98ff_4cb8_40b8_beee_296c916a23ed/businessRolePages/MyProfileMainView.jspx" shared="true" hidden="true"/>
```

- Set `hidden="true"` for the pages that should be hidden.
- Set `hidden="false"` for the pages that should be shown.

3. Upload your changes to the `pages.xml` files to MDS using the WLST command `importMetadata`.

For example:

```bash
importMetadata(application='webcenter', server='WC_Portal', fromLocation='/scratch/mdsdump/s8bba98ff_4cb8_40b8_beee_296c916a23ed/role/anonymous-role/pages.xml')
importMetadata(application='webcenter', server='WC_Portal', fromLocation='/scratch/mdsdump/s8bba98ff_4cb8_40b8_beee_296c916a23ed/role/authenticated-role/pages.xml')
```

Where `fromLocation` specifies the directory that contains the file you want to import. For detailed syntax, see `importMetadata` in WLST Command Reference for WebLogic Server.

For information on how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

**Note:**

By default, any authenticated or anonymous user role will not be able to view the Activity Stream page (used as an example here). However, if the user logs into WebCenter Portal, from the Personalize Pages page the user can override this setting and make the page visible using the Show Page option. This user customization will be stored in MDS too, as `/oracle/webcenter/page/scopedMD/s8bba98ff_4cb8_40b8_beee_296c916a23ed/user/<GUID of user>/pages.xml`

The `<GUID of user>` can be queried from the table `WC_AS_ACTOR_DETAIL.ACTOR_ID`.

If you delete this `pages.xml` file within MDS, then it would revert to the set functionality from `/oracle/webcenter/page/scopedMD/s8bba98ff_4cb8_40b8_beee_296c916a23ed/role/authenticated-role/pages.xml`. 
43.5 Revoking Access to a Custom Business Role Page

To revoke access privileges to a custom business role page:

1. Follow the steps in Setting Access on a Custom Business Role Page to open the Set Page Access dialog.

2. From Role or User, select the row that has user, group, or application role from whom you want to revoke access, and click **Delete Access** (Figure 43-8).

   ![Figure 43-8 Delete Access Option in Set Page Access Dialog]

3. Click **Delete** in the confirmation dialog.

43.6 Showing and Hiding Business Role Pages

To show or hide a business role page in Home portal navigation for all authorized users:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Business Role Pages**.

   You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

   http://host:port/webcenter/portal/admin/settings/businessrolepages

   **See Also:**

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. For the page you want to show or hide (Figure 43-9):
   
   - Select the check box in the **Show Page** column to show the page in the Home portal views of authorized users.

   - Deselect the check box in the **Show Page** column to hide the page from view.
### 43.7 Setting a Default Display Order for Business Role Pages

If you present business role pages in a logical order, the page content is more accessible and easier for users to navigate. As the WebCenter Portal system administrator, you can determine the initial order in which business role pages are presented to their intended audience. You can do this by dragging and dropping pages into the desired order or by clicking the **Reorder** icons.

Individual users can change the initial display order you specify on their **Personalize Pages** page in the Home portal. Additionally, they can hide the business role pages they do not use.

---

**Note:**

There are two locations from which to define the order and the visibility of pages: from WebCenter Portal administration (described here) and from the **Personalize Pages** page (described in Rearranging Page Order in the Home Portal in *Using Oracle WebCenter Portal*). The difference between the two is that the administration change is an *application customization* and the **Personalize Pages** change is a *user customization*. Keep in mind that user customizations override application customizations in a given user’s view.

---

To change the display order of all business role pages:

1. On the **Settings** page (see *Accessing the Settings Pages in WebCenter Portal Administration*), click **Business Role Pages**.

You can also enter the following URL in your browser to navigate directly to the **Business Role Pages** page:

    http://host:port/webcenter/portal/admin/settings/businessrolepages
2. Select a business role page, and then click the arrows in the Reorder column to change the display order (Figure 43-10).

Figure 43-10 Reorder Icons on Business Role Pages

Alternatively, drag and drop pages into the desired order.

43.8 Editing a Business Role Page

Anyone granted the Edit Page permission on a business role page can edit that page. For these users, the editing process is the same as for regular pages (for more information, see Editing a Page in Building Portals with Oracle WebCenter Portal and Editing a Personal Page in Using Oracle WebCenter Portal.

As the WebCenter Portal system administrator, you can also initiate an edit of a business role page.

To edit a custom business role page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Business Role Pages.

You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

http://host:port/webcenter/portal/admin/settings/businessrolepages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Select the page, click the Actions icon for the page you want to edit, and select Edit Page (Figure 43-11).
Figure 43-11  Edit Option on a Custom Business Role Page

The page opens in edit mode in Composer. For more information about editing a page in Composer, see Editing a Page in *Building Portals with Oracle WebCenter Portal*.

3. Edit the page, and click **Save** and then **Close** when you have finished.

### 43.9 Editing the Source of a Business Role Page

If you have the **Edit Page** permission on a Business Role page, you can edit the source of the page without opening the page in Composer.

To edit the source of a custom Business Role page:

1. On the **Settings** page (see **Accessing the Settings Pages in WebCenter Portal Administration**), click **Business Role Pages**.

   You can also enter the following URL in your browser to navigate directly to the **Business Role Pages** page:

   http://host:port/webcenter/portal/admin/settings/businessrolepages

   **See Also:**

   WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal***.

2. Click the **Actions** icon for the custom page whose source you want to edit, and select **Edit Source** (Figure 43-12).
The Edit Source dialog opens (Figure 43-13).

3. Edit the page source, as desired.
For more information about editing the source of a page, see Viewing and Modifying Page Source Code in Building Portals with Oracle WebCenter Portal.

4. Click OK.

43.10 Copying a Business Role Page

When you copy a business role page, you can save it as another business role page or as a personal page in your view of the Home portal. If you copy another business role page, you must set access on the new page because access permissions from the original page are not copied (for more information, see Specifying the Target Audience for a Business Role Page). You cannot copy custom business role pages.

To copy a seeded business role page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Business Role Pages.

You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

http://host:port/webcenter/portal/admin/settings/businessrolepages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Select the page, click the Actions icon for the page you want to copy, and select Copy Page (Figure 43-14).

Figure 43-14 Copy Page Option on a Seeded Business Role Page

3. In the Copy Page dialog, enter a name for the new page (Figure 43-15).
4. Next to **Copy as**, specify whether the page will be copied as a personal or business role page:

   - Select **Business Role Page** if you intend to expose the copy to a group of people with the same job role.
   - Select **Personal Page** if you intend to expose the copy only in your own view (that is, as a personal page in your view of the Home portal).

5. Click **OK**.

   The page opens in edit mode in Composer. For more information about editing a page in Composer, see Editing a Page in *Building Portals with Oracle WebCenter Portal*.

6. Optionally, edit the page, and click **Save** when you have finished.

### 43.11 Removing All User Customizations from a Business Role Page

A control is available for removing all user customizations from a selected business role page. Using this control removes such personal changes as rearrangement, resizing, or collapsing of task flows. It does this in each user’s personal view of the business role page.

To remove all user customizations from all views of a custom business role page:

1. On the **Settings** page (see *Accessing the Settings Pages in WebCenter Portal Administration*), click **Business Role Pages**.

   You can also enter the following URL in your browser to navigate directly to the **Business Role Pages** page:

   http://host:port/webcenter/portal/admin/settings/businessrolepages

   **See Also:**

   WebCenter Portal Pretty URLs in *Building Portals with Oracle WebCenter Portal*.

2. From the **Actions** menu next to the target page, select **Delete Personalization**.

3. In the resulting confirmation dialog, click **OK**.

   All user customizations added by users to their own views of the page are removed. That is, task flows are returned to their original positions and their original sizes; collapsed task flows are expanded; and so on.
43.12 Deleting a Custom Business Role Page

Anyone granted the Delete Page permission on a custom business role page can delete it. For these users, the process is the same as deleting regular pages (for more information, see Deleting a Page in Building Portals with Oracle WebCenter Portal. As the WebCenter Portal system administrator, you can delete custom business role pages.

**Note:**

Seeded business role pages (see Table 43-1) cannot be deleted, even by the system administrator.

After a custom business role page is removed from the WebCenter Portal, it cannot be recovered. Deleted pages are permanently removed, and users previously assigned that page no longer see it in their views of the Home portal.

To delete a custom business role page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Business Role Pages.

   You can also enter the following URL in your browser to navigate directly to the Business Role Pages page:

   http://host:port/webcenter/portal/admin/settings/businessrolepages

   **See Also:**

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the page you want to delete, and select Delete Page (Figure 43-16).
3. In the confirmation dialog, click **Delete**.
Managing Personal Pages

This chapter describes how to administer personal pages in WebCenter Portal. While individuals are primarily responsible for managing the content of their personal pages, WebCenter Portal system administrators also have access to all personal pages by default. System administrators may be required to clean up or manage personal data when owners experience difficulties with their personal pages or leave the organization.

This chapter includes the following topics:

• About Personal Page Administration
• Setting Application-Level Page Creation Defaults for Personal Pages
• Preventing Users from Creating Personal Pages
• Providing Navigation to Personal Pages
• Changing Access Permissions on a Personal Page
• Editing a Personal Page
• Editing the Source of a Personal Page
• Copying a Personal Page
• Removing All User Customizations from a Personal Page
• Deleting a Personal Page

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permissions:

• Portal Server: Manage All or Portal Server: Manage Configuration
• Pages: Create, Edit, and Delete Pages

For more information about permissions, see About Application Roles and Permissions.

44.1 About Personal Page Administration

Personal pages are the pages users create in their personal views of the Home portal. As the WebCenter Portal system administrator, you have full access to all personal
pages created by other users. Full access means you can edit, copy, rename, set access, delete, and perform other like actions on any user’s personal pages.

System administrators can access everyone’s personal pages from the Personal Pages page in WebCenter Portal Administration. An Actions menu is associated with each listed page, providing access to options for editing in the page editor, removing user customizations, copying, renaming, securing, editing the source, deleting, and making the personal page public (Figure 44-1).

Figure 44-1 Page Actions Menu on a Personal Page

Additional options include sending a mail message containing a link to the page and viewing information about the page.

44.2 Setting Application-Level Page Creation Defaults for Personal Pages

In addition to the page creation defaults authorized users can set for themselves (see Setting Page Creation Defaults for Personal Pages in Using Oracle WebCenter Portal), system administrators can set application-level page creation defaults for personal pages. After page creation defaults are configured, application-level page creation defaults affect the creation of all personal pages. This control (Set Page Defaults) is available on the Business Role Pages in WebCenter Portal Administration (for more information, see Setting Page Creation Defaults for Business Role Pages).

Note:
The page creation defaults that authorized users set for themselves through the Personalize Pages page in the Home portal override the application-level settings described in this chapter.

44.3 Preventing Users from Creating Personal Pages

The application-level Pages: Create Pages permission allows users to create personal pages in the Home portal. You can revoke this permission from individual users to prevent them from creating personal pages. For more information, see

To assign permissions to users, you assign them a role that includes the permissions they need. To assign a user a role that includes or excludes the Pages: Create Pages permission, see Assigning Users (and Groups) to Application Roles.
44.4 Providing Navigation to Personal Pages

If you want to add a link to a personal page in a portal’s navigation, see Adding Resources to a Navigation Model in Building Portals with Oracle WebCenter Portal. For detailed information about working with portal navigation, see Working with Navigations in Building Portals with Oracle WebCenter Portal.

44.5 Changing Access Permissions on a Personal Page

As the system administrator, you are authorized to view and manage all personal pages. Page owners normally determine who can see their pages; however, as the system administrator, you have default access to all personal pages that other users create.

To change access permissions for a personal page:

1. On the Settings tab (see Accessing the Settings Pages in WebCenter Portal Administration), click Personal Pages.

   You can also enter the following URL in your browser to navigate directly to the Personal Pages page:

   \[ http://host:port/webcenter/portal/admin/settings/personalpages \]

   See Also:

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the page you want to secure, and select Set Page Access (see Figure 44-1).

   The Set Page Access dialog opens (Figure 44-2).

   **Figure 44-2 Set Page Access Dialog**

3. To set access for authenticated users, click Add Authenticated Access.

   The role authenticated-role is added under Role or User (Figure 44-3). Use this to set access permissions for all users who are logged in to WebCenter Portal.
Notice that the newly added role has only View access. Set other permissions for the user role appropriately.

4. To set access for public users, click Add Public Access.

The role anonymous-role is added under Role or User (Figure 44-4). Use this to set access permissions for all users who are not logged in to WebCenter Portal.

Notice that the newly added role has only View access. Set other permissions for the user role appropriately. You might want to leave the anonymous role with View access only.

5. To grant access to other users and roles, click Add Access to open the Add Access dialog (Figure 44-5).
6. Identify the users who can access this page.

Choose from all available users, groups, and application roles. Use the Search feature to search your identity store:

a. In the **Search** field, enter two or more characters and click the **Search** icon. For tips on searching the identity store, see Searching for a User or Group in the Identity Store in *Building Portals with Oracle WebCenter Portal*.

**Tip:**

This search is not case sensitive.

Users, groups, and roles matching your search criteria appear in the **Add Access** dialog.

b. Select one or more names from the list.

   Press Ctrl-click to select multiple users.

c. Click **Select**.

   The selected users and groups appear in the Set Page Access dialog. By default, users have the **View Page** permission on the page. Set other permissions appropriately.

7. To modify the permissions assigned to a current user or role, select one or more check boxes to grant page privileges:

   - **View Page**—The selected user or role can access the page for viewing, but cannot perform any actions on the page.

   - **Edit Page**—The selected user or role can edit the page. This includes adding, rearranging, and deleting content.

   - **Delete Page**—The selected user or role can delete the page.
Perform All Page Actions—The selected user or role has full access rights to the page. The user can edit the page, revise the page layout, set additional access privileges for other users, and all other page permissions.

Personalize Page—The selected user or role can personalize the page. Personalizations are changes made to a page in view mode. Such changes do not affect another user’s view of the page.

Tip:
You can revoke privileges by taking the same steps and deselecting one or more privileges for a listed user or role.

8. To revoke access to the page, select the role or user, and click Delete Access.

9. Click OK.

44.6 Editing a Personal Page

As the system administrator, you are authorized to view and modify any personal pages that users have created in their view of the Home portal. Individuals are primarily responsible for editing content on their personal pages, but, occasionally, you may be required to edit such content. See also Editing the Source of a Personal Page.

To edit a personal page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Personal Pages.

   You can also enter the following URL in your browser to navigate directly to the Personal Pages page:

   http://host:port/webcenter/portal/admin/settings/personalpages

   See Also:

   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the page you want to edit, and select Edit Page (see Figure 44-1) to open the page in the page editor.

   See Also:

   For information about editing a page, see Editing a Page in Building Portals with Oracle WebCenter Portal.

3. Update the page, and click Save and then Close when you have finished.

44.7 Editing the Source of a Personal Page

You can edit the source of a personal page without opening the page in the page editor.

To edit the source of a personal page:
1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Personal Pages.

You can also enter the following URL in your browser to navigate directly to the Personal Pages page:

http://host:port/webcenter/portal/admin/settings/personalpages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the page whose source you want to edit, and select Edit Source (Figure 44-1) to open the Edit Source dialog (Figure 44-7).

Figure 44-6  Edit Source Dialog

3. Edit the page source, as desired.

4. Click OK.

44.8 Copying a Personal Page

As the system administrator, you are authorized to copy any page in the Oracle WebCenter Portal. This includes copying the personal pages created by other users. When you copy a personal page as an administrator, you can save it as a business role page to be pushed to other users or as a personal page in your own view of the Home portal.
Tip:
If you create another business role page, you must set access on the new page because access permissions from the original page are not copied. For more information, see Specifying the Target Audience for a Business Role Page.

To copy a personal page:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Personal Pages**.

   You can also enter the following URL in your browser to navigate directly to the **Personal Pages** page:

   http://host:port/webcenter/portal/admin/settings/personalpages

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the **Actions** icon for the page you want to copy, and select **Copy Page** (Figure 44-1) to open the Copy Page dialog (Figure 44-7).

   ![Copy Page Dialog](image)

3. Enter a name for the new page.

4. Next to **Copy as**, specify whether the copy is one of your personal pages or a business role page:

   - Select **Business Role Page** if you intend to make the page available to a group of people with the same job function or who are in the same enterprise group.
   - Select **Personal Page** if you intend to expose the copy only in your own view.

   To learn more about copying a page, see Copying a Page in Building Portals with Oracle WebCenter Portal.

5. Click **OK**.

### 44.9 Removing All User Customizations from a Personal Page

A control is available for removing all user customizations from a selected personal page. Using this control removes such personal changes as rearrangement, resizing, or collapsing of task flows. The changes affect each user’s personal view of the page.

To remove all user customizations from all views of a personal page:
1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Personal Pages.

You can also enter the following URL in your browser to navigate directly to the Personal Pages page:

http://host:port/webcenter/portal/admin/settings/personalpages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the target page, and select Delete Personalization (Figure 44-1).

3. In the resulting dialog, click OK.

All user customizations added by users to their own views of the page are removed; that is, task flows are returned to their original positions and sizes, collapsed task flows are expanded, and so on.

44.10 Deleting a Personal Page

In addition to having full access to the personal pages created by other users, a WebCenter Portal system administrator can also delete them, if required.

Note:
After a personal page is deleted, it cannot be recovered.

To delete a personal page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Personal Pages.

You can also enter the following URL in your browser to navigate directly to the Personal Pages page:

http://host:port/webcenter/portal/admin/settings/personalpages

See Also:
WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Actions icon for the page you want to delete, and select Delete Page (Figure 44-1).

3. In the confirmation dialog, click Delete.
This chapter describes how to manage device settings in WebCenter Portal. Device settings allow you to control how portals render on different kinds of devices including desktop browsers, smart phones, and tablets.

This chapter includes the following topics:

- About Device Settings
- Creating and Managing Devices
- Creating and Managing Device Groups
- Managing Device and Device Group Life Cycles
- Previewing Devices
- Guidelines and Best Practices for Device Settings
- Discovering Device Attributes: A Sample Task Flow

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permission:

- Portal Server: Manage All or Portal Server: Manage Configuration

For more information about permissions, see About Application Roles and Permissions.

45.1 About Device Settings

To successfully manage and administer device settings, you need to be familiar with the concepts described in this section.

- Introduction to Device Settings
- What Are Devices?
- What Are Device Groups?
- Other Related Concepts
- Basic Use Case: Adding Support for a New Device
- Understanding How Device Settings are Applied
45.1.1 Introduction to Device Settings

Enterprise portal users access portals from a range of devices, from smart phones to tablets to desktop browsers. Device settings and related features allow you to control exactly how your portal pages render on different devices. As a system administrator, you may be asked to support a new type of device or to change or improve the way portal pages render on certain devices.

WebCenter Portal includes the capability to recognize which type of device a given request comes from, and to render the portal properly on that device. As a system administrator, you use device settings to modify or fine-tune this device recognition and to specify which page templates and skins to associate with specific devices or classes of devices. It is through device settings that you control exactly how those skins and templates are applied.

Out-of-the-box, WebCenter Portal provides several page templates that are designed to render well on general classes of devices, like smart phones, tablets, or desktop browsers. You can choose to use these templates as they are, modify them to suit your needs, or create new ones.

As a system administrator, consider using device settings when:

- You need to add rendering support for a new device or class of devices.
- You discover a problem with the way portal pages render on a device or class of devices.
- You find that portal developers have created device-specific pages that are not being detected and are not showing up on the targeted devices.

45.1.2 What Are Devices?

A device is a representation in WebCenter Portal of a physical device, like a smart phone or tablet, that users use to interact with a portal. Each time a portal page is requested, WebCenter Portal determines the type of device from which the request originated. This information enables the portal to decide what category of devices or "device group" the device is associated with. See What Are Device Groups?.

WebCenter Portal comes with a number of pre-configured devices out-of-the-box, such as iPhone, iPad, iPad mini, Samsung Galaxy Nexus, Samsung Galaxy Note 10.1, and others. You can also create new devices as needed.

Figure 45-1 shows some of the default devices listed in WebCenter Portal Administration.
Each device has three primary characteristics: a name, a display name, and a user agent string:

- **Name** – A unique name for the device. One use of this name is that, for certain use cases, it can be located by a developer with an Expression Language expression.

- **Display Name** – This name will appear in the WebCenter Portal user interface.

- **User Agent** – A regular expression string that is used to identify the device from which a request originates. For example, an expression like `
.*iPhone.+3G.+OS.+2_2.*` matches a variety of iPhone 3G versions.

**Note:**

The user agent string is a regular expression and conforms to the syntax specified by the Java platform (java.util.regex.Pattern). As such, certain special characters might need to be escaped if you want to match them. These characters include `[\^$.|]?*+()` and, in some cases, curly brace characters `{}`. For example, a parenthesis must be escaped with `"\`”, as in `"(iPhone; CPU iPhone OS 5_0 like Mac OS X)"`. For further guidance, a good reference on regular expression syntax is recommended.

As a system administrator, you can create new devices and manage existing ones. For example, you might need to modify the user agent string so to correctly identify a new version of a device. Or, you may need to create new devices as needed. For more information, see [Creating and Managing Devices](#).

### 45.1.3 What Are Device Groups?

A *device group* represents a collection of devices that share similar display requirements. Out-of-the-box, WebCenter Portal comes with several pre-configured device groups: Desktop Browsers, iOS Phones, Android Phones, iOS Tablets, and Android Tablets.

Device groups are populated with appropriate devices. For example, the iOS Phones device group includes iPhone, iPhone 3G, iPhone 3GS, iPhone 4, iPhone 4S, and others. As you create more devices, you can add them to existing groups, or create new groups as needed.
The advantage of device groups is that you do not have to configure display assets (page templates and skins) for each supported device. Rather, you can add multiple related devices to a group and specify the assets to be used by those devices. Figure 45-2 shows the Administration page for device groups. This page lets you create, edit, copy, upload, and perform other operations on device groups. For more information, see Creating and Managing Device Groups.

The following features are related to device settings. They include the default device group, page variants, and the fallback page.

- **Default Device Group** – One device group is always specified as the default. Out-of-the-box, the default device group is Desktop Browsers. This means that, by default, all pages in a new portal are associated with the Desktop Browsers device group. If a request comes from an unrecognized device, the portal page is rendered according to the default device group settings.

  **Note:**

  The base page is always rendered on devices that belong to the default device group.

The default device group is associated with the portal template feature (portal templates are templates on which new portals are based). Any portal created from a portal template automatically receives that template’s default device group. Likewise, if you create a portal template from a portal, the default device group associated with that portal is placed into the template.

For a discussion of how WebCenter Portal selects which device group to use, see Understanding How Device Settings are Applied.
**Page Variant** – A page variant is an alternative view of an existing, or "base," page designed to be used with specific devices. The base page from which the variant is derived and the page variant itself have the same URL, security settings, parameters, and so on; however, they are designed with specific rendering characteristics appropriate for the targeted device. When you create a page variant, you can specify a device group and page style with which to associate it.

Page variants have several uses. Suppose you find that one of your company intranet portal pages returns an error on a particular device. For example, such an error may occur when a page containing Flash video is rendered on an Apple device. In this case, you can create a variant of that page that will be used only when the page is requested for an Apple device, but not for others. In this case, the variant includes an image, perhaps, instead of the Flash video, and the error disappears.

Page variants are typically created by application specialists; however, only an administrator can create page variants for system pages. For example, you might want to create a login page variant suitable for a smart phone.

For information on creating page variants for system pages, see Creating a Page Variant of a System Page for Device Groups. For information on creating page variants for portal pages, see "Creating a Page Variant for a Device Group in Building Portals with Oracle WebCenter Portal.”

**Fallback Page** – One other related concept is the fallback page. Whenever a page does not have a page variant, then the base page is rendered by default; however, you can override this behavior so that no page is displayed in this circumstance.

---

**Note:**

When a page's fallback behavior is set to Display No Page, any navigational links to that page are hidden from view. In other words, any navigational links that would result in a "Page Not Available for Device" message are hidden from users.

---

You can set fallback for individual pages or for all portal pages. For more information about fallback, see Setting Page Behavior for a Specific Page When No Page Variant Exists in Building Portals with Oracle WebCenter Portal.

### 45.1.5 Basic Use Case: Adding Support for a New Device

Here is a use case to help you understand when you may need to work with device settings for the portal you administer.

Suppose a new mini-tablet is released with a different screen resolution and size than the currently supported tablet devices. In fact, a user discovers that the company intranet portal does not render properly on this device–there is a lot of white space and the company logo doesn’t look right. You are asked to support this new device. The basic steps are:

1. Discover the user agent string that this device sends to the portal.

2. Create a new device that has a user agent string that can match the new device's user agent string. See Creating a New Device.
3. Create a new device group for all devices that share similar rendering characteristics to the new device. In this case, the device group would hold devices with similar display characteristics as the new tablet. See Creating a Device Group.

4. Apply an appropriate skin and page template to the device group. If necessary, create new assets from scratch or by copy and modify existing ones.

5. Add the new device to the device group.

6. Test the portal on the new device to ensure it renders properly.

7. If similar mini-tablet devices are released, they can be added to the same group.

45.1.6 Understanding How Device Settings are Applied

Figure 45-3 illustrates the flow of how WebCenter Portal handles requests from multiple different devices.

**Figure 45-3  How the Portal Handles Requests from Different Devices**

As Figure 45-3 shows, when a request comes in to the server, the user agent string is examined in the header of the request. Next, WebCenter Portal looks for a device that matches that user agent (a regular expression string).

If multiple devices are defined whose user-agents can potentially map to the incoming user-agent, then the server tries to map the request to the *most appropriate* device. The most appropriate device is one whose user-agent has the maximal possible match.

When a device is identified, WebCenter Portal looks to see if it is in a device group. If it is in more than one group, the first one in the list of device groups for the portal is used. See also Ordering Device Groups.

If no device is identified, then WebCenter Portal assigns the "default device group" to the current request.

Finally, the appropriate skin, page template associated with the device group, and page variant (if one exists) are returned and the page renders on the device. If a page does not have a page variant, then the base page is rendered, by default; however, you
can override this behavior so that no page is displayed in this circumstance. For more information, see Setting the Page Behavior for a Portal When No Page Variant Exists in Building Portals with Oracle WebCenter Portal.

45.2 Creating and Managing Devices

This section explains how to create and manage devices:

- Creating a New Device
- Editing a Device
- Copying a Device
- Filtering the List of Devices
- Deleting a Device

**Note:**

In some cases, you may be unable to view page variants after a device configuration is added or modified on the **Device Settings** page. In this case, log out and log in again to clear the cache, and after that, the device will be recognized correctly.

45.2.1 Creating a New Device

To create a new device:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Device Settings**.

   You can also enter the following URL in your browser to navigate directly to the **Device Settings** page:

   http://host:port/webcenter/portal/admin/settings/device

   **See Also:**
   
   Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the **Devices** tab, click **Create**.

   The Create Device page displays, containing three sections: **Device**, **Optional Attributes**, and **Additional Attributes**.

3. In the **Device** section, specify the following details:

   - **Name** - The name of the device. This name must be unique and cannot contain spaces. One use of this name is that it can be located with an Expression Language expression.

   - **Display Name** - Specify the display name of the device. This name must be unique and will appear in the WebCenter Portal user interface.
- **User Agent** - Specify the user agent string. WebCenter Portal identifies a device by comparing the user agent string passed in the request header (comes from the user’s device) and the string specified in this field. This parameter does not have to be a literal match with the request header. It is taken to be a regular expression, and you can enter any valid regular expression in this field.

**Note:**

The user agent string is a regular expression and conforms to the syntax specified by the Java platform (java.util.regex.Pattern). As such, certain special characters might need to be escaped if you want to match them. These characters include [\^$.|?*+() and, in some cases, curly brace characters {]. For example, a parenthesis must be escaped with "\", as in \(iPhone; CPU iPhone OS 5_0 like Mac OS X\). For further guidance, a good reference on regular expression syntax is recommended.

- **Description** - (Optional) Specify a description that helps to identify the purpose of the device.

4. Use the **Optional Attributes** section to manage attributes such as display resolution height and width. You can edit their default values as required, as shown in **Figure 45-4**.

**Note:**

Optional attributes do not affect the way portals are rendered on a device. They exist simply to provide a way to specify information about a device that may be useful to a page designer. Portal designers can use Expression Language to access the values of device attributes.

**Figure 45-4** Specifying Optional Attributes

5. Optionally, add additional attributes. In the **Additional Attributes** section, click **Add Attribute** and specify a name and value.

**Note:**

Additional attributes do not affect the way portals are rendered on a device. They exist simply to provide a way to specify information about a device that may be useful to a page designer. Portal designers can use Expression Language to access the values of device attributes.

6. Click **Create** to create the device.
45.2.2 Editing a Device

To edit an existing device:

**Note:**
In some cases, you may be unable to view page variants after a device configuration is added or modified on the **Device Settings** page. In this case, log out and log in again to clear the cache, and after that, the device will be recognized correctly.

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Device Settings**.

You can also enter the following URL in your browser to navigate directly to the **Device Settings** page:

http://host:port/webcenter/portal/admin/settings/device

**See Also:**
Pretty URLsin *Building Portals with Oracle WebCenter Portal*.

2. On the **Devices** tab, select the device you wish to edit, then click the **Actions** menu and select **Edit**.

3. Edit the device settings. For information about the device settings that can be edited, see Creating a New Device.

4. Click **Save**.

45.2.3 Copying a Device

Creating a copy of a device is useful when you want to:

- Create a backup of a device.
- Update a device while keeping the original in use.
- Use a built-in device as the starting point for creating a new device.

To copy a device group:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Device Settings**.

You can also enter the following URL in your browser to navigate directly to the **Device Settings** page:

http://host:port/webcenter/portal/admin/settings/device

**See Also:**
Pretty URLsin *Building Portals with Oracle WebCenter Portal*. 
2. On the Devices tab, select the device you wish to copy, then click the Actions menu and select Copy.

3. In the Copy dialog, specify the name, display name, user agent, and description of the device.

4. Click OK.

The copied device appears in the Devices list.

45.2.4 Filtering the List of Devices

The Filter field lets you filter the list of devices shown in the Devices table. Filtering searches on device group names, display names, descriptions, and user agents.

45.2.5 Deleting a Device

You can delete any device that you created or copied. You cannot delete any of the devices that are seeded out-of-the-box.

To delete a device:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

You can also enter the following URL in your browser to navigate directly to the Device Settings page:

http://host:port/webcenter/portal/admin/settings/device

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Devices tab, select the device you wish to delete. Press Ctrl+click to select multiple devices.

Note:
You can only delete devices that you created or copied. You cannot delete the out-of-the-box devices provided with WebCenter Portal.

3. Click Delete.

4. Confirm your action in the Delete Device dialog.

45.3 Creating and Managing Device Groups

A device group represents a collection of devices that share similar display requirements. This section explains how to create and manage device groups to support.

• Creating a Device Group

• Editing a Device Group
**Creating a Device Group**

To create a device group:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Device Settings**.

   You can also enter the following URL in your browser to navigate directly to the **Device Settings** page:

   http://host:port/webcenter/portal/admin/settings/device

   **See Also:**
   Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the **Device Groups** tab, click **Create**.

   The Create Device Group page displays (Figure 45-5).
3. Give the new device group a name and a display name. The name must be a unique name and is used internally. The display name is the name that is shown in WebCenter Portal. It also must be unique.

4. In the Devices section, use the arrows to move the available devices that you wish to add to the Device Group list.

5. In the Assets section, select the page template and skin that you want this device group to use.

**Note:**

Click the Advanced Edit Options arrow next to an asset, then Expression Builder to enter an EL expression in the Expression Editor. An EL allows the skin or template to be selected dynamically. If you need EL assistance, a developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

6. To create the group, click Create.
45.3.2 Editing a Device Group

You can change the display name of a device group, edit the description that explains the purpose of the device group, and change the skin and/or template associated with a device group. You cannot change the device group name that is internally used to identify it.

To edit the basic details of a device group:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

   You can also enter the following URL in your browser to navigate directly to the Device Settings page:

   http://host:port/webcenter/portal/admin/settings/device

   See Also:
   WebCenter Portal Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups tab, select the device group you wish to edit, then click the Actions menu and select Edit.

3. On the Edit Device Group page, specify the required Display Name for the device group.

4. In the Description box, specify the purpose for which the device group has been created.

5. In the Assets section, select the page template and skin that you want this device group to use.

   Note:
   Click the Advanced Edit Options arrow next to an asset, then Expression Builder to enter an EL expression in the Expression Editor. An EL allows the skin or template to be selected dynamically. If you need EL assistance, a developer can provide an EL expression; see Expression Language Expressions in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

6. Click Save.

7. Click Close to close the Edit Device Group page.

45.3.3 Copying a Device Group

You can create copies of device groups. This is useful when you want to:

- Create a backup of a device group.
- Update a device group while keeping the original in use.
- Use a built-in device group as the starting point for creating a new device group.
When you create a copy of a device group, the copy is marked as hidden regardless of the status of the original device group.

To copy a device group:

1. On the **Settings** page (see Accessing the Settings Pages in WebCenter Portal Administration), click **Device Settings**.

   You can also enter the following URL in your browser to navigate directly to the **Device Settings** page:

   `http://host:port/webcenter/portal/admin/settings/device`

   **See Also:** Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the **Device Groups** tab, select the device group you wish to edit, then click the **Actions** menu and select **Copy**.

3. In the Copy dialog, specify the name, display name, and description of the device group (Figure 45-6).

   ![Figure 45-6  Copying a Device Group](image)

4. Click **OK**.

### 45.3.4 Showing and Hiding Device Groups

All device groups, whether built-in or custom, can be marked as hidden or available. A check mark next to a device group's name indicates that the device group is available to use. An empty check box indicates that the device group is not available for use in portals (Figure 45-7). This setting also controls the available selections when you create page variants. If a device group is hidden, it does not show up as an option to use with a new page variant, and you can’t create a page variant with that group. The show/hide settings are inherited from the Portal Administration settings; however, they can be overridden at the portal level by a portal manager. See also Creating a Page Variant for a Device Group in Building Portals with Oracle WebCenter Portal.

When you create a device group, by default, it is marked as unavailable.
To show or hide a device group:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

You can also enter the following URL in your browser to navigate directly to the Device Settings page:

http://host:port/webcenter/portal/admin/settings/device

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups tab, in the Available column, select or deselect the checkbox in the Available column to show or hide the device group.

45.3.5 Setting a Default Device Group

The built-in device group named Desktop Browsers is the default device group in WebCenter Portal. All new pages that you create are automatically associated with the default device group.

On the Device Groups tab, Default appears next to the device group that is set as default.

To set a device group as default:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

You can also enter the following URL in your browser to navigate directly to the Device Settings page:

http://host:port/webcenter/portal/admin/settings/device

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.
2. On the Device Groups tab, select the device group that you want to specify as default, then click the Actions menu and select Set as Default.

Notice that Default now appears next to the selected device group.

### 45.3.6 Ordering Device Groups

When a user accesses WebCenter Portal using a device, portals are rendered using the assets like page template and skin associated with the device group to which that device belongs. However, a device may be associated with multiple device groups. In such cases, the ordering of the device groups in the Device Groups tab determines the precedence of device groups.

To define the order of the device groups:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

   You can also enter the following URL in your browser to navigate directly to the Device Settings page:

   ```
   http://host:port/webcenter/portal/admin/settings/device
   ```

   **See Also:**
   
   Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups tab, use the ordering icons to define the order of the device groups:

   - **Move to top:** Click to move the selected device group to the top in the list of device groups displayed.
     
     This implies that if a device belongs to more than one device group, then the topmost device group must take precedence.

   - **Move up:** Click to move the selected device group one level up in the list of device groups displayed.

   - **Move down:** Click to move the selected device group one level down in the list of device groups displayed.

   - **Move to bottom:** Click to move the selected device group to the end in the list of device groups displayed.

   **Figure 45-8 Reordering Device Groups**
45.3.7 Filtering Device Groups

The Filter field lets you filter the list of device groups shown in the Device Group table. Filtering searches on device group names, display names, and descriptions.

45.3.8 Deleting a Device Group

If you no longer require a device group, you may want to delete it. However, you can delete only the custom device groups, and not the built-in device groups.

Note:

If a device group is deleted, page variants associated with that device group will still exist (they are not deleted). For important guidelines related to deleting a device group, see Guidelines and Best Practices for Device Settings.

To delete a device group:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

You can also enter the following URL in your browser to navigate directly to the Device Settings page:

http://host:port/webcenter/portal/admin/settings/device

See Also:

Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups tab, select the device group that you want to delete, then click Delete.

3. In the Delete Device Group dialog, click Delete.

45.4 Managing Device and Device Group Life Cycles

You can download device groups and devices to a file, and then upload them to another WebCenter Portal instance. For example, if you want to move your device groups from a staging to a production server, use the life cycle mechanism described in the following sections:

• Downloading a Device Group or Device
• Uploading a Device Group or Device
Note:

- You can only download device groups or devices that you have copied or created. You cannot download any of the out-of-the-box device groups.
- When you upload or download a device group, all artifacts associated with that device group are included, including any devices associated with that group. For example, suppose you create a new device and add it to a group, then download the group. When you upload that group to another server, that new device is automatically added to the list of devices.

45.4.1 Downloading a Device Group or Device

To download a device group or a device to a file:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

   You can also enter the following URL in your browser to navigate directly to the Device Settings page:

   http://host:port/webcenter/portal/admin/settings/device

   See Also:
   Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups or Devices tab, select the device group or device you wish to download. Press Ctrl+click to select multiple rows.

3. Click Download.

4. In the Download dialog, in the Archive File Name field, enter a name for the device group or the device archive file. The archive file must have the .aar extension.

5. Select:
   - Save to My Computer to save the archive file to your local file system. When you click the Download button you are prompted for the location on the file system where you want to save the file.
   - Save to WebCenter Portal Server to save the archive file to the file system of the server. The .aar archive file is saved to the default path $DOMAIN_HOME/WC_Archives, where $DOMAIN_HOME refers to the domain location where WebCenter Portal is installed.

   See also Downloading an Asset in Building Portals with Oracle WebCenter Portal.

6. Click Download.

45.4.2 Uploading a Device Group or Device

To upload a previously downloaded device or device group to the portal:
1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click Device Settings.

You can also enter the following URL in your browser to navigate directly to the Device Settings page:

http://host:port/webcenter/portal/admin/settings/device

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. On the Device Groups or Devices tab, click Upload.

3. Use the Upload Devices/Device Groups dialog to locate the .aar file on your system. Select:

- Look on My Computer to upload an archive file from your local file system. Click Browse to locate the file.

- Look on WebCenter Portal Server to upload an archive file from a remote server file system. In the field, enter the location on the server where the file is located.

When you download an archive file, it is saved to the default path $DOMAIN_HOME/ WC_Archives, where $DOMAIN_HOME refers to the domain location where WebCenter Portal is installed.

See also Downloading an Asset in Building Portals with Oracle WebCenter Portal.

4. Click Upload.

5. If the archive already exists in WebCenter Portal, click Yes to confirm that you want to replace the device group or device with the contents of the archive file.

6. Click OK in the resulting success dialog.

45.5 Previewing Devices
WebCenter Portal includes a preview feature that lets you preview how pages and page variants will render on a particular device. For more information, see Previewing a Mobile Device Variant of a Page in Building Portals with Oracle WebCenter Portal.

45.6 Guidelines and Best Practices for Device Settings
This section discusses best practices for working with device settings.

Avoid Changing the Default Device Group for a Production Portal
Changing the default device group in a production portal can lead to unexpected behaviors. It is best to avoid changing the default device group after your portal is in production.

Avoid Deleting a Custom Device Group for a Production Porta
If you delete a custom device group for a production or portals, the server does not warn you that existing portals use that device group, leading to incorrect page renderings in some cases.

If You Accidentally Delete a Device Group
You can create another device group with the same device group name as the one that was deleted. When a device group is deleted, the page variants are not removed from the system. These page variants are associated using the name of the device group. Recreating a device group with the same will bring back all those pages.

If You Need Information About the Requesting Device

In some cases, it is useful to obtain information about the device used to access the portal and discover which device settings the portal is mapping the device to. For your convenience, Discovering Device Attributes: A Sample Task Flow, lists code that a developer can use to create a task flow that echoes back this device information.

### 45.7 Discovering Device Attributes: A Sample Task Flow

Expression Language expressions can be used to return device attributes. Sample code that can be used for this purpose is presented in EL Expressions Related to Device Settings in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper. A developer can use this code to create a task flow that returns device information that can be useful in troubleshooting a problem with the way a portal renders on a given device. Figure 45-9 shows the output from a task flow created with this sample code.

Customizing Task Flows

This chapter describes how to use the Task FlowEditor system page to customize task flows for use by all portals in WebCenter Portal.

Note:
Task flow customization is also possible at design time through Oracle JDeveloper. The process differs significantly from the runtime procedure discussed in this chapter. For more information, see Adding Custom Actions to a Task Flow in Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

This chapter includes the following topics:

- About Task Flow Customization at the Application Level
- Customizing Task Flows at the Application Level
- Removing Task Flow Customizations

Permissions:
To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants the following permission:

- Portal Server: Manage All or Portal Server–Manage Configuration

46.1 About Task Flow Customization at the Application Level

Task flow customization provides a means of configuring a particular task flow in a way that all instances of that task flow within the current scope are affected. For example, you can add a link or icon to a task flow that requires it for all portals.

The task flow customization feature is available exclusively on the Task FlowEditor system page. The Task FlowEditor system page is available for both the application (all portals) and for individual portals:

- To change all instances of a given task flow across all portals (including the Home portal), customize the task flow on the application-level Task FlowEditor system page, as described in this chapter.

- To change only those instances exposed in a given portal, the portal manager can customize the task flow on the portal-level Task FlowEditor system page. See Working with Task Flows in Building Portals with Oracle WebCenter Portal.
Note:
When you customize a task flow element at the application level, and another user customizes the same task flow element at the portal level, the portal-level customization take precedence in that portal.

The Task Flow Editor system page is provided to enable customization of any out-of-the-box task flow. Custom task flows that are created through the Assets or Shared Assets page cannot be customized in this way.

System pages have a Restore Default feature that enables authorized users to remove all page customizations and restore a system page to its out-of-the-box state. It is important to note that Restore Default does not also restore customized task flows to their default states. A separate control, Reset Task Flow, is available to remove task flow customizations.

See Also:
For information about the Restore Default and Reset Task Flow features for system pages, see Removing All Page Customizations from a System Page and Removing Task Flow Customizations, respectively.

46.2 Customizing Task Flows at the Application Level

This section describes how to perform task flow customizations for WebCenter Portal, at the application level.

To perform application-wide task flow customizations through the Task Flow Editor system page:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click System Pages.

You can also enter the following URL in your browser to navigate directly to the System Pages page:

http://host:port/webcenter/portal/admin/settings/systempages

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Customize link next to the Task Flow Editor system page (Figure 46-1) to open it in Structure view in the page editor.
3. Add a task flow that you want to edit to the **Task Flow Editor** page (Figure 46-2).

   a. Click on the page to activate it.

   b. Click the **Add content into the selected component** icon (the Add icon on the right toolbar).

      The Add Content dialog opens.

      The method for adding a task flow to a page is that same as for any other component in the resource catalog. For more information, see Adding a Component to a Page in *Building Portals with Oracle WebCenter Portal*.

4. Click the **Edit Task Flow** link next to the task flow you want to customize (Figure 46-2).

5. In the Confirm Task Flow Edit dialog, click **Edit**.

   Structure view zooms into the source code hierarchy of the task flow being edited (Figure 46-3)
6. Set the properties of a task flow element by clicking it in the Task Flow Editor, then click the **Show the properties of region** icon. Alternatively, right-click the region and select **Edit** (Figure 46-4).
7. Make your changes to the element’s properties. Click the **Help** icon for descriptions of the parameters for the component you are editing.
Note:
Remember that changes to one element affect all like elements in the task flow within the current scope. For example, a change to the font used on a folder name affects all folder names within the scope and not just the selected instance.

8. Click Apply to view the effect of your changes; click OK to save your changes and exit the dialog.

Every instance of the customized task flow within the current scope renders with your customizations.

9. Click Save then Close to exit Composer.

46.3 Removing Task Flow Customizations

You can remove all customizations made to seeded task flows in WebCenter Portal.

Note:
This procedure does not apply to task flows created at runtime. That is, task flows created through the Assets or Shared Assets pages. Changes made to a task flow created at runtime are base edits rather than layered customizations; therefore, when you click Reset Task Flow, there are no customization layers to remove.

To remove task flow customizations made at the application level:

1. On the Settings page (see Accessing the Settings Pages in WebCenter Portal Administration), click System Pages.

You can also enter the following URL in your browser to navigate directly to the System Pages page:

http://host:port/webcenter/portal/admin/settings/systempages

See Also:
Pretty URLs in Building Portals with Oracle WebCenter Portal.

2. Click the Customize link next to the Task Flow Editor system page (Figure 46-6) to open it in page edit mode.
3. In the Structure view toolbar, click Reset Task Flow.

4. In the Reset Task Flow dialog, click Reset Task Flow to confirm the action.
Analyzing Portal Usage

The Analytics service offers real-time usage and activity reporting for your portal. This chapter describes how to use the pages and task flows provided through the Analytics service.

This chapter includes the following topics:

• About the Analytics Task Flows and Service
• About the Analytics Administration Page
• Working with Analytics Task Flows

For Analytics task flows to work, the Analytics schema (ACTIVITIES) must be installed and configured, and a connection set up between WebCenter Portal and the Analytics Collector. For more information about the Analytics schema and how to manage the Analytics service backend, see Managing Analytics.

This chapter describes how to add Analytics task flows to portal pages at runtime. To learn how to add Analytics task flows at design time using Oracle JDeveloper, see Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper.

Permissions:

To perform the tasks in this chapter, you must have the WebCenter Portal Administrator role or a custom role that grants at least the following permission:

• Portal Server: Manage Configuration

For more information about permissions, see About Application Roles and Permissions.

47.1 About the Analytics Task Flows and Service

The Analytics service allows WebCenter Portal administrators and portal managers to track and analyze WebCenter Portal traffic and usage. The Analytics service provides the following basic functionality:

• Usage Tracking Metrics: The Analytics service collects and reports metrics of common WebCenter Portal functions, including community and portlet traffic.

• Behavior Tracking: The Analytics service can be used to analyze WebCenter Portal metrics to determine usage patterns, such as page visit duration and usage over time.
• User Profile Correlation: The Analytics service can be used to correlate metric information with user profile information. Usage tracking reports can be viewed and filtered by user profile data such as country, company or title.

**Note:**
Profile information is cached meaning that changes to a user profile are not visible in reports until the cache is updated. The default cache time is 60 minutes, but this value can be changed by your administrator.

### 47.2 About the Analytics Administration Page

An analytics console that displays metrics for the entire Oracle WebCenter Portal is available to WebCenter Portal administrators with the Manage Configuration permission. The console consists of four pages, grouping several different reports:

- **Summary Metrics** – portal traffic, page views, and login metrics
- **Portal Metrics** – Portal usage and response times
- **Portlet Metrics** – Portlet views and response times
- **Service Metrics** – Usage of searches, documents, wikis, blogs and discussions

**Figure 47-1    Analytics Console for Administrators**

Out-of-the-box, this console is only available through a business role page named Analytics. It is the WebCenter Portal administrator's responsibility to grant people permissions to see the Analytics page. This page is intended for anyone who needs to analyze access and usage statistics; this could include administrators, sales or marketing managers or directors, business analysts, and so on.

Just like other business role pages, the Analytics page is pushed to all the users to whom it is assigned, appearing in the Home portal. Once the Analytics page is available in the Home portal, users can show and hide the page through the Manage Page dialog.
47.3 Working with Analytics Task Flows

This section describes the Analytics task flows, including how to add them to a portal page, how to customize them, how to change their properties, and how to personalize report views.

This section contains the following topics:

- Understanding Analytics Task Flows
- Adding Analytics Task Flows to a Page
- Customizing Analytics Reports
- Personalizing Your Analytics Report
- Setting Analytics Task Flow Properties

47.3.1 Understanding Analytics Task Flows

This section lists and describes all the Analytics task flows that are provided with WebCenter Portal. Note that those marked with "Administrator" are only available to users with an Administrator account, and those marked with "System Administrator" are only available to system administrators.

The following task flows are available out-of-the-box:

**Application Analytics:**
- WebCenter Traffic
- Page Traffic (Administrator)
- Login Metrics (System Administrator)

**Portal Analytics:**
- Portal Traffic (System Administrator)
- Portal Response Time (System Administrator)

**Portlet Analytics:**
- Portlet Traffic (Administrator)
- Portlet Instance Traffic (Administrator)
- Portlet Response Time (Administrator)
- Portlet Instances Response Time (Administrator)

**Service Analytics:**
- Search Metrics
- Document Metrics (System Administrator)
- Wiki Metrics (System Administrator)
- Blog Metrics (System Administrator)
• Discussion Forum Metrics (System Administrator)

**Note:**
The images shown in the following sections represent one view of each report. However each report can be customized to display the data in different ways (for example, a bar chart, a pie chart, a line chart, or a table). For information on customizing reports, see [Customizing Analytics Reports](#) and [Personalizing Your Analytics Report](#).

### 47.3.1.1 WebCenter Traffic

The WebCenter Traffic task flow displays a summarized view for common events within the portal. Use this task flow to track application-wide events—portal views, page views, portlet views, logins, number of searches, wiki views, blog views, discussion forum views, and document views. For more information, see [WebCenter Traffic](#) in *Building Portals with Oracle WebCenter Portal*.

### 47.3.1.2 Page Traffic (Administrator)

The Page Traffic task flow displays the number of page hits and the number of unique users that have visited any portal page. Use this task flow to quickly see the most visited pages (top pages) and/or the least visited pages (bottom pages). For more information, see [Page Traffic (Administrator)](#) in *Building Portals with Oracle WebCenter Portal*.

### 47.3.1.3 Login Metrics (System Administrator)

The Login task flow (Figure 47-2) reports the number of times users log in to WebCenter Portal. Use this task flow to see the total number of portal logins and/or the number of times unique users logged into WebCenter Portal.

*Figure 47-2  Analytics Task Flow - Login Metrics*

### 47.3.1.4 Portal Traffic (System Administrator)

The Portal Traffic task flow (Figure 47-3) displays usage information—the number of page hits, number of unique users, and the number of unique visits (multiple consecutive page views within the same portal during the same WebCenter Portal session is treated as one visit)—for individual portals.
Use this task flow to quickly see the most popular portals (top), and the least popular portals (bottom). You can filter the data to only show specific portals or show all portals.

**Figure 47-3  Analytics Task Flow - Portal Traffic**

![Figure 47-3 Analytics Task Flow - Portal Traffic](image)

**Note:**
The Home portal is not included in the data.

### 47.3.1.5 Portal Response Time (System Administrator)

The Portal Response Time task flow (**Figure 47-4**) displays page performance information—average, minimum, or maximum response time—for individual portals over any time period you specify. Use this task flow to quickly see the slowest portals (bottom), and the fastest portals (top). You can filter the data to only show specific portals or show all portals.
47.3.1.6 Portlet Traffic (Administrator)

The Portlet Traffic task flow displays portlet usage information—the number of portlet hits (the number of times a portlet is displayed) and number of unique users that access a portlet.

Use this task flow to quickly see the most popular portlets (top), and the least popular portlets (bottom). You can filter the data to only show specific portlets or show all portlets. Similarly, you can filter the portlet data by portal. For more information, see Portlet Traffic (Administrator) in Building Portals with Oracle WebCenter Portal.

47.3.1.7 Portlet Instance Traffic (Administrator)

The Portlet Instance Traffic task flow displays usage information—the number of portlet hits (the number of times a portlet is displayed) and number of unique users that access a portlet—for individual portlet instances. If the same portlet displays on several different pages, each placement is considered as a portlet instance.

Use this task flow to quickly see the most popular portlet instances (top), and the least popular portlet instances (bottom). You can filter the data to only show specific portlet instances or show all portlet instances. Similarly, you can filter the portlet data by portal. For more information, see Portlet Instance Traffic (Administrator) in Building Portals with Oracle WebCenter Portal.

47.3.1.8 Portlet Response Time (Administrator)

The Portlet Response Time task flow displays performance information—average, minimum, and maximum response time—for individual portlets. Use this task flow to quickly see the slowest portlets (bottom), the fastest portlets (top), and compare

---

**Figure 47-4  Analytics Task Flow - Portal Response Time**

Note:
The Home Portal is not included in the data.
performance data. Portlet response times are important because there is often a direct link between page performance and the slowest portlets. When troubleshooting poor performance within a portal, it is important to identify the worst performing portlets. You can filter the data to only show specific portlets or show all portlets. Similarly, you can filter the portlet data by portal. For more information, see Portlet Response Time (Administrator) in Building Portals with Oracle WebCenter Portal.

47.3.1.9 Portlet Instances Response Time (Administrator)

The Portlet Instances Response Time task flow displays performance information—average, minimum, and maximum response time—for individual portlet instances. If the same portlet displays on several different pages, each placement is considered as a portlet instance.

Use this task flow to quickly see the slowest portlet instances (bottom), the fastest portlet instances (top), and compare performance data. You can filter the data to only show specific portlet instances or show all portlet instances. Similarly, you can filter the portlet data by portal. For more information, see Portlet Instances Response Time (Administrator) in Building Portals with Oracle WebCenter Portal.

47.3.1.10 Search Metrics

The Search Metrics task flow tracks searches performed within the portal. Use this task flow to quickly see the most popular (top) and least popular (bottom) search phrases. For more information, see Search Metrics in Building Portals with Oracle WebCenter Portal.

47.3.1.11 Document Metrics (System Administrator)

The Document Metrics task flow (Figure 47-5) tracks how often a document is accessed. Use this task flow to quickly see the most popular (top) and least popular (bottom) documents. You can filter the data to only show specific portals or show all portals.

**Note:**

Documents in the Home Portal are included in this report.

**Note:**

If you have two different documents with the same name, they are treated as two separate documents. The metrics include the parent folder for context.
47.3.1.12 Wiki Metrics (System Administrator)

The Wiki Metrics task flow (Figure 47-6) tracks how often wikis are accessed within WebCenter Portal. Use this task flow to quickly see the most popular (top) and least popular (bottom) wikis. You can filter the data to only show specific portals or show all portals.

47.3.1.13 Blog Metrics (System Administrator)

The Blog Metrics task flow (Figure 47-7) tracks how often blogs are accessed within WebCenter Portal. Use this task flow to quickly see the most popular (top) and least
popular (bottom) blogs. You can filter the data to only show specific portals or show all portals.

**Figure 47-7  Analytics Task Flow - Blog Metrics**

47.3.1.14 Discussion Forum Metrics (System Administrator)

The Discussion Forum Metrics task flow (Figure 47-8) tracks discussion forums within WebCenter Portal. Use this task flow to quickly see the most popular (top) and least popular (bottom) discussions. You can filter the data to only show specific portals or show all portals.

**Figure 47-8  Analytics Task Flow - Discussion Metrics**

47.3.2 Adding Analytics Task Flows to a Page

The process of adding an Analytics task flow to a page is the same as for any other task flow (for more information, see Adding Analytics to a Portal in *Building Portals with Oracle WebCenter Portal*). The process varies only in where you find these task flows in the resource catalog. All the Analytics task flows are under the Analytics folder.
47.3.3 Customizing Analytics Reports

You can set defaults for Analytics reports by editing the report settings in page Edit mode. Any changes you make while in Edit mode will become the default report settings for all users in page View mode.

For example, you can edit the Analytics page, changing the following settings on the Summary Metrics page in the Traffic report: set the report type to pie chart, set the time frame to this week, and remove Discussion Forums from the display. When users visit the Analytics page, those settings will be applied by default. Users can then edit the report as necessary for their needs. This can be useful if there are particular settings you know are commonly used by your users, or to customize a particular instance of an Analytics task flow on a group-specific page.

You can also configure report settings to specify the controls available to users in View mode. For more information, see Customizing Analytics Reports in Building Portals with Oracle WebCenter Portal.

47.3.4 Personalizing Your Analytics Report

Analytics task flows include display options at the top of the report and query options to the left of the report. These options enable you to personalize the report for your needs by changing the metrics included in the report and the way the report is presented. Most options are the same for all Analytics task flows.

This section includes the following subsections:

- Report Display Options
- Query Options

47.3.4.1 Report Display Options

The report display options at the top of the report enable you to select the type of report, select the type of metrics to include, and, for some task flows, control the top/bottom range to display.

**Report Types**

You can display your report as a bar chart, pie chart, line chart, or table depending on the display and query options you select. To choose your report type, click the associated icon.
Table 47-1 lists the report types available for different display and query options. It includes the following columns:

- Selected Metrics specifies what has been selected in the list of metrics, a single metric or multiple metrics.

**Note:**

Search Metrics and Document Metrics task flows show only those single metrics; there is no list to select metrics.

- Group By Options specifies what has been selected in the Grouping Options section to the left of the report, No Selection or one of the available selections.

- Bar, Pie, Line, and Table specify whether you can view that type of report with the specified selections.

### Table 47-1  Display Options for the Analytics Task Flows

<table>
<thead>
<tr>
<th>Selected Metrics</th>
<th>Group By Option</th>
<th>Bar</th>
<th>Pie</th>
<th>Line</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single metric Login Traffic task flow</td>
<td>No selection</td>
<td>Y</td>
<td>N</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>Single metric All other task flows</td>
<td>No selection</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>Single metric</td>
<td>Time interval, user property, or Both*</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>Multiple metrics WebCenter Traffic and Login Traffic task flows</td>
<td>No selection</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>Multiple metrics All other task flows</td>
<td>No selection</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>Multiple metrics WebCenter Traffic and Login Traffic task flows</td>
<td>Time interval or user property</td>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>Multiple metrics All other task flows</td>
<td>Time interval or user property</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>Multiple metrics Login Traffic task flow</td>
<td>Both*</td>
<td>N</td>
<td>N</td>
<td>N</td>
<td>Y</td>
</tr>
</tbody>
</table>

* The grouping option Both is available only for the Login Traffic task flow.

### Metrics

You can select which type of metrics to include in your report. Your metrics options differ depending on the task flow you are using:

- WebCenter Traffic: Portals, Pages, Portlets, Logins, Searches, Wikis, Blogs, Discussion Forums, Documents
- Page Traffic: Hits, Unique Users
Working with Analytics Task Flows

- Login Metrics: Logins, Unique Users
- Space Traffic: Hits, Unique Users, Visits
- Space Response Time: Average Response Time, Minimum Response Time, Maximum Response Time
- Portlet Traffic: Hits, Unique Users
- Portlet Instance Traffic: Hits, Unique Users
- Portlet Response Time: Average Response Time, Minimum Response Time, Maximum Response Time
- Portlet Instance Response Time: Average Response Time, Minimum Response Time, Maximum Response Time
- Search Metrics: This task flow shows only search metrics, so it does not include an option to select metrics.
- Document Metrics: This task flow shows only document metrics, so it does not include an option to select metrics.
- Wiki Metrics: Views, Unique Users
- Blog Metrics: Views, Unique Users
- Discussion Forum Metrics: Views, Unique Users

To select which metrics to include in your report, select the metrics from the list above the report.

**Figure 47-10   Analytics Task Flow - Metrics Selection**

Top, Bottom, or Custom Ranges

With some task flows you can specify whether you want to see the top, bottom, all, or a custom ranges of metrics in your report. Use these options to see the most and least popular items in your portal.

To display the top or bottom ranges of metrics in your report, in the lists above the report, select **Top** or **Bottom**, and then select a number to define the range.

To display a custom range, in the list above the report, select **Specify**, then click **Select**.

The top and bottom options are available for Pages, Portlet Traffic, Portlet Instances Traffic, Response Time, Portlet Response Time, Portlet Response Time, Portlet Instances Response Time.

47.3.4.2 Query Options

Analytics task flows include the following query options to the left of the report:

- **Report Summary**
  Displays a summary of the selected display and query options shown in the report.

- **Time Frame**
  Enables you to specify the date range for the metrics displayed in the report. You can select from the following options: Yesterday, Today, This Week, Last Week, This Month, Last Month, Last Three Months, Last Six Months, This Year, Last Year, or you can specify your own date range.

- **User Property**
  Enables you to filter your report by user property. After selecting a property from the list, you can specify a value that the property must contain or must not contain, and only metrics that apply to the filtered property display in the report.
  - **Property**: Select a property on which to filter the report. You can select City, Company, Country, Department, Display Name, Employee ID, IM User, Manager, Phone, State or Province, Street, Title, or ZIP code.
  - **Operator**: Select how you want to filter the property. You can select *Contains* or *Does Not Contain*.
  - **Value**: Type a value on which to filter the property.

  **Note:**
  To search using a wildcard (for example, % or ?), you must prefix the wildcard with a forward slash (/). For example, to search for give or giving, type `giv\%` in the **Value** box.

- **Additional Options**
  Enables you to include Home portal pages in report data. These options are available with the Pages task flow (in the Page Traffic report).

- **Portals**
  When Analytics task flows display in the Home portal or on a business role page, you can choose which portals to include in your report. When Analytics task flows are used within a particular portal, only metrics only for that portal display; the Portals option is unavailable (grayed out).
  To specify the portals to include in your report, click the **Portal Filter** icon to display the Specify Portals popup. Select the portals you want to include in your report, using Ctrl+click and Shift+click to select multiple portals.
  This option is not available with the Traffic, Logins, or Search Metrics task flows.

- **Grouping Options**
  Enables you to select an option by which to group the metrics in your report. You can group by a time interval (Hour, Day, Week, Month, or Year), a user property, or, with the Logins task flow, both.
47.3.5 Setting Analytics Task Flow Properties

The Analytics service task flows have associated properties, which users with sufficient privileges can access through the task flows' View Actions menu. For example, select Parameters to show the Parameters dialog (Figure 47-11).

Figure 47-11  Analytics Task Flow: Parameters Dialog

The following sections provide information about properties of the Analytics service task flows and describe the task flow parameters:

- About the Analytics Service Task Flow Properties
- Analytics Service Task Flow Parameters

47.3.5.1 About the Analytics Service Task Flow Properties

When you edit a page, the View Actions menu appears in the toolbar of the Analytics task flows when you click the task flow. The View Actions menu provides access to the properties dialogs: Parameters, Access, Display Options, Style, and Content Style.

- Parameters control the default task flow content. For descriptions of each parameter, see Analytics Service Task Flow Parameters. Parameters can be wired to events, and can be used facilitate the wiring of the task flow to page parameters and page definition variables. For more information, see Wiring Pages, Task Flows, Portlets, and UI Components in Building Portals with Oracle WebCenter Portal.

- Access settings show or hide the component to specific roles, users, or groups. For more information, see Setting Component Access in Building Portals with Oracle WebCenter Portal.

- The Display Options, Style, and Content Style properties affect the appearance and behavior of the task flow for all users. These properties are common to all task flows. For more information, see Modifying Components in Building Portals with Oracle WebCenter Portal.

The Parameters and Display Options dialogs provide access to an Expression Language (EL) editor, which you can use to select or specify a variable value instead of
a constant value. Click the ▼ icon next to a property, then select Expression Builder to open the editor.

**Note:**
When you enter EL in the Display Options dialog, the parser reports an error only if it detects invalid syntax, such as a missing closing bracket. Validation is performed only on syntax, not on the expression value. Generic Display Options are those cataloged in Display Options Properties in *Building Portals with Oracle WebCenter Portal*.

EL validation is not performed on non-generic display options.

If you need EL assistance, an application developer can provide an EL expression; see Expression Language Expressions in *Developing WebCenter Portal Assets and Custom Components with Oracle JDeveloper*.

### 47.3.5.2 Analytics Service Task Flow Parameters

Table 47-2 describes the parameters that are unique to the Analytics service task flows.

**Table 47-2  Analytics Task Flow Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics Report Title</td>
<td>Specifies the display title that appears above the analytics data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• Use the Analytics Report Title rather than the Text property in the Display Options dialog. Changing the Text value has no effect on Analytics task flows.</td>
</tr>
<tr>
<td></td>
<td>• You cannot change the report titles in the Analytics console.</td>
</tr>
<tr>
<td>Analytics Resource Id</td>
<td>Specifies the MDS document used to store user customizations/application customizations for the task flow instance in MDS.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Do not edit this value.</td>
</tr>
<tr>
<td>Application Name*</td>
<td>Specifies the WebCenter Portal application for which you want to display analytics data. For WebCenter Portal, this is always <code>webcenter</code>.</td>
</tr>
<tr>
<td></td>
<td>The analytics database can be used to store event data from multiple applications so this parameter is required to identify which application data to display.</td>
</tr>
<tr>
<td></td>
<td>If omitted, the task flow displays analytics data for all supported WebCenter Portal applications.</td>
</tr>
<tr>
<td>Max Data Points Per Series</td>
<td>Indicates the maximum number of data points to be displayed in a bar or line chart. The default value is 25. Valid values are between 1 and 1000.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Increasing the number of data points might increase the time it takes to render the report.</td>
</tr>
</tbody>
</table>
Part IX
Appendixes

This part of *Administering Oracle WebCenter Portal* provides appendixes with supporting information for the chapters in this guide.

- Oracle WebCenter Portal Configuration
- Oracle HTTP Server Configuration for WebCenter Portal
- Third-Party Product Support
- Migrating Wiki Content to WebCenter Portal
- Migrating Folders_g to FrameworkFolders
- Troubleshooting Oracle WebCenter Portal
Oracle WebCenter Portal Configuration

This chapter describes the two main configuration files for WebCenter Portal, adf-config.xml and connections.xml. This appendix describes both these files, how to locate them, and also when to configure these files and which tools to use.

Other configuration files, such as web.xml and webcenter-config.xml are described here too. See also Oracle WebCenter Portal Configuration Considerations.

This appendix includes the following topics:

- Configuration Files
- Cluster Configuration
- Configuration Tools
- Modifying the File Upload Size in Content Manager

A.1 Configuration Files

adf-config.xml, connections.xml, and web.xml are used to configure WebCenter Portal and its back-end services. The webcenter-config.xml configuration file, which is specific to the out-of-the-box application WebCenter Portal, is used to configure application-wide settings.

This section describes how applications use each file and the location of these files post deployment. This section includes the following subsections:

- adf-config.xml and connections.xml
- web.xml
- webcenter-config.xml

A.1.1 adf-config.xml and connections.xml

adf-config.xml and connections.xml both store design time configuration information, such as the discussions server, mail server, or content server that is used by the application in the development environment:

- **adf-config.xml** - Stores application-level settings, such as which discussions server or mail server the application is currently using.
- **connections.xml** - Stores connection details for WebCenter Portal services.

See Developing Fusion Web Applications with Oracle Application Development Framework.
After you deploy WebCenter Portal to a production environment, Oracle recommends that you use Fusion Middleware Control or WebLogic Scripting Tool (WLST) commands to reconfigure properties in these files. For example, you may want to modify connection details to point to production server instances. See Configuration Tools.

The main advantage of using Fusion Middleware Control and WLST commands is that any configuration changes that you make, post deployment, are stored as customizations in the application’s Oracle Metadata Services (MDS) repository. MDS uses the original deployed versions of adf-config.xml and connections.xml as base documents and stores all subsequent customizations separately into MDS using a single customization layer. If the application is redeployed in the future, all previous configuration changes are retained.

When WebCenter Portal starts up, application customizations stored in MDS are applied to the appropriate base documents and the application uses the merged documents (base documents with customizations) as the final set of configuration properties.

This section includes the following subsections:

- Reviewing Post Deployment Customizations in MDS
- Exporting Configuration Files with MDS Customizations
- Handling Configuration Conflicts
- Deleting MDS Customizations for adf-config.xml or connections.xml

For more information on MDS customizations, see Understanding the MDS Repository in Administering Oracle Fusion Middleware.

A.1.1.1 Reviewing Post Deployment Customizations in MDS

Post deployment, always use Fusion Middleware Control or WLST commands to review the latest configuration or make configuration changes. In Fusion Middleware Control you will mostly use WebCenter Portal-specific configuration screens but a useful Systems MBean Browser is also available for reviewing configuration settings. These tools always show you the current configuration so, typically, there is no need for you to examine or change the content of base documents or MDS customization data for files such as adf-config.xml and connections.xml.

At times it might be useful to 'see' the information in MDS. If for any reason you must extract or examine configuration file customizations that are stored in MDS, use the WLST command exportMetadata.

Note:
For detailed syntax and examples, see exportMetadata in WLST Command Reference for Infrastructure Components.

For example, to determine MDS customizations for connections.xml in WebCenter Portal, which has the application name webcenter and is deployed to the WC_Portal managed server, the file name and location is always /META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml, you might specify:
And similarly, to determine MDS customizations for adf-config.xml:

```java
exportMetadata(application='webcenter', server='WC_Portal',
     toLocation='/tmp/mydata',
     docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml.xml')
```

You choose where to save file customizations by specifying `toLocation`. If, for example, `toLocation` is set to `/tmp/mydata`, then the requested file is saved to `/tmp/mydata/META-INF/mdssys/cust/adfshare/adfshare`.

If no customizations exist for the requested file, then nothing is saved to the specified location—previously extracted customizations at the same location are not overwritten.

### A.1.1.2 Exporting Configuration Files with MDS Customizations

You can use the System MBean Browser to obtain "current versions" of configuration files such as `adf-config.xml` or `connections.xml`, that is, a version of the file that includes the base document merged with MDS customizations.

To export `adf-config.xml` or `connections.xml` with MDS customizations from the System MBean Browser:

1. Log on to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select System MBean Browser.

4. Navigate to the MBean associated with the file you want to export.

   For example, navigate to MBeans for `adf-config.xml` or `connections.xml` as follows:

   - `adf-config.xml` - oracle.adf.share.config > Server: WC_Portal > Application: webcenter > ADFConfig > ADFConfig
   - `connections.xml` - Click oracle.adf.share.connections > Server: WC_Portal > Application: webcenter > ADFConnections > ADFConnections

5. Click the Operations tab.

6. Click Export.

   Alternatively, click ExportToDisk and then specify a sever location for the XML file.

7. Click Invoke.

   If you selected the Export operation, the content of the XML file displays on the screen (Figure A-1).
A.1.1.3 Handling Configuration Conflicts

MDS customizations use references to elements in the base document to call out which elements must be inserted/deleted/replaced, and at what location. If an element is inadvertently removed from a future redeployment and MDS contains a reference to that element, then the WebCenter Portal application’s configuration appears corrupt.

You are unlikely to face this problem but should a previously deployed application appear corrupt after making changes to `adf-config.xml` or `connections.xml` you have the following options:

- Remove the MDS customization causing conflict manually:
  1. Extract MDS customization information for `adf-config.xml` or `connections.xml`.
     
     For example, for WebCenter Portal specify:
     
     ```sh
     exportMetadata(application='webcenter', server='WC_Portal',
     toLocation='/tmp/mydata',
     docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml.xml')
     
     exportMetadata(application='webcenter', server='WC_Portal',
     toLocation='/tmp/mydata',
     docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml')
     ```
  2. Remove the customization instruction that is causing conflict from the document.
  3. Import the modified document back in to MDS.
     
     For example, for WebCenter Portal specify:
     
     ```sh
     importMetadata(application='webcenter', server='WC_Portal',
     fromLocation='/tmp/mydata',
     docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml')
     
     importMetadata(application='webcenter', server='WC_Portal',
     fromLocation='/tmp/mydata',
     docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml.xml')
     ```
  4. Restart the managed server.
• Delete MDS customizations for adf-config.xml or connections.xml, deploy the new EAR file, and reconfigure your application from scratch using Fusion Middleware Control or WLST.

For detailed steps, see “Deleting MDS Customizations for adf-config.xml or connections.xml.

• Redeploy the EAR file on a new partition or a partition where older customizations are deleted. In either case, all data previously stored in MDS for the application is lost, including any application customizations for adf-config.xml or connections.xml, and all user customizations. You must reconfigure your application from scratch too, using Fusion Middleware Control or WLST.

See exportMetadata and importMetadata in WLST Command Reference for Infrastructure Components.

A.1.1.4 Deleting MDS Customizations for adf-config.xml or connections.xml

This section describes how to remove all post-deployment configuration for connections.xml or adf-config.xml. This operation cannot be reversed; customizations are permanently removed.

If you do want to delete MDS customizations, Oracle recommends that you use the exportMetadata command to save a copy of the existing files before completing the steps below. For detailed syntax and examples, see exportMetadata in WLST Command Reference for Infrastructure Components.

1. Use the exportMetadata command to backup connections.xml and adf-config.xml.

For example, for WebCenter Portal specify:

    exportMetadata(application='webcenter', server='WC_Portal',
    toLocation='/tmp/mydata',
    docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml')

    exportMetadata(application='webcenter', server='WC_Portal',
    toLocation='/tmp/mydata',
    docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml')

2. Delete customizations for connections.xml, using WLST.

For example, for WebCenter Portal specify:

    deleteMetadata(application='webcenter', server='WC_Portal',
    docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml')

3. Delete customizations for adf-config.xml, using WLST.

For example, for WebCenter Portal specify:

    deleteMetadata (application='webcenter', server='WC_Portal', docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml')

4. Restart the application.

5. Reconfigure your application from scratch using Fusion Middleware Control or WLST.
A.1.2 web.xml

web.xml is a standard J2EE application deployment descriptor file and it is located in the /META-INF directory for your application. Typical run-time settings in web.xml include initialization parameters, custom tag library locations, and security settings.

Most web.xml properties are static so they are specified for the application at design time before generating and deploying the application's .par file. If you need to modify some properties in a deployed environment, you can edit some properties through the "Configure Web Modules" screen on the "Deployment Settings" page.

Unlike connections.xml and adf-config.xml, web.xml does not store post deployment customizations in MDS and you cannot use Fusion Middleware Control or WLST commands to modify web.xml in an existing deployment, such as WebCenter Portal.

Note:

Do not edit the web.xml file for WebCenter Portal post deployment. Oracle does not recommend that you explode application .par files and risk corrupting your installation.

There are very few instances where you might want to modify web.xml, for example, in some circumstances you may want to change:

• **Content repository upload parameters**: UPLOAD_MAX_MEMORY, UPLOAD_MAX_DISK_SPACE, and UPLOAD_TEMP_DIR.

  For WebCenter Portal, use the uploadedFileMaxDiskSpace parameter in webcenter-config.xml to configure a maximum upload size for files. For details, see webcenter-config.xml.

• **Time after which HTTP sessions expire**.

  See Specifying Session Timeout Settings.

• **JSP page timeout value**.

• **Browser compatibility notifications for Internet Explorer**. Set the oracle.adf.view.rich.HIDE_UNSUPPORTED_BROWSER_ALERTS parameter:

  ```xml
  <!-- Suppress Browser Compatibility popup messages -->
  <context-param>
      <param-name>
          oracle.adf.view.rich.HIDE_UNSUPPORTED_BROWSER_ALERTS
      </param-name>
      <param-value>IECompatibilityModes</param-value>
  </context-param>
  ```

  **Note:** Alternatively, Internet Explorer users can turn off Compatibility Mode before trying to access WebCenter Portal. In Internet Explorer, select the Tools menu, and the Compatibility View Settings. In the Compatibility View Settings dialog, deselect all the options, and click Close.
A.1.3 webcenter-config.xml

webcenter-config.xml is a configuration file for the out-of-the-box application WebCenter Portal. This file contains application-level settings, such as the application name and logo. Most of the properties in this file are managed through WebCenter Portal administration screens so there is no need to edit webcenter-config.xml directly. For more information, see Exploring the Settings Pages in WebCenter Portal Administration and Configuring Global Defaults Across Portals.

There are very few instances where you might be required to manually modify settings in webcenter-config.xml; for example, if you want to change the following:

- **Maximum file upload size** (uploadedFileMaxDiskSpace) - the default setting is 2 GB. This setting is applicable when specifying the maximum upload size for files uploaded from features such as wiki, blog, or activity stream.

  **Note:** For information about specifying the maximum upload size for files uploaded using Content Manager, see Modifying the File Upload Size in Content Manager.

If you want to modify this setting, you must export the latest version of webcenter-config.xml from MDS and modify the uploadedFileMaxDiskSpace value as follows:

1. Export the latest webcenter-config.xml from MDS.

   For example:

   ```
   exportMetadata(application='webcenter', server='WC_Portal',
   toLocation='/tmp/mydata',
   docs='/oracle/webcenter/webcenterapp/metadata/mdssys/cust/site/webcenter/webcenter-config.xml.xml')
   ```

   **Note:**

   webcenter-config.xml is created in MDS the first time you configure global defaults on the General page in WebCenter Portal Administration. If the file does not yet exist in MDS you can edit webcenter-config.xml directly. The file is located at: /oracle/webcenter/webcenterapp/metadata/webcenter-config.xml

2. Open webcenter-config.xml exported from MDS in a text editor and add the following snippet, changing the uploadedFileMaxDiskSpace value as required:

   ```
   <mds:replace
   node="webcenter(xmlns(webcenter=http://xmlns.oracle.com/webcenter/webcenterapp)"/
   >webcenter:uploadedFileMaxDiskSpace"/>
   <mds:insert
   after="webcenter(xmlns(webcenter=http://xmlns.oracle.com/webcenter/webcenterapp)"/
   >webcenter:custom-attributes" parent="webcenter">
   <uploadedFileMaxDiskSpace
   xmlns="http://xmlns.oracle.com/webcenter/webcenterapp">2147483648</uploadedFileMaxDiskSpace>
   </mds:insert>
   ```
3. Save and close webcenter-config.xml.

4. Import the updated webcenter-config.xml file to MDS.

For example:

```java
importMetadata(
    application='webcenter',
    server='WC_Portal',
    fromLocation='/tmp/mydata',
    docs='/oracle/webcenter/webcenterapp/metadata/mdssys/cust/site/webcenter/webcenter-config.xml')
```

A.2 Cluster Configuration

All post deployment configuration through Fusion Middleware Control, WLST, or the Systems MBean Browser is stored as customizations in the MDS repository. In a cluster environment, since the MDS repository is shared across all nodes, all WebCenter Portal configuration changes done on one node are visible to all nodes in the cluster. To effect configuration changes that are not dynamic, all nodes in the cluster must be restarted. See Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

In WebCenter Portal, most configuration changes that you make through Fusion Middleware Control or using WLST, are not dynamic. For example, when you add or modify connection details for various tools and services (analytics, announcements, discussions, documents, events, mail, instant messaging and presence, search, worklists, and so on) you must restart the application's managed server. There are two exceptions; portlet producer and external application registration is dynamic. Any new portlet producers and external applications that you register are immediately available in your application and any changes that you make to existing connections take effect immediately too.

If you edit configuration files in a cluster environment, then you must ensure that identical changes are made in each cluster member so that the overall cluster configuration remains synchronized.

A.3 Configuration Tools

Oracle offers a range of tools for configuring WebCenter Portal deployments. This section outline which tools are available.

---

**Note:**

Most WebCenter Portal configuration parameters are immutable and cannot be changed at runtime unless otherwise specified.

---

Post deployment, always use Fusion Middleware Control or WebLogic Scripting Tool (WLST) commands to review the latest configuration or make configuration changes. In Fusion Middleware Control you will mostly use WebCenter Portal-specific configuration screens but a useful Systems MBean Browser is also available for reviewing and modifying configuration settings.

For more information about these tools, read:

- Oracle Enterprise Manager Fusion Middleware Control Console
- Oracle WebLogic Scripting Tool (WLST)
• **System MBean Browser**

These tools always show you the current configuration so, typically, there is no need for you to examine or manually change the content of configuration files or MDS customization data for files such as `adf-config.xml` or `connections.xml`. If you use the same MDS details when you redeploy the application, all configuration performed using these tools is preserved.

### What Configuration Tool to Use

You can use any tool for post-deployment configuration. However, if you intend to repeat the configuration steps multiple times, for example, when provisioning newer instances or for automation, screen-based configuration using tools such as Fusion Middleware Control becomes less efficient. In such cases, Oracle highly recommends that you write WLST scripts to perform the required configuration.

All configuration operations possible through Fusion Middleware Control are available using Oracle WebCenter Portal’s WLST commands. You can also use WLST scripts to configure other components, for example, to deploy applications, create managed servers, set MDS properties for an application, configure data sources, and so on.

If you want help to automate domain configuration, you can record configuration actions in the WebLogic Server Administration Console as a series of WLST commands and then use WLST to replay the commands. For more details on this topic, see Recording WLST Scripts in *Understanding Oracle WebLogic Server*.

**Tip:**

Where Oracle documentation describes steps in the WebLogic Server Administration Console, consider automating the process using the "Record" option.

Another way to configure deployment specific properties is through the WebCenter Portal application’s deployment plan. Typical properties changed on deployment include:

• Host/port properties for connections

• Standard J2EE artifacts in `web.xml`

**Note:**

While reconfiguration is possible this way, any metadata repository and ADF connection configuration changes that you make are not saved as part of the deployment plan, that is, they are saved in the archive that is deployed. Therefore, your configuration changes must be repeated on subsequent redeployments.

If you redeploy your application multiple times, Oracle recommends that you use Fusion Middleware Control or WLST commands to perform your post-deployment configuration. This way, configurations changes are saved in MDS and remain intact on redeployment.
A.4 Modifying the File Upload Size in Content Manager

You can configure the maximum size for files uploaded through Content Manager. The default upload size is 50 MB.

**Note:** For information about specifying the maximum upload size for files uploaded from features such as wiki, blog, or activity stream, see webcenter-config.xml.

To specify the maximum upload size allowed for files in Content Manager by using System MBean Browser:

1. Log on to Fusion Middleware Control and navigate to the home page for WebCenter Portal. For more information, see Navigating to the WebCenter Portal Home Page.

2. From the WebCenter Portal menu, select System MBean Browser.

3. Under Application Defined MBeans, under the adf-config MBean, navigate to the WccAdfConfiguration attribute:

   oracle.adf.share.config > Server: WC_Portal > Application: webcenter > ADFConfig > ADFConfig > WccAdfConfiguration

4. In the MaximumUploadedFileSize attribute, specify the required file size in bytes.

5. For a High Availability environment, you need to update the Temporary Directory attribute to specify the temporary location where files are stored. The Temporary Directory attribute must be set to a directory so that the uploaded files stored under that directory can be accessed by both node1 and node2.

6. Navigate to the adf-config MBean to invoke the save operation.

   Click oracle.adf.share.config > Server: WC_Portal > Application: webcenter > ADFConfig > ADFConfig

7. Click the Operations tab.
8. Click the save operation link.

Figure A-3    Saving the MBean Changes

9. On the Operation:save page, click **Invoke** to commit all the MBean changes made since the last save operation.

Oracle HTTP Server Configuration for WebCenter Portal

This appendix describes the Oracle HTTP Server configuration required for WebCenter Portal.

B.1 Oracle HTTP Server Configuration

This section includes the following topics:

- Scenarios for Using Oracle HTTP Server
- Sample mod_wl_ohs.conf
- Configuring OHS

B.1.1 Scenarios for Using Oracle HTTP Server

When Oracle WebCenter Portal components are running on Oracle WebLogic Server, you can set Oracle HTTP Server (OHS) as the frontend to Oracle WebLogic Server. Some scenarios that require OHS as the frontend are:

- For OSSO to function properly between Site Studio and Oracle Content Server. This is achieved through mod_osso of OHS.
- The adequate distribution of load across the Oracle WebLogic Server cluster nodes. This is achieved through mod_wl of OHS.
- OHS is required for OAM’s WebGate component.
- OHS is used as a reverse proxy.

In these cases, you must configure the mod_wl_ohs module to allow requests to be proxied from an OHS to Oracle WebLogic Server.

B.1.2 Sample mod_wl_ohs.conf

The default location of the mod_wl_ohs.conf file is: OHS_HOME/Oracle_WT1/instances/instance1/config/OHS/ohs1/mod_wl_ohs.conf. After you have configured the mod_wl_ohs module using the Fusion Middleware Control, the file mod_wl_ohs.conf file looks similar to the following sample code:

```bash
# WebCenter Portal Application
<Location /webcenter>
  SetHandler weblogic-handler
  WeblogicHost webcenter.example.com
  WeblogicPort 8888
</Location>

<Location /webcenterhelp>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8888
</Location>

<Location /rss>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8888
</Location>

<Location /rest>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8888
</Location>

# Discussions
<Location /owc_discussions>
SetHandler weblogic-handler
WeblogicHost discuss.example.com
WeblogicPort 8890
</Location>

# SES Search
<Location /rsscrawl>
SetHandler weblogic-handler
WeblogicHost ses.example.com
WeblogicPort 7777
</Location>

<Location /sesUserAuth>
SetHandler weblogic-handler
WeblogicHost ses.example.com
WeblogicPort 7777
</Location>

# Portlets
<Location /portalTools>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8889
</Location>

<Location /wsrp-tools>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8889
</Location>

<Location /pagelets>
SetHandler weblogic-handler
WeblogicHost webcenter.example.com
WeblogicPort 8889
</Location>

# UCM
#  Web server context root for Oracle WebCenter Content Server
<Location /cs>
SetHandler weblogic-handler
WeblogicHost ucm.example.com
WeblogicPort 16200
</Location>

# Enables Oracle WebCenter Content Server authentication
<Location /adfAuthentication>
SetHandler weblogic-handler
WeblogicHost ucm.example.com  # Same as /cs entry
WeblogicPort 16200  # Same as /cs entry
</Location>

# SAML SSO
B.1.3 Configuring OHS

SSL Directives
If you have configured SSL, then the following additional directives are required:

- WLProxySSL ON
- WLProxySSLPassThrough ON

For example, mod_wl_ohs.conf entries with SSL directives looks like the following:

```
# WebCenter Portal Application
<Location /webcenter>
  SetHandler weblogic-handler
  WeblogicHost webcenter.example.com
  WeblogicPort 8888
  WLProxySSL ON
  WLProxySSLPassThrough ON
</Location>
```

Frontend Listening Host and Frontend Listening Port
If the Oracle HTTP Server (OHS) frontend is also the site entry point, use the Oracle WebLogic Server Administration Console to set the `FrontEnd Host` and `FrontEnd HTTP Port` for each server that uses the OHS frontend.

Configuring an Error Page for a Cluster
Include the `ErrorPage` parameter in mod_wl_ohs.conf as follows:

```
<Location /webcenter>
  WebLogicCluster
  app1.mycompany.com:8888,app2.mycompany.com:8888,app3.company.com:8888
  SetHandler weblogic-handler
  ErrorPage http://mycompany.com/error.html
</Location>
```

Users are redirected to `http://company.com/error.html` if all the WC_Portal managed servers are down. When any managed server comes back online, users access WebCenter Portal as normal.
See also, Configuring mod_wl_ohs in *Administrator’s Guide for Oracle HTTP Server*. 
Third-Party Product Support

This appendix lists third party products that can be used with WebCenter Portal.

C.1 Third-Party Product Support

Table C-1 lists the third party products that can be used with WebCenter Portal.

This appendix describes how to migrate wiki content from wiki applications, such as Confluence, into WebCenter Portal using a custom wiki extraction tool in combination with the Document Migration Utility. The custom wiki extraction tool extracts the wiki content into an archive format that you can import into a WebCenter Portal content repository, using the Document Migration Utility.

Note:

Do not use the Document Migration Utility to export or import portal folders and portal template folders.

To be able to perform the tasks listed in this appendix, you should have an understanding of the content created in Content Server for a portal, portal template, wiki documents, and wiki pages, and a detailed understanding of the Document Migration Utility and the format of its archive.

This appendix includes the following topics:

- Understanding Wiki Documents and Wiki Pages
- Migrating Data from the Source Wiki Application to WebCenter Portal

D.1 Understanding Wiki Documents and Wiki Pages

This section describes the format and how wiki documents and wiki pages work in WebCenter Portal. For more information about wiki documents and wiki pages in WebCenter Portal, see Working with Wikis in Using Oracle WebCenter Portal.

This section contains the following topics:

- Understanding Wiki Documents
- Understanding Wiki Pages

D.1.1 Understanding Wiki Documents

In WebCenter Portal you can create a wiki document within a wiki page. These documents can reside anywhere in the hierarchy of any created folders inside a portal. Wiki documents can sit alongside documents of other types, or you could choose to arrange all your wiki documents inside a single folder.

When a wiki document is created in WebCenter Portal, an HTML document is created and checked into Content Server. This wiki document contains special metadata values that tell WebCenter Portal that the document is a wiki document as opposed to a regular HTML document. These metadata values are:
dDocType = Application
dDocFunction = wiki
dOriginalName (document filename) = <wikiName>.htm

When you open a document in WebCenter Portal with the above metadata, WebCenter Portal will know to display it as a wiki document.

D.1.2 Understanding Wiki Pages

In WebCenter Portal you can create a wiki page by creating a page based on the Wiki page style. When you navigate to a wiki page you are presented with a wiki document. See Working with Wikis in Using Oracle WebCenter Portal for details on how to create wiki pages.

When a wiki page is created in WebCenter Portal the following artifacts are created in Content Server:

- A wiki folder is created in the folder for the portal the wiki page is being created in; the name of the wiki folder is the same name as the wiki page name but with special characters removed:
  /RootFolder/PortalFolder/wikiPageNameFolder/

When FrameworkFolders is enabled, the wiki folder is created at the following path: /Enterprise Libraries/PortalFolder/wikiPageNameFolder/

- A document is created inside the wiki folder with the following metadata:
  - dDocTitle = document title (same name as the wiki page name with an extension of .htm)
  - dOriginalName = the documents filename (same as dDocTitle)
  - dDocFunction = wiki
  - dDocType = Application
  - xWCPageID = the name of the wiki page's JSPX page

This is best illustrated with an example. Consider that the portal in which a wiki page is being created is Marketing, and the wiki page being created is Wiki1. The following artifacts will be created in Content Server.

- Folder: /Enterprise Libraries/Marketing/Wiki1
- Document: /Enterprise Libraries/Marketing/Wiki1/Wiki1.htm

Attributes set for the document:
  - dDocTitle= Wiki1.htm
  - dOriginalName = Wiki1.htm
  - dDocFunction = 'wiki'
  - dDocType = 'Application'
  - xWCPageID = Wiki1.jspx

When you navigate to a wiki page the following occurs:

- Content Server is queried for the document in the following location:
• If the document is found, it is displayed as a wiki document.
• If the document is not found, the wiki page will display the contents of the wiki folder.

D.2 Migrating Data from the Source Wiki Application to WebCenter Portal

To migrate content from an existing wiki application to WebCenter Portal, perform the following steps:

1. Prepare WebCenter Portal for import of the wiki content.
2. Write and run a 'Custom Wiki Extraction Tool' to extract content from the Wiki application into an archive matching the precise format expected by the Document Migration Utility.
3. Use the Document Migration Utility to import the archive into Content Server.
4. Create any wiki pages in WebCenter Portal to tie up with the content in Content Server.

These steps are described in more detail in the following topics:

• Preparing WebCenter Portal for Importing Wiki Content
• Writing and Running a Custom Wiki Extraction Tool to Extract Content from the Wiki Application
• Using the Document Migration Utility to Import the Archive into the Target Portal
• Creating Wiki Pages in WebCenter Portal for the Content in WebCenter Content Server

D.2.1 Preparing WebCenter Portal for Importing Wiki Content

When the documents tool is enabled in a portal or portal template, a folder is created in Content Server for that portal or portal template. The GUIDs of these folders must be determined in order to construct the archive to be used with the Document Migration Utility. The folder GUIDs can be determined by following steps below:

1. Decide if you want to import all the wiki content into a single portal or multiple portals.
2. Log into WebCenter Portal and create the portals, taking note of the internal name of the portals.
   Ensure you are using a template that includes documents tool, otherwise you will have to enable the documents tool and setup the role permissions after portal creation.
3. Log into Content Server.
4. Ensure that the user's layout is Top Menus:
   a. Click the user's name to display the user's Profile page.
   b. Under User Personalization Settings check that Layout is set to Top Menu.
5. For each portal in which wiki content is to be imported, determine the folder GUID:

   a. Click **Browse Content**.

   b. Click on the root folder for the WebCenter Portal instance.

      This is the same as the **Root Folder** setting in the Content Server connection.

   c. Click the folder for the portal.

      The folder name will be the same as the portal’s internal name.

   d. Click **Info** on the toolbar to display the folder information.

   e. Add **IsSoap=1** to the URL.

   f. Search for the string **dCollectionGUID** in a Folders_g setup. For example:

      ```xml
      <idc:field name="dCollectionGUID">05573322-E895-EDA3-8A83-07CF39CBDE05</idc:field>
      ``

      When using the FrameworkFolders folder service, search for the string **fApplicationGUID**, for example:

      ```xml
      <idc:field name="fApplicationGUID">WC01:8c1c6442-a258-4cd7-8cf1-adb60fc45ce2</idc:field>
      ```

6. Keep a note of the portal folder name and its GUID as the GUID is needed when building the archive in the next step.

**D.2.2 Writing and Running a Custom Wiki Extraction Tool to Extract Content from the Wiki Application**

To extract content from the source wiki application into an archive suitable for use with the Document Migration Utility, you’ll need to write a custom application.

The custom wiki extraction tool must perform the following steps:

1. Extract and arrange the wiki content.

   Create a temporary directory and extract the wiki content from the source wiki application into it and arrange in the file system as it is to appear in WebCenter Portal.

2. Clean up the source HTML of wiki documents.

   For each wiki document, edit the HTML to remove application-specific HTML tags.

3. Re-write the URLs.

   For each wiki document, replace the existing URLs to content in the source wiki application to the URLs of the same artifacts that will be imported into WebCenter Portal.

4. Build the **ExportImportData.xml** documents.

   For each root folder build the **ExportImportData.xml** document which describes the data in the export set and is used to drive the import.

5. Build the archive file.
Create an archive of the manipulated wiki content that can be used to import the wiki content into WebCenter Portal.

Each of these steps is described more fully in the following topics:

- Extracting and Arranging the Wiki Content
- Cleaning Up the Source HTML of Wiki Documents
- Rewriting the URLs
- Building the ExportImportData.xml Documents
- Building the Archive File

**D.2.2.1 Extracting and Arranging the Wiki Content**

The wiki documents in the source application need to be extracted into a temporary directory on the file system and then arranged such that the file system mimics how the content is to be laid out in the target WebCenter Portal instance. If all the wiki documents are to be imported into a single portal, all of the content should be laid out under a single root folder named with the GUID of the corresponding portal folder in Content Server. If the wiki documents are to be imported into multiple portals, the content should be laid out under multiple root folders, each named with the GUID of their corresponding folder in Content Server. For more information on determining the GUID of a portal folder in Content Server, see Preparing WebCenter Portal for Importing Wiki Content.

Note that when arranging the wiki content on the file system, you should consider how that content will be used in WebCenter Portal. For example:

- If wiki pages are to be created, then the wiki document for that wiki page must be located under a folder of the same name. For more information about wiki pages, see Understanding Wiki Documents and Wiki Pages.
- When a folder contains a large number of contents, the rendering of that folder's contents could be impaired.
- Content Server has two settings that limit the number of folders and the number of files which can reside in a folder (Maximum Folders Per Virtual Folder and Maximum Content Per Virtual Folder). When arranging your wiki content, ensure that a folder does not contain more folders than the folder limit setting or more documents than the document limit setting.

To create extracted wiki content, perform the following tasks:

1. Create root folders for each portal into which you will be importing the wiki documents, name the folders based on the GUID of the corresponding portal folder in Content Server.

2. For wiki documents for which wiki pages will be created in WebCenter Portal after import:
   a. Create a wiki folder with the same name as the wiki document.
   b. Place the wiki document in this folder.
   c. Place any other documents in this folder, if required.
d. If there are related images and/or documents, add them to this wiki folder as well.

3. For any other wiki documents, create the folder hierarchy that will contain the documents.

Example:
Portal SI’s folder in Content Server has a GUID of 21SD15F13B8_141D_421B_AD0e_BC54B6F16893. After import, the MarketingWiki and Tradeshows wiki pages will be created and it is expected these wiki pages will show the MarketingWiki.htm and Tradeshows.htm wiki documents.

The following shows the organized structure of the extracted wiki documents and artifacts:

21SD15F13B8_141D_421B_AD0e_BC54B6F16893 (Root portal folder)
   Home.htm (Wiki document)
   MarketingWiki (Folder)
      MarketingWiki.htm (Wiki document)
   Branding (Folder)
      Presentation Dates.htm (Wiki document)
      Presentations (Folder)
   ProductBranding.pptx (File)
   ProjectedDesigns.pptx (File)
   Tradeshows (Folder)
      TradeShows.htm (Wiki document)
   Images (Folder)
      Image.jpg (Image)

D.2.2.2 Cleaning Up the Source HTML of Wiki Documents

In WebCenter Portal, the wiki editor will remove any HTML tags when the wiki page is being edited. Therefore it is advisable to remove any such HTML tags in the wiki documents prior to importing them into WebCenter Portal to avoid any confusion of tags being removed when editing a wiki document after import. The following tags can be safely removed:

<html>, </html>
<head>, </head>
<meta>, </meta>
<title>, </title>
<body>, </body>
<tbody>, </tbody>
<thead>, </thead>
<tfoot>, </tfoot>
<script>, </script>
<link>, </link>

D.2.2.3 Rewriting the URLs

Wiki pages in the source wiki application may contain URLs referencing artifacts in within the source wiki application, such as links for embedded images or to other wiki page or documents. These artifacts will be migrated to the target WebCenter Portal instance and these links will need to be updated to reference the new artifact locations in the target WebCenter Portal instance.

The following types of URLs in the extracted wiki pages need to be changed to reference the URLs of the same artifacts in WebCenter Portal:
Follow the steps below to rewrite the URLs in the wiki documents:

1. Define attributes for the target WebCenter Portal instance that will be used in the URL replacement in step 3.
   - **WC_BASE_URL**: WebCenter instance base URL
     Example: `WC_BASE_URL=https://webcenter.example.com`
   - **UCM_ID**: The name of the connection in WebCenter Portal to the Content Server
     Example: `UCM_ID=dev_ucm`
   - **SPACE_GUID**: The GUID of the portal in WebCenter Portal where the content resides
     Example: `SPACE_GUID=s21sd15f13b8_141d_421b_ad0e_bc54b6f16893`
     For more information about determining the GUID, see Preparing WebCenter Portal for Importing Wiki Content.

2. For each content item, define the item attributes that will be used in the URL replacement in step 3.
   - **FILE_NAME**: File name of the content item
     Example: `FILE_NAME=Home.htm`
   - **FILE_ID**: Unique Content Server content ID
     Example: `MARKETINGPORTAL1001`
     Note that the FILE_ID must be unique across the entire Content Server instance. A suggested value is the name of the portal which the wiki documents are going to be imported into (with no portal in the name) post-fixed with a unique number (in the example above, the portal name was Marketing Portal).

3. Rewrite the URLs using the defined attributes as shown below:

   **Embedded images**
   - New URL format:
     ```
     IMG_REPLACE=img alt="FILE_NAME" resourceid="UCM_ID#dDocName:FILE_ID" src="WC_BASE_URL/webcenter/content/conn/UCM_ID/uuid/dDocName%3aFILE_ID"
     ```
   - Example:
     - Source URL:
       ```
       <img alt="image.jpg" src="images/image.jpg">
       ```
     - WebCenter URL:
       ```
       <img alt="image.jpg" resourceid="dev-ucm#dDocName:WSIMPORT4" src="http://
       ```
Wiki pages

- New URL format:
  \[
  \text{URL\_REPLACE} = \text{WC\_BASE\_URL}/\text{webcenter/faces/owResource.jspx?z=oracle.webcenter.doclib%21SPACE\_GUID%21UCM\_ID}\%2523dDocName%253AFILE\_ID%21\%21FILE\_NAME}
  \]

- Example:
  - Source URL:
    <a href="Home.htm">Home</a>
  
  - WebCenter URL:
    <a href="http://webcenter.example.com/webcenter/faces/owResource.jspx?z=oracle.webcenter.doclib%21sd15f13b8_141d_421b_ad0e_bc54b6f16893%21dev-ucm%2523dDocName%253AWSIMPORT25%21%21Home.htm">Home</a>

Links to documents

- New URL format:
  \[
  \text{DOCUMENT\_REPLACE} = \text{WC\_BASE\_URL}/\text{webcenter/content/conn/UCM\_ID/uuid/dDocName%3aFILE\_ID}
  \]

- Example:
  - Source URL:
    <a href="MarketingWiki/Presentations/ProductBranding.pptx"> Download Product Branding Presentation</a>
  
  - WebCenter URL:
    <a href="http://webcenter.example.com/webcenter/content/dev-ucm/uuid/dDocName%3aWSIMPORT7"> Download Product Branding Presentation</a>

D.2.2.4 Building the ExportImportData.xml Documents

In each root folder containing the contents to be imported an ExportImportData.xml document needs to be created. The ExportImportData.xml document describes the contents of the root folder and is used to drive the import when importing the content into WebCenter Portal using the Document Migration Utility.

Any metadata to be created with the document on import must be specified in the ExportImportData.xml document. In WebCenter Portal, wiki documents are stored as HTML documents but have extra metadata to identify them as wiki documents rather than normal HTML documents. Ensure the ExportImportData.xml document has this metadata specified for all wiki documents in the extracted contents. For more information about the metadata required for wiki document, see Understanding Wiki Documents and Wiki Pages.
Note:
A content ID (dDocName) is automatically generated by Content Server when a document is checked in without one being specified. If you wish your documents to have fixed content IDs, include the dDocName metadata with the document metadata in the ExportImportData.xml document. The dDocName must be unique across the whole Content Server or document check in will fail. A suggestion is to chose your own prefix for the content ID and append numbers incrementally to the end.

The ExportImportData.xml document can be generated manually for each root folder. Alternatively, you can write a custom script to traverse through the root folder contents and generate the document.

It is imperative for the structure of the contents on the file system is detailed in ExportImportData.xml document correctly. If there is a mismatch between the hierarchy of contents described in the ExportImportData.xml document and the file system, the import into the portal folder in the target Content Server will fail.

The XSD for the ExportImportData.xml document is shown below.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="groupspace-folder" type="FolderType" />
  <!-- ©folders© must contain 1 or more ©folder© child elements -->
  <xs:complexType name="FoldersType">
    <xs:sequence>
      <xs:element name="folder" type="FolderType" minOccurs="1" maxOccurs="unbounded"/>
    </xs:sequence>
  </xs:complexType>

  <!-- ©documents© must contain 1 or more ©document© elements -->
  <xs:complexType name="DocumentsType">
    <xs:sequence>
      <xs:element name="document" type="DocumentType" minOccurs="1" maxOccurs="unbounded"/>
    </xs:sequence>
  </xs:complexType>

  <!-- ©attributes© must have 1 or more ©attribute© child elements -->
  <xs:complexType name="AttributesType">
    <xs:sequence>
      <xs:element name="attribute" type="AttributeType" minOccurs="1" maxOccurs="unbounded"/>
    </xs:sequence>
  </xs:complexType>

  <!-- ©folder© has to have 1 and only 1 ©attributes© child element
  0 or 1 ©folders© child element, 0 or 1 ©documents© child element -->
  <xs:complexType name="FolderType">
    <xs:sequence>
      <xs:element name="attributes" type="AttributesType" minOccurs="1" maxOccurs="1"/>
      <xs:element name="folders" type="FoldersType" minOccurs="0" maxOccurs="1"/>
      <xs:element name="documents" type="DocumentsType"/>
    </xs:sequence>
  </xs:complexType>
</xs:schema>
```
Where:

- `<groups_folder>` is the root tag that represents the portal or portal template folder. This tag contains the `<attributes>` tag, which in turn contains a number of attributes about the root folder and export data. These attributes are for information purposes only; they are not used in the import.

- `<attributes>` is used to group all the attributes of the document or folder. This tag must contain one or more `<attribute>` tags. No other child tags are permitted.

- `<attribute>` contains the metadata for a folder or document. This tag has two attributes:
  - name - the Content Server metadata name
  - value - the value of the metadata

  No child tags are permitted.

- `<folders>` is used to group all the folders in the current folder. This tag must contain 1 or more `<folder>` tags. No other child tags are permitted.

- `<folder>` is used to indicate a child folder. This tag must have the `<attributes>` tag. If the folder has child folders, it will have the `<folders>` tag. If the folder has child documents, it will have the `<documents>` tag.

- `<documents>` is used to group all the documents in the current folder. This tag must contain one or more `<document>` tags. No other child tags are permitted.

- `<document>` is used to indicate a document in the current folder. This tag must have the `<attributes>` tag. No other child tags are permitted.
The following annotated example shows a partially complete ExportImportData.xml document, when FrameworkFolders is used as the folder service. Note that the example contains blank lines and XML comments that should not exist in a real ExportImportData.xml document.

```
<groupspace-folder>
  <attributes>
    <!-- Contains a set of attributes of the main portal folder -->
    <attribute name="export-date" value="2011-07-22 13:02:29"/>
  </attributes>

  <folders><!-- only present if the portal contains any child folders -->
    <folder><!-- a 'folder' tag exists for each child folder -->
      <attributes>
        <!-- contains the set of folder attributes, examples below -->
        <attribute value="F1" name="fFolderName"/>
      </attributes>

      <!-- a 'folder' tag will contain the 'folders' tag if this folder contains child folders, i.e. if 'F1' has child folders -->
      <folders>
        <folder>
          <!-- attribute tags, child folders, child documents etc -->
          <folder>
          </folder>
        </folders>

        <!-- closing tag for all the folders in the current folder-->
        <!-- a 'folder' tag will contain the 'documents' tag if this folder contains documents, i.e. if 'F1' has documents at its root -->
        <documents>
          <document>
            <!-- attributes tags, see below -->
            <attribute name="dDocTitle" value="Doc1"/>
            <attribute value="0" name="fInhibitPropagation"/>
          </document>
          <!-- closing tag for document 'Doc1' -->
        </documents>
      </folder>
    </folders>

    <!-- closing tag for all the folders in the portal root -->
  </folders>

  <!-- closing tag for folder 'F1' -->
</groupspace-folder>
```

In this example a custom script named convert_program traverses through a root folder called 21SD15F13B8_141D_421B_AD0e_BC54B6F16893 and creates an ExportImportData.xml document in the current working directory detailing the contents of the folder.

```
cd 21SD15F13B8_141D_421B_AD0e_BC54B6F16893
run convert_program
```
D.2.2.5 Building the Archive File

Create an archive of the extracted and manipulated wiki documents by zipping up the root portal folders. The zip archive must have the root folders inside the archive rather than just the contents of the root folders. One zip file can contain multiple root folders for different portals, or you can create one zip file for each root folder.

Example:

In the following example, wiki documents have been extracted and manipulated in a folder called 21SD15F13B8_141D_421B_AD0e_BC54B6F16893 in the folder /scratch/wikiexports and the archive to create is wsiimport.zip.

```
cd /scratch/wikiexports
zip -r wsiimport.zip 21SD15F13B8_141D_421B_AD0e_BC54B6F16893/
```

Note:
Ensure that the archive does not exist prior to zipping up the folder contents as some zip tools will add content to the specified archive if it already exists rather than overwriting the archive.

D.2.3 Using the Document Migration Utility to Import the Archive into the Target Portal

Run the Document Migration Utility specifying the archive generated in the previous step to import the content into the target Content Server.

Log into WebCenter Portal and navigate to the portals to which content was imported and ensure the content exists.

D.2.3.1 Properties Required to Run the Document Migration Utility

Table D-1 describes the properties required to run the Document Migration Utility. For information on how to run the utility, see Migrating Content Using the Document Migration Utility.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Usage</td>
<td>Specifies whether you want to import or export content to a file. Options are: import and export</td>
<td>Export and Import</td>
</tr>
<tr>
<td>MDSConn</td>
<td>Specifies MDS JDBC connection in the format: jdbc:oracle:thin:@host:port:SID or jdbc:oracle:thin:@host:port/ServiceName</td>
<td>Export</td>
</tr>
<tr>
<td>MDSUser</td>
<td>Specifies the MDS user name used by WebCenter Portal.</td>
<td>Export</td>
</tr>
<tr>
<td>MDSPwd</td>
<td>Specifies password for the MDS user. Only include to avoid password prompt.</td>
<td>Export</td>
</tr>
</tbody>
</table>
Table D-1  (Cont.) Document Migration Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExportScopes</td>
<td>Specifies the internal name of each portal/portal template with content to export. Separate multiple portal/template names with a comma. Prefix portal template names with spacetemplate/&lt;template_internal_name&gt;. Ensure there are no spaces in the comma separated list. You can obtain internal names from the About Portal and About Portal Template dialogs. Do not enter display names here.</td>
<td>Export</td>
</tr>
<tr>
<td>UCMConn</td>
<td>Specifies Content Server URL in the format: idc://host:intradocPort. When usage=export, specify the URL of the Content Server instance from which content is to be exported. When usage=import, specify the URL of the Content Server instance to which the content is to be imported.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>UCMUser</td>
<td>Specifies the Content Server user name used to connect through RIDC. This user must have sufficient privileges to perform the export or import; either a user defined in an external identity store or the Content Server administrator sysadmin.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>UCMPwd</td>
<td>Specifies password for the Content Server user. Only include to avoid password prompt.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>UCMSpacesRoot</td>
<td>Root folder under which WebCenter Portal content is stored. The value may be set as /foldername.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>TmpDirPath</td>
<td>Optional. Temporary location for data extraction. If not specified, defaults to the system tmp directory.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>ArchivePath</td>
<td>Document archive location.</td>
<td>Export and Import</td>
</tr>
<tr>
<td>ArchiveName</td>
<td>Optional. Name for the document archive (.zip). Default is docsexport.zip.</td>
<td>Export and Import</td>
</tr>
</tbody>
</table>

D.2.3.2 Migrating Content Using the Document Migration Utility

You can use any of the following methods to migrate content using the Document Migration Utility:

- Specifying Document Migration Properties in a Properties File
- Specifying Document Migration Properties on the Command Line
- Specifying Document Migration Properties on the Command Line When Prompted

D.2.3.2.1 Specifying Document Migration Properties in a Properties File

1. Create a properties file containing all the properties required for your export/import. See Table D-1 for a description of all the properties.
a. Copy and paste the following properties file into Notepad or another suitable text editor, then edit according to your environment:

```
# Document migration properties.

# Specify whether you want to export content to a file or
# import content from an archive to another content repository
# valid values: export | import
Usage=export

# Specify connection details for Oracle WebCenter Content repository:
# UCMConn - Content Server URL. Format: idc://host:intradocPort
# UCMUser - Content Server user name used to connect through RIDC
# UCMPwd - Password for UCMUser. Only include to avoid password prompt
# UCMSpacesRoot - Root folder where WebCenter Portal content is stored.
# Format: /foldername
# Required for: Export and Import
UCMConn=idc://mycontentserver.mycompany.com:9444
UCMUser=<enter Content Server admin user name here>
#UCMPwd=<enter password for UCMUser here>
#UCMSpacesRoot=/portalrootfolder

# Specify a temp directory and name/location for the export archive
# TmpDirPath  -Optional. Temporary location for data extraction.
# If not specified, defaults to the system temporary directory.
# ArchiveName -Optional. Name for the document archive (.zip).
# Default is docsexport.zip.
# ArchivePath -Document archive location
# Required for: Export and Import
TmpDirPath=/scratch/user1/migrateMyPortalDocs/tmpdir
ArchivePath=/scratch/user1/migrateMyPortalDocs/output
ArchiveName=myportaldocs.zip

# Specify MDS details (export only)
# MDSConn - MDS JDBC connection. Format:
# jdbc:oracle:thin:@host:port:SID   or
# jdbc:oracle:thin:@host:port/ServiceName
# MDSUser - MDS schema user name used by the WebCenter Portal application
# MDSPwd = Password for MDSUser. Only include to avoid password prompt
# Required for: Export
MDSConn=jdbc:oracle:thin:@mymdshost.mycompany.com:1521:wkcdb01
MDSUser=<enter MDS user name here>
#MDSPwd=<enter password for MDSUser here>

# Specify target portal for export or import.
# Separate multiple portal/template names with a comma.
# Use internal names only. Do not enter display names.
# Obtain internal names from "About Portal" and "About Portal Template" dialogs.
# Prefix portal template names with 'spacetemplate/<template_internal_name>'
# as indicated in the example.
# Required for: Export
ExportScopes=MyPortal1,MyPortal2,spacetemplate/MyPortalTemplate
```

b. Save the file. For example, save as myMigrationProperties.properties or similar.
2. Navigate to the `WCP_ORACLE_HOME/webcenter/archives` directory in which the Document Migration Utility, `content-migration-tool.jar` is located.

3. Run the Document Migration Utility by specifying the absolute path to your document migration properties file on the command line:

   ```
   java -jar content-migration-tool.jar
   <absolute_path_to_migrationPropertiesFilename>
   ```

   For example:

   ```
   java -jar content-migration-tool.jar /home/user1/myMigrationProperties.properties
   ```

   Optionally, specify logging settings using the `java.util.logging.config.file` parameter as described in Running the Document Migration Utility with Additional Logging.

D.2.3.2.2 Specifying Document Migration Properties on the Command Line

1. Navigate to the `WCP_ORACLE_HOME/webcenter/archives` directory in which the Document Migration Utility, `content-migration-tool.jar` is located.

2. Run the Document Migration Utility by specifying individual properties on the command line:

   To export content:
   ```
   java -jar content-migration.jar Usage UCMConn UCMUser TmpDirPath ArchivePath
   ArchiveName MDSConn MDSUser ExportScopes [UCMPwd MDSPwd] UCMSpacesRoot
   ```

   To import content:
   ```
   java -jar content-migration.jar Usage UCMConn UCMUser TmpDirPath ArchivePath
   ArchiveName UCMPwd UCMSpacesRoot
   ```

   **Note:** You can, optionally, specify the `UCMPwd` and `MDSPwd` parameters on the command line. If you do not do so, you are prompted to provide them.

   Optionally, specify logging settings using the `java.util.logging.config.file` parameter as described in Running the Document Migration Utility with Additional Logging.

D.2.3.2.3 Specifying Document Migration Properties on the Command Line When Prompted

1. Navigate to the `WCP_ORACLE_HOME/webcenter/archives` directory in which the Document Migration Utility, `content-migration-tool.jar` is located.

2. Run the Document Migration Utility by specifying the properties on the command line when prompted:

   ```
   java -jar content-migration.jar
   ```

   Optionally, specify logging settings using the `java.util.logging.config.file` parameter as described in Running the Document Migration Utility with Additional Logging.

D.2.3.3 Running the Document Migration Utility with Additional Logging

You can optionally run the Document Migration Utility with additional logging using the `java.util.logging.config.file` parameter as follows:
java -Djava.util.logging.config.file=<absolute_path_to_logging_properties_file> -jar content-migration-tool.jar <migrationProperties>

**Note:** The `java.util.logging.config.file` parameter must be specified immediately after the `java` command and before `-jar`.

Where the `logging_properties_file` includes settings such as:

```
handlers=java.util.logging.ConsoleHandler.level=INFO
java.util.logging.ConsoleHandler.level=FINER
java.util.logging.ConsoleHandler.formatter=java.util.logging.SimpleFormatter
oracle.webcenter.doclib.level=INFO
```

### D.2.4 Creating Wiki Pages in WebCenter Portal for the Content in WebCenter Content Server

To use WebCenter Portal wiki pages to display the imported wikis, perform the following steps:

1. Log into WebCenter Portal.
2. Locate the portal where the content has been uploaded.
3. Select **Create Page** from the **Pages and Portals Actions** menu.
4. Select the **Wiki** page style.
5. In the **Title** field, enter a name for the wiki document, and click **Create**. Note that the name of the wiki page must match the name of the folder in the portal folder in WebCenter Portal, which contains the wiki page of the same name.

For example, if in the portal folder you have a *MarketingWiki* folder and a *MarketingWiki.htm* document, the name of the wiki page must be *MarketingWiki*.

For more information about wiki pages, see Enabling Wikis in a Portal in *Building Portals with Oracle WebCenter Portal*.
This appendix describes how to migrate Oracle WebCenter Portal content from the Folders_g folder service to the FrameworkFolders folder service on Oracle WebCenter Content Server.

This appendix includes the following topics:

- Understanding Folders_g Migration to FrameworkFolders
- Understanding the Folders_g and FrameworkFolders Directory Structure
- Migrating WebCenter Portal Data
- Troubleshooting Migration Issues

E.1 Understanding Folders_g Migration to FrameworkFolders

Oracle WebCenter Content offers two folder solutions: Folders_g and FrameworkFolders. The Folders_g component (aka the Contribution Folders interface) provides a hierarchical folder interface to content on Content Server. The FrameworkFolders component (aka the Folders interface) also provides a hierarchical folder interface similar to a conventional file system, for organizing and locating some or all of the content in the repository. However, Folders is a scalable, enterprise solution and is designed to replace Contribution Folders as the folder service for Content Server.

Oracle WebCenter Portal supports the FrameworkFolders component on Content Server. For an Oracle WebCenter Portal instance patched from an earlier release that used the Folders_g folder service, you must migrate to the FrameworkFolders folder service.

Note:

FrameworkFolders is the name of the component that replaces the older Folders_g component. The older Folder interface is now referred to as Contribution Folders. The interface supported by the FrameworkFolders component is referred to as Folders.

In this chapter, the migration process has been described using the terms FrameworkFolders and Folders_g. Unless referring to a UI selection or a command, the term FrameworkFolders can be used interchangeably with Folders, and the term Folders_g can be used interchangeably with Contribution Folders.

For more information about the migration procedure, see Migrating Folders_g to Folders in Administering Oracle WebCenter Content.
E.2 Understanding the Folders_g and FrameworkFolders Directory Structure

Both Folders_g and FrameworkFolders provide a hierarchical folder interface, however, the way content is organized differs in these two setups. This section describes the directory structure used for organizing content in Folders_g and FrameworkFolders.

When WebCenter Portal uses a Content Server repository with Folders_g enabled, portals are stored under the WebCenter Portal root folder. Each user has a personal folder (the Home portal) stored under the path /PersonalSpaces, and this folder is named after the user. Whereas, when WebCenter Portal is configured to use FrameworkFolders, all portal folders and personal folders are treated as enterprise libraries and are stored under the path /Enterprise Libraries. Portal folders are named after the portal and personal folders are usually named after the user.

For example, consider a company with the following portals and users:

- **HR Portal**: contains HR policies and documents
- **Partner Portal**: contains documents related to partners
- **Users**: Karen, Monty, and Sam

Figure E-1 shows how WebCenter Portal folders are organized in the Folders_g and FrameworkFolders setups on Content Server. In a Folders_g setup, personal folders for users Karen, Monty, and Sam are organized under PersonalSpaces, and the portals HR Portal and Partner Portal are organized under the WebCenter Portal root folder WebCenter0202. In a FrameworkFolders setup, personal folders Karen, Monty, and Sam and the portal folders HR Portal and Partner Portal are organized under Enterprise Libraries.
For example, if Karen creates any new folders in the Home portal in a Folders_g setup, the new folders are created under /PersonalSpaces/Karen as shown in Figure E-2.

**Figure E-2  Folder Path When Folders_g is Enabled**

If Karen creates any new folders in the Home portal in a FrameworkFolders setup, the new folders are created under /Enterprise Libraries/Karen as shown in Figure E-3.

**Figure E-3  Folder Path When FrameworkFolders is Enabled**

Item Level Security in Folders_g and FrameworkFolders

In the Folders_g setup, Item Level Security (ILS) can be set on files and folders. ILS settings on folders are inherited by all files within a folder unless a file has its own ILS defined. In the FrameworkFolders setup, ILS can be set only on files. ILS cannot be set on folders.

After you migrate from Folders_g to FrameworkFolders, you will not be able set ILS for a folder, but the ILS settings on each file contained in that folder are retained. You can update or remove file-level ILS settings after migration.

### E.3 Migrating WebCenter Portal Data

This section describes the procedure for migrating WebCenter Portal content from Folders_g to FrameworkFolders.

This section includes the following subsections:

- Migration Roadmap
- Running exportFoldersGData to Generate the Pre-Migration Data
- Migrating WebCenter Portal MetaData to FrameworkFolders
- Running migrateFoldersGDataToFrameworkFolders to Validate the Migrated Data

### E.3.1 Migration Roadmap

The flow chart (Figure E-4) and the table (Table E-1) in this section provide an overview of the steps required to migrate WebCenter Portal content from Folders_g to FrameworkFolders.
**Note:**

In a clustered environment, you must bring down all the managed servers except one WebCenter Portal managed server and one WebCenter Content managed server. Ensure that you run the migration WLST commands from the machine where WebCenter Portal is running.

In a non-clustered environment, if WebCenter Portal and WebCenter Content managed servers run on different machines, run the migration WLST commands from the machine where WebCenter Portal is running.

**Figure E-4  Migrating WebCenter Portal Data from Folders_g to FrameworkFolders**

**Table E-1  Migrating WebCenter Portal Data from Folders_g to FrameworkFolders**

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>

<tr>
<td>Run the <strong>migrateFoldersGDataToFrameworkFolders</strong> WLST command</td>
<td>Run the <code>migrateFoldersGDataToFrameworkFolders</code> WLST command from the WebCenter Portal Oracle home directory to validate the migrated data.</td>
<td>Running <code>migrateFoldersGDataToFrameworkFolders</code> to Validate the Migrated Data.</td>
</tr>
</tbody>
</table>
### E.3.2 Running exportFoldersGData to Generate the Pre-Migration Data

Use the WLST command `exportFoldersGData` to generate the Folders_g pre-migration data:

```
exportFoldersGData(appName, server, [connectionName, directoryPath, applicationVersion])
```

The following example exports the Folders_g data for a WebCenter Portal application deployed to the WC_Spaces managed server. The content server connection named `MyContentServerConnection` is used, and Folders_g data exported to the `/scratch/myTemp_Dir` directory.

```
exportFoldersGData(appName='webcenter', server='WC_Spaces', connectionName='MyContentServerConnection', directoryPath='/scratch/myTemp_Dir/')
```

For command syntax and examples, see `exportFoldersGData` in *WebCenter WLST Command Reference*. You must run this command from the WebCenter Portal Oracle home directory. For information about how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

The pre-migration data generated by `exportFoldersGData` can be used to generate data consistency reports and ascertain the sanity of the migrated files and folders after you have migrated WebCenter Portal data to FrameworkFolders.

The `exportFoldersGData` WLST command performs the following tasks:

- Generates the pre-migration metadata for all portal folders under the WebCenter Portal root folder
- Generates the pre-migration metadata for all user folders under the Home portal root folder
- Writes the generated metadata to the `PreMigrationData.csv` file.
- Exports all MDS documents

The `PreMigrationData.csv` file includes the following metadata for the portal folders and user folders stored in the Folders_g data structure:

- Folder name for the WebCenter Portal root folder or the Home portal root folder
- `dCollectionGUID`, the identifier used by WebCenter Portal to map a portal to the corresponding folder on Content Server
- `dCollectionID`, the identifier used in Folders_g to uniquely identify a folder
• dCollectionName, the folder name
• dSecurityGroup, the security group
• dDocAccount, the account name

By default, PreMigrationData.csv is stored at the following path: WCP_ORACLE_HOME/common/wlst/FG_FF_MIGRATION. You can choose a different location for the file while running the exportFoldersGData WLST command.

Figure E-5 shows a sample PreMigrationData.csv file. Each row displays the metadata for a portal folder or a user folder.

Figure E-5    Sample PreMigrationData.csv File

E.3.3 Migrating WebCenter Portal MetaData to FrameworkFolders

You use the Folders Migration utility available on Content Server to migrate WebCenter Portal metadata and folder structure from Folders_g to FrameworkFolders.

To migrate WebCenter Portal metadata from Folders_g to FrameworkFolders:

1. Log on to Content Server as an administrator.

2. Enable Framework Folders. Ensure Folders_g is also enabled. For information, see Enabling Mandatory Components.

   Note: When you migrate from the Folders_g to the FrameworkFolders setup, both the Folders_g and FrameworkFolders components must be enabled during the migration process.

3. Add the required attributes:
   a. Log on to Content Server.
   b. Navigate to Administration > Admin Server > General Configuration.
   c. In the Additional Configuration Variables box, add the following entry:
      MigrationFormatForfApplicationGUID=dCollectionName:dCollectionGUID
      DisableQueryTimeoutSupport=true
   d. Click Save.

4. Restart Content Server, and log on as an administrator.

5. Choose Administration, then Folder Migration to begin performing data migration.
6. Migrate the **PersonalSpaces** root folder.
   
   a. Under the Run Migration section on the Folder Migration page, click **Modify Excluded Folders**.
   
   b. In the Folder Migration: Excluded Folders dialog, specify the folders that need to be excluded from migration. Ensure that all folders other than the **PersonalSpaces** root folder appear in the **Legacy Folders to Exclude from Migration** box. In Figure E-6, **WebcenterSpaces-Root** refers to the WebCenter Portal root folder.

   ![Figure E-6 Specifying Folders Excluded from Migration](image)

   c. Click **OK**.
   
   d. Click **Migrate Folder Data** to migrate the data.

7. Migrate the WebCenter Portal root folder.
   
   a. Under the Run Migration section, click **Modify Excluded Folders**.
   
   b. In the Folder Migration: Excluded Folders dialog, ensure that all folders other than the WebCenter Portal root folder appear in the **Legacy Folders to Exclude from Migration** box. In Figure E-7, **WebcenterSpaces-Root** refers to the WebCenter Portal root folder.
c. Click OK.

d. Click Migrate Folder Data to migrate the data.

8. Remove the MigrationFormatForfApplicationGUID attribute added in step 3.

9. Restart Content Server.

10. If Contribution Folders contains any content that is referenced in WebCenter Portal, you must migrate the Contribution Folders folder as an enterprise library.

   a. In the Run Migration section, click Modify Excluded Folders.

   b. In the Folder Migration: Excluded Folders dialog, ensure that all folders other than Contribution Folders appear in the Legacy Folders to Exclude from Migration box (Figure E-8).
c. Click OK.

d. In the Folder Migration Destination section, click **Browse** to specify the destination for the folders to be migrated.

e. In the Browse dialog, select **Enterprise Libraries**, and click **OK**.

f. Click **Migrate Folder Data**.

11. Migrate folders other than PersonalSpaces, the WebCenter Portal root folder, and Contribution Folders if they contain any content that is referenced in WebCenter Portal. Follow the same procedure that you used in step 10.

   In the Folder Migration: Excluded Folders dialog, ensure that all folders other than the folder you want to migrate are listed in the **Legacy Folders to Exclude from Migration** box.

12. Disable Folders_g.

   On the Advanced Component Manager page, from the **Enabled Components** list box, select **Folders_g** and click **Disable**.

13. Restart Content Server.

14. Rebuild the collection and update the search index using the Repository Manager utility. When rebuilding the collection, ensure that the **Use fast rebuild** check box is unchecked in the Indexer Rebuild dialog (**Figure E-9**). For information, see Working with the Search Index in *Administering Oracle WebCenter Content*. 

---

*Figure E-8  Specifying Folders Excluded from Migration*

![Folder Migration: Excluded Folders](image)
Logs generated during the migration process are available at WCC_DOMAIN/servers/UCM_server1/logs, where WCC_DOMAIN refers to the Oracle WebCenter Content domain.

**E.3.4 Running migrateFoldersGDataToFrameworkFolders to Validate the Migrated Data**

Use the `migrateFoldersGDataToFrameworkFolders` WLST command to migrate Folders_g data to FrameworkFolders and check the integrity of the migrated data:

```java
migrateFoldersGDataToFrameworkFolders(appName, server, contentDbConnectionUrl, contentDbUserName, [connectionName, directoryPath, reportMode, applicationVersion])
```

The following example migrates Folders_g data from the `/scratch/myTemp_Dir` directory to FrameworkFolders and validates the migrated data for the WebCenter Portal application deployed to the WC_Portal managed server. Content Server connection named MyContentServerConnection and the specified WebCenter Content database connection and username are used to perform the migration.

```java
migrateFoldersGDataToFrameworkFolders(appName='webcenter', server='WC_Portal', contentDbConnectionUrl='wccdbhost.example.com:wccdbport:wccdbsid', contentDbUserName='SCHEMA_PREFIX_OCS', connectionName='MyContentServerConnection', directoryPath='/scratch/myTemp_Dir')
```

The path specified in the `directoryPath` attribute must be the same that you specified while running the `exportFoldersGData` WLST command.

For command syntax and examples, see `exportFoldersGData` in WebCenter WLST Command Reference. For information about how to run WLST commands, see Running Oracle WebLogic Scripting Tool (WLST) Commands.

The `migrateFoldersGDataToFrameworkFolders` command performs the following tasks:

- Generates the metadata for the migrated WebCenter Portal content and validates it against the pre-migration metadata generated by the `exportFoldersGData` WLST command. It verifies that each migrated folder is an enterprise library, and the values for the account name and the security group are same as the pre-migration metadata.

Any data inconsistency is reported in the summary text displayed after the command is executed, and is also stored in a log file available at this default location: WCP_ORACLE_HOME/common/wlst/POST_MIGRATION/MigrationDiagnostic.log.

- Creates `MigrationMap.csv`, a mapping file that maps the Folders_g identifier `dCollectionID` to the `FrameworkFolders` identifier `fFolderGUID`. The mapping file is stored here: Migration_Directory/POST_Migration/MigrationMap.csv.
In case of any folder name changes, the file also contains a mapping of the Folders_g path and the FrameworkFolders path. For example, suppose there is a user folder named Monty, and also a portal folder by the same name. In the Folders_g setup, the user folder Monty appears under the PersonalSpaces root folder, and the portal folder Monty appears under the WebCenter Portal root folder (such as, WebCenter0202). During migration, PersonalSpaces folders are migrated first. To resolve the folder name conflict, the portal folder is renamed as Monty(WebCenter0202), as shown in Figure E-10. This folder path change is stored in the mapping file.

Figure E-10  FrameworkFolders Directory Structure After Migration

- Using the mapping file, replaces the dCollectionID value with the fFolderGUID value in the MDS documents generated by the exportFoldersGData WLST command. It also replaces any old path references containing the WebCenter Portal root folder name or PersonalSpaces, with the new path. For example, /PersonalSpaces/weblogic is replaced with /Enterprise Libraries/weblogic.

Any inconsistencies are reported in MigrationDiagnostic.log. For troubleshooting information, see Troubleshooting Migration Issues.

- Imports all the updated MDS documents.

E.4 Troubleshooting Migration Issues

This section provides information to assist you in troubleshooting the problems you may encounter while migrating the Folders_g setup to the FrameworkFolders setup.

Problem

The migration summary displayed for the migrateFoldersGToFrameworkFolders WLST command contains a warning that a few MDS documents contain Folders_g path references that do not adhere to any known patterns.

Solution
Manually verify the MigrationDiagnostic.log file present in the WCP_ORACLE_HOME/common/wlst/POST_MIGRATION directory and look for the warning messages. For the specified files, verify whether the Content Server path reference is valid. If required, manually update the Folders_g path to the FrameworkFolders path and import the file.

**Problem**

When you run the exportFoldersGData WLST command for a non-primary Content Server connection for WebCenter Portal, the following exception is reported in the MigrationDiagnostic.log file:

`oracle.stellent.ridc.protocol.ServiceException: Unable to open folder.`

**Solution**

When you have multiple Content Server connections registered, to run the exportFoldersGData WLST command using a non-primary Content Server connection, set it as the active connection and specify the Root Folder and Application Name values. After running exportFoldersGData, set the active connection back to the previous Content Server connection and continue with migration.

**Problem**

Your WebCenter Portal application includes custom codes that use various Folders_g services-based queries. After migration to FrameworkFolders, the queries do not work.

**Solution**

Folders_g services cannot be used in WebCenter Portal migrated to FrameworkFolders. If your application includes Folders_g services, after migration you must replace them with the equivalent FrameworkFolders services. Table E-2 provides a mapping of Folders_g services and the corresponding FrameworkFolders services.

For information about FrameworkFolders services, see Folders Services in Services Reference for Oracle WebCenter Content.

**Table E-2  Mapping of Folders_g Services with FrameworkFolders Services**

This appendix presents troubleshooting information for Oracle WebCenter Portal. This appendix includes the following topics:

- Using My Oracle Support for Additional Troubleshooting Information
- Troubleshooting Oracle WebCenter Portal Configuration Issues
- Troubleshooting Oracle WebCenter Portal WLST Command Issues
- Troubleshooting Oracle WebCenter Portal Performance Issues
- Troubleshooting WebCenter Portal Workflows
- Troubleshooting WebCenter Portal Import and Export
- Troubleshooting Individual Portal and Portal Template Import and Export
- Troubleshooting Issues with Mail
- Troubleshooting Issues with Announcements and Discussions
- Troubleshooting Issues with Events
- Troubleshooting Issues with Users and Roles
- Troubleshooting Issues with Content Repositories
- Troubleshooting Issues with Analytics
- Troubleshooting Issues with Oracle SES
- Troubleshooting Issues with Notifications
- Troubleshooting External Application Issues
- Troubleshooting Security Configuration Issues

**F.1 Using My Oracle Support for Additional Troubleshooting Information**

You can use My Oracle Support (formerly MetaLink) to help resolve Oracle WebCenter Portal problems. My Oracle Support contains several useful troubleshooting resources, such as:

- Knowledge base articles
- Community forums and discussions
- Patches and upgrades
F.2 Troubleshooting Oracle WebCenter Portal Configuration Issues

This section includes the following subsections:

• Configuration Options Unavailable

• Logs Indicate Too Many Open Files

F.2.1 Configuration Options Unavailable

Problem
When you try to configure WebCenter Portal through Fusion Middleware Control, the following message displays:

Configuration options currently unavailable. The application application_name might be down, did not start-up properly, or is incorrectly packaged. Check the log files for further details.

For example, you try to change options available through the Application Settings screen or configure connections through the WebCenter Portal Service Configuration screen in Fusion Middleware Control.

Solution
Check the application's diagnostic logs. For WebCenter Portal, the log file is available in the DOMAIN_HOME/servers/ServerName/logs directory. The log file follows the naming convention of ServerName-diagnostic.log. See also, Viewing and Configuring WebCenter Portal Logs.

Analyze messages for the modules oracle.adf.mbean.share.connection and oracle.adf.mbean.share.config, and determine what must be done.

F.2.2 Logs Indicate Too Many Open Files

Problem
WebCenter Portal is inaccessible or displaying error messages and the diagnostic log files indicates that there is an issue with 'too many open files'.

Solution
Do the following:

• Check the number of file handles configured on each of the back-end servers, primarily the database, and increase appropriately.

• If the problem persists after increasing the file handles, check the value of fs.file-max in the /etc/sysctl.conf file and increase the value appropriately.
F.3 Troubleshooting Oracle WebCenter Portal WLST Command Issues

This section includes the following topics:

- No Oracle WebCenter Portal WLST Commands Work
- WLST Commands Do Not Work for a Particular Tool or Service
- Connection Name Specified Already Exists
- WLST Shell is Not Connected to the WebLogic Server
- More Than One Application with the Same Name Exists in the Domain
- More Than One Application with the Same Name Exists on a Managed Server
- Already in Domain Runtime Tree Message Displays

See also, Running Oracle WebLogic Scripting Tool (WLST) Commands.

F.3.1 No Oracle WebCenter Portal WLST Commands Work

Problem
You are unable to run any WLST commands.

Solution
Ensure the following:

- Always run Oracle WebCenter Portal WLST commands from Oracle home directory (ORACLE_HOME/common/bin).
  If you attempt to run Oracle WebCenter Portal WLST commands from the wrong directory you will see a NameError.

- No files other than Python are stored in the WLST source directory: WCP_ORACLE_HOME/common/bin/wlst. This directory must contain files with the .py extension only.
  The default set of files in this location contain legal Python files from Oracle. It is possible that a user copied some non-python script to this directory, for example, a backup file or a test python file with syntax errors.

- webcenter-wlst.jar is located at WCP_ORACLE_HOME/common/bin/wlst/lib.

See also, Running Oracle WebLogic Scripting Tool (WLST) Commands.

F.3.2 WLST Commands Do Not Work for a Particular Tool or Service

Problem
You are unable to run WLST commands for a particular tool or service, and therefore, you cannot configure that tool/service.

Solution
First, run generic non-Oracle WebCenter Portal commands, for example, run listApplications or displayMetricTableNames to verify whether these commands
work. If generic commands do not work, then apply the solution described in *No Oracle WebCenter Portal WLST Commands Work*.

If generic commands work, then run test commands to check Oracle WebCenter Portal-specific commands for syntax errors. Run the appropriate WSLT check command (see Table F-1).

For more information about Oracle WebCenter Portal's WLST commands, see WebCenter Portal Custom WLST Commands in WebCenter WLST Command Reference.

F.3.3 Connection Name Specified Already Exists

Problem

You are unable to create a connection with the name 'Connection_Name'. The following message displays:

A connection with name 'Connection_Name' already exists.

For example, you try to create an external application connection using the WLST command `createExtAppConnection` or connect to a mail server using `createMailConnection`.

Solution

Connection names must be unique (across all connection types) within WebCenter Portal. This error occurs when you try to create a connection with a name that is in use. Ensure that you use a unique name for your connection.

F.3.4 WLST Shell is Not Connected to the WebLogic Server

Problem

You must connect to the Administration Server for Oracle WebCenter Portal before running WLST commands. Oracle WebCenter Portal WLST commands do not work without a connection.

Solution

Run the following command to connect the WLST shell to the managed server:

```
connect(username, password, serverhost:serverport)
```

See also, No Oracle WebCenter Portal WLST Commands Work and Running Oracle WebLogic Scripting Tool (WLST) Commands.

F.3.5 More Than One Application with the Same Name Exists in the Domain

Problem

You attempt to perform an operation on WebCenter Portal, such as create a connection for a service or register a portlet producer, and the following message displays:
Another application named "YourApplicationName" exists. Specify the Server on which your application is deployed. Use: server="YourServerName".

This message displays if there are multiple applications with the same name in the domain. This usually happens in a cluster environment, where the same application is deployed to multiple managed servers.

For example, you tried to register a portlet producer for WebCenter Portal using the following WLST command:

```
registerWSRPProducer(appName='webcenter', name='MyWSRPSamples', url='http://myhost.com:9999/portletapp/portlets/wsrp2?WSDL')
```

**Solution**

Specify on which managed server you want to run the WLST command, that is, include the server argument. For example:

```
registerWSRPProducer(appName='webcenter', name='MyWSRPSamples', url='http://myhost.com:9999/portletapp/portlets/wsrp2?WSDL', server=WC_CustomPortal2)
```

See also, Running Oracle WebLogic Scripting Tool (WLST) Commands.

### F.3.6 More Than One Application with the Same Name Exists on a Managed Server

**Problem**

You attempt to perform an operation on WebCenter Portal such as create a connection for a service or register a portlet producer, and the following message displays:

Another application named application_name exists on the server managedServerName.

This message indicates that there are multiple applications with the same name on specified managed server. This usually happens when applications are assigned different versions.

For example, you tried to register a portlet producer for an application named "MyApp" using the following WLST command:

```
registerWSRPProducer(appName='myApp', name='MyWSRPSamples', url='http://myhost.com:9999/portletapp/portlets/wsrp2?WSDL')
```

**Solution**

Specify on which application version you want to run the WLST command, that is, include the server and applicationVersion arguments. For example:

```
registerWSRPProducer(appName='myApp', name='MyWSRPSamples', url='http://myhost.com:9999/portletapp/portlets/wsrp2?WSDL', server=WC_CustomPortal1, applicationVersion=2)
```

See also, Running Oracle WebLogic Scripting Tool (WLST) Commands.

### F.3.7 Already in Domain Runtime Tree Message Displays

**Problem**

While running a WLST command, the following message displays:

Already in Domain Runtime Tree

**Solution**

Troubleshooting Oracle WebCenter Portal WLST Command Issues
None required. This is for information only.

F.4 Troubleshooting Oracle WebCenter Portal Performance Issues

Use the information in this section to help diagnose performance-related issues for Oracle WebCenter Portal.

This section contains the following sub sections:

- **About Performance Monitoring and Troubleshooting Tools**
- **How to Identify Slow Pages**
- **How to Identify Slow Page Components**
- **How to Troubleshoot Slow Page Requests**
- **How to Troubleshooting Requests using JRockit Flight Recordings**

**F.4.1 About Performance Monitoring and Troubleshooting Tools**

Various tools are available for monitoring and troubleshooting performance issues with your Oracle WebCenter Portal environment.

<table>
<thead>
<tr>
<th>Tool</th>
<th>Use to...</th>

F.4.2 How to Identify Slow Pages

Use Fusion Middleware Control to determine the slowest pages in WebCenter Portal. If a poorly performing page is also very popular (the Invocation metric is high) then it makes sense for you to focus efforts to improve performance on those pages.

To find the slowest pages:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Portal, as described in Navigating to the Home Page for WebCenter Portal.

2. From the WebCenter Portal menu, select Monitoring > Recent Page Metrics.

   Page requests that respond slower than the pageResponseTime threshold display "red" in the chart at the top of the page.

3. Click the Sort Descending arrow in the Time (ms) column to sort the page requests by response times.

   Page response times that exceed the threshold display "orange" in the table.

4. Identify the slowest pages and make a note of the portal in which the page displays.

5. For more detailed metrics, including how frequently the slowest pages are requested, From the WebCenter Portal menu, select Monitoring > Overall Page Metrics.
Note: Requests for pages in the Home portal are excluded from the "Overall Page Metrics" page.

See also, Understanding Page Request Metrics and Customizing Key Performance Metric Thresholds and Collection.

F.4.3 How to Identify Slow Page Components

Use WebCenter Portal’s page performance analyzer to quickly see how long individual components take to display on a portal page, as well as the overall time taken to display a page. When enabled, this tool dynamically measures and presents the performance of individual page components whenever you display a portal page.

The portal page performance analyzer is useful to developers who are performing first level performance analysis, customers who build their own pages, and any user who customizes pages in WebCenter Portal.

This section includes the following subsections:

- About the Portal Page Performance Analyzer
- Enabling and Disabling Portal Page Performance Analysis
- Displaying and Hiding Page Timing Information for Your Current Session
- Using the Page Performance Analyzer to Troubleshoot Performance Issues

F.4.3.1 About the Portal Page Performance Analyzer

The portal page analyzer offers a simple way to diagnose slow pages and requires minimal set up or configuration. When this feature is on, the time spent on "high level" page components is calculated and displayed so you can see at a glance which components are slowing down your page. The overall time spent on the page also displays at the top left of the page (see Figure F-1).

Figure F-1  Portal Page Displays Timing Information

About Page Component Timings

In WebCenter Portal, "high level" page components are wrapped in a ShowDetailFrame so they can be moved, hidden or shown on the page, and edited by Oracle Composer and it is the overall timing for each ShowDetailFrame that displays.
About Overall Page Time
The overall page time is the sum of the individual page component timings, plus some additional processing time for page-level operations such as session replication, save and restore page state, page level security checks, and so on. For more consistent results, refresh the pages by clicking through the testing pages before enabling Page Performance Analysis.

Color Coding
Performance timings display in various colors to help alert you to problem areas. Refer to the following table:

<table>
<thead>
<tr>
<th>Color</th>
<th>Time to Display</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>&lt; 100 ms</td>
</tr>
<tr>
<td>Green/Yellow</td>
<td>100 - 500 ms</td>
</tr>
<tr>
<td>Yellow</td>
<td>500 ms - 1 second</td>
</tr>
<tr>
<td>Orange</td>
<td>1 - 3 seconds</td>
</tr>
<tr>
<td>Red</td>
<td>&gt; 3 seconds</td>
</tr>
</tbody>
</table>

F.4.3.2 Enabling and Disabling Portal Page Performance Analysis
The portal page performance analyzer is disabled out-of-the-box. To make use of this feature, an administrator must specifically enable its use; while the impact on page performance to run this tool is minimal some additional page processing is required.

In a production environment, Oracle recommends that the analyzer is generally disabled to avoid the additional performance data collection and processing and then dynamically enabled when someone reports performance issues for a particular page.

If you do not want end users to see performance data in a production environment, this is another reason to disable the analyzer most of the time.

To enable or disable the portal page analyzer for a WebCenter Portal instance:

1. Use the WLST command `exportMetadata` to export the base `webcenter-config.xml` file from MDS.

   For example:
   ```
   exportMetadata(application='webcenter', server='WC_Portal', toLocation='/tmp/mydata', docs='oracle/webcenter/webcenterapp/metadata/webcenter-config.xml')
   ```

2. Open `webcenter-config.xml` exported from MDS in a text editor and set the `perfdebug-enabled` attribute to `true` to enable or `false` to disable this feature.

   For example:
   ```
   <webcenter:perfdebug-enabled>true</webcenter:perfdebug-enabled>
   ```

3. Save and close `webcenter-config.xml`.

4. Import the updated `webcenter-config.xml` file to MDS.

   For example:
   ```
   importMetadata(application='webcenter', server='WC_Portal', fromLocation='/tmp/mydata', docs='oracle/webcenter/webcenterapp/metadata/webcenter-config.xml')
   ```
There is no need to restart WebCenter Portal to effect this change.

Page performance information does not automatically display after you enable this feature. Anyone who wants to see timing information on portal pages must specifically request that the information displays. For details, see Displaying and Hiding Page Timing Information for Your Current Session.

**F.4.3.3 Displaying and Hiding Page Timing Information for Your Current Session**

When an administrator enables the page performance analyzer in an WebCenter Portal instance, anyone with access to that WebCenter Portal instance can elect to display or hide page timing information, for their current user session, by appending the `perfDebug` parameter to the page URL as follows:

<table>
<thead>
<tr>
<th>To...</th>
<th>Add a <code>perfDebug</code> parameter to the page URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display timing information on portal pages</td>
<td>&amp;perfDebug=on</td>
</tr>
<tr>
<td>Stop displaying page performance information</td>
<td>&amp;perfDebug=off</td>
</tr>
</tbody>
</table>

To display timing information on portal pages:

1. Verify that your administrator enabled the page performance analyzer in your WebCenter Portal instance.  
   See also Enabling and Disabling Portal Page Performance Analysis.

2. Log in to WebCenter Portal and navigate to the portal page that you want to investigate.  
   You do not need to log in if the page is a public page.

3. Add `&perfDebug=on` to the end of the page URL (Figure F-2).  
   For example:

   ```
   http://mycompany.com/webcenter/portal/MySalesPortal?_adf.ctrl-state=mji83146_4&_afrLoop=47489135539364&perfDebug=on
   ```

4. Click "Go" or press Enter to redisplay the page with timing information (as shown in Figure F-1).  
   All subsequent pages that you display show timing information as well.

**Figure F-2    Appending the `perfDebug` Parameter to Page URLs**

To stop displaying page timing information:

1. In your browser, add `&perfDebug=on` to the end of any page URL (Figure F-2).  
   For example:
2. Click "Go" or press Enter to display the page again without timing information.

**F.4.3.4 Using the Page Performance Analyzer to Troubleshoot Performance Issues**

The steps in this section describe how to troubleshoot slow pages using WebCenter Portal tools:

1. If a user reports performance issues with a particular page, navigate to the slow pages and confirm that the slow performance consistently reproduces.

   Alternatively, use Fusion Middleware Control to proactively identify the slowest pages in your application. See *How to Identify Slow Pages*.

2. Append `&perfDebug=on` to the page URL to display timing information for the page.

   See also, *Displaying and Hiding Page Timing Information for Your Current Session*.

   **Note:**

   If page timing information does not display, ask your administrator to enable the page performance analyzer. For details, see *Enabling and Disabling Portal Page Performance Analysis*.

3. Identify the slowest page components, and troubleshoot the issue further:

   For example, if the slow component contains:

   - **Document, wiki, or content presenter**, check the performance of the back-end Content Server and the database that Content Server is using.

   - **Activity stream**, use AWR reports to check database performance and to see if you can tune the database table used by activity stream.

   - **Collaboration features**, check the performance of the associated back-end server. For example, for announcements or discussions, monitor the performance of the discussions server.

   - **Portlets**, use Fusion Middleware Control to monitor portlet request timing information, errors, portlet producer performance, and so on

4. If necessary, add the slow page component to a separate "blank" page and then do further profiling.

   For example, use JRockit flight recording to pinpoint the bottleneck.

**F.4.4 How to Troubleshoot Slow Page Requests**

Use the information in this section to diagnose issues relating to poor page performance:

- **Troubleshooting Live Requests**
- **Troubleshooting Stuck Threads**
• Troubleshooting Slow Requests Using JFR Recordings
• Troubleshooting Memory Leaks and Heap Usage Problems
• Troubleshooting Slow Requests for Content

F.4.4.1 Troubleshooting Live Requests

To troubleshoot slow page requests that are still running, extract and view a JRockit Flight Recorder (JFR) recording against the server on which the user session is running. See also, How to Troubleshooting Requests using JRockit Flight Recordings.

If you compare the thread dumps, you might see threads that spent a long time on certain method calls as the call stacks are the same in several consecutive thread dumps. For example, you might see a method call to a database, Oracle WebCenter Content Server, collaboration server, portlet producer, LDAP server, and so on, in which case you can investigate the associated backend server to diagnose the issue further.

F.4.4.2 Troubleshooting Stuck Threads

Stuck threads can occur for several reasons:

• **Server is nearly out of memory.** If the server is close to out of memory, all requests slow down. To resolve out-of-memory issues, see Troubleshooting Slow Requests Using JFR Recordings.

• **Deadlock threads.** Take thread dumps and search for deadlock threads. This normally exposes an issue with the product code.

• **Extremely slow page requests.** Take several evenly spaced thread dumps and find out which method is taking a long time to execute.

If a request is taking longer than 10 minutes, the stuck thread is reported to Oracle WebLogic Server `server_name.out` in the following directories:

(UNIX) `DOMAIN_HOME/servers/server_name/logs`
(Windows) `DOMAIN_HOME\servers\server_name\logs`

For example:

```
<Mar 4, 2012 7:44:08 AM PST> <Error> <WebLogicServer> <BEA-000337>
<[STUCK] ExecuteThread: '19' for queue: 'weblogic.kernel.Default (self-tuning)' has been busy for "600" seconds working on the request "weblogic.servlet.internal.ServletRequestImpl@18986012"
```

```
GET /server_name/faces/PimDashboardUiShellPage?_afrLoop=1398820150000&_afrWindowMod
de=0&_afr.ctrl-state=e44e7uxcc_13 HTTP/1.1
Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg,
apPLICATION/x-shockwave-flash, application/x-ms-application,
apPLICATION/x-ms-xbap, application/vnd.ms-xpsdocument, application/xaml+xml,
apPLICATION/vnd.ms-excel, application/vnd.ms-powerpoint, application/msword,
*/
Accept-Language: fr
UA-CPU: x86
...
```

"*[STUCK] ExecuteThread: '19' for queue: 'weblogic.kernel.Default"
Diagnosing a Stuck Thread

If the stack shows the thread is waiting for a response from another server, check the status of the other server and see if it has performance problems before proceeding with the steps below.

To determine what the stuck thread was doing prior to becoming stuck, perform the following steps:

1. Look at the next few log messages in server_name.out for a message indicating an incident has been created. For example:

   <Mar 4, 2012 7:44:10 AM PST> <Alert> <Diagnostics> <BEA-320016> <Creating diagnostic image in DOMAIN_HOME/servers/server_name/adr/diag/ofm/MyDomain/server_name_1/incident/incdir_394 with a lockout minute period of 1.>

   The above message may not always appear after each stuck thread reported. It is printed at most four times an hour. If the message does not appear, manually look for the incident directory by checking the readme file in the subdirectories under the following directories:

   (UNIX)  DOMAIN_HOME/servers/server_name/adr/diag/ofm/domain_name/server_name/incident
   (Windows)  DOMAIN_HOME\servers\server_name\adr\diag\ofm\domain_name\server_name\incident

   The incident directory contains a WLDF diagnostic image which contains the JFR recording, and a file containing the thread dump.

   For more information about diagnosing incidents, see Diagnosing Problems in the Administering Oracle Fusion Middleware.

2. Review the thread dump to find the call stack of the thread. If the thread is blocked waiting for a lock, check what the thread holding the lock is doing.

3. If the call stack shows that JDBC calls are taking a long time, generate an AWR report on the database to find the query and which table to look and tune.

4. Review the JRockit flight recording file JRockitFlightRecorder.jfr for more details. You will also need the ECID of the request which is recorded in the readme.txt file of the incident directory, and also the Oracle WebLogic Server log.

   See also, How to Troubleshooting Requests using JRockit Flight Recordings.

   The ECID of the request that caused the stuck thread is recorded in the error message.

F.4.4.3 Troubleshooting Slow Requests Using JFR Recordings

See How to Troubleshooting Requests using JRockit Flight Recordings.

F.4.4.4 Troubleshooting Memory Leaks and Heap Usage Problems

If WebCenter Portal performance degrades over time, heap usage and garbage collection activity is increasing, and you see OutOfMemoryErrors, there could be
memory leaks in the application causing the amount of free memory in the JVM to continuously decrease.

Figure F-3 shows a typical memory leak trend displayed in JConsole.

**Figure F-3  Typical Memory Leak Trend in JConsole**

To solve this problem:

1. **Determine the cause of OutOfMemoryErrors errors:**
   - Review the server_name.out file for OutOfMemoryErrors errors.
     - The server_name.out file is located at:
       - (UNIX) `DOMAIN_HOME/servers/server_name/logs`
       - (Windows) `DOMAIN_HOME\servers\server_name\logs`
   - Take a memory dump when OutOfMemoryErrors errors occur.
     - For example:
       - **On Sun HotSpot:** `jmap -dump:live,format=b,file=<path>/heap.hprof <pid>`
       - **On JRockit:** `jrcmd <pid> hprofdump filename=<path>/heap.hprof`
     - You can configure JRockit to automatically generate a heap dump in HPROF binary format (.hprof file) each time an OutOfMemoryErrors occurs, by setting the JRockit JVM option, `-XX:+HeapDumpOnOutOfMemoryError`. For details, refer to the .

2. **Restart the managed server.**
   - If the problem persists, proceed to Step 3.
3. Open the heap.hprof file with a heap-dump analysis tool that can handle binary HPROF format, such as Eclipse Memory Analyzer.

4. Determine which objects and classes are retaining the most memory.

5. If necessary, take several heap dumps to determine which objects or classes are consuming and increasing the amount of memory.

   Take at least two memory dumps:
   - Take the first dump when the system is warmed up and stabilized.
   - Take the second dump, when the system is about to run out of memory, that is, full garbage collection gets less than 300MB from the maximum heap size.

Instructions on how to take a heap dump using Sun HotSpot (jmap) or JRockit (jrcmd) is described in step 1.

See the "Running Diagnostic Commands" chapter in the Oracle JRockit JDK Tools Guide. Many heap dump analysis tools, such as Eclipse Memory Analyzer, enable you to compare two heap dumps to identify memory growth areas.

Heap dumps provide information on why memory is retained (Retained Heap). Sometimes it is necessary to know how memory is allocated to further resolve the issue. For these cases, proceed to Step 6.

6. Use the JRockit Memory Leak Detector tool that is part of JRockit Mission Control Client to understand how memory is allocated.

   For more information, see the JRockit Mission Control online help.

F.4.4.5 Troubleshooting Slow Requests for Content

If slow page performance is due to content/document-related components, for example, Documents service task flows, Content Presenter task flows, wikis or blogs, Oracle recommends that you review performance metrics for the backend Oracle WebCenter Content Server (System Audit Information page). For details, see Viewing System Audit Information in Administering Oracle WebCenter Content.

Ensure that the systemdatabase tracing option is selected so you can see performance information for each query that is sent to the database. For details, see Server-Wide Tracing in Administering Oracle WebCenter Content.

F.4.5 How to Troubleshooting Requests using JRockit Flight Recordings

JRockit Flight Recorder (JFR) files contain a record of various events that consume time. If requests are slow, you can analyze the JRockit Flight Recorder (JFR) file to find out why request are taking time.

To create a JFR file:

1. Extract a JFR file from the Oracle WebLogic Server server by running the following command:

   UNIX)  JROCKIT_HOME/bin/jrcmd jrockit_pid dump_flightrecording recording=1 
   copy_to_file=path compress_copy=true

   (Windows) JROCKIT_HOME\bin\jrcmd.exe jrockit_pid dump_flightrecording 
   recording=1 copy_to_file=path compress_copy=true
For more information about the jrcmd command-line tool, see Running Diagnostic Commands in Oracle JRockit JDK Tools Guide.

2. To view the file, start the JRockit Mission Control Client from the following directories:
   
   (UNIX)  `JAVA_HOME/bin/bin/jrmc`
   
   (Windows)  `JAVA_HOME\bin\jrmc.exe`

3. Select File > Open File to select the JFR file.

4. Locate the slowest requests or investigate a specific request:
## To locate the slowest requests:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>a.</strong></td>
<td>In the JRockitFlightRecorder.jfr page, click the <strong>Events</strong> icon.</td>
</tr>
<tr>
<td><strong>b.</strong></td>
<td>Click the <strong>Log</strong> tab at the bottom of the page.</td>
</tr>
<tr>
<td><strong>c.</strong></td>
<td>In the <strong>Event Type</strong> navigation pane on the left, locate <strong>Dynamic Monitoring System</strong> and then <strong>HttpRequest</strong>.</td>
</tr>
<tr>
<td><strong>d.</strong></td>
<td>Click <strong>HTTP request</strong>; de-select all the other event types.</td>
</tr>
<tr>
<td><strong>e.</strong></td>
<td>In the <strong>Log</strong> tab, in the <strong>Event Log</strong> section, click the <strong>Duration</strong> column to sort the duration in descending order. Each row corresponds to a HTTP Request and the duration column shows the response time for that request.</td>
</tr>
<tr>
<td><strong>f.</strong></td>
<td>Click the row in the table to view the attributes of the requests.</td>
</tr>
<tr>
<td><strong>g.</strong></td>
<td>In the <strong>Event Attributes</strong> sections, note the start time and the thread that serviced the request.</td>
</tr>
</tbody>
</table>

## To investigate a specific request:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>a.</strong></td>
<td>Find the Execution Context Identifier (ECID) of that request. If the request is related to an incident triggered by a <strong>STUCK</strong> thread, the incident readme.txt file will contain the ECID. Alternatively, you can search the Oracle WebLogic Server HTTP access.log for requests from specific users. See Viewing and Searching Log Files in the <em>Administering Oracle Fusion Middleware</em>.</td>
</tr>
<tr>
<td><strong>b.</strong></td>
<td>In the JRockit Mission Control Client, in the JRockitFlightRecorder.jfr page, select the <strong>WebLogic</strong> icon. Note: If the <strong>Weblogic</strong> icon is not available, select <strong>Help &gt; Install Plugins</strong> to download the Oracle WebLogic Server plug-in.</td>
</tr>
<tr>
<td><strong>c.</strong></td>
<td>Click the <strong>ECIDs</strong> tab at the bottom of the page.</td>
</tr>
<tr>
<td><strong>d.</strong></td>
<td>In the <strong>ECIDs</strong> section, from Filter Column list, select <strong>ECID</strong>.</td>
</tr>
<tr>
<td><strong>e.</strong></td>
<td>Enter the ECID in the search box and select <strong>&lt;Enter&gt;</strong>.</td>
</tr>
<tr>
<td><strong>f.</strong></td>
<td>In the results table, highlight the row with the matching ECID and right-click to bring up the menu. Select <strong>Operative Set &gt; Clear</strong>, and then <strong>Operative Set &gt; Add matching ECID &gt; ECID</strong> to add the ECID to the operative set. This enables users to view only events associated with the operative set.</td>
</tr>
<tr>
<td><strong>g.</strong></td>
<td>Click the <strong>Events</strong> icon.</td>
</tr>
<tr>
<td><strong>i.</strong></td>
<td>In the Event Type navigation pane on the left, locate <strong>Dynamic Monitoring System</strong> and then <strong>HttpRequest</strong>.</td>
</tr>
<tr>
<td><strong>j.</strong></td>
<td>Click <strong>HTTP request</strong>; de-select all the other event types. <strong>In the Event Log</strong> section, click <strong>Show Only Operative Set</strong>. Each row corresponds to the request with the matching ECID.</td>
</tr>
<tr>
<td><strong>k.</strong></td>
<td>Click the row in the table to view the attributes of the requests.</td>
</tr>
<tr>
<td><strong>l.</strong></td>
<td>Note the start time and the thread that serviced the request.</td>
</tr>
</tbody>
</table>
5. Once you have identified the start time and the thread that serviced the request, navigate to the Logs tab, and drag the time selector at the top of the screen to include only the time window for the duration of the request.

6. In the Event Log section, perform the following search:
   a. Deselect Show Only Operative Set.
   b. Enter the thread name in the search box.
   c. From the Filter Column list, select Thread.
   d. Select <Enter>.

7. In the Event Type navigation pane on the left, click the events of interest. Typically, these events are located under nodes Dynamic Monitoring System, Java Application, and WebLogic > JDBC.

   The selected events appear in the table in the Event Log section.

8. Click the Start Time column to sort the time when these events occur, or click the Duration column to view the events that took longest.

   The JDBC Statement Execute events corresponds to SQL execution. If there are slow SQL statements, the event details give the SQL text. These events do not have callstacks.

9. To check the call stacks for slow SQL statements, view the Socket Read event that happens immediately after the JDBC Statement Execute event.

   This event corresponds to Oracle WebLogic Server waiting for the SQL results to return, and it has callstack in the event details.

10. Review the call stacks for long Java Blocked and Java Wait events to see if you can identify what is causing slow performance.

11. If you need more detail than the information captured in the default recording, and you can reproduce the slow requests, you can start an explicit recording.

F.5 Troubleshooting WebCenter Portal Workflows

If you experience issues with WebCenter Portal workflows, review the following sections:

- Validating the WebCenter Portal Workflow Configuration
- Troubleshooting Issues with WebCenter Portal Workflows
- Email Notifications Not Working

F.5.1 Email Notifications Not Working

Problem

Notifications for workflows are not being sent by email to BPM Worklist, as described in Configuring WebCenter Portal Workflow Notifications to be Sent by Email.
Note:
To identify causes of failures, examine log files on the managed SOA server, hosting BPM Worklist processes, you have configured.

Solution
Check the error logs on the WebCenter and SOA servers for errors at the time when the invite process is instigated. If there appears to be an issue with the email configuration, then validate that you can use the exact same LDAP settings and user accounts to send and receive emails using a different email client.

Note:
To identify causes of failures, examine log files for any SOA BPEL servers you have configured.

F.5.2 Validating the WebCenter Portal Workflow Configuration
The Installing and Configuring Oracle WebCenter Portal describes how to install and configure WebCenter Portal workflows. For details, see Back-End Requirements for WebCenter Portal Workflows. You can validate the workflow configuration as follows:

1. Log in to WebCenter Portal.
2. Create a portal and then navigate to the Members tab (click the Administration link, then Security, then Members).
3. Invite a new member with any role (say User2).
4. Log out, and then log in to BPM Worklists as User2.

You will be able to view the notification in your worklist items that you have been added to the portal in the specified role.
5. Open the invite notification and click the Acknowledge button.

If the WebCenter Portal workflows are working properly, the newly created portal ia available to User2. If the portal is not available or listed, there is some issue with the configuration.

F.5.3 Troubleshooting Issues with WebCenter Portal Workflows
If WebCenter Portal workflows are not working properly, follow these steps to help troubleshoot the issue:

1. Check that WebCenter Portal workflows are deployed on the Oracle SOA server:
   a. Log in to Fusion Middleware Control.
   b. Check that WebCenterWorklistDetailApp.ear is deployed.
   c. Verify that sca_CommunityWorkflows.jar is deployed.

   For details, see Oracle SOA Server - Extending the Domain in Installing and Configuring Oracle WebCenter Portal.
2. Ensure the Web Service connection between the Oracle SOA server and the WebCenter Portal application is secure:
   
a. Check the alias in the keystore file on the Oracle SOA server.
   For example, use the following command to list the content of the keystore file on the Oracle SOA server:
   
   ```
   keytool -list -v -keystore bpel.jks -storepass <password>
   ```
   
   There should be an entry with:
   
   ```
   Alias name: webcenter_spaces_ws
   ```
   
b. Verify that the credential stores for both WebCenter Portal and Oracle SOA server are configured correctly.

c. Check that keystores exist at both ends of the connection, for example:

   - `webcenter.jks` (copied to WebCenter Portal server end)
   - `bpel.jks` (copied to Oracle SOA server end)

   For example, the following commands generate `webcenter.jks` and `bpel.jks`:
   
   ```
   keytool -genkeypair -keyalg RSA -dname 
   "cn=webcenter,dc=us,dc=oracle,dc=com" -alias webcenter -keypass mypassword 
   -keystore webcenter.jks -storepass mypassword -validity 360
   ```
   
   ```
   keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass mypassword 
   -rfc -file webcenter.cer
   ```
   
   ```
   keytool -importcert -alias webcenter_spaces_ws -file webcenter.cer -keystore bpel.jks -storepass mypassword
   ```
   
   ```
   keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=us,dc=oracle,dc=com" -alias bpel -keypass mypassword 
   -keystore bpel.jks -storepass mypassword -validity 360
   ```
   
   ```
   keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass mypassword 
   -rfc -file bpel.cer
   ```
   
   ```
   keytool -importcert -alias bpel -file bpel.cer -keystore webcenter.jks -storepass mypassword
   ```
   
   See Creating the SOA Domain Keystore.

d. Configure role members for the BPMWorkflowAdmin application role in Oracle SOA server (soa-infra).

   When associating the domain with an identity store that does not contain the user `weblogic`, you must assign some other valid user to the application role BPMWorkflowAdmin. Use WLST commands to do this from the SOA Oracle home, for example, to assign a user named "monty" that exists in LDAP:
   
   ```
   cd $SOA_ORACLE_HOME/common/bin/
   wlst.sh
   ```
   
   ```
   connect('<admin username>','<admin password>', 'mysoahost.example.com:7001')
   revokeAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin", 
   principalClass="oracle.security.jps.service.policystore.ApplicationRole", 
   principalName="SOAAdmin")
   ```
   
   ```
   grantAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin", 
   principalClass="weblogic.security.principal.WLSUserImpl", 
   principalName="monty")
   ```
F.6 Troubleshooting WebCenter Portal Import and Export

This section contains the following subsections:

- ResourceLimitException Issue
- LockRefreshTask Issue
- Portals and Portal Templates Not Available After Import
- Unable to Migrate Portals or Documents If the Source and Target Applications Share the Same Content Server

F.6.1 ResourceLimitException Issue

Problem
The ResourceLimitException error displays when you try to export all portals or the entire WebCenter Portal instance:

Weblogic.common.resourcepool.ResourceLimitException

Solution
Increase the maximum capacity in the JDBC connection pool. To reconfigure the connection pool, log in to the WLS Administration Console. From Services, select Data Sources, WebCenterDS, and then the Connection Pool tab.

F.6.2 LockRefreshTask Issue

Problem
A LockRefreshTask warning displays similar to that below when you try to import or export an entire WebCenter Portal instance or a portal:

[WARNING] [[oracle.webcenter.lifecycle.operation.LockRefreshTask]

If you try the import or export operation again, an error similar to that shown here displays:

Starting WebCenter Portal application import...
WebCenter Portal application import started.

Error occurred while performing import
None
Check the WebCenter Portal log files for additional details.
Unable to contact MBeanServer for oracle.webcenter.lifecycle:ApplicationName=webcenter,Location=WC_Portal,name=LifecycleManager,type=LifecycleManager,Application=webcenter,ApplicationVersion=11.1.1.4.0
Error occurred while destroying MBean
The lock hasn't been released from the previous failed import.

Solution
Use the deleteMetadata WLST command to delete unwanted locks in MDS that may be created and not destroyed due to an unexpected and unusual import or export.
operation failure. Depending on the operation that failed, run one of the following commands:

For WebCenter Portal application import failure, run:

```
deleteMetadata(application='webcenter', server='WC_Portal', docs='/oracle/webcenter/lock/applicationImport/applicationImport.xml')
```

For WebCenter Portal application export failure, run:

```
deleteMetadata(application='webcenter', server='WC_Portal', docs='/oracle/webcenter/lock/applicationExport/applicationExport.xml')
```

For portal import failure, run:

```
deleteMetadata(application='webcenter', server='WC_Portal', docs='/oracle/webcenter/lock/scopeImport/**')
```

For portal export failure, run:

```
deleteMetadata(application='webcenter', server='WC_Portal', docs='/oracle/webcenter/lock/gesExportImport/**')
```

**F.6.3 Portals and Portal Templates Not Available After Import**

**Problem**

When you first log in to WebCenter Portal after the import operation, the portals and portal templates that you migrated are not available as expected. This can sometimes occur if the portal or portal template cache fails to refresh properly.

**Solution**

Refresh the portal or portal template cache manually using the `refreshGroupSpaceCache` and `refreshSpaceTemplateCache` WLST commands.

To completely clear the cache (all portals):

```
refreshGroupSpaceCache(appName='webcenter', spaceNames='*', syncMode=1, updateType='all', cleanCache=1)
```

To completely clear the cache (all portal templates):

```
refreshSpaceTemplateCache(appName='webcenter', spaceTemplateNames='*', syncMode=1, updateType='all', cleanCache=1)
```

For information on how to run WLST commands, see *Running Oracle WebLogic Scripting Tool (WLST) Commands*.

**F.6.4 Unable to Migrate Portals or Documents If the Source and Target Applications Share the Same Content Server**

You cannot migrate portals or portal templates between two different WebCenter Portal instances that share the same Content Server.

**F.6.5 Target Portal Server Shown As Unavailable When Creating a Connection**

While creating a Portal Server connection to a target server, you can test the connection by clicking the Test button. After clicking Test, if you view the state of the target Portal Server in its administration console, it is shown as unavailable even if the
server is up and running. This happens when the name of the target domain or server
is same as the source domain or server. This does not lead to any functionality loss.

F.7 Troubleshooting Individual Portal and Portal Template Import and Export

This section contains the following subsections:

- Portal Blocked After Unsuccessful Export or Import
- Page or Portal Not Found Message After Import
- Portal Import Archive Exceeds Maximum Upload File Size
- Maximum Number of Portals Exceeded on Export
- Lists Not Imported Properly
- Exporting and Importing Portals with Tools and Services Configured
- Tools and Services Disabled After Import
- Importing from the Subportals Page
- Unable to Import a Portal If the Source and Target Applications Share the Same Content Server
- Shared Library Changes Not Available after Portal Deployment
- Members Not Listed in an Imported Portal
- Deployment Messages Not Displayed in the Browser Locale

F.7.1 Portal Blocked After Unsuccessful Export or Import

If an error occurs during a portal export/import operation, some portals may appear
blocked. To unblock a portal, bring the portal back online temporarily, and then take
the portal offline again to complete the export/import operation. Switching between
the online and offline modes will unblock the portal. For more information, see Taking
Any Portal Offline and Bringing Any Portal Back Online. See also, the WLST
command setSpaceState in WebCenter WLST Command Reference.

F.7.2 Page or Portal Not Found Message After Import

When users first log in to WebCenter Portal after an import operation, they may see a
"Page not found" or "Portal not found" message if the page or portal they last visited
no longer exists. Last accessed page information is retained during import operations
which is why these messages display sometimes.

F.7.3 Portal Import Archive Exceeds Maximum Upload File Size

**Problem**

There is a file size limitation uploading content to WebCenter Portal. If your export
archive exceeds the maximum upload size, the import operation through WebCenter
Portal Administration will fail.

**Solution**
Import the portal archive using WLST. For details, see Importing a Portal from an Archive Using WLST.

Alternatively, modify the maximum upload size in `webcenter-config.xml`. The default maximum upload size is 2 GB. See Changing the Maximum File Upload Size.

### F.7.4 Maximum Number of Portals Exceeded on Export

**Problem**
The maximum number of portals that you can export must be less than or equal to 80% of the connection pool size specified for the MDS Data Source. If you try to export too many portals you might see a `ResourceLimitException` error:

```
Weblogic.common.resourcepool.ResourceLimitException
```

**Solution**
Export fewer portals. Alternatively, modify the connection pool setting. For details, see the Tuning Performance.

### F.7.5 Lists Not Imported Properly

**Problem**
Lists are not importing properly due to list definition differences in the source and target systems.

**Solution**
Consider exporting and importing list data. This ensures that list data is consistent with the list definitions being imported.

If you choose to import without data, the list data in the target system is migrated to be consistent with the imported list definitions. If a list column data type is changed, the column values are converted from the target data type to the imported data type, if possible, otherwise the value is deleted. If a list column is removed during import, the column values are deleted.

### F.7.6 Exporting and Importing Portals with Tools and Services Configured

**Problem**
The following error message displays when you try to export a portal with tools and services configured, and try to import the same portal from an instance where some or all of those tools or services are not configured.

```
The following services are not configured: <list of tools and services>. Please configure these services and try again.
```

**Solution**
You can work around this problem by either adding the tools and services to the target, or removing the service-related info from the `data.xml` file of the archive as described below.

To remove service-related info:

1. Extract the archive.

   The archive contains two files: `policy-store.xml` and `transport.mar`. 

   ```
   The archive contains two files: policy-store.xml and transport.mar.
   ```
2. Expand the transport.mar into a directory.

    The data.xml file is located in the oracle\webcenter\lifecycle\importexport directory.

3. Remove the service tags for all the tools and services that are not present in the target as listed in the error message.

   For the example error message above, we would need to remove the following:

   ```xml
   <service id="oracle.webcenter.collab.forum" version="11.1.1.0">
     <metadataUsages>
       <metadataUsage includeBaseDocuments="YES" includeSystemCustomizations="YES">
         <paths>
           <include path="/oracle/webcenter/collab/forum/scopedMD/s516227ec_dde1_4991_9e18_28d487cb3bce/**"/>
         </paths>
       </metadataUsage>
     </metadataUsages>
   </service>

   <service id="oracle.webcenter.collab.rtc" version="11.1.1.0"/>
   ```

4. Repack the transport.mar file by zipping the top-level directories Oracle and pagedefs into a file named transport.mar.

5. Repack the export archive by zipping the newly created transport.mar and the policy-store.xml file into an archive.

6. Import the new archive.

F.7.7 Tools and Services Disabled After Import

   **Problem**

   When you navigate directly to the Tools and Services tab in portal administration after importing a portal, all the tools and services are disabled even though they were enabled in the source portal.

   **Solution**

   Select the Enable check box for tools and services, as required.

   Alternatively, open the portal after you import instead of navigating to portal administration. When you access the portal for the first time, tools and services enable automatically.

F.7.8 Importing from the Subportals Page

   **Problem**

   When you import a portal from the Portals page, the imported portal does not automatically become a subportal of the current portal. The newly imported portal displays in the Portals switcher menu, Portals Browser task flow, or the Portals page, which display all the portals that are available to you.

   **Solution**

   You can import a portal as a subportal by selecting the parent portal on the Portals page before you import the archive.
F.7.9 Unable to Import a Portal If the Source and Target Applications Share the Same Content Server

You cannot export/import portals or portal templates between two different WebCenter Portal applications that share the same Content Server.

Similarly, you cannot use the Document Migration Utility to migrate portal documents between two different WebCenter Portal applications that share the same Content Server.

F.7.10 Shared Library Changes Not Available after Portal Deployment

Problem
Changes made to the shared library are not showing up in the newly deployed portal.

Solution
Shared library deployment might have failed. To find out about the deployment status of the shared library, go to the WebLogic Server Admin console on the target instance and check the state of the latest version of the shared library that you deployed. The newly deployed library must be in "active" state on the target.

If the shared library deployment failed, and the state of the last deployed version on the target is shown as failed, delete the failed version and either redeploy the portal or propagate the portal to include shared library changes.

If the shared library deployment failed, and the shared library on the target is not shown in the failed state but some other intermediate state (such as Distribute running/Deploy running/New), try restarting the servers and then click on Activate Changes in the console (if it is enabled). If the shared library state is still not shown as active, delete the shared library version from the target server and redeploy or propagate the portal. If you get an error message that this version of the library cannot be deleted as it is being referenced by one or more applications, stop the WebCenter Portal managed server (WC_Portal), delete the library, and then start the managed server again. After restart, it will start using the last active version of the shared library.

F.7.11 Members Not Listed in an Imported Portal

Problem
After you have imported a portal from a portal archive (PAR file) containing members under various roles, like Viewer or Portal Manager, member names are not displayed on the Portal’s members page.

Solution
Users on both the source and target instances must be identical. If a shared identity store is not used, your system administrator must synchronize users in WebCenter Portal by using the synchronizeUserInformation WLST command. For information about this command, contact Oracle Support.

F.7.12 Deployment Messages Not Displayed in the Browser Locale

When you deploy a portal, the deployment progress messages coming from the target server might be displayed in the source server’s environment locale instead of the browser locale. This happens when your source server's environment locale is different than the browser locale set in WebCenter Portal.
F.8 Troubleshooting Issues with Mail

This section includes the following subsections:

- Mail is Not Accessible in Secure Mode
- Mail is Not Accessible in Non-Secure Mode
- Unable to Create Distribution Lists in the Non-Secure Mode
- Unable to Create Distribution Lists in the Secure Mode
- Provisioning of Mail Fails in a Portal (Default Distribution List not Created)
- Unable to Configure the Number of Mail Messages Downloaded
- Unable to Publish and Archive WebCenter Portal Mail
- Changing Passwords on Microsoft Exchange

F.8.1 Mail is Not Accessible in Secure Mode

Problem
You configured mail to function in secure mode, but it is not accessible.

Solution
Ensure the following:

- IMAP and SMTP ports are specified correctly. See Registering Mail Servers.
- Properties are set to true in your mail server.
  - mail.imap.secured = true
  - mail.smtp.secured = true

F.8.2 Mail is Not Accessible in Non-Secure Mode

Problem
You configured mail to function in non-secure mode, but it is not accessible.

Solution
Ensure the following:

- IMAP and SMTP ports are specified correctly. See, Registering Mail Servers.
- Properties are set to false in your mail server.
  - mail.imap.secured = false
  - mail.smtp.secured = false

F.8.3 Unable to Create Distribution Lists in the Non-Secure Mode

Problem
You are unable to create portal distribution lists in non-secure mode; that is, SSL is not configured on the LDAP server.

**Solution**

Check if the mail server has been reinstalled or the user has been deleted. Also ensure that the following parameters are configured accurately in non-secure mode, in the LDAP server:

- `ldapHost`
- `defaultUser`
- `ldapAdminPassword`
- `ldapBaseDN`
- `ldapPort`

See [Registering Mail Servers](#).

**F.8.4 Unable to Create Distribution Lists in the Secure Mode**

**Problem**

You are unable to create WebCenter Portal distribution lists in secure mode, that is, SSL is configured on the LDAP server.

**Solution**

Check if the mail server has been reinstalled or the user has been deleted. Also ensure that the following parameters are configured accurately in secure mode, in the LDAP server:

- `ldapHost`
- `defaultUser`
- `ldapAdminPassword`
- `ldapBaseDN`
- `ldapPort`
- `ldap.connection.secure`, 'true'

See Also:

- [Registering Mail Servers](#)

**F.8.5 Provisioning of Mail Fails in a Portal (Default Distribution List not Created)**

**Problem**

In WebCenter Portal, when accessing a portal’s Tools and Services Mail page, the following error message appears "*Provisioning of Mail service for this portal has failed*" and the Distribution List field is blank.

**Solution**
Make sure that the portal name is unique. If the portal name is not unique, a distribution list already exists. You can select the existing distribution list or select another distribution list.

F.8.6 Unable to Configure the Number of Mail Messages Downloaded

Problem
You cannot configure how many mail messages are downloaded to each user's Inbox.

Solution
Use the setMailServiceProperty WLST command. For example, to download 100 mail messages from the mail client, specify the mail.messages.fetch.size parameter as 100, as shown in the following example:

```bash
setMailServiceProperty(appName='webcenter', property='mail.messages.fetch.size', value='100')
```

For command syntax and examples, see the setMailServiceProperty in WebCenter WLST Command Reference.

F.8.7 Unable to Publish and Archive WebCenter Portal Mail

Problem
You are unable to archive WebCenter Portal mail.

Solution
If the archiving fails, check the following:

- In WebCenter Portal, navigate to Administration > Tools and Services > Discussions. Check whether the required configuration is accurate. For details, see Publishing Portal Mail in a Discussion Forum in Building Portals with Oracle WebCenter Portal.

- Check whether the user account configured here is a member of the distribution list.

- For a particular portal, check whether the forum configured is available in the discussions server. For details, see Publishing Portal Mail in a Discussion Forum in Building Portals with Oracle WebCenter Portal.

- Check whether the user who sends mail to the distribution list is available in the discussions server and the mail address is the same.

F.8.8 Changing Passwords on Microsoft Exchange

Problem
If multiple users log on to Microsoft Exchange with the same user name and password, and then one user changes the password, the original password remains valid until all users log off.

For example, say the current password of the user monty is mypassword. Two users, A and B, log on from different clients using WebCenter Portal or Microsoft Exchange. Both log on as monty/mypassword, and both are able to see the mail messages. Now user A changes the password in Microsoft Exchange to oracle1. Because there currently are clients using the passwords oracle1 and mypassword, both are valid.
passwords; that is, new users can log on as monty/mypassword and still see the mail messages.

Solution
After all existing users with the original password log off, the new password takes effect. Until then, users can use both passwords to log on.

F.9 Troubleshooting Issues with Announcements and Discussions

This troubleshooting section includes the following subsections:

- Authentication Failed
- Discussions Cannot Be Enabled in WebCenter Portal
- Login Failed
- Login Does Not Function Properly After Configuring Oracle Access Manager
- Category Not Found Exceptions
- Watched Topics and Recent Topics Not Displaying Topics From Multiple Discussion Forums
- Discussion and Announcement Updates Not Displayed
- Announcements Page Displays "User Is Not Authorized"
- Discussions Page Displays "User Is Not Authorized"

F.9.1 Authentication Failed

Problem
WS-Security does not appear to be set properly for the connection between WebCenter Portal and the back-end discussions server. You may see the following error:

failure to authenticate the user WebLogic, due to: Authentication Failed

Solution
This error may be caused due to various reasons. Check the following:

- Ensure that the OWSM SAML policy setting is appropriately defined between the discussions connection and the discussions server.

- Review WC_Portal-diagnostic.log for errors and exceptions relating to discussion services in WebCenter Portal. If the log does not provide enough information to correct errors, then turn on debugging for the oracle.webcenter.collab.share and oracle.webcenter.collab.forum packages.

- For the discussions server, review WC_Collaboration-diagnostics.log and jive.error.log inside your domain’s DOMA I N_HOME/config/fmwconfig/servers/SERVER_NAME/owc_discussions/logs directory. If the logs do not provide enough information to correct errors, then turn debugging on for the discussions server. To turn on debug logs, log on to the discussions server admin console, go to page logs, the Debug tab, and enable. Restart the WC_Collaboration managed server to change the logging setting.
- Make sure that time settings on WebCenter Portal and the back-end discussions server are in sync. This is important with OWSM WS-Security.

**F.9.2 Discussions Cannot Be Enabled in WebCenter Portal**

**Problem**

Discussions cannot be enabled in any portal in your WebCenter Portal installation.

**Solution**

This error may be caused due to various reasons. Check the following:

- The back-end discussions server is up and running and accessible. See Testing Discussions Server Connections.

- Administrator User Name (`adminUser`) property configured for the active connection has administrative privileges on the application root category (the category configured for WebCenter Portal). See Registering Discussions Servers.

  It is not necessary for this user to be a super admin. However, the user must have administrative privileges on the application root category configured for WebCenter Portal, that is, the category (on the discussions server) under which all WebCenter Portal discussions and announcement are stored.

- Application root category, where all WebCenter Portal discussions and announcements are stored, exists on the back-end discussions server.

  You can check the application root category ID configured for WebCenter Portal by navigating to WebCenter Portal Administration, then selecting Tools and Services, and then Discussions. See Specifying Where Discussions and Announcements are Stored on the Discussions Server.

**F.9.3 Login Failed**

**Problem**

You may see the following login exception:

```java
caught exception running task oracle.webcenter.collab.share.LoginFailedException:
failure to authenticate the user monty, due to: Failed to read user monty from database.
at oracle.webcenter.collab.forum.internal.jive.JiveAuthenticator.login(JiveAuthenticator.java:213)
```

This occurs when an incorrect admin user name is specified.

**Solution**

Follow these steps:

1. Confirm that the admin user specified while creating the discussion forum connection has access to the Discussions Administration console at `http://host:port/owc_discussions/admin`.

   If the user does not have admin privileges, then use the WLST command `addDiscussionsServerAdmin` to provision the user. For more information, see Granting the Discussions Server Administrator Role using WLST.
2. Confirm that you have configured the discussion server with the appropriate DISCUSSIONS schema. If not, then create or extend the domain using config.sh or was_config.sh.

F.9.4 Login Does Not Function Properly After Configuring Oracle Access Manager

Problem
When you log in to WebCenter Portal’s Discussion Server after configuring Oracle Access Manager single sign-on, a 500 - Internal Server Error occurs.

Solution
1. If one does not exist, add a user as super admin on WebCenter Portal’s Discussion Server using the WLST command addDiscussionsServerAdmin. For command syntax and examples, see addDiscussionsServerAdmin in WebCenter WLST Command Reference.

2. Log on to the Discussions Admin Console with the super admin account, and navigate to System - System Properties. See Accessing the Discussions Server Admin Console.

3. Create or edit the property owc_discussions.sso.mode, and set its value to true.
   For more information, see Configuring the Discussions Server for SSO.

F.9.5 Category Not Found Exceptions

Problem
If you change the connection to use a different discussions server, and if you change WebCenter Portal’s root category ID from Administration - Tools and Services - Discussions, then you could see exceptions like, "Category Not Found."

Solution
Restart the managed server on which WebCenter Portal is deployed.

F.9.6 Watched Topics and Recent Topics Not Displaying Topics From Multiple Discussion Forums

Problem
Portals created from the Discussion Site template include Recent Topics and Watched Topics task flows on the Home page. By default, both these task flows are configured to display information for a single forum. If your portal is configured to support multiple forums, topics from the other forums do not display in these task flows.

Solution
Edit the Watched Topics and Recent Topics task flows to remove the task flow parameters from the Forum ID field. In this instance, the Forum ID will be set to $ {sessionContext['oracle.webcenter.collab.forum'].groupInfo[portalContext.currentPortalName].forumId}. Delete this value and save the page.
F.9.7 Discussion and Announcement Updates Not Displayed

Problem
If clustered caching is enabled in your environment, content updates to discussions and announcements may not refresh immediately.

Solution
Click the Refresh icon to force a manual refresh at any time.

F.9.8 Announcements Page Displays "User Is Not Authorized"

Problem
A user creates an announcement, then changes their user name. When they try to log in with the new user name to access the page, a message indicating that the user is not authorized to view the announcement is displayed even if the two user names were synced.

Solution
This can occur if the same Identity Store is not used by WebCenter Portal and the Discussions server; the user must exist in both stores if the store is not shared.

F.9.9 Discussions Page Displays "User Is Not Authorized"

Problem
A user creates a discussion topic, then changes their user name. When they try to log in with the new user name to access the page, a message indicating that the user is not authorized to view the discussion page is displayed even if the two user names were synced.

Solution
This can occur if the same Identity Store is not used by WebCenter Portal and the Discussions server; the user must exist in both stores if the store is not shared.

F.10 Troubleshooting Issues with Events

If users cannot see their personal events, verify the following:

- Is the Microsoft Exchange Server/IIS server accessible from the managed server on which WebCenter Portal is deployed? Can they ping each other?
- Is the configuration correct on the Microsoft Exchange Server? For more information, see Events Prerequisites for Personal Events.
- Is the events server connection correct in the managed server? For more information, see Registering Events Servers.
- Did the user enter the correct user name and password for the account on the Microsoft Exchange Server? The user name is usually an email address.

F.11 Troubleshooting Issues with Users and Roles

For Oracle WebCenter Portal to properly maintain enterprise group-to-role mappings, the back-end discussions server and content server must support enterprise groups. The WebCenter Portal’s Discussion Server and WebCenter Content’s Content Server
versions provided with Oracle WebCenter Portal 11.1.1.2.0 and later both support enterprise groups, but previous versions may not. If a back-end server does not support enterprise groups, an error message similar to the following displays when you try to add a group.

**Warning:** Group [name] not found in Identity Store

Also, an error is logged containing more detailed information as shown here:

```
[2011-03-28T01:03:07.143-07:00] [WC_Spaces] [NOTIFICATION] [WCS-07855]
oracle.webcenter.doclib.internal.spaces.AbstractDoclibRoleMapper [tid: pool-1-daemon-thread-1] [userId: monty]
[ecid: a4789a41d7e6bc9f:36de4556:12eb72d049:-8000-00000000000002c0,0:5]
[APP: webcenter#11.1.1.4.0] Adding groups
[oracle.webcenter.security.common.WCGroup@18b96a3] to documents service roles
[Administration, Delete Documents, Create and Edit Documents, View Documents] for scope Scope[name=rbgs25mar01, guid=sbf125dd4_cd43_41cc_9d3d_467d06e84100]
[2011-03-28T01:03:09.122-07:00] [WC_Spaces] [ERROR] [WCS-44002]
oracle.webcenter.security.rolemapping.RoleManager
[tid: [ACTIVE].ExecuteThread: ©3© for queue: ©weblogic.kernel.Default (self-tuning)] [userId: monty]
[ecid: a4789a41d7e6bc9f:36de4556:12eb72d049:-8000-00000000000002c0,0]
[APP: webcenter#11.1.1.4.0] The Role Mapping provider encountered an exception while performing security role mapping for service oracle.webcenter.doclib.
[oracle.webcenter.security.rolemapping.spi.RoleMappingSPIException: Cannot add role null and permissions, 15, to the account for the folder, rbgs25mar01 for the user/group Admin. at oracle.webcenter.doclib.internal.spaces.UCMSpacesUtils $2.newException(UCMSpacesUtils.java:2595)
```

**Note:**

In previous releases, if a back-end server did not support enterprise groups, users belonging to enterprise groups were individually added to WebCenter Portal roles; this behavior has changed.

---

### F.12 Troubleshooting Issues with Content Repositories

This section includes the following subsections:

- Documents Tools Unavailable in WebCenter Portal

### F.12.1 Documents Tools Unavailable in WebCenter Portal

If document tools are not available in WebCenter Portal, that is, the Documents tab is not available in your Home portal or other portals, there may be a connection issue to the backend WebCenter Content Server, or the WebCenter Content Server does not contain some required WebCenter Portal data.

To diagnose the problem, follow these steps:

1. Check that the WebCenter Content Server is up and running. Ensure the server has the **Server Port** *(intradoc)* configured and the **Server IP Filter** allows WebCenter Portal to connect:
   
   a. Log in to the Content Server.
   
   b. Click Administration.
c. Click **Configuration for instance name**.

d. Click the **Server Configurations** link under System Configuration.

e. Ensure that **Server Port** is listed and that **Server IP Filter** allows access from WebCenter Portal.

2. Check the connection between WebCenter Portal and the WebCenter Content Server that is being used as the backend document store:

   a. Login to Fusion Middleware Control, and navigate to Content Repository Connection settings. For details, see Creating a Connection to Oracle WebCenter Content Server Using Fusion Middleware Control.

   b. Select and edit the required connection.

   c. Ensure the **Active Connection** check box is selected.

   d. Ensure that **Content Administrator**, **Portal Server Identifier** and **Security Group** are specified correctly:

      • **Content Administrator** - the Content Administrator *must* have administration rights on the Content Server. This user will be used to create and maintain folders for portal content, security groups and roles, and manage content access rights.

      • **Portal Server Identifier and Security Group** - both must be unique and not used by any other WebCenter Portal instance using the same WebCenter Content Server. If you change these values, ensure that both values are changed and not just one of them.

      • **Security Group** - must be 14 characters or less as it is used as a prefix for items created in WebCenter Content Server, which have a limit on the length of the item name.

   e. If you make changes, click **Test** to verify that the connection works.

   f. Click **OK** to save the connection.

   g. If you made changes, you must restart **WC_Portal**, the managed server on which WebCenter Portal is deployed.

   h. Log in to WebCenter Portal to see if the documents tools are available after your connection updates.

3. If the Document service is still not available, check log messages around WebCenter Portal start-up for any errors connecting to the WebCenter Content Server or saving data on the WebCenter Content Server.

   For details, see Viewing and Configuring WebCenter Portal Logs.

4. If the log does not show any useful log information, increase the logging level for the WebCenter Content Server, and then restart WebCenter Portal to investigate the messages in more detail:

   a. i. Use Fusion Middleware Control (or edit the logging.xml file) to increase logging for **oracle.webcenter.doclib.internal.model** and **oracle.webcenter.doclib.internal.spaces**.
      
      See also, Viewing and Configuring WebCenter Portal Logs.
ii. Restart WebCenter Portal.

iii. View the logs again:

**F.13 Troubleshooting Issues with Analytics**

**Problem**

If users cannot see analytics in WebCenter Portal, verify the following:

**Solution**

- Check that the Analytics Collector configuration is correct and in particular that both Enable WebCenter Event Collection and Active Connection are both set (Figure F-4). See Registering an Analytics Collector for Your Application.

**Figure F-4 Enabling the Connection and Analytics Collection**

![Edit Analytics Collector Connection](image)

If you make changes to the connection you must restart the managed server on which WebCenter Portal is deployed. For more information, see Starting and Stopping Managed Servers for WebCenter Portal Application Deployments.

- If WebCenter Portal was recently upgraded, verify that the domain startup script does not contain legacy Analytics Collector settings as these values override any connection details that you specify through Fusion Middleware Control or using WLST.

- 1. Shut down the managed server on which WebCenter Portal is deployed (WC_Portal).

2. Edit the domain startup script `setDomainEnv` located at:
   - UNIX: `DOMAIN_HOME/bin/setDomainEnv.sh`
   - Windows: `DOMAIN_HOME\bin\setDomainEnv.cmd`

3. Remove Analytics Collector settings.

4. Restart the managed server.

**Problem**

Analytics Collector deployment fails when configured with the Pluggable Database (PDB), if the number of cursors in the database exceeds the maximum limit.

**Solution**

Try to increase the number of `open_cursors` in the Pluggable Database (PDB), for example 3000. The allowed value for the `open_cursors` is from 0 to 65535.

where, `open_cursors` specifies the maximum number of open cursors allowed per session.
Troubleshooting Issues with Oracle SES

This section provides troubleshooting tips on administering Oracle SES. It includes the following topics:

- No Search Results Found
- Search Failure Errors
- Cannot Grant View Permissions to WebCenter Portal
- Restricting Oracle SES Results by Source Group or Source Type
- Search Results Do Not Include Secured Resources
- Search Results Do Not Include Documents
- Search Results Do Not Include Discussions and Announcements
- Search Results Do Not Include Recently Added Resources
- Search Results Do Not Reflect Authorization Changes
- Search Results Do Not Include Resources Available to Wide Audience

F.14.1 No Search Results Found

Problem

No search results are found.

Solution

Check the following:

- Oracle SES Connection
- Documents and Discussions Connections
- WebCenter Portal Crawl Configuration
- Oracle SES Configuration
- User Authentication
- Oracle SES Crawling
- Oracle SES Authorization

F.14.1.1 Oracle SES Connection

Confirm that you can access the Oracle SES SOAP URL and that connection properties to Oracle SES are correct.

For more information, see Testing the Connection to Oracle SES.

F.14.1.2 Documents and Discussions Connections

Confirm that connections exist in WebCenter Portal to the Content Server and the discussions server.
The Oracle SES log shows if a WebCenter Portal component is excluded from the search. Locate the search log file on the Oracle SES instance and check the log file for `totalSearchTime`.

When nothing is excluded (that is, Oracle SES is enabled for all WebCenter Portal components), the line looks similar to the following:

```
req=Search userName=vicki totalSearchTime=1150ms userQuery=0712>
```

When Oracle SES is not enabled for Documents, Discussions, and Announcements, the lines look similar to the following:

```
req=Search userName=vicki totalSearchTime=1133ms userQuery=0712
-wc_serviceId:oracle.webcenter.doclib
-wc_serviceId:oracle.webcenter.collab.forum
-wc_serviceId:oracle.webcenter.collab.announcement>
```

F.14.1.3 WebCenter Portal Crawl Configuration

Use Fusion Middleware Control or WLST to confirm that Oracle SES is enabled in WebCenter Portal, as described in Setting Up WebCenter Portal for Oracle SES.

F.14.1.4 Oracle SES Configuration

1. Confirm that you have installed all required patches for Oracle SES. For the latest information on required patches, see Back-End Requirements for Search in Installing and Configuring Oracle WebCenter Portal and the Release Notes.

2. Confirm that Oracle SES is configured with an identity management system to validate and authenticate users. Also confirm that WebCenter Portal and Oracle SES use the same identity management system, such as Oracle Internet Directory. All repositories you are using (such as WebCenter Portal, WebCenter Content Server, and Oracle WebCenter Portal's Discussion Server) must share the same user base as Oracle SES.

Additionally, each Oracle SES instance must have a trusted entity for allowing WebCenter Portal end users to be securely propagated at search time. For more information, see Oracle SES – Configuration.

To test the Oracle SES is connection with a federated trusted entity user, see Testing the Connection to Oracle SES.

F.14.1.5 User Authentication

Confirm that the user exists (that is, confirm that the user can log on) in WebCenter Portal identity plug-ins, Oracle SES, and all configured data repositories, such as the Content Server and the discussions server.

An Oracle SES proxy login error in the WebCenter Portal diagnostic log looks similar to the following:

```
Received status "failed" during proxy login with application entity "weblogic" to Oracle SES at [http://host:port/search/query/OracleSearch], as search user "vicki". Defaulting to public.
```

F.14.1.6 Oracle SES Crawling

Confirm that Oracle SES crawled successfully in all sources.

1. In the Oracle SES administration tool, go to the Home - Schedules tab. Click the Log File icon to display the log file for the source. To obtain the location of the full
log, click the Status link. The Crawler Progress Summary and Log Files by Source section displays the full path to the log file.

2. If Oracle SES fails to log in to the Content Server crawl endpoint due to an authentication error, then the following errors are logged:

   EQP-60303: Exiting saxthread due to errors

3. For the Oracle WebCenter source, verify if the rsscrawl servlet is unavailable. For example:

   FATAL main EQP-80309: Exception while opening a stream to the URI: https://example.com:port/rsscrawl?command=GetControl

4. For the Content Server source, verify if the password is invalid. For example:

   -1 Admin credentials passed in were not valid - Rejecting request.

5. Monitor the crawl process in the Oracle SES administration tool with a combination of the following:

   a. Check the crawler progress and status on the Home - Schedules page. (Click Refresh Status.) From the Status page, you can view statistics of the crawl.

6. Additionally, examine snapshots and data feeds on the Content Server instance, and examine the Oracle WebCenter Portal’s Discussions Server database.

F.14.1.7 Oracle SES Authorization

1. In the Oracle SES administration tool, go to the Home - Sources tab.

2. Click the Edit icon for each source to see source configuration tabs.

3. Click the Authorization tab to confirm the authorization connection string, user name, password, and authorization user ID format.

4. Examine the Oracle SES log file (described in a previous step). Look for phrases including a URL value. For example, the URIHandler initialized for the URI:

   http://host:8888/sesUserAuth?userId=someone

For detailed information on the Oracle SES administration tool, see the Oracle SES documentation included with the product. (This is listed in the WebCenter Portal product area on the Oracle Fusion Middleware documentation library.)
F.14.2 Search Failure Errors

**Problem**
Search failure messages may appear inconsistently after a search. For example, when connecting to database `jdbc:oracle:thin:@host:1521/sid`, user: `PREFIX_DISCUSSIONS_CRAWLER`:

- Search failure: time out error
- Search failure: problem preparing search executor
- Search failure: problem with execution

**Solution**
Wait a moment, and try the search again. These messages appear when the service times out, which largely depends on the system load. If the time out error persists, adjust the `executionTimeout` parameter in the `setSearchConfig` command.

For command syntax and examples, see `setSearchConfig` in WLST Command Reference for WebLogic Server.

F.14.3 Cannot Grant View Permissions to WebCenter Portal

**Problem**
You get the following error when granting "view" permissions, as described in Setting Up WebCenter Portal for Oracle SES.

Command FAILED, Reason: `javax.naming.directory.AttributeInUseException`:

```
[LDAP: error code 20 - uniquemember attribute has duplicate value.]; remaining name 'orc1guid=F0CC506017B711DFBFFED9EA6A94EAE0C,cn=Permissions, cn=JAAS Policy, cn=webcenter, cn=wc_domain, cn=JPSContext, cn=jpsroot_webcenter_dadvmc0057'
```

**Solution**
This error appears if the permission is granted. Ignore the error.

F.14.4 Restricting Oracle SES Results by Source Group or Source Type

**Problem**
You want to restrict search results by source group or source type.

**Solution**
In the Oracle SES administration tool, navigate to the Home - Sources - Customize Federated Source - Search Restrictions page to set search restrictions. Alternatively, use filters, where each filter is a restriction on search result.

For detailed information about using Oracle SES, see the Oracle SES documentation on the Oracle Fusion Middleware documentation library (in the WebCenter Portal product area).
F.14.5 Search Results Do Not Include Secured Resources

**Problem**

Search results do not include secured resources. One cause is that the proxy login of WebCenter Portal users failed in Oracle SES. An Oracle SES proxy login error in the WebCenter Portal diagnostic log looks similar to the following:

Received status "failed" during proxy login with application entity "weblogic" to Oracle SES at http://host:port/search/query/OracleSearch, as search user "vicki". Defaulting to public.

**Solution**

Confirm that Oracle SES is configured with an identity management system to validate and authenticate users.

Also confirm that WebCenter Portal and Oracle SES use the same identity management system, such as Oracle Internet Directory. All repositories (such as WebCenter Portal, WebCenter Content Server, and Oracle WebCenter Portal Discussions Server) must share the same user base as Oracle SES.

Additionally, each Oracle SES instance must have a trusted entity for allowing WebCenter Portal end users to be securely propagated at search time.

**Problem**

Search results do not include secured resources. Another cause is that authorization endpoints are not configured correctly. Locate the search log file on the Oracle SES instance. Look for phrases including the URL value. For example:

EQP-80309: Exception while opening a stream to the URI: http://<host>:<port>/sesUserAuth?userId=<end-user-name>

QueryFilterPlugin returned null or empty array value for security attribute "WCSECATTR". Values required for all security attributes.

**Solution**

1. In the Oracle SES administration tool, go to the Home - Sources tab.

2. Click the Edit icon for the source to see source configuration tabs.

3. Click the Authorization tab to confirm the authorization connection string, user name, password, and authorization user ID format.

**Problem**

Search results do not include secured resources. Yet another cause is that authorization endpoints are not returning authorization data.

Locate the search log file on the Oracle SES instance. Look for phrases including a URL value. For example, the URIHandler initialized for the URI:

http://host:8888/sesUserAuth?userId=someone

**Solution**

Reduce the number of crawl sources.
F.14.6 Search Results Do Not Include Documents

**Problem**
Search results do not include documents. Crawling of Content Server documents fails.

**Solution**
1. In the Oracle SES administration tool, go to the Home - Schedules tab.
2. Click the **Log File** icon to display the log file for the source. To obtain the location of the full log, click the **Status** link.
3. The Crawler Progress Summary and Log Files by Source section display the full path to the log file. If Oracle SES fails to log in to the Content Server crawl endpoint due to an authentication error, then the following errors are logged:
   - EQP-60303: Exiting saxthread due to errors,
   - EQP-80330: Unrecognized QName
   - oracle.search.sdk.crawler.PluginException
4. Update the configuration parameters of the Content Server crawl source.

F.14.7 Search Results Do Not Include Discussions and Announcements

**Problem**
In the crawl source, the **Single Record Query** parameter is set to true on the Authorization tab.

**Solution**
Set the **Single Record Query** parameter to false.

**Problem**
The identity management system uses mixed case user names, but Oracle WebCenter Portal’s discussions server (Jive) database uses all lowercase user names. The authorization query for the crawl source must apply the **LOWER()** function to user name parameters.

**Solution**
Confirm that the authorization query looks like the following statement:

```sql
SELECT forumID as WCSECATTR FROM AUTHCRAWLER_FORUM_VW WHERE (username) = LOWER(?)
UNION SELECT DISTINCT -1 as WCSECATTR FROM AUTHCRAWLER_FORUM_VW
```

**Note:**
It is not recommended to convert the actual user name column to lowercase in the query; for example, **WHERE LOWER(username) = LOWER(?)**. Adding a function to a possibly indexed column could affect performance.

F.14.8 Search Results Do Not Include Recently Added Resources

**Problem**
A new resource was created recently, but search results do not include the new resource.
Solution
New resources must be crawled and indexed before they can be returned in search results. Crawl schedules are run periodically to index new content. If new resources are created often, then increase the frequency of the crawl schedule. If new resources need to be crawled immediately, then start that crawl schedule manually.

F.14.9 Search Results Do Not Reflect Authorization Changes

Problem
Some resources are accessible to more users due to authorization changes in WebCenter Portal. For example, resources in a portal are now accessible to all authenticated users. The affected users cannot search for those resources.

Solution
Authorization data is cached in Oracle SES. The cache is invalidated according to the Security Filter Lifespan global setting in Oracle SES. The default value is 1 day or 1440 minutes. Adjust the value according to the general frequency of changes to authorization data.

F.14.10 Search Results Do Not Include Resources Available to Wide Audience

Problem
A portal is publicly accessible, but unauthenticated users cannot see portal resources in search results.

Solution
By default, view access of resources is granted to portal members only, even if the portal is accessible to the public. View access of resources must be granted to non-members explicitly. Go to the portal settings page, select the Role tab and the intended role, and check view access to resources.

F.15 Troubleshooting Issues with Notifications

Problem
No notifications are received.

Solution
• If the log indicates that the Notification Sender is not configured, then it means the service is unable to find the connection to use.

• Ensure that Notifications is configured to use either a valid BPEL or MAIL connection. This can be verified through the getNotificationsConfig() WLST command (see Specifying the Notifications Channel Using WLST) or through the Fusion Middleware Control user interface (see Specifying the Notifications Channel Using Fusion Middleware Control).

Problem
Notifications is configured (BPEL or MAIL) correctly, but still no notifications.

Solution
Notifications relies on a valid BPEL or MAIL connection. Run the respective connection validations and troubleshooting scenarios as described in Managing Mail or Managing the SOA Connection for WebCenter Portal Membership Workflows.
Problem
MAIL or BPEL connections are set up appropriately, but still do not receive notifications.

Solution
Notifications are generated based on user subscriptions. Apart from notification for invitations to connect, which is configured out of the box, other notifications are generated only when a user has specifically subscribed. Ensure that the user has created subscriptions through his or her personal Preferences or through application- or object-level subscriptions. For more information, see Subscribing to the Application, to Portals, and to Objects in Using Oracle WebCenter Portal.

Problem
Users have set up their subscriptions, but still receive no notifications.

Solution
• Depending on how it is configured, Notifications delegates the delivery of notifications to BPEL/UMS or the Mail service. For the Mail service, ensure that the user's email address is configured. For UMS, look in Fusion Middleware Control under the Message Status section of User Messaging Service, where you see the status of each outgoing message from UMS. For more information, see Monitoring Oracle User Messaging Service in Administering Oracle SOA Suite and Oracle Business Process Management Suite.
• For UMS, this problem could also mean that the configuration of the sender on the WebCenter Portal side does not match or find a corresponding driver on the UMS side. Ensure that the sender address (domain) allows UMS to match at least one driver for outbound messages.
• For the Mail service, ensure that the mail connection points to a shared connection as described in About Connection Channels.

Problem
For UMS configurations, users receive notifications on some channels but not on others.

Solution
This is most likely due to the way the user’s messaging channels and filters are configured. For more information, see Establishing and Managing Your Messaging Channels and Filters in Using Oracle WebCenter Portal.

F.16 Troubleshooting External Application Issues
This section contains common issues and workarounds related to external applications.
This section contains the following topic:
• Users Experience Password Lockout

F.16.1 Users Experience Password Lockout

Problem
Using an external application to store or retrieve credentials for collaboration connections when your identity store uses a password change policy that causes the
password to be changed in the identity store directly, may lead users to experience a password lockout.

Solution
The external applications cannot know that a password has been changed directly in the identity store and consequently cannot react to it. A partial solution is to define one external application for all your collaboration connections.

F.17 Troubleshooting Security Configuration Issues
This section includes the following subsections:

- WebCenter Portal Application Does Not Find Users in LDAP Provider
- Portal Created with Errors When Logged in as OID User
- Users Cannot Self-Register when WebCenter Portal Configured with Active Directory
- User Made Administrator Does Not Have Administrator Privileges
- OmniPortlet Producer Authorization Exception in SSO Environment
- Deploying the SAML SSO-specific Discussions EAR file Produces an Exception
- Configuring SAML Single Sign-on Produces 403 Error
- Impersonation Session Produces Error with OAM 11.1.2.2.0

F.17.1 WebCenter Portal Application Does Not Find Users in LDAP Provider

Problem
Weblogic Server was configured with an external LDAP provider. Users in the external LDAP can log in to WebCenter Portal, but when you try to assign the administrator role in WebCenter Portal to a user from the external LDAP, no users are found.

Solution
Change the Control Flag for the DefaultAuthenticator Authentication Provider to Sufficient as described in Configuring the Identity Store. Restart the Administration Server and Managed Servers for the domain.

F.17.2 Portal Created with Errors When Logged in as OID User

Problem
When logged in to WebCenter Portal as an OID user (for example, orcladmin), and you try to create a portal, the portal gets created but with errors. The error message appears as "No matching users were found with search string <login user>".

Solution
The following property is missing in the jps-config.xml file:

```xml
<property name="jps.user.principal.class.name" value="weblogic.security.principal.WLSUserImpl"/>
```

To fix this:
1. Edit `DOMAIN_HOME/config/fmwconfig/jps-config.xml`.

2. Add this line in the general properties:
   ```xml
   <property name="jps.user.principal.class.name" value="weblogic.security.principal.WLSUserImpl"/>
   ``

3. Restart the WC_Portal server.

### F.17.3 Users Cannot Self-Register when WebCenter Portal Configured with Active Directory

**Problem**

Users cannot self-register with Active Directory after configuring WebCenter Portal to use AD authenticator. When a user tries to self-register, the following error message appears:

"User not created. Either the user name or the password does not adhere to the registration policy or the identity store is unavailable. Specify the required user credentials or contact your administrator for assistance."

**Solution**

To fix the problem:

1. Set the user name attribute to `sAMAccountName` while configuring Active Directory in the WebLogic Administration Console.

2. Use the HTTPS port of the LDAP and enable the SSL checkbox while configuring Active Directory in the WebLogic Administration Console.

### F.17.4 User Made Administrator Does Not Have Administrator Privileges

**Problem**

After logging in as `orcladmin` and making a user an administrator, after logging out and logging in as that user, the Administrator link is still not available.

**Solution**

The problem is due to duplicate `cn` entries in the identity store. Since `cn` is mapped to the username attribute, it must be unique. Remove the duplicate from the identity store and the user should have the appropriate privileges for `cn`.

### F.17.5 OmniPortlet Producer Authorization Exception in SSO Environment

**Problem**

OmniPortlet producer receives an authorization exception when it tries to store connection information in the Credential Store Framework (CSF) wallet when WebCenter Portal is configured with SSO.

**Solution**

Grant the required permissions to `ssofilter.jar` by connecting to the Oracle WebCenter Portal Administration Server using WLST (for more information, see [Running Oracle WebLogic Scripting Tool (WLST) Commands](#)) and running the following grant commands:
grantPermission(codeBaseURL="file:${oracle.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar",
permClass="oracle.security.jps.service.credstore.CredentialAccessPermission",
permTarget="context=SYSTEM,mapName=omniportlet_user,keyName=*",
permActions="*")

grantPermission(codeBaseURL="file:${oracle.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar",
permClass="oracle.security.jps.service.credstore.CredentialAccessPermission",
permTarget="context=SYSTEM,mapName=omniportlet_default,keyName=*",
permActions="*")

F.17.6 Deploying the SAML SSO-specific Discussions EAR file Produces an Exception

Problem
Undeploying the discussions EAR file and deploying the SAML SSO-specific discussions EAR file and then starting the application in the WLS Administration Console produces the following exception:

java.lang.ClassCastException:
org.apache.xerces.parsers.XIncludeAwareParserConfiguration

Solution
Restart the WC_Collaboration server. This should fix the issue and the discussions application will be in an active state.

F.17.7 Configuring SAML Single Sign-on Produces 403 Error

Problem
While testing a SAML SSO configuration you encounter 403 errors, and after turning on debug logging, as described in Checking Your Configuration, you see the following kind of error logs in the destination server:

Troubleshooting Security Configuration Issues

F-48 Administering Oracle WebCenter Portal
Solution

Chances are that something went wrong with your certificate setup due to which SAML assertions are not being validated. This is likely because the certificate registered in the SAML Identity asserter is incorrect. Export the certificate used for SAML SSO setup in the WebCenter Portal domain specified by `certAlias` and `certPassword` and copy it to a accessible location in the destination domain.

1. Update the relevant config section in the `wcsamlsso.properties` file in the WebCenter Portal domain (for example, if the certificate was invalid for the SOA configuration, update the `certPath` in the `soa_config` section).

2. Open the WebLogic Server Admin Console, and from the `WC_Portal` domain go to `Security Realm > Providers > Credential Mapping > wcsamlcm` > `Management > Relying Parties` and delete the relying parties relevant to the domain (for example, for SOA, it would be Worklist Detail.)

3. Go to `Destination Domain > Security Realm > Providers > Authentication >wcsamlia` > `Management > Asserting Parties` and delete the corresponding asserting parties.

4. Open the Certificates tab and delete the certificate as well.

5. Go back to the WebCenter Portal domain and re-run the scripts for creating asserting-relying parties pairs. For SOA, for example, you would need to re-run:

```bash
WCP_ORACLE_HOME/webcenter/scripts/samlsso/configureWorklistDetail.py
```

6. Test your configuration again. If all works well, you can disable SAML logging.

F.17.8 Impersonation Session Produces Error with OAM 11.1.2.2.0

**Problem**

An internal error is produced when switching between users in an impersonation session with OAM 11.1.2.2.0.

**Solution**

Check that:

- The `EnableImpersonation` flag in `oam-config.xml` is set to `true`
- The new OID identity store you created in the OAM 11.1.2.2 console does not contain spaces (for example, `Oracle Identity Store` rather than `OracleIdentityStore`)
- The `UserPassword` attribute for the new identity store is `userPassword`
