This documentation describes the Oracle WebLogic Server Multitenant RESTful server runtime resources that are used to monitor the Administration Server in the specified domain partition.

For a complete listing of the WLS REST reference documents and descriptions of their use, see Administering Oracle WebLogic Server with RESTful Management Services.
This resource is used to access different versions (if applicable) of the resources that are in this domain.

There are two versions: 12.2.1.0 (deprecated) and latest, where latest is another name for 12.2.1.1.0. For future releases, latest always refers to the most recent release.

All new MBean features have been added to the 12.2.1.1.0 and the 12.2.1.0 REST resources. Any MBean features that were deprecated in 12.2.1.1.0, will still be available using the 12.2.1.0 REST URLs, but not the 12.2.1.1.0 REST URLs.

To always use the latest resources, make sure to use latest in the URLs. Note that this might require updating a client when moving to a newer version of WebLogic Server. To fix the version so that an update is not required, use 12.2.1.1.0 in the URLs.

The resource supports the following methods:

- GET
GET

Get this collection of `weblogic.management.rest.bean.model.Version` instances.

Roles

Admin, Deployer, Monitor, Operator

Response Body

Contains a list of `weblogic.management.rest.bean.model.Version` entities.

This method can return the following links:

- `uri=/management/weblogic rel=canonical`
  This resource.
- `uri=/management/weblogic/12.2.1.0 rel=current`
  Access the latest version of the WLS resources in the this domain.
- `uri=/management/weblogic rel=self`
  This resource.

Example

**Example 1  View the versions collection.**

This example uses the GET method to display the version instances in this collection.

Example Request

```
curl -v  \
--user admin:admin123 \n-H X-Requested-By:MyClient \n-H Accept:application/json \n-X GET http://localhost:7001/management/weblogic
```

Example Response

/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JMSRuntime/JMSServers/{name}/pauseConsumption

The resource supports the following methods:

- POST
POST

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

Contains an empty JSON object.
The resource supports the following methods:

- POST
Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a “client acknowledge” session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCreationFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in...
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

Pauses the new message production on all the destinations hosted by the JMSServer.

new and existing producers attached to the destinations. When the destination is
"resumed from production pause", all the new message production is allowed from
both new and existing producers attached to that destination.

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

Contains an empty JSON object.
The resource supports the following methods:

- POST
Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  
  - **UN-COMMITTED MESSAGES**
    
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  
  - **QUOTA BLOCKING SEND**
    
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  
  - **UN-AKLOWELEDGED (CLIENT ACK PENDING) MESSAGES**
    
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  
  - **UN-COMMITTED MESSAGES**
    
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  
  - **ROLLED BACK MESSAGES**
    
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSConectionFactory and JMSDestination respectively.

    If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

weblogic.management.runtime.ApplicationRuntimeMBean

An application represents a Java EE enterprise application packaged in an EAR file or EAR exploded directory. The EAR file or directory contains a set of components such as WAR, EJB, and RAR connector components, each of which can be deployed on one or more targets. A target is a server or a cluster. Modules in the application can have one of the following states:

- UNPREPARED - Indicates that none of the modules in this application are currently prepared or active.
- PREPARED - Indicates that none of the modules in this application are currently prepared or active.
- ACTIVATED - Indicates that at least one module in this application is currently active.

ApplicationRuntimeMBean encapsulates runtime information about a deployed enterprise application.

The properties of the weblogic.management.runtime.ApplicationRuntimeMBean entity are as follows:

**activeVersionState**
Specifies whether this application version is the currently active version.

An application can be the only version currently deployed, or it can have more than one version currently deployed, using the side-by-side deployment feature. If more than one version is deployed, only one version can be active. This attribute specifies the state the current application version is in.

An application can be in an INACTIVE state, which means that it has not been activated yet, or that there is more than one version of the application deployed (using side-by-side deployment) and this version is retiring.

An application can be in ACTIVE_ADMIN state, which means that it is the currently active version for administrative channel requests.

An application can be in ACTIVE state, which means that it is the currently active version for normal (non-administrative) channel requests.

_Type_: int  
_Constraints_: Read Only, Restart Required

**applicationName**

weblogic.management.runtime.QueryCacheRuntimeMBean
This interface contains accessor methods for all query cache runtime information collected for an EJB. The cache miss counts need some explaining. A query-cache miss can occur due to one of the following reasons:

- The query result was not found in the query-cache
- The query result has timed out
- A bean which satisfies the query was not found in the entity cache
- A query with relationship-caching turned on did not find the related-beans query result
- A query which loads multiple EJBs could not load one or more of them

To better aid tuning, there are separate counters provided for each of the last four of the above causes. The fifth counter is a total cache miss counter. This counter takes into account all five causes of a cache miss.

The properties of the weblogic.management.runtime.QueryCacheRuntimeMBean entity are as follows:

weblogic.management.runtime.TaskRuntimeMBean

Exposes monitoring information about an ongoing and potentially long-running administrative process. This should be taken to mean, at minimum, any OA&M operation involving I/O. Examples include starting and stopping servers, deploying and undeploying applications, or migrating services.

An MBean operation of this sort should fork a separate thread to perform the actual work and immediately return an instance of TaskRuntimeMBean to the caller. The caller can then use this to track the task’s progress as desired. Users can also query for all instances of TaskRuntimeMBean to get a summary of both currently-running and recently-completed tasks.

Instance of TaskRuntimeMBean continue to exist in the MBeanServer after the completion of the work they describe. They will eventually either be explicitly deregistered by the user, or removed by a scavenger process which periodically purges instances of TaskRuntimeMBean that have been completed for some time.

**weblogic.management.runtime.TriggerRuntimeMBean**

The `weblogic.management.runtime.TriggerRuntimeMBean` holds runtime state (for the current Server instance) for a Trigger that has been configured in the Resource Consumption Management policy of the current Domain Partition.

The WebLogic Resource Consumption Management feature automatically initiates the configured recourse action of a Trigger when the Trigger's configured usage limits are exceeded by a Domain Partition. When a usage limit is exceeded, and the configured recourse action has been successfully executed, the Trigger is *Activated*.

When the current resource usage by the Domain Partition falls below the Trigger's configured usage limit, the feature automatically withdraws the recourse action where
possible. When the current usage is below the configured usage limit, and the configured recourse action has been successfully withdrawn, the Trigger is said to be _not Activated_.

The MBean captures the following states for a Trigger when the current resource consumption usage by the Domain Partition exceeds or goes below the configured usage limit for the Domain Partition:

- Whether the Trigger is _Activated_ (usage has exceeded the limit and the recourse action was successfully executed) or not
- The time when the last recourse action was executed successfully for the Trigger
- Whether a recourse action has been initiated in response to the resource usage by the Domain Partition exceeding the configured usage limits

The properties of the weblogic.management.runtime.TriggerRuntimeMBean entity are as follows:

- **activated**
  Indicates if the Trigger is _Activated_

  **Type**: boolean

  **Constraints**: Read Only, Restart Required

- **initiated**
  Indicates if a recourse action has been initiated for this Trigger as a result of the current resource usage by a Domain Partition exceeding its usage limit. A new [@code RecourseActionEventVBean] is added to the array returned by getRecourseActionEventsHistory().

  The kind of recourse action initiated (for example, a new recourse action or a withdrawal of an existing recourse action) can be determined through RecourseActionEventVBean#isActive().

  **Type**: boolean

  **Constraints**: Read Only, Restart Required

- **lastTimeExecuted**
  The [@code Date] when the last recourse action was successfully executed for the current Trigger.
