Oracle® Fusion Middleware
Developing Extensible Applications for Oracle Web Services Manager
12c (12.2.1.1)
E71228-01

June 2016
Documentation for software developers that describes how to develop custom assertions with Oracle Web Services Manager (OWSM).

1 Understanding Policies and Assertions in Oracle Web Services Manager
- 1.1 About Predefined Policies and Assertions .......................................................................................................... 1-1
- 1.2 About Web Service Policies Creation .................................................................................................................... 1-1
- 1.3 Understanding Custom Assertions ......................................................................................................................... 1-2
  - 1.3.1 About Policies, Assertions, Expressions, and Operators ..................................................................................... 1-2
  - 1.3.2 About Policy Combinations ............................................................................................................................... 1-2
  - 1.3.3 Supported Custom Assertion Categories ........................................................................................................... 1-4
  - 1.3.4 About the Rules for Binding Custom Assertions ................................................................................................ 1-4
  - 1.3.5 About the Life Cycle of a Custom Assertion ........................................................................................................ 1-5
  - 1.3.6 Understanding the Types of Custom Assertions .................................................................................................. 1-5

2 Creating Custom Assertions
- 2.1 About Policy Name ..................................................................................................................................................... 2-1
- 2.2 Developing Custom Assertions for Web Service .................................................................................................. 2-1
  - 2.2.1 Creating the Custom Assertion Executor ............................................................................................................ 2-2
  - 2.2.2 Creating the Custom Policy File .......................................................................................................................... 2-3
  - 2.2.3 Specifying the Custom Assertion Executor .......................................................................................................... 2-4
  - 2.2.4 Creating the Custom Assertion JAR File ............................................................................................................... 2-6
2.2.5 Adding the Custom Policy to the Policy Store ................................................................. 2-6
2.2.6 Deploying the Custom Assertion .................................................................................... 2-7
2.2.7 Attaching the Custom Policy to a Web Service ............................................................. 2-8
2.3 Testing the Web Service ..................................................................................................... 2-8

3 Managing Sample Custom Assertions

3.1 Validating IP Address in Custom Assertion ........................................................................ 3-1
3.1.1 Validating IP Address Using Custom Assertion Executor ............................................ 3-1
3.1.2 Validating IP Address Using Policy File ........................................................................... 3-3
3.1.3 Validating IP Address Using policy-config.xml File .................................................... 3-4
3.1.4 Validating IP Address Using Web Service ..................................................................... 3-4
3.1.5 Validating IP Address Using JSE Client .......................................................................... 3-4

3.2 Performing IP Address Validation in Custom Assertion .................................................. 3-5

3.3 Encrypting and Decrypting Data in Custom Assertion ...................................................... 3-6
3.3.1 Encrypting and Decrypting Data Using Custom Assertion Executor ............................. 3-6
3.3.2 Encrypting Elements of an Inbound Message Using Custom Assertion Executor .......... 3-8
3.3.3 Decrypting Elements of an Outbound Message Using Custom Assertion Executor ... 3-12
3.3.4 Encrypting Data Using Custom Assertion Executor ...................................................... 3-16
3.3.5 Decrypting Data Using Custom Assertion Executor ...................................................... 3-16
3.3.6 Receiving the Encrypted Message Using Composite Application ............................... 3-17
3.3.7 Receiving the Decrypted Message Using Composite Application ............................... 3-18

3.4 Performing Data Encryption and Decryption in Custom Assertion .................................. 3-18

3.5 Authenticating a User in Custom Assertion ....................................................................... 3-20
3.5.1 Authenticating Using Custom Assertion Executor .......................................................... 3-20
3.5.2 Authenticating Using Policy File ..................................................................................... 3-24
3.5.3 Implementing User Authentication Using Files ............................................................... 3-25

3.6 Performing User Authentication in Custom Assertion ..................................................... 3-31

4 Implementing Advanced Features in Custom Assertions

4.1 Supplying Parameters for Custom Assertions ...................................................................... 4-1
4.1.1 About Custom Assertion Interfaces ............................................................................... 4-1
4.1.2 Inputting Parameters to Custom Assertions .................................................................... 4-2

4.2 Examining OWSM Context Properties ............................................................................... 4-2
4.2.1 About OWSM Context Properties Interfaces ................................................................. 4-2
4.2.2 Accessing OWSM Context Properties .......................................................................... 4-3

4.3 Accessing OWSM Custom Security Assertion .................................................................. 4-3
4.3.1 About OWSM Custom Security Assertion Stages .......................................................... 4-3
4.3.2 About OWSM Custom Security Assertion Interfaces .................................................. 4-3
4.3.3 Accessing Request, Response, and Fault Message Objects ........................................... 4-4

4.4 Accessing Parts of a Message Using XPath ....................................................................... 4-4
4.4.1 About XPath Expression ................................................................................................. 4-4
4.4.2 Identifying the Value of a Node ...................................................................................... 4-5
4.4.3 Adding a Namespace to Namespace Context ................................................................. 4-5
4.4.4 Retrieving the Value of a Node .................................................................................. 4-5
4.5 Retrieving Certificates Used by Container for SSL....................................................... 4-6
4.6 Accessing Transport Properties .................................................................................... 4-6
4.7 Accessing Credential Store Framework Keys ............................................................... 4-6
4.8 Handling Exceptions in Custom Assertions .................................................................... 4-8
  4.8.1 About WSMException Method .................................................................................. 4-8
  4.8.2 Processing Exceptions in WSMException................................................................. 4-9

A Custom Assertions Schema Reference

A.1 Element Hierarchy of Custom Assertions in a WS-Policy File ........................................  A-1
A.2 Custom Assertion Elements ............................................................................................ A-1
  A.2.1 wsp:Policy ................................................................................................................. A-2
  A.2.2 orasp:Assertion ......................................................................................................... A-2
  A.2.3 orawsp:bindings ....................................................................................................... A-3
  A.2.4 orawsp:Implementation ............................................................................................ A-4
  A.2.5 orawsp:Config .......................................................................................................... A-4
  A.2.6 orawsp:PropertySet .................................................................................................. A-4
  A.2.7 orawsp:Property ....................................................................................................... A-5
  A.2.8 orawsp:Description .................................................................................................. A-5
  A.2.9 orawsp:Value ............................................................................................................ A-6

Preface

This preface describes the document accessibility features and conventions used in this guide—Developing Extensible Applications for Oracle Web Services Manager.

Intended Audience

This manual is intended for software developers who are interested in creating custom assertions for web services.

How to Use This Guide

This document describes the following:

About Policies and Assertions

• Learn about predefined policies and assertions
  For more information, see About Predefined Policies and Assertions and Understanding Custom Assertions.

• Learn about parts and types of custom assertions
  For more information, see About Policy Combinations and Understanding the Types of Custom Assertions.

• Review the rules and restrictions about categories and bindings
  For more information, see Supported Custom Assertion Categories and About the Rules for Binding Custom Assertions.

• Review the lifecycle of a custom assertion
  For more information, see About the Life Cycle of a Custom Assertion.

• Understand the types of custom assertions
  For more information, see Understanding the Types of Custom Assertions.

Creation of Custom Assertions

• Review the naming conventions for policies and assertions
  For more information, see About Policy Name.

• Create the custom assertions
  For more information, see Developing Custom Assertions for Web Service.

• Test the custom assertion
For more information, see Testing the Web Service.

Code Examples

• Validating IP Address in Custom Assertion
• Encrypting and Decrypting Data in Custom Assertion
• Authenticating a User in Custom Assertion

Advanced Topics

• Implement advanced features:
  – input parameters to the assertion
  – access OWSM context properties
  – access request, response, and fault message objects
  – access specific parts of a message based on XPath
  – access certificate used by container for SSL
  – access transport properties such as HTTP requests and responses
  – access CSF keys
  For more information, see Implementing Advanced Features in Custom Assertions.

• Handling exceptions
  For more information, see Handling Exceptions in Custom Assertions.

References

• XML schema for creating custom assertions
  For more information, see Custom Assertions Schema Reference.

• Java API reference for OWSM
  For more information, see Java API Reference for Oracle Web Services Manager.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following manuals:

• "Web Services" in Release Notes for Oracle Fusion Middleware Infrastructure
Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New in This Guide

This chapter lists the new and changed features of Oracle Web Services Manager (OWSM) extensibility.

This document is the new edition of the formerly titled Extensibility Guide for Oracle Web Services Manager.

New and Changed Features for Release 12c (12.2.1.1)

This topic contains the New and Changed Features for Release 12c (12.2.1.1).

Minor updates, such as fixes or corrections, were made to this document.

New and Changed Features for Release 12c (12.2.1)

This topic contains the New and Changed Features for Release 12c (12.2.1).

Minor updates, such as fixes or corrections, were made to this document.

New and Changed Features for Release 12c (12.1.3)

This topic contains the New and Changed Features for Release 12c (12.1.3).

Oracle Fusion Middleware 12c (12.1.3) includes the following new and changed features for this document:

• Added support for the "provides" attribute in the orasp:ipAssertion element. This attribute is required by RESTful web service and client endpoints. For more information, see the following sections:
  – “Creating the Custom Policy File”
  – “orasp:Assertion”

New and Changed Features for Release 12c (12.1.2)

This topic contains the New and Changed Features for Release 12c (12.1.2).

Oracle Fusion Middleware 12c (12.1.2) does not contain any new and changed features for this features document.
Oracle Web Services Manager (OWSM) delivers set of predefined policies and assertion templates that are automatically available when you install Oracle Fusion Middleware. OWSM also enables you to develop custom assertions when specific functionality is not provided with the predefined policies. For example, if an application requires the use of an authentication type that is not available in OWSM, then you can create a custom authentication assertion. This guide provides information on how to develop, deploy, and test custom assertions.

This chapter includes the following sections:

- About Predefined Policies and Assertions
- About Web Service Policies Creation
- Understanding Custom Assertions

For definitions of unfamiliar terms found in this and other books, see the Glossary.

1.1 About Predefined Policies and Assertions

OWSM provides read-only predefined policies with Oracle Fusion Middleware.

For information about the OWSM policies and their use, see Securing Web Services and Managing Policies with Oracle Web Services Manager.

Each policy consists of one or more assertions, defined at the domain-level, that define the security requirements. OWSM also provides a set of predefined assertion templates. For information about these predefined assertions and their use, see,

- "Predefined Assertion Templates" in Securing Web Services and Managing Policies with Oracle Web Services Manager
- "Managing Policy Assertion Templates" in Securing Web Services and Managing Policies with Oracle Web Services Manager

In addition to using the existing assertions, you can develop your own custom assertions using the APIs for OWSM. For more information, see the Java API Reference for Oracle Web Services Manager.

1.2 About Web Service Policies Creation

This topic lists the methods you can use to create web service policies.

You can use any of the following methods to create a web service policy:

- Create a new policy using existing assertion templates
- Create a new policy from an existing policy
• Import a policy from a zip archive
• Create policies from custom assertions

The first three methods are described in "Managing Web Service Policies" in Administering Web Services.

This guide describes how to create policies using custom assertions that you develop.

1.3 Understanding Custom Assertions

You can develop custom assertions to fulfill the requirement of specific functionality that is not available with the predefined policies or assertions provided by OWSM.

The following topics provide information to help you understand custom assertions:

• About Policies, Assertions, Expressions, and Operators
• About Policy Combinations
• Supported Custom Assertion Categories
• About the Rules for Binding Custom Assertions
• About the Life Cycle of a Custom Assertion
• Understanding the Types of Custom Assertions

1.3.1 About Policies, Assertions, Expressions, and Operators

Web services use policies to describe their capabilities and requirements. Policies define how a message must be secured and delivered reliably, whether a message must flow a transaction, and so on. A policy is a set of assertions (rules, requirements, obligations) that express specific policy requirements or properties of a web service.

A policy assertion is a basic unit representing an individual requirement, capability or property in a policy. Assertions use domain-specific semantics to enable interoperability.

A policy expression is an XML representation of a policy. The policy expression consists of various logical combinations of the basic policy assertions that form the content of the wsp:Policy element. The logical combinations are created using policy operators (wsp:Policy, wsp:All, and wsp:ExactlyOne elements).

1.3.2 About Policy Combinations

You can combine policy with either assertions or operators. The following topics explain this in detail:

• Combining a Policy with an Assertion
• Combining a Policy with Two Assertions and wsp:All Operator
• Combining a Policy with Many Assertions and wsp:ExactlyOne Operator
1.3.2.1 Combining a Policy with an Assertion

This topic explains an example that shows a policy (defined by the wsp:Policy element) with one assertion (orasp:AssertionOne).

The following is the example. For more information about the elements and Oracle extensions of their attributes, see Custom Assertions Schema Reference.

```xml
<wsp:Policy
   xmlns="http://schemas.xmlsoap.org/ws/2004/09/policy"
   xmlns:orasp="http://schemas.oracle.com/ws/2006/01/securitypolicy">

   <orasp:AssertionOne orawsp:Silent="true" orawsp:Enforced="true"
   orawsp:name="Validator"
   orawsp:category="security/authentication">
   ...
   </orasp:AssertionOne>

</wsp:Policy>
```

1.3.2.2 Combining a Policy with Two Assertions and wsp:All Operator

This topic shows an example combining a policy with two assertions.

The following example shows a list of policy assertions wrapped by the policy operator wsp:All element (all of the policy assertions in the list must evaluate to true). The wsp:Policy element is semantically equivalent to wsp:All.

```xml
<wsp:Policy
   xmlns="http://schemas.xmlsoap.org/ws/2004/09/policy"
   xmlns:orasp="http://schemas.oracle.com/ws/2006/01/securitypolicy">

   <wsp:All>
   <orasp:AssertionOne orawsp:Silent="true" orawsp:Enforced="true"
   orawsp:name="SAMLValidator"
   orawsp:category="security/authentication">
   ...
   </orasp:AssertionOne>
   <orasp:AssertionTwo orawsp:Silent="true" orawsp:Enforced="true"
   orawsp:name="UserNameValidator"
   orawsp:category="security/authentication">
   ...
   </orasp:AssertionTwo>
   </wsp:All>

</wsp:Policy>
```

1.3.2.3 Combining a Policy with Many Assertions and wsp:ExactlyOne Operator

This topic shows an example of combining a policy with assertions.

In the following example, each line within the operators <wsp:All>...</wsp:All> represents a valid policy alternative. The policy is satisfied if one set of the policy alternatives is true.

```xml
<wsp:Policy
   xmlns="http://schemas.xmlsoap.org/ws/2004/09/policy"
   xmlns:orasp="http://schemas.oracle.com/ws/2006/01/securitypolicy">

   <wsp:ExactlyOne>
   <wsp:All>
   <orasp:SAML orawsp:Silent="true" orawsp:Enforced="true"
   orawsp:name="SAML" ...
   </wsp:ExactlyOne>
   <wsp:All>
   <orasp:AssertionOne orawsp:Silent="true" orawsp:Enforced="true"
   orawsp:name="Validator"
   orawsp:category="security/authentication">
   ...
   </orasp:AssertionOne>

</wsp:Policy>
```
Using the operators and combinations of policy assertions, you can create complex policy alternatives.

### 1.3.3 Supported Custom Assertion Categories

This topic describes the supported custom assertion categories based on the web service specification they conform to and their significance. You specify the category using `orawsp:category`, an attribute of the `orasp:Assertion` element.

Table 1-1 describes this. Managing Sample Custom Assertions provides samples for various categories of security custom assertions.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
<th>Valid Values for <code>orawsp:category</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Security</td>
<td>Policies that implement the WS-Security 1.0 and 1.1 standards, which allow the communication of various security token formats, such as SAML, Kerberos, and X. 509. They enforce authentication and authorization of users, identity propagation, and message protection.</td>
<td>security/authentication, security/msg-protection, security/authorization, security/logging</td>
</tr>
<tr>
<td>Management</td>
<td>Policies used to store request, response, and fault messages to a message log.</td>
<td>management</td>
</tr>
</tbody>
</table>

You can use Enterprise Manager Fusion Middleware Control to view, edit, and manage policies of different categories. Note that policies of a category can be attached to specific endpoints. See About the Rules for Binding Custom Assertions for rules for binding custom assertions.

### 1.3.4 About the Rules for Binding Custom Assertions

This topic describes the `<orawsp:bindings>` element used to define the bindings in the assertion.

For a description of the `<orawsp:bindings>` element used to define the bindings in the assertion, and all its subelements, see `orawsp:bindings` in Securing Web Services and Managing Policies with Oracle Web Services Manager.
1.3.5 About the Life Cycle of a Custom Assertion

The OWSM runtime manages the life cycle of a custom assertion, which consists of four phases; initialization, execution, post-execution, and termination. For each phase, the OWSM runtime invokes a method of custom assertion executor.

The following methods must be implemented inside the custom assertion executor of the custom policy:

- **void init(IAssertion ia, IExecutionContext context, IContext msgContext):** This method is called after the AssertionExecutor is created or after one of the properties has been changed.

- **IResult execute(IContext mcontext):** This method is invoked at stages such as request, response, and in the event of a fault. This method must always return a non-null IResult object. To find the stage of policy execution, see Accessing OWSM Custom Security Assertion.

- **IResult postExecute(IContext messageContext):** Executes any task required after policy execution.

- **void destroy():** The destroy method is invoked by OWSM runtime when application is shutting down. Its invoked for a cleaner ending of the assertion lifecycle.

1.3.6 Understanding the Types of Custom Assertions

The policy object model defines two types of assertions: Simple Assertions and Multi-Element Simple Assertions.

The following topics explain this further:

- Understanding Simple Assertions
- Understanding Multi-Element Simple Assertions

1.3.6.1 Understanding Simple Assertions

A Simple Assertion contains only one assertion (defining a single behavior) and cannot contain other assertions. A Simple Assertion maps to an org.w3c.dom.Element that does not have any nested elements except for extensions defined by Oracle. The class for the Simple Assertion extends the class oracle.wsm.policy.model.ISimpleAssertion. ISimpleOracleAssertion provides the extensions defined by Oracle for a WS-Policy Assertion.

This section contains the following topics:

- Rules for Using Simple Assertions
- Defining a Pseudo-schema for Simple Assertions

1.3.6.1.1 Rules for Using Simple Assertions

This topic lists the rules for using Simple Assertions.

When using Simple Assertions, be aware of the following usage rules:

- Cannot contain nested elements other than Oracle extension element `<orawsp:bindings>`
• Cannot contain other assertions
• Use the default Serializer and De-Serializer
• Use the default Implementation class
• Must extend the base class SimpleAssertion. The method getAssertionType must return the appropriate value if you introduce a new Class.
• Do not need Serializer and De-Serializer if you introduce a new Class.

1.3.6.1.2 Defining a Pseudo-schema for Simple Assertions
This topic shows a pseudo-schema for Simple Assertions with only binding elements.

The following is the pseudo-schema:

```xml
<Assertion>
[ wsp:Optional="xsd:boolean" ]?
[ orawsp:Silent="xsd:boolean" ]?
[ orawsp:Enforced="xsd:boolean" ]?
[ orawsp:description="xsd:string" ]?
[ orawsp:category="xsd:string" ]?...
<orawsp:bindings>?
</Assertion>
```

1.3.6.2 Understanding Multi-Element Simple Assertions
A Multi-element Simple Assertion cannot contain other assertions; however, it may contain nested XML elements. A Multi-element Simple Assertion maps to an org.w3c.dom.Element which has nested XML elements and extension elements defined by Oracle. The class for the Multi-element Simple Assertion extends the class oracle.wsm.policy.model.IMultiElementSimpleAssertion.

This section contains the following topics:

• Rules for Using Multi-element Simple Assertions
• Defining a Pseudo-schema for Multi-element Simple Assertions

1.3.6.2.1 Rules for Using Multi-element Simple Assertions
This topic lists the usage rules for using Multi-element Simple Assertions.

When using Multi-element Simple Assertions, be aware of the following usage rules:

• May contain nested XML elements other than Oracle extension element <orawsp:bindings>

• Cannot contain other assertions and are defined in domain-specific specifications. Nested XML elements participate in policy intersections only if domain-specific intersection semantics are defined.

1.3.6.2.2 Defining a Pseudo-schema for Multi-element Simple Assertions
This topic shows a psuedo-schema for Multi-element Simple Assertions that may contain elements other than the bindings.

The following is the pseudo-schema:

```xml
<Assertion>
[ wsp:Optional="xsd:boolean" ]?
```
Understanding Custom Assertions

[ orawsp:Silent="xsd:boolean" ]?
[ orawsp:Enforced="xsd:boolean" ]?
[ orawsp:description="xsd:string" ]?
[ orawsp:category="xsd:string" ]?...
<other-xml-elements>+
<orawsp:bindings>?
</Assertion>
Creating Custom Assertions

This chapter provides information that you can use to develop custom assertions and test the Web Service.

This chapter includes the following sections:

- About Policy Name
- Developing Custom Assertions for Web Service
- Testing the Web Service

2.1 About Policy Name

The policy name is specified by the name attribute of the policy content. The policy name must not already exist in the OWSM Repository. Once you import the policy to the repository, you cannot edit the name of a policy. To change the policy name, you must copy the policy and assign it a different name.

Oracle recommends that you follow the policy naming conventions described in "Recommended Naming Conventions for Policies" in Understanding Oracle Web Services Manager. The same conventions are used to name assertions.

2.2 Developing Custom Assertions for Web Service

To develop a custom assertion, you import a custom policy file and attach it to your web service or client.

The following topics explain this further.

1. Creating the Custom Assertion Executor
2. Creating the Custom Policy File
3. Specifying the Custom Assertion Executor
4. Creating the Custom Assertion JAR File
5. Adding the Custom Policy to the Policy Store
6. Deploying the Custom Assertion
7. Attaching the Custom Policy to a Web Service
2.2.1 Creating the Custom Assertion Executor

Create the custom assertion executor to execute and validate the logic of your policy assertion. The custom assertion executor must extend oracle.wsm.policyengine.impl.AssertionExecutor.

When building the custom assertion executor, ensure that the following JAR files are in your CLASSPATH:

- wsm-policy-core.jar
- wsm-agent-core.jar
- oracle.logging-utils_11.1.1.jar (located at oracle_common/modules/oracle.wsm.common_12.1.2, oracle_common/modules/oracle.wsm.common_12.1.2, and oracle_common/modules respectively)

If necessary, add these files to your CLASSPATH.

The following example shows a custom assertion executor that you can use to validate the IP address of the request to the web service. If the IP address of the request is invalid, a FAULT_FAILED_CHECK exception is thrown.

```java
package sampleassertion;

import oracle.wsm.common.sdk.IContext;
import oracle.wsm.common.sdk.IMessageContext;
import oracle.wsm.common.sdk.IResult;
import oracle.wsm.common.sdk.Result;
import oracle.wsm.common.sdk.WSMException;
import oracle.wsm.policy.model.IAssertionBindings;
import oracle.wsm.policy.model.IConfig;
import oracle.wsm.policy.model.IPropertySet;
import oracle.wsm.policy.model.ISimpleOracleAssertion;
import oracle.wsm.policyengine.impl.SimpleAssertion;
import oracle.wsm.policyengine.impl.AssertionExecutor;

public class IpAssertionExecutor extends AssertionExecutor {
    public IpAssertionExecutor() {
    }

    public void destroy() {
    }

    public void init(oracle.wsm.policy.model.IAssertion assertion, oracle.wsm.policyengine.IExecutionContext econtext, oracle.wsm.common.sdk.IContext context) {
        this.assertion = assertion;
        this.econtext = econtext;
    }

    public oracle.wsm.policyengine.IExecutionContext getExecutionContext() {
        return this.econtext;
    }

    public boolean isAssertionEnabled() {
        return ((ISimpleOracleAssertion)this.assertion).isEnforced();
    }

    public String getAssertionName() {
        return this.assertion.getQName().toString();
    }

    /**
     * @param context
     */
```
public IResult execute(IContext context) throws WSMException {
    try {
        IAssertionBindings bindings =
            ((SimpleAssertion)(this.assertion)).getBindings();
        IConfig config = bindings.getConfigs().get(0);
        IPropertySet propertyset = config.getPropertySets().get(0);
        String valid_ips =
            propertyset.getPropertyByName("valid_ips").getValue();
        String ipAddr = ((IMessageContext)context).getRemoteAddr();
        IResult result = new Result();
        if (valid_ips != null && valid_ips.trim().length() > 0) {
            String[] valid_ips_array = valid_ips.split(",");
            boolean isPresent = false;
            for (String valid_ip : valid_ips_array) {
                if (ipAddr.equals(valid_ip.trim())) {
                    isPresent = true;
                }
            }
            if (isPresent) {
                result.setStatus(IResult.SUCCEEDED);
            } else {
                result.setStatus(IResult.FAILED);
                result.setFault(new WSMException(WSMException.FAULT_FAILED_CHECK));
            }
        } else {
            result.setStatus(IResult.SUCCEEDED);
        }
        return result;
    } catch (Exception e) {
        throw new WSMException(WSMException.FAULT_FAILED_CHECK, e);
    }
}

public oracle.wsm.common.sdk.IResult postExecute(oracle.wsm.common.sdk.IContext p1) {
    IResult result = new Result();
    result.setStatus(IResult.SUCCEEDED);
    return result;
}

2.2.2 Creating the Custom Policy File

Create the custom policy file to define the bindings for and configure the custom assertion.

Custom Assertions Schema Reference describes the schema that you can use to construct your custom policy file and custom assertion.

The following example defines the oracle/ip_assertion_policy custom policy file. The assertion defines a comma-separated list of IP addresses that are valid for a request.

```xml
<<?xml version = '1.0' encoding = 'UTF-8'?>
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://schemas.oracle.com/ws/2004/01/securitypolicy">
    <wsp:status="enabled">
        <wsp:wsu:PolicyTarget
            xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"/>
    </wsp:Policy>
</wsp:Policy>
```

For more information about the APIs that are available to you for developing your own custom assertion executor, see the Java API Reference for Oracle Web Services Manager.
To use this custom policy file with a RESTful web service and client endpoints, you must add the provides attribute to the orasp:ipAssertion element, as follows:

```xml
<orasp:ipAssertion orawsp:Silent="true" orawsp:Enforced="true"
orawsp:name="WSSecurity IpAssertion Validator" orawsp:category="security/authentication">
  <orawsp:provides="{http://schemas.oracle.com/ws/2006/01/policy}REST_HTTP">
</orasp:ipAssertion>
```

### 2.2.3 Specifying the Custom Assertion Executor

Specify the custom assertion executor in the Custom policy file or in the policy-config.xml file.

The following topics explain this further:

- **Specifying the Custom Assertion Executor in the Custom Policy File**
- **Specifying the Custom Assertion Executor in the policy-config.xml File**

#### 2.2.3.1 Specifying the Custom Assertion Executor in the Custom Policy File

This topic shows an example of updating the custom policy to specify the custom executor information in the orawsp:Implementation element.

The following is the example:

```xml
<?xml version='1.0' encoding='UTF-8'?><wsp:Policy
xmlns="http://schemas.xmlsoap.org/ws/2004/09/policy"
xmlns:orasp="http://schemas.oracle.com/ws/2006/01/securitypolicy"
orawsp:status="enabled"
xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" orawsp:category="security"
orawsp:attachTo="binding.server" wsu:Id="ip_assertion_policy"
xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
wsp:Name="oracle/ip_assertion_policy">
  <orasp:ipAssertion orawsp:Silent="true" orawsp:Enforced="true"
orawsp:name="WSSecurity IpAssertion validator" orawsp:category="security/authentication">
    <orawsp:bindings>
      <orawsp:Implementation>sampleassertion.IpAssertionExecutor</orawsp:Implementation>
  </orawsp:bindings>
</orasp:ipAssertion>
</wsp:Policy>
```
2.2.3.2 Specifying the Custom Assertion Executor in the policy-config.xml File

Create a policy-config.xml file that defines an entry for the new assertion and associates it with its custom assertion executor. You can also specify the custom assertion executor class in the configuration file.

This section includes the following topics:

- About the Policy Configuration File
- Defining the Policy Configuration File

2.2.3.2.1 About the Policy Configuration File

This topic explains the format of the policy-config.xml file and the attributes for the Key element.

The format for the policy-config.xml file is shown in the following example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<policy-config>
  <policy-model-config>
    <entry>
      <key namespace="namespace" element-name="elementname"/>
      <executor-classname>assertionclass</executor-classname>
    </entry>
  </policy-model-config>
</policy-config>
```

Table 2-1 describes the attributes for the key element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace of the policy. This value must match the namespace defined in the custom policy file (in Step 1). In the custom policy file example in Creating the Custom Policy File, the namespace is defined as part of the <a href="">wsp:Policy</a> tag as follows: xmlns:orasp=&quot;<a href="http://schemas.oracle.com/ws/2006/01/securitypolicy">http://schemas.oracle.com/ws/2006/01/securitypolicy</a>&quot;</td>
</tr>
</tbody>
</table>
Table 2-1  (Cont.) Attributes for Key Element

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>element-name</td>
<td>Name of the element. This value must match the assertion name defined in the custom policy file (in Step 1). In the custom policy file example in Creating the Custom Policy File, the element name ipAssertion is defined in the following tag:</td>
</tr>
<tr>
<td></td>
<td>&lt;orasp:ipAssertion orawsp:Silent=&quot;true&quot; orawsp:Enforced=&quot;true&quot; orawsp:name=&quot;WSSecurity IpAssertion Validator&quot; orawsp:category=&quot;security/authentication&quot;&gt;</td>
</tr>
</tbody>
</table>

2.2.3.2.2 Defining the Policy Configuration File

This topic shows an example of policy-config.xml file with an entry for the ipAssertion policy.

The following is the example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<policy-config>
  <policy-model-config>
    <entry>
      <key namespace="http://schemas.oracle.com/ws/2006/01/securitypolicy" element-name="ipAssertion"/>
      <executor-classname>sampleassertion.IpAssertionExecutor</executor-classname>
    </entry>
  </policy-model-config>
</policy-config>
```

**Note:**
The policy-config.xml file must be in the CLASSPATH of the server. Add this file to the custom executor jar file as mentioned in Creating the Custom Assertion JAR File.

2.2.4 Creating the Custom Assertion JAR File

Create a custom assertion JAR file that includes the custom assertion executor and the policy-config.xml file.

You can use Oracle JDeveloper, other IDE, or the jar tool to generate the JAR file.

2.2.5 Adding the Custom Policy to the Policy Store

You can add the custom policy to the policy store using Fusion Middleware Control or WLST.

The following topics explain this further:

- Adding a Custom Policy to the Policy Store Using Fusion Middleware Control
- Adding a Custom Policy to the Policy Store Using WLST
2.2.5.1 Adding a Custom Policy to the Policy Store Using Fusion Middleware Control

This topic explains the procedure to add a Custom Policy to the Policy Store by using Fusion Middleware Control.

Before you can attach the custom policy to a web service, you must import it using the procedure described in “Importing Web Service Policies” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

2.2.5.2 Adding a Custom Policy to the Policy Store Using WLST

This topic explains the procedure to add a Custom Policy to the Policy Store by using WLST.

Use the WebLogic Scripting Tool (WLST) commands to import the custom policy. For information, see “Importing and Exporting Documents in the Repository” in Securing Web Services and Managing Policies with Oracle Web Services Manager.

2.2.6 Deploying the Custom Assertion

This topic explains the procedure to add the custom assertion JAR to your CLASSPATH.

You can add the custom assertion JAR to your CLASSPATH using the WLST command. To do so, perform the following steps:

1. Invoke the WLST command located at
   `ORACLE_HOME/oracle_common/common/bin/wlst.sh` (UNIX) or
   `ORACLE_HOME/oracle_common\common\bin\wlst.cmd` (Windows).

2. Run the `appendToExtensionLoader` command to add the custom assertion jar to servers specified by target list:

   `appendToExtensionLoader('path to custom-assertion.jar', 'comma separated targets')`

   For example:

   ```
   connect('demouser', 'demopassword', 't3://localhost:7001')
   appendToExtensionLoader('/user/home/customAssertion.jar', 'server1,server2,server3')
   ```

You can also add the custom assertion JAR manually to your CLASSPATH by performing the following steps:

1. Stop WebLogic Server.

2. Copy the custom assertion JAR file you have created as described in Creating the Custom Assertion JAR File to the following directory: `$DOMAIN_HOME/lib`.

For information about starting and stopping WebLogic Server, see “Starting and Stopping Oracle WebLogic Server Instances” in Administering Oracle Fusion Middleware.
2.2.7 Attaching the Custom Policy to a Web Service

This topic explains the procedure to attach the custom policy to a web service.

Create a web service using the information described in "Roadmap for Implementing WebLogic Web Services" in Understanding WebLogic Web Services for Oracle WebLogic Server.

Attach the custom policy to the web service, as described in "Attaching Policies" in Securing Web Services and Managing Policies with Oracle Web Services Manager.

2.3 Testing the Web Service

Use the Fusion Middleware Control Test Web Service page to test the operations and view results of the web service without deploying the web service.

For more information, see "Testing Web Services" in Administering Web Services.

You can also test your web service by creating a client proxy for the web service using clientgen. For more information, see "Using the clientgen Ant Task to Generate Client Artifacts" in Developing JAX-WS Web Services for Oracle WebLogic Server.
Managing Sample Custom Assertions

This chapter describes some sample custom assertions and provides sample code for each custom assertion. It also describes the key features that are implemented in the sample.

The following topics explain this further:

- Validating IP Address in Custom Assertion
- Performing IP Address Validation in Custom Assertion
- Encrypting and Decrypting Data in Custom Assertion
- Performing Data Encryption and Decryption in Custom Assertion
- Authenticating a User in Custom Assertion
- Performing User Authentication in Custom Assertion

3.1 Validating IP Address in Custom Assertion

The IP Address Validation Custom Assertion sample validates whether a request that is made to the web service is from a set of valid IP addresses. In the custom policy assertion you can include the valid IP addresses as a comma-separated list of values. Any request coming from any other IP address results in a FAILED_CHECK response.

This section includes the following topics:

- Validating IP Address Using Custom Assertion Executor
- Validating IP Address Using Policy File
- Validating IP Address Using policy-config.xml File
- Validating IP Address Using Web Service
- Validating IP Address Using JSE Client

3.1.1 Validating IP Address Using Custom Assertion Executor

This topic shows a sample custom assertion executor to validate the IP address.

The following is the sample custom assertion executor:

```java
package sampleassertion;

import oracle.wsm.common.sdk.IContext;
import oracle.wsm.common.sdk.IMessageContext;
import oracle.wsm.common.sdk.IResult;
import oracle.wsm.common.sdk.Result;
import oracle.wsm.common.sdk.WSMException;
```
import oracle.wsm.policy.model.IAssertionBindings;
import oracle.wsm.policy.model.IConfig;
import oracle.wsm.policy.model.IPropertySet;
import oracle.wsm.policy.model.ISimpleOracleAssertion;
import oracle.wsm.policy.model.impl.SimpleAssertion;
import oracle.wsm.policyengine.impl.AssertionExecutor;

public class IpAssertionExecutor extends AssertionExecutor {
    public IpAssertionExecutor() {
    }

    public void destroy() {
    }

    public void init(oracle.wsm.policy.model.IAssertion assertion,
    oracle.wsm.policyengine.IExecutionContext econtext,
    oracle.wsm.common.sdk.IContext context) {
        this.assertion = assertion;
        this.econtext = econtext;
    }

    public oracle.wsm.policyengine.IExecutionContext getExecutionContext() {
        return this.econtext;
    }

    public boolean isAssertionEnabled() {
        return ((ISimpleOracleAssertion)this.assertion).isEnforced();
    }

    public String getAssertionName() {
        return this.assertion.getQName().toString();
    }

    /**
     * @param context
     * @return
     */
    public IResult execute(IContext context) throws WSMException {
        try {
            oracle.wsm.common.sdk.IMessageContext.STAGE stage =
            ((oracle.wsm.common.sdk.IMessageContext)context).getStage();
            if (stage  == IMessageContext.STAGE.request)  {
                IAssertionBindings bindings =
                ((SimpleAssertion)this.assertion).getBindings();
                IConfig config = bindings.getConfigs().get(0);
                IPropertySet propertyset = config.getPropertySets().get(0);
                String valid_ips = propertyset.getPropertyByName("valid_ips").getValue();
                String ipAddr = ((IMessageContext)context).getRemoteAddr();
                IResult result = new Result();
                if (valid_ips != null && valid_ips.trim().length() > 0) {
                    String[] valid_ips_array = valid_ips.split(",");
                    boolean isPresent = false;
                    for (String valid_ip : valid_ips_array) {
                        if (ipAddr.equals(valid_ip.trim())) {
                            isPresent = true;
                        }
                    }
                }
        } catch (Exception e) {
            throw new WSMException("Error executing assertion", e);
        }
    
    }
if (isPresent) {
    result.setStatus(IResult.SUCCEEDED);
} else {
    result.setStatus(IResult.FAILED);
    result.setFault(new WSMException(WSMException.FAULT_FAILED)
    _CHECK));
} else {
    result.setStatus(IResult.SUCCEEDED);
} return result;
} catch (Exception e) {
    throw new WSMException(WSMException.FAULT_FAILED_CHECK, e);
}

public oracle.wsm.common.sdk.IResult
postExecute(oracle.wsm.common.sdk.IContext p1) {
    IResult result = new Result();
    result.setStatus(IResult.SUCCEEDED);
    return result;
}

3.1.2 Validating IP Address Using Policy File

This topic shows a sample policy file to validate the IP address.

The following is the sample policy file:

```xml
<?xml version = '1.0' encoding = 'UTF-8'%>
xmlns:orasp="http://schemas.oracle.com/ws/2006/01/securitypolicy"
orawsp:status="enabled"
xmns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"
xmns:xsi="http://www.w3.org/2001/XMLSchema-instance" orawsp:category="security"
orawsp:attachTo="binding.server" wsu:Id="ip_assertion_policy"
xmns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
wsp:Name="oracle/ip_assertion_policy">
  <orawsp:ipAssertion orawsp:Silent="true" orawsp:Enforced="true"
orawsp:name="WSSecurity IpAssertion validator"
orawsp:category="security/authentication">
    <orawsp:bindings>
      <orawsp:Config orawsp:name="ipassertion"
orawsp:configType="declarative">
        <orawsp:PropertySet orawsp:name="valid_ips">
          <orawsp:Property orawsp:name="valid_ips" orawsp:type="string" orawsp:contentType="constant">
            <orawsp:Value>140.87.6.143,10.178.93.107</orawsp:Value>
          </orawsp:Property>
        </orawsp:PropertySet>
      </orawsp:Config>
    </orawsp:bindings>
  </orawsp:ipAssertion>
</wsp:Policy>
```

Validating IP Address in Custom Assertion

Managing Sample Custom Assertions 3-3
3.1.3 Validating IP Address Using policy-config.xml File

This topic contains a sample that demonstrates how to use the policy-config.xml file to specify the custom assertion executor.

You can also use the custom policy to specify the custom policy executor, as described in Specifying the Custom Assertion Executor.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<policy-config>
<policy-model-config>
<entry>
<key namespace="http://schemas.oracle.com/ws/2006/01/securitypolicy" element-name="ipAssertion"/>
<executor-classname>sampleassertion.IpAssertionExecutor</executor-classname>
</entry>
</policy-model-config>
</policy-config>
```

3.1.4 Validating IP Address Using Web Service

This topic shows a sample web service to validate the IP address.

The following is the sample web service. You can attach the custom assertion to a web service as described in Attaching the Custom Policy to a Web Service.

```java
package project1;
import javax.jws.WebService;
import weblogic.wsee.jws.jaxws.owsm.SecurityPolicies;
@WebService
@SecurityPolicy(uri="policy:oracle/ip_assertion_policy")
public class Class1 {
    public Class1() {
        super();
    }

    public String echo1() {
        return "one";
    }
}
```

3.1.5 Validating IP Address Using JSE Client

This topic shows a sample JSE client generated from the web service.

The following sample shows a JSE client generated from the web service shown in Validating IP Address Using Web Service.

```java
package project1;
import javax.xml.ws.WebServiceRef;

public class Class1PortClient {
    @WebServiceRef
    private static Class1Service class1Service;
    public static void main(String [] args) {
        class1Service = new Class1Service();
        Class1 port = class1Service.getClass1Port();
        // Add your code to call the desired methods.
    }
}
```
System.out.println(port.echo1());
}
}

3.2 Performing IP Address Validation in Custom Assertion

This topic explains the procedure to perform IP address validation in custom assertion.

To perform IP address validation in custom assertion:

1. Create the custom assertion and custom assertion executor with the sample codes as described in Validating IP Address Using Custom Assertion Executor. These samples demonstrate the following key features:

   • Specify the valid values of IP addresses in the custom assertion:

   ```
   <orawsp:PropertySet orawsp:name="valid_ips">
     <orawsp:Property orawsp:name="valid_ips" orawsp:type="string" orawsp:contentType="constant">
       <orawsp:Value>140.87.6.143,10.178.93.107</orawsp:Value>
     </orawsp:Property>
   </orawsp:PropertySet>
   ```

   For more information, see Supplying Parameters for Custom Assertions.

   • View the execution stage in the custom assertion executor:

   ```java
   oracle.wsm.common.sdk.IMessageContext.STAGE stage =
   ((oracle.wsm.common.sdk.IMessageContext)context).getStage();
   ```

   For more information, see Accessing OWSM Custom Security Assertion.

   • Access the IP address from the custom assertion executor:

   ```java
   IConfig config = bindings.getConfigs().get(0);
   IPropertySet propertyset = config.getPropertySets().get(0);
   String valid_ips = propertyset.getPropertyByName("valid_ips").getValue();
   ```

   For more information, see Supplying Parameters for Custom Assertions.

   • Access the context property remote address:

   ```java
   String ipAddr = ((IMessageContext)context).getRemoteAddr();
   ```

   For more information, see Examining OWSM Context Properties.

   • In the event of failure, set the fault that caused the request execution to fail:

   ```java
   result.setFault(new WSMException(WSMException.FAULT_FAILED_CHECK));
   ```

   For more information, see Handling Exceptions in Custom Assertions.

2. Create the JAR file as described in Creating the Custom Assertion JAR File.

3. Add the custom policy to the policy store as described in Adding the Custom Policy to the Policy Store.

4. Update the CLASSPATH as described in Deploying the Custom Assertion.

5. Attach the custom policy to the web service by any one of the methods described in Attaching the Custom Policy to a Web Service.
6. Test the web service by creating a JSE client as shown in Validating IP Address Using JSE Client.

3.3 Encrypting and Decrypting Data in Custom Assertion

The Encryption and Decryption Custom Assertion sample uses a set of custom assertions to encrypt data from an inbound message, which makes it unreadable from consoles, audit trails, or logs. The encrypted data is decrypted for outbound messages for downstream services that require access to the data.

This section includes the following topics:

- Encrypting and Decrypting Data Using Custom Assertion Executor
- Encrypting Elements of an Inbound Message Using Custom Assertion Executor
- Decrypting Elements of an Outbound Message Using Custom Assertion Executor
- Encrypting Data Using Custom Assertion Executor
- Decrypting Data Using Custom Assertion Executor
- Receiving the Encrypted Message Using Composite Application
- Receiving the Decrypted Message Using Composite Application

3.3.1 Encrypting and Decrypting Data Using Custom Assertion Executor

This topic shows a sample custom assertion executor used for encryption and decryption of data.

The following is the sample custom assertion executor. For more information on the implementation, see Performing Data Encryption and Decryption in Custom Assertion.

```java
package owsm.custom.soa;

import java.util.HashMap;
import java.util.Iterator;
import javax.xml.namespace.NamespaceContext;
import javax.xml.xpath.XPath;
import javax.xml.xpath.XPathConstants;
import javax.xml.xpath.XPathExpressionException;
import javax.xml.xpath.XPathFactory;
import oracle.wsm.common.sdk.IContext;
import oracle.wsm.policy.model.IAssertion;
import oracle.wsm.policyengine.IExecutionContext;
import oracle.wsm.policyengine.impl.AssertionExecutor;
import org.w3c.dom.Element;
import org.w3c.dom.Node;

/**
 * A base class for OWSM custom assertions that specific classes can extend. It
 * contains common code and variables used across all custom assertions.
 * All custom assertions must extend the AssertionExecutor class.
 */
public abstract class CustomAssertion
```
extends AssertionExecutor
{

protected final static String PROP_DEBUG = "debugFlag";

protected final static String DEBUG_START = "===========================================================>>>";
protected final static String DEBUG_END = "<<<===========================================================";

protected IAssertion mAssertion = null;
protected IExecutionContext mEcontext = null;
protected oracle.wsm.common.sdk.IContext mIcontext = null;

/**
 * A tag or text to display when printing debug information to identify the
 * content.
 */
protected String mTag;

/**
 * Constructor
 */
public CustomAssertion(String tag)
{
    super();
    mTag = tag;
} // CustomAssertion()

/**
 * Implemented from parent class
 */
public void init(IAssertion iAssertion,
    IExecutionContext iExecutionContext,
    IContext iContext)
{
    mAssertion = iAssertion;
    mEcontext = iExecutionContext;
    mIcontext = iContext;
    //IAssertionBindings bindings = ((SimpleAssertion)
    (mAssertion)).getBindings();
} // init()

/**
 * Implemented from parent class
 */
public void destroy()
{
    // Nothing to do.
} // destroy()

/**
 * A utility method for extracting the node specified by <code>xpathStr</code>
 * (with namespaces defined by <code>namespaces</code>) from
 *<code>payload</code>
 * This method will print an stack trace if their is an exception. If you want
 * to
 * return the exception instead then modify the method appropriately.
 *
public static Node getDataNode(Element payload, final HashMap<String, String> namespaces, String xpathStr)
{
    Node node = null;

    try
    {
        // Create a namespace context based on the namespaces passed in.

        NamespaceContext ctx = new NamespaceContext()
        {
            public String getNamespaceURI(String prefix)
            {
                return namespaces.get(prefix);
            }
            // Dummy implementation - not used
            public Iterator getPrefixes(String val)
            {
                return null;
            }
            // Dummy implementation - not used
            public String getPrefix(String uri)
            {
                return null;
            }
        }
        XPathFactory xpathFact = XPathFactory.newInstance();
        XPath xpath = xpathFact.newXPath();
        xpath.setNamespaceContext(ctx);
        node = (Node)xpath.evaluate(xpathStr, payload, XPathConstants.NODE);
    }
    catch (XPathExpressionException ex)
    {
        ex.printStackTrace();
        return null;
    }

    return node;
} // getDataNode()
import oracle.wsm.common.sdk.IContext;
import oracle.wsm.common.sdk.IMessageContext;
import oracle.wsm.common.sdk.IResult;
import oracle.wsm.common.sdk.Result;

    return result;
}
} // execute()
3.3.4 Encrypting Data Using Custom Assertion Executor

This topic shows a sample custom assertion executor for encryption.

The following is the sample custom assertion executor:

```xml
<orasp:Assertion xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
    orawsp:id="soa_encryption_template"
    orawsp:attachTo="generic" orawsp:category="security"
    orawsp:description="Custom Encryption of payload"
    orawsp:displayName="Custom Encryption"
    orawsp:name="custom/soa_encryption"
    xmlns:custom="http://schemas.oracle.com/ws/soa/custom">
    <custom:custom-executor orawsp:Enforced="true" orawsp:Silent="false"
        orawsp:category="security/custom"
        orawsp:name="WSSecurity_Custom_Assertion">
        <orawsp:bindings>
            <orawsp:Implementation>owsm.custom.soa.InboundEncryptor</orawsp:Implementation>
        </orawsp:bindings>
        <orawsp:Config orawsp:configType="declarative" orawsp:name="encrypt_soa">
            <orawsp:PropertySet orawsp:name="encrypt">
                <orawsp:Property orawsp:contentType="constant"
                    orawsp:name="encryption_key" orawsp:type="string">
                    <orawsp:Value>MySecretKey</orawsp:Value>
                </orawsp:Property>
                <orawsp:Property orawsp:contentType="constant"
                    orawsp:name="debugFlag" orawsp:type="string">
                    <orawsp:Value>true</orawsp:Value>
                </orawsp:Property>
            </orawsp:PropertySet>
        </orawsp:Config>
    </custom:custom-executor>
</orawsp:Assertion>
```

3.3.5 Decrypting Data Using Custom Assertion Executor

This topic shows an example of decrypting data by using custom assertion executor.

The following is a sample custom assertion for decryption.

```xml
<orasp:Assertion xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
    orawsp:id="soa_decryption_template"
    orawsp:attachTo="binding.client"
    orawsp:category="security"
    orawsp:description="Custom Decryption of payload"
    orawsp:displayName="Custom Decryption"
    orawsp:name="custom/soa_decryption"
    xmlns:custom="http://schemas.oracle.com/ws/soa/custom">
    <custom:custom-executor orawsp:Enforced="true" orawsp:Silent="false"
        orawsp:category="security/custom"
        orawsp:name="WSSecurity_Custom_Assertion">
        <orawsp:bindings>
        </orawsp:bindings>
        <orawsp:Config orawsp:configType="declarative" orawsp:name="decrypt_soa">
            <orawsp:PropertySet orawsp:name="decrypt">
                <orawsp:Property orawsp:contentType="constant"
                    orawsp:name="decryption_key" orawsp:type="string">
                    <orawsp:Value>MySecretKey</orawsp:Value>
                </orawsp:Property>
            </orawsp:PropertySet>
        </orawsp:Config>
    </custom:custom-executor>
</orawsp:Assertion>
```
3.3.6 Receiving the Encrypted Message Using Composite Application

This topic shows a sample composite application with a BPEL process used to demonstrate that it received the encrypted value.

The following is the sample composite application:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<composite name="CustomEncryptionComposite" revision="1.0"
    label="2010-05-10_09-33-01_807"
    mode="active"
    xmlns="http://xmlns.oracle.com/sca/1.0"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
    <import namespace="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionComposite/ProcessCustomer"
                location="ProcessCustomer.wsdl" importType="wsdl"/>
    <import namespace="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionExternalService/ExternalServiceBpel"
                location="ExternalServiceBpel.wsdl" importType="wsdl"/>
    <service name="processcustomer_client_ep"
        ui:wsdlLocation="ProcessCustomer.wsdl">
        <interface.wsdl interface="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionComposite/ProcessCustomer#wsdl.interface(ProcessCustomer)"/>
        <binding.ws port="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionComposite/ProcessCustomer#wsdl.endpoint(processcustomer
                _client_ep/ProcessCustomer_pt)"
            location="externalservicebpel_client_ep.wsdl" soapVersion="1.1">
            <wsp:PolicyReference URI="SOA/CustomDecryption" orawsp:category="security"
                orawsp:status="enabled"/>
        </binding.ws>
    </service>
    <component name="ProcessCustomer">
        <implementation.bpel src="ProcessCustomer.bpel"/>
    </component>
    <reference name="ExternalSvc" ui:wsdlLocation="ExternalServiceBpel.wsdl"/>
    <interface.wsdl interface="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionExternalService/ExternalServiceBpel#wsdl.interface(ExternalSe
                rviceBpel)"/>
    <binding.ws port="http://xmlns.oracle.com/CustomEncryption
                _jws/CustomEncryptionExternalService/ExternalServiceBpel#wsdl.endpoint(externalser
                vicebpel_client_ep/ExternalServiceBpel_pt)"
            location="externalservicebpel_client_ep.wsdl" soapVersion="1.1">
            <wsp:PolicyReference URI="SOA/CustomDecryption" orawsp:category="security"
                orawsp:status="enabled"/>
        </binding.ws>
    </component>
</composite>
```
3.3.7 Receiving the Decrypted Message Using Composite Application

This topic shows a sample composite application used to represent an external service being called and show that it received the decrypted value.

The following is the sample composite application:

```xml
<composite name="CustomEncryptionExternalService" revision="1.0"
label="2010-05-10_09-41-00_810"
mode="active"
state="on"
xmlns="http://xmlns.oracle.com/sca/1.0"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
<import namespace="http://xmlns.oracle.com/CustomEncryption_jws/CustomEncryptionExternalService/ExternalServiceBpel"
location="ExternalServiceBpel.wsdl" importType="wsdl"/>
<service name="externalservicebpel_client_ep"
ui:wsdlLocation="ExternalServiceBpel.wsdl">
<interface.ws interface="http://xmlns.oracle.com/CustomEncryption_jws/CustomEncryptionExternalService/ExternalServiceBpel#wsdl.interface(ExternalServiceBpel)"/>
</service>
</composite>
```

3.4 Performing Data Encryption and Decryption in Custom Assertion

This topic explains the procedure to perform data encryption and decryption in custom assertion.

To perform data encryption and decryption in custom assertion:
1. Create the custom assertion policy file and custom assertion executor with the sample codes as described in Encrypting and Decrypting Data in Custom Assertion. These samples demonstrate the following key features:

- Specify the properties encryption_key and debugFlag in the encrypt property set for the encryption custom assertion:

```xml
<orawsp:PropertySet orawsp:name="encrypt">
  <orawsp:Property orawsp:contentType="constant" orawsp:name="encryption_key" orawsp:type="string">
    <orawsp:Value>MySecretKey</orawsp:Value>
  </orawsp:Property>
  <orawsp:Property orawsp:contentType="constant" orawsp:name="debugFlag" orawsp:type="string">
    <orawsp:Value>true</orawsp:Value>
  </orawsp:Property>
</orawsp:PropertySet>
```

For more information, see Supplying Parameters for Custom Assertions.

- Set the properties decryption_key and debugFlag in the property set decrypt for decryption custom assertion:

```xml
<orawsp:PropertySet orawsp:name="decrypt">
  <orawsp:Property orawsp:contentType="constant" orawsp:name="decryption_key" orawsp:type="string">
    <orawsp:Value>MySecretKey</orawsp:Value>
  </orawsp:Property>
  <orawsp:Property orawsp:contentType="constant" orawsp:name="debugFlag" orawsp:type="string">
    <orawsp:Value>true</orawsp:Value>
  </orawsp:Property>
</orawsp:PropertySet>
```

For more information, see Supplying Parameters for Custom Assertions.

- Extract the node specified by XPath expressions with defined namespaces from the custom assertion class:

```java
NamespaceContext ctx = new NamespaceContext()
{
  public String getNamespaceURI(String prefix)
  {
    return namespaces.get(prefix);
  }
  // Dummy implementation - not used
  public Iterator getPrefixes(String val)
  {
    return null;
  }
  // Dummy implementation - not used
  public String getPrefix(String uri)
  {
    return null;
  }
};
XPathFactory xpathFact = XPathFactory.newInstance();
XPath xpath = xpathFact.newXPath();
```
For more information, see Accessing Parts of a Message Using XPath.

2. Create the JAR file as described in Creating the Custom Assertion JAR File.

3. Add the custom policy to the policy store as described in Adding the Custom Policy to the Policy Store.

4. Update the CLASSPATH as described in Deploying the Custom Assertion.

5. Attach the custom policy to the web service by any one of the methods described in Attaching the Custom Policy to a Web Service.

3.5 Authenticating a User in Custom Assertion

The authentication custom assertion sample is used to authenticate a user using WebLogic authentication providers. The credentials (user name and password) are read from incoming SOAP message and are authenticated against WebLogic authentication provider using a custom login module.

This section includes the following topics:

- Authenticating Using Custom Assertion Executor
- Authenticating Using Policy File
- Implementing User Authentication Using Files

3.5.1 Authenticating Using Custom Assertion Executor

This topic explains how a sample executor invokes the custom login module to perform the authentication.

The following example describes it.

```java
package sampleAssertion;
/**
 * <p>

3.5.2 Authenticating Using Policy File

This topic contains a sample custom assertion that invokes the executor, which is used
to authenticate users against WebLogic authentication provider.

The following sample is a custom assertion that invokes the executor described in
Authenticating Using Custom Assertion Executor, which is used to authenticate users
against WebLogic authentication provider.

```xml
<?xml version="1.0"?>
  xmlns:oralgp="http://schemas.oracle.com/ws/2006/01/loggingpolicy"
  xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
orawsp:provides="{http://docs.oasis-open.org/ns/opencsa/sca/200903}authentication,
  {http://docs.oasis-open.org/ns/opencsa/sca/200903}clientAuthentication,
  {http://docs.oasis-open.org/ns/opencsa/sca/200903}clientAuthentication.message,
  {http://schemas.oracle.com/ws/2006/01/policy}token.usernamePassword"
xmns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-uti
```
3.5.3 Implementing User Authentication Using Files

This topic demonstrates the user authentication using the login configuration file and the implementation of various classes as specified in the file.

It contains the following topics:

- Authenticating Using Login Configuration File
- Implementing a Custom Login Module Class
- Implementing a Simple Login Module Class
- Implementing a Callback Handler Class

3.5.3.1 Authenticating Using Login Configuration File

The following sample describes a Login configuration file that contains an entry specifying the Login Module that is to be used to do the user authentication.

/** Login Configuration for the Sample Application
JAAS authentication is performed in a pluggable fashion, so Java applications can remain independent from underlying authentication technologies. Users can plugin there custom loginmodule implementations which can integrate with corresponding authentication provider.

The name for an entry in a login configuration file is the name that applications use to refer to the entry when they instantiate a LoginContext. The specified LoginModules (described below) are used to control the authentication process.

As part of this sample we are using CustomLoginModule and SimpleLoginModule
1. CustomLoginModule - integrates with weblogic authentication provider
2. SimpleLoginModule - simply returns

You can also provide implementation of javax.security.auth.login.Configuration interface
Refer http://download.oracle.com/javase/1.4.2/docs/api/javax/security/auth/login/Config uration.html and http://download.oracle.com/javase/1.4.2/docs/guide/security/jaas/tutorials/LoginC onfigFile.html for more details.
CustomLoginModule {
    sampleAssertion.loginmodule.CustomLoginModule required debug=true;
};

SimpleLoginModule {
    sampleAssertion.loginmodule.SimpleLoginModule required debug=true;
};

3.5.3.2 Implementing a Custom Login Module Class

This topic shows a sample CustomLoginModule class. It provides an implementation of javax.security.auth.spi.LoginModule and authenticates a user against WebLogic authentication provider.

The following is a sample CustomLoginModule class that is specified by the LoginConfig file in Authenticating Using Login Configuration File.

```java
package sampleAssertion.loginmodule;

/**
 * <Description>
 * <p>
 * CustomLoginModule class implements the javax.security.auth.spi.LoginModule
 * interface. CustomLoginModule class is specified
 * by the login configuration file i.e Login.config file.
 * This class authenticates user against weblogic authentication provider.
 * If authentication is successful, the CustomLoginModule associate Principals and
 * Credentials with the authenticated Subject
 * <p>
 * Users can create there own custom login modules
 * by implementing <code>javax.security.auth.spi.LoginModule</code> interface
 * </p>
 * </Description>
 *
*/
import java.security.AccessController;
import java.security.PrivilegedAction;
import java.util.Map;
import javax.security.auth.Subject;
import javax.security.auth.callback.CallbackHandler;
import javax.security.auth.login.LoginException;
import javax.security.auth.spi>LoginModule;
import weblogic.security.services.Authentication;

public class CustomLoginModule implements LoginModule {
    private Subject authenticatorSubject;
    private CallbackHandler callbackHandler;
    private boolean loginSucceeded;

    /**
     * Initialize this LoginModule.
     *
     * <p>This method is called by the <code>LoginContext</code> to initialize
     * the <code>LoginModule</code> with the relevant information.
     * </p>
     */
    @param subject the - <code>javax.security.auth.Subject</code> to be
    * authenticated.
```
@param callbackHandler - instance of 
<code>javax.security.auth.callback.CallbackHandler</code>
the CallbackHandler object is used by LoginModules to retrieve the 
information set by the user 
e.g user name / password.

@param sharedState state shared with other configured LoginModules. <p>

@param options options specified in the login Configuration for this 
particular LoginModule.

**/

@Override
public void initialize(Subject subject, CallbackHandler callbackHandler, 
Map<String, ?> sharedState, Map<String, ?> options) 
{
    this.authenticatorSubject = subject;
    this.callbackHandler = callbackHandler;
}

/**
 * Method to authenticate a <code>Subject</code>.
 * <p>
 * @exception LoginException if the authentication fails
 * @return true if the authentication succeeded
 */
public boolean login() throws LoginException 
{
    /**authenticates user against weblogic authentication provider and sets
    * loginSucceeded
    * flag to true in case of successful authentication */
    this.authenticatorSubject = authenticate(this.callbackHandler);
    loginSucceeded = true;
    return loginSucceeded;
}

/**
 * authenticates using weblogic authentication provider
 * @param CallableHandler 
 * @return authenticated Subject
 * @throws LoginException
 */
private Subject authenticate(CallbackHandler cbh) throws LoginException 
{
    try {
        return Authentication.login(cbh);
    } catch (LoginException e) {
        throw new LoginException("Authentication Failed"+e.getMessage());
    }
}

/**
 */
* Method to commit the authentication process.
*<p>This method is called if the LoginContext's overall authentication succeeded<br>
*<p>@exception LoginException if the commit fails<br>
*<p>@return true if this method succeeded, or false if this <code>LoginModule</code> should be ignored.
*/
public boolean commit() throws LoginException {
    if (this.authenticatorSubject != null) {
        addToSubject(this.authenticatorSubject);
        return true;
    } else {
        return false;
    }
}

/**
 * Method to abort the authentication process.
 *<p>This method is called if the LoginContext's overall authentication failed.
 *<p>@exception LoginException if the abort fails<br>
 *<p>@return true if this method succeeded, or false if this <code>LoginModule</code> should be ignored.
 */
public boolean abort() throws LoginException {
    return this.loginSucceeded && logout();
}

/**
 * Method which logs out a <code>Subject</code>.<p>
 *<p>An implementation of this method might remove/destroy a Subject's Principals and Credentials.<p>
 *<p>@exception LoginException if the logout fails<br>
 *<p>@return true if this method succeeded, or false if this <code>LoginModule</code> should be ignored.
 */
public boolean logout() throws LoginException {
    if (this.authenticatorSubject != null) {
        removeFromSubject(this.authenticatorSubject);
    }
    this.loginSucceeded = false;
    return true;
}

/**
 * associates relevant Principals and Credentials with the Subject located in the LoginModule<br>
 * @param Subject
3.5.3.3 Implementing a Simple Login Module Class

This topic shows a sample SimpleLoginModule class that provides an implementation of javax.security.auth.spi.LoginModule.

The following is the sample SimpleLoginModule class:

```java
/*
* SimpleLoginModule class implements the LoginModule interface. SimpleLoginModule
* class is specified
* by the login configuration file i.e Loginconfig file.
* This class simply returns true resulting in successful authentication.
* This class is shown for illustration purpose only, users can integrate it with
* their custom authentication provider
*/

package sampleAssertion.loginmodule;

import java.util.Map;
import javax.security.auth.Subject;
```

```java
/**
 * <Description>
 * <p>
 * SimpleLoginModule class implements the LoginModule interface. SimpleLoginModule
 * class is specified
 * by the login configuration file i.e Loginconfig file.
 * This class simply returns true resulting in successful authentication.
 * 
 * This class is shown for illustration purpose only, users can integrate it with
 * their custom authentication provider
 * </p>
 * </Description>
 */

package sampleAssertion.loginmodule;

import java.util.Map;
import javax.security.auth.Subject;
```
import javax.security.auth.callback.CallbackHandler;
import javax.security.auth.login.LoginException;
import javax.security.auth.spi.LoginModule;

public class SimpleLoginModule implements LoginModule {

    @Override
    public boolean abort() throws LoginException {
        return false;
    }

    @Override
    public boolean commit() throws LoginException {
        return true;
    }

    @Override
    public void initialize(Subject subject, CallbackHandler callbackHandler,
            Map<String, ?> sharedState, Map<String, ?> options) {
    }

    @Override
    /**
     * This method simply returns true and results in successful authentication
     * Users can integrate it using there custom authentication provider
     */
    public boolean login() throws LoginException {
        System.out.println("Inside SimpleLoginModule");
        return true;
    }

    @Override
    public boolean logout() throws LoginException {
        return false;
    }
}

3.5.3.4 Implementing a Callback Handler Class

This topic shows a sample CallbackHandler class that provides an implementation of javax.security.auth.callback.Callback interface.

The following is the sample CallbackHandler class:

package sampleAssertion;
/**
 * <Description>
 * <p>
 * MyCallbackHandler class implements the
 * An application implements its own implementation of CallbackHandler.
 * An instance of CallbackHandler is passed as an argument to the LoginContext
 * instantiation.
 * The LoginContext forwards the CallbackHandler directly to the underlying
 * LoginModules
 * so that they may interact with the application to retrieve specific
 * authentication data,
 * such as usernames and passwords.
 * </p>
 */
import java.io.IOException;
import javax.security.auth.callback.Callback;
import javax.security.auth.callback.CallbackHandler;
import javax.security.auth.callback.NameCallback;
import javax.security.auth.callback.PasswordCallback;
import javax.security.auth.callback.UnsupportedCallbackException;

public class MyCallbackHandler implements CallbackHandler {
    private String userName = null;
    private String password = null;

    public void setUserName(String userName) {
        this.userName = userName;
    }

    public void setPassword(String password) {
        this.password = password;
    }

    @Override
    /**
     * sets user name and password into callback
     */
    public void handle(Callback[] callbacks) throws IOException,
    UnsupportedCallbackException {
        for (int i = 0; i < callbacks.length; i++) {
            Callback c = callbacks[i];
            if (c instanceof NameCallback) {
                ((NameCallback) c).setName(this.userName);
            } else if (c instanceof PasswordCallback) {
                char[] password = this.password.toCharArray();
                ((PasswordCallback) c).setPassword(password);
            } else {
                throw new UnsupportedCallbackException(callbacks[i],
                "Unrecognized Callback");
            }
        }
    }
}

3.6 Performing User Authentication in Custom Assertion

This topic explains the procedure to perform user authentication in custom assertion.

To perform user authentication in custom assertion:

1. Create the custom assertion and custom assertion executor with the sample codes
   as described in Authenticating a User in Custom Assertion. These samples
   demonstrate the following key features:

   • Define the custom assertion implementation class:
For more information, see `orawsp:Implementation`

- View the execution stage in the custom assertion executor:
  ```java
  oracle.wsm.common.sdk.IMessageContext.STAGE stage =
  ((oracle.wsm.common.sdk.IMessageContext) context).getStage();
  ```

  For more information, see `Accessing OWSM Custom Security Assertion`.

- In order to authenticate a user, you first need a `javax.security.auth.login>LoginContext`. Obtain a LoginContext. Use the LoginModule implementation specified by the entry named "CustomLoginModule" in the JAAS login configuration file and use the specified CallbackHandler as follows:
  ```java
  Subject subject = new Subject();
  LoginContext lc = new LoginContext("CustomLoginModule", subject,
  callbackhandler);
  ```

  Once the caller has instantiated a LoginContext, it invokes the login method to authenticate a subject. If authentication is successful, the CustomLoginModule populates the Subject with a Principal representing the user.

  For more information, see `http://download.oracle.com/javase/1.5.0/docs/guide/security/jgss/tutorials/index.html`.

  initializerCallbackHandler (from `Authenticating Using Custom Assertion Executor`) is used to check if incoming SOAP message contains UsernameToken, retrieve credentials from the incoming SOAP message and pass them to Login module class

- In the event of success, set the result to success:
  ```java
  result.setStatus(IResult.SUCCEEDED);
  ```

- In the event of failure, set the fault that caused the request execution to fail:
  ```java
  result.setStatus(IResult.FAILED);
  throw new WSMException(
  WSMException.FAULTCODE_QNAME_FAILED_AUTHENTICATION, e);
  ```

  For more information, see `Handling Exceptions in Custom Assertions`.

2. Create the JAR file as described in `Creating the Custom Assertion JAR File`.

3. Add the custom policy to the policy store as described in `Adding the Custom Policy to the Policy Store`.

4. Update the CLASSPATH as described in `Deploying the Custom Assertion`.

5. Attach the custom policy to the web service by any one of the methods described in `Attaching the Custom Policy to a Web Service`.

6. Create a client for the web service. This sample custom policy uses `wss_username_token_client_policy` on the client side. Attach the `wss_username_token_client_policy` to the client.
7. Create a configuration file and the class files that implement authentication as described in Implementing a Custom Login Module Class. For more information on the configuration file, refer to the JAAS API at http://download.oracle.com/javase/1.5.0/docs/guide/security/jgss/tutorials/index.html.

8. Specify the Login configuration file created in Authenticating Using Login Configuration File. You can specify the file in any one of the following ways:

   - Edit the script you use to start WebLogic Server to add the following option after the java command and restart the server:
     
     -Djava.security.auth.login.config=<path of LoginConfig file>

   - The Java security properties file is located in the file named <JAVA_HOME>/lib/security/java.security, where <JAVA_HOME> refers to the directory where the JDK was installed. In this file, change the value of the "login.configuration.provider" security property to the fully qualified name of the Login configuration file.

9. Invoke request from the client. The user name and password set into client will be authenticated against configured login module which integrates with Weblogic authentication provider.
You can use the Java API Reference for Oracle Web Services Manager, which specifies packages, interfaces, and methods to implement advanced features in custom assertions.

This chapter describes how to use the API to implement some common features and exception handling. This information is organized into the following sections:

- Supplying Parameters for Custom Assertions
- Examining OWSM Context Properties
- Accessing OWSM Custom Security Assertion
- Accessing Parts of a Message Using XPath
- Retrieving Certificates Used by Container for SSL
- Accessing Transport Properties
- Accessing Credential Store Framework Keys
- Handling Exceptions in Custom Assertions

4.1 Supplying Parameters for Custom Assertions

This section describes the various interfaces and methods to access the parameters inside the custom assertion executor.

It contains the following topics:

- About Custom Assertion Interfaces
- Inputting Parameters to Custom Assertions

4.1.1 About Custom Assertion Interfaces

This topic lists interfaces and methods using which you can input parameters to custom assertions.

You can input parameters to custom assertions using the following interfaces and methods:

- IAssertionBindings
- IConfig
- IPropertySet
4.1.2 Inputting Parameters to Custom Assertions

This topic explains the procedure to input parameters to custom assertions.

To input parameters to custom assertions:

1. Specify parameters as properties inside your custom assertion. In this example, the orawsp:PropertySet with the name valid_ips defines a group of properties. The orawsp:Property element defines a single property. orawsp:Value defines a list of valid values for the property.

   ```xml
   <orawsp:PropertySet orawsp:name="valid_ips">
     <orawsp:Property orawsp:name="valid_ips" orawsp:type="string" orawsp:contentType="constant">
       <orawsp:Value>140.87.6.143,10.178.93.107</orawsp:Value>
     </orawsp:Property>
   </orawsp:PropertySet>
   ``

2. Access the parameters inside the custom executor for the corresponding policy. For example, the following code in the execute method of custom assertion's executor class accesses the property valid_ips:

   ```java
   IAssertionBindings bindings = ((SimpleAssertion)(this.assertion)).getBindings();
   IConfig config = bindings.getConfigs().get(0);
   IPropertySet propertyset = config.getPropertySets().get(0);
   String valid_ips = propertyset.getPropertyByName("valid_ips").getValue();
   ```

4.2 Examining OWSM Context Properties

This topic describes the various interfaces to access the contextual properties inside the custom assertion executor.

It contains the following topics:

- About OWSM Context Properties Interfaces
- Accessing OWSM Context Properties

4.2.1 About OWSM Context Properties Interfaces

OWSM context properties are accessed using the IMessageContext interface.
You access parameters to custom assertions using the following interfaces and methods:

- IMessageContext
- getServiceURL
- getProperty
• getAllProperty

4.2.2 Accessing OWSM Context Properties

This topic explains the procedure to access OWSM context properties.

To access OWSM context properties:

1. To access OWSM context properties inside the custom assertion executor, use the IMessageContext interface. For example:

```java
IMessageContext messagecontext = (IMessageContext) context;
messagecontext.getServiceURL();
```

2. To access the value of a specific property inside the custom assertion executor, use the IMessageContext interface. For example:

```java
messagecontext.getProperty("<property name>");
```

3. To access all the properties that are used during execution from inside the custom assertion executor, use the IMessageContext interface. For example:

```java
msgContextProperties = messagecontext.getAllProperties();
```

4.3 Accessing OWSM Custom Security Assertion

This section describes the various interfaces to access the stages and retrieve the request and response messages inside the custom assertion executor.

It contains the following topics:

• About OWSM Custom Security Assertion Stages
• About OWSM Custom Security Assertion Interfaces
• Accessing Request, Response, and Fault Message Objects

4.3.1 About OWSM Custom Security Assertion Stages

The OWSM custom security assertion has three stages: request, response, and fault.

The following is the details of these stages:

• The request stage occurs when a client has made a request and that request is in the process of being delivered to its destination.

• The response stage occurs after the destination has processed the message and is in the process of returning a response.

• The fault stage occurs in the event of a fault.

4.3.2 About OWSM Custom Security Assertion Interfaces

The contextual information (such as stages and messages) is passed using context properties and can be obtained by the IMessageContext interface.

You can use the following interfaces and methods to access context properties:

• IMessageContext

• getStage
• getRequestMessage
• getResponseMessage

4.3.3 Accessing Request, Response, and Fault Message Objects

This topic explains the procedure to access request, response, and fault message objects.

To access request, response and fault messages, and stages:

1. To access the stage, use the following code within the custom assertion executor:

   ```java
   IMessageContext.STAGE stage = ((IMessageContext) iContext).getStage();
   if (stage == IMessageContext.STAGE.request) {
       //handle request
   }
   if (stage == IMessageContext.STAGE.response) {
       //handle response
   }
   if (stage == IMessageContext.STAGE.fault) {
       //handle fault conditions
   }
   ```

2. To retrieve the SOAP request message, use the same context oracle.wsm.common.sdk.IMessageContext, as shown in the following example:

   ```java
   oracle.wsm.common.sdk.SOAPBindingMessageContext soapMsgCtxt = (oracle.wsm.common.sdk.SOAPBindingMessageContext) context;
   javax.xml.soap.SOAPMessage soapMessage = soapMsgCtxt.getRequestMessage();
   ```

3. To retrieve the SOAP response message, use the same context oracle.wsm.common.sdk.IMessageContext, as shown in the following example:

   ```java
   oracle.wsm.common.sdk.SOAPBindingMessageContext soapMsgCtxt = (oracle.wsm.common.sdk.SOAPBindingMessageContext) context;
   javax.xml.soap.SOAPMessage soapMessage = soapMsgCtxt.getResponseMessage();
   ```

4.4 Accessing Parts of a Message Using XPath

You can use XPath expression to access parts of a SOAP message inside the custom assertion executor.

The following topics explain this further:

- **About XPath Expression**
- **Identifying the Value of a Node**
- **Adding a Namespace to Namespace Context**
- **Retrieving the Value of a Node**

4.4.1 About XPath Expression

You can access parts of a SOAP message using XPath expression inside your custom policy executor.

In the following SOAP message example, the node arg0 has the value john:
In XPath, there are seven types of nodes: element, attribute, text, namespace, processing-instruction, comment, and document nodes. XPath uses path expressions to select nodes in an XML document. Table 4-1 describes some examples of XPath expressions.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/S:Envelope</td>
<td>Selects from the root element S:Envelope.</td>
</tr>
<tr>
<td>/S:Envelope/S:Body</td>
<td>Selects all S:Body elements that are children of S:Envelope</td>
</tr>
<tr>
<td>//S:Body</td>
<td>Selects all S:Body elements no matter where they are in a document</td>
</tr>
</tbody>
</table>

### 4.4.2 Identifying the Value of a Node

This topic shows an example which uses the XPath expression to identify the value of the node arg0.

The following is the example:

```java
//xpath expression that will be used to identify the node arg0
String xpathStr = "/*:Envelope/S:Body/ns2:echo/arg0";
```

### 4.4.3 Adding a Namespace to Namespace Context

You can define namespaces for any namespace referenced by the XPath expression and add them to the namespace context.

For example:

```java
final DefaultNamespaceContext nsContext = new DefaultNamespaceContext();
nsContext.addEntry("S", "http://schemas.xmlsoap.org/soap/envelope/");
nscContext.addEntry("ns2", "http://project1/");

XPathFactory xpathFact = XPathFactory.newInstance();
XPath xpath = xpathFact.newXPath();
xpath.setNamespaceContext(nsContext);
```

### 4.4.4 Retrieving the Value of a Node

This topic shows an example of retrieving the value of a node by using the evaluate method.

The following is the example:

```java
//This will return node arg0 from SOAP message, here soapElement is
// org.w3c.dom.Element representation of SOAP message
```
4.5 Retrieving Certificates Used by Container for SSL

This topic explains the procedure to retrieve certificates for SSL.

To retrieve certificates for SSL:

1. Retrieve SOAP response message using the same context
   oracle.wsm.common.sdk.IMessageContext, as shown in the following example:

   ```java
   oracle.wsm.common.sdk.SOAPBindingMessageContext soapMsgCtxt =
   (oracle.wsm.common.sdk.SOAPBindingMessageContext) context;
   ```

2. Access the attributes of an X.509 certificate. For example:

   ```java
   X509Certificate[] certificates = (X509Certificate[]) soapMsgCtxt.getTransportContext() .getAttribute(oracle.wsm.security.util.SecurityConstants.SSL_PEER_CERTIFICATES);
   ```

4.6 Accessing Transport Properties

This topic explains the procedure to access the transport properties of HTTP requests and responses.

To access transport properties for HTTP requests and responses:

1. Retrieve SOAP response message using the same context
   oracle.wsm.common.sdk.IMessageContext, as shown in the following example:

   ```java
   oracle.wsm.common.sdk.SOAPBindingMessageContext soapMsgCtxt =
   (oracle.wsm.common.sdk.SOAPBindingMessageContext) context;
   ```

2. Retrieve `TransportContext` from message context, as shown in following example:

   ```java
   ITransportContext transCtx = invokerCtx.getTransportContext();
   ```

   See the `ITransportContext` and `HttpTransportContext` javadoc classes in `Oracle Fusion Middleware Java API Reference for Oracle Web Services Manager` to see how you can access various properties. Information about these classes is available inside the `oracle.wsm.common.sdk` package.

4.7 Accessing Credential Store Framework Keys

You can use credential store framework (CSF) to manage the credentials securely, and store, retrieve, and maintain credentials.

To configure and use CSF:

1. Configure CSF in jps-config.xml.

   For details on configuring credential store using WLST, see Configuring the Credential Store in `Securing Web Services and Managing Policies with Oracle Web Services Manager`.

2. You can add, update, or retrieve CSF keys from CSF inside your custom assertion executor.
You can use the following sample to access CSF keys from credential store.

```java
final String mapName = "oracle.wsm.security";
final String csfKey = "user.credentials";
final oracle.security.jps.service.credstore.PasswordCredential userCreds =
    getCredentialsFromCSF(mapName, csfKey);

if (userCreds != null) {
    System.out.println("name:" + userCreds.getName());
    System.out.println("name:" + new String(userCreds.getPassword()));
}
```

This sample uses the getCredentialsFromCSF method:

```java
private static oracle.security.jps.service.credstore.PasswordCredential
    getCredentialsFromCSF(final String mapName, final String csfKey) {
    try {
        if (csfKey != null) {
            final oracle.security.jps.service.credstore.CredentialStore credStore =
                getCredStore();
            if (credStore != null) {
                passwordCredential =
                    (oracle.security.jps.service.credstore.PasswordCredential)
                        java.security.AccessController
                            .doPrivileged(new
                                java.security.PrivilegedExceptionAction<
                                    oracle.security.jps.service.credstore.Credential>() {
                                    public
                                        oracle.security.jps.service.credstore.Credential run() throws Exception {
                                            return (credStore .getCredential(mapName, csfKey));
                                        }
                                });
            } else {
                // failure obtaining csf credentials
            }
        } catch (final java.security.PrivilegedActionException ex) {
            //handle exception
        } catch (final oracle.security.jps.JpsException jpse) {
            //handle exception
        }
        return passwordCredential;
    }
```
factory.getContext(oracle.security.jps.internal.api.runtime.ServerContextFactory.S
cope.SYSTEM);

final oracle.security.jps.JpsContext jpsCtxAppDefault = factory
  .getContext(oracle.security.jps.internal.api.runtime.ServerContextFact
ory.Scope.AP
PLICATION);

appCsfStore = (jpsCtxAppDefault != null) ? jpsCtxAppDefault
  .getServiceInstance(oracle.security.jps.service.credstore.CredentialSt
ore.class) :
    null;

if (appCsfStore == null) {
  systemCsfStore = jpsCtxSystemDefault
    .getServiceInstance(oracle.security.jps.service.credstore.Credenti
alStore.class);
  csfStore = systemCsfStore;
} else {
  //use Credential Store defined in app-level jps-config.xml
  csfStore = appCsfStore;
}
return csfStore;

---

**Note:**

The following JAR files must be included in the classpath: oracle.jps_12.1.2/jps-api.jar, oracle.jps_12.1.2/jps-
unsupported-api.jar.

You must provide the CredentialAccessPermission permission to the custom policy
executor jar. For more information about granting permissions, see "Setting the Java
Security Policy Permissions" in *Securing Applications with Oracle Platform Security
Services*.

## 4.8 Handling Exceptions in Custom Assertions

This topic describes the WSMException method to handle exceptions in the custom
assertion executor.

It contains the following topics:

- **About WSMException Method**
- **Processing Exceptions in WSMException**

### 4.8.1 About WSMException Method

Any exceptions during the execution of custom assertions must be handled by the
WSMException in the custom assertion executor.

IResult execute(IContext mcontext) throws WSMException

This method must always return a non-null IResult object. The status field indicates
success or failure or other state. The IResult.getFault() method is used to return the
detailed cause for failure and returns null in case of success.
4.8.2 Processing Exceptions in WSMException

The exceptions arising from within the execute method of custom assertion executor should first be wrapped in WSMException, the execution status should be set to IResult.FAILED, and the generateFault method throws the WSMException.

The following example shows this:

```java
IResult execute(IContext mcontext) throws WSMException {
    IResult result = new Result();
    try {
        ...
    } catch (Exception e) {
        WSMException wsmException = new WSMException(e);
        result.setStatus(IResult.FAILED);
        generateFault(wsmException);
    }
    ...
}
```
You can use the XML schema in this appendix as a reference when creating a WS-Policy file that contains custom web service assertions.

This appendix includes the following topics:

- Element Hierarchy of Custom Assertions in a WS-Policy File
- Custom Assertion Elements

A.1 Element Hierarchy of Custom Assertions in a WS-Policy File

This topic shows the element hierarchy of the custom assertions in a WS-Policy file. The following figure illustrates it:

![Figure A-1 Element Hierarchy of Custom Assertion]

A.2 Custom Assertion Elements

This topic lists the custom assertion elements.

A custom assertion contains the following elements:

- wsp:Policy
- orasp:Assertion
- orawsp:bindings
- orawsp:Implementation
A.2.1 wsp:Policy

This topic describes the <wsp:Policy> element and its attributes.

The <wsp:Policy> element groups nested policy assertions.

Attributes

The following table summarizes the Oracle extensions to the WS-Policy attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachTo</td>
<td>Policy subjects to which the policy can be attached. Valid values include: binding.client, binding.server, binding.any.</td>
</tr>
<tr>
<td>category</td>
<td>Category of the policy. Valid values include: security and management.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the policy.</td>
</tr>
<tr>
<td>status</td>
<td>Status of the policy reference. Valid values include: enabled and disabled.</td>
</tr>
</tbody>
</table>

Example

The following example illustrates the <wsp:Policy> element:

```xml
    xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/securitypolicy"
    orawsp:status="enabled"
    xmlns:wsu="http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    orawsp:category="security"
    orawsp:attachTo="binding.server"
    wsu:Id="ip_assertion_policy"
    xmlns:orawsp="http://schemas.oracle.com/ws/2006/01/policy"
    wsp:Name="oracle/ip_assertion_policy">
```

A.2.2 orasp:Assertion

This topic describes the attributes of the <orasp:Assertion> element.

The <orasp:Assertion> element is the main element of the custom assertion.
Attributes

The following table summarizes the attributes of the `<orasp:Assertion>` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Flag that specifies whether the assertion is optional or required.</td>
</tr>
<tr>
<td>Silent</td>
<td>Flag that specifies whether the assertion is advertised. If set to true, the assertion is not advertised.</td>
</tr>
<tr>
<td>Enforced</td>
<td>Flag that specifies whether the assertion is currently enabled.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the assertion.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the assertion.</td>
</tr>
<tr>
<td>category</td>
<td>Category to which the assertion applies. Valid values include: security/authentication, security/msg-protection, security/authorization, security/logging and management.</td>
</tr>
<tr>
<td>provides</td>
<td>Web service endpoint type to which this policy can be attached. Note: This attribute is required for RESTful endpoints. For example, to specify RESTful web services: <code>&lt;orawsp:provides=&quot;{http://schemas.oracle.com/ws/2006/01/policy}REST_HTTP&quot;</code></td>
</tr>
</tbody>
</table>

Example

The following example illustrates the `<orasp:Assertion>` element:

```xml
<orasp:ipAssertion orawsp:Silent="true" orawsp:Enforced="true"
orawsp:name="WSSecurity IpAssertion Validator"
orawsp:category="security/authentication"
orawsp:provides="{http://schemas.oracle.com/ws/2006/01/policy}REST_HTTP">
  ...
</orasp:ipAssertion>
```

A.2.3 orawsp:bindings

This topic describes the `<orawsp:bindings>` element.

The `<orawsp:bindings>` element defines the bindings in the custom assertion.

Example

The following example illustrates the `<orawsp:bindings>` element:

```xml
<orawsp:bindings>
  ...
</orawsp:bindings>
```
A.2.4 orawsp:Implementation

This topic describes the <orawsp:Implementation> element.

The <orawsp:Implementation> element defines the custom assertion implementation class.

Example

The following example illustrates the <orawsp:Implementation> element:

```xml
<orawsp:Implementation>sampleassertion.IpAssertionExecutor</orawsp:Implementation>
```

A.2.5 orawsp:Config

This topic describes the <orawsp:Config> element and its attributes.

The <orawsp:Config> element defines the configuration for the custom assertion.

Attributes

The following table summarizes the attributes of the <orawsp:Config> element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the configuration.</td>
</tr>
<tr>
<td>type</td>
<td>Category to which the configuration applies.</td>
</tr>
<tr>
<td>configType</td>
<td>Configuration type. Valid values include: declarative and programmatic.</td>
</tr>
<tr>
<td></td>
<td>• declarative—Use deployment descriptors and configuration files to describe authentication and authorization requirements.</td>
</tr>
<tr>
<td></td>
<td>• programmatic—Embed security enforcement within the application.</td>
</tr>
</tbody>
</table>

Example

The following example illustrates the <orawsp:Config> element:

```xml
<orawsp:Config orawsp:name="iexpression" orawsp:configType="declarative"/>
```

A.2.6 orawsp:PropertySet

This topic describes the <orawsp:PropertySet> element and its attributes.

The <orawsp:PropertySet> element groups nested properties.

Attributes

The following table summarizes the attributes of the <orawsp:PropertySet> element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>

Table A-4 Attributes of <orawsp:PropertySet> Element
### Table A-4 (Cont.) Attributes of `<orawsp:PropertySet>` Element

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the property set.</td>
</tr>
</tbody>
</table>

**Example**

The following example illustrates the `<orawsp:PropertySet>` element:

```
<orawsp:PropertySet orawsp:name="valid_ips">
```

### A.2.7 `orawsp:Property`

This topic describes the `<orawsp:Property>` element and its attributes.

The `<orawsp:Property>` element defines a single property.

**Attributes**

The following table summarizes the attributes of the `<orawsp:Property>` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the property.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the property. For example, string.</td>
</tr>
</tbody>
</table>
| contentType | Specifies whether the property is required and can be overridden. Valid values include:  
  • constant—Property is a constant value and cannot be overridden.  
  • required—Property is required and can be overridden.  
  • optional—Property is optional and can be overridden.  
  For information about overriding policies, see "Overriding Policy Configuration Overrides" in *Administering Web Services*. |

**Example**

The following example illustrates the `<orawsp:Property>` element:

```
<orawsp:Property orawsp:name="valid_ips" orawsp:type="string" orawsp:contentType="constant">
```

### A.2.8 `orawsp:Description`

This topic describes the `<orawsp:Description>` element.

The `<orawsp:Description>` element provides a description of the property.

**Example**

The following example illustrates the `<orawsp:Description>` element:

```
<orawsp:Description>Valid IP Values</orawsp:Description>
```
A.2.9 orawsp:Value

This topic describes the <orawsp:Value> element.
The <orawsp:Value> element provides a list of valid values for the property.

Example
The following example illustrates the <orawsp:Value> element:

<orawsp:Value>140.87.6.143,10.178.93.107</orawsp:Value>
