This documentation describes the Oracle WebLogic Server RESTful server runtime resources that are used to monitor the Administration Server or a Managed Server.

For a complete listing of the WLS REST reference documents and descriptions of their use, see *Administering Oracle WebLogic Server with RESTful Management Services*. 
This resource is used to access different versions (if applicable) of the resources that are in this domain.

There are two versions: 12.2.1.0 (deprecated) and latest, where latest is another name for 12.2.1.1.0. For future releases, latest always refers to the most recent release.

All new MBean features have been added to the 12.2.1.1.0 and the 12.2.1.0 REST resources. Any MBean features that were deprecated in 12.2.1.1.0, will still be available using the 12.2.1.0 REST URLs, but not the 12.2.1.1.0 REST URLs.

To always use the latest resources, make sure to use latest in the URLs. Note that this might require updating a client when moving to a newer version of WebLogic Server. To fix the version so that an update is not required, use 12.2.1.1.0 in the URLs.

The resource supports the following methods:

- GET
GET

Get this collection of `weblogic.management.rest.bean.model.Version` instances.

Roles

Admin, Deployer, Monitor, Operator

Response Body

Contains a list of `weblogic.management.rest.bean.model.Version` entities.

This method can return the following links:

- **uri**=/management/weblogic **rel**=canonical
  This resource.
- **uri**=/management/weblogic/12.2.1.0 **rel**=current
  Access the latest version of the WLS resources in the this domain.
- **uri**=/management/weblogic **rel**=self
  This resource.

Example

Example 1 View the versions collection.
This example uses the GET method to display the version instances in this collection.

Example Request

curl -v \
--user admin:admin123 \
-H X-Requested-By:MyClient \
-H Accept:application/json \

Example Response

HTTP/1.1 200 OK

Response Body:

/management/weblogic/{version}

This resource describes the resource trees that are used to manage a WebLogic Server domain and its managed servers. The resource trees mimic the bean trees in WLST and allow you to view and edit configuration and monitor runtime behavior.

The resource supports the following methods:

- GET
GET

Get this `weblogic.management.rest.bean.model.Version` instance.

Roles

Admin, Deployer, Monitor, Operator

Response Body

Contains a `weblogic.management.rest.bean.model.Version` entity.

This method can return the following links:

- `uri=/management/weblogic/{version} rel=canonical`
  This resource.
- `uri=/management/weblogic/{version}/currentUser rel=currentUser`
- `uri=/management/weblogic/{version}/domainConfig rel=domainConfig`
- `uri=/management/weblogic/{version}/domainRuntime rel=domainRuntime`
- `uri=/management/weblogic/{version}/edit rel=edit`
- `uri=/management/weblogic rel=parent`
  The parent resource of this resource.
- `uri=/management/weblogic/{version} rel=self`
  This resource.
- `uri=/management/weblogic/{version}/serverConfig rel=serverConfig`
- `uri=/management/weblogic/{version}/serverRuntime rel=serverRuntime`

Example

Example 1  View the latest version.
This example uses the GET method to display the latest version.

Example Request

curl -v 
  --user admin:admin123 
  -H X-Requested-By:MyClient 
  -H Accept:application/json 

Example Response

HTTP/1.1 200 OK

Response Body:

Example 2  View a specific version.
This example uses the GET method to display a specific version.

Example Request

Asynchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. These connections remain in the pool and are not closed because the pool may be resumed.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

Pauses the consumption operation on all the destinations hosted by the JMS Server.

When the JMS Server is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination is "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Response Body

/management/weblogic/{version}/serverRuntime/JMSRuntime/JMSServers/{name}/pauseInsertion

The resource supports the following methods:

- POST
Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERY MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

The resource supports the following methods:

- POST

Pauses the new message production on all the destinations hosted by the JMSServer. When the production paused, it would prevent any new produce operations from both new and existing producers attached to the destinations. When the destination is "resumed from production pause", all the new message production is allowed from both new and existing producers attached to that destination.

The resource supports the following methods:

- POST
POST

Gracefully, asynchronously shuts down a data source that has a health state of Running. A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Shutdown

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

Roles

Admin

Request Body

Must contain a JSON object with the following fields:

operationSecs
The number of seconds to allow the operation to run before stopping processing. If set to 0, the default is used. The default is to use Inactive Connection Timeout Seconds if set or 60 seconds. If you want a minimal timeout, set the value to 1. If you want no timeout, set it to a large value (not recommended).

Type: int

Response Body

Contains a JSON object with a weblogic.management.runtime.JDBCDataSourceTaskRuntimeMBean reference return field.
The resource supports the following methods:

- POST
POST

Asynchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. These connections remain in the pool and are not closed because the pool may be resumed.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JBCPartitionRuntime/JDBCDataSourceRuntimeMBeans/{name}/shutdown

The resource supports the following methods:

- POST
POST

Gracefully, synchronously shuts down a data source that has a health state of Running. A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

If successful, the health state is set to Shutdown

This is a privileged operation that can only be invoked by an authorized user.

Roles

Admin

Response Body

Contains an empty JSON object.
/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JDBCPartitionRuntime/JDBCDataSourceRuntimeMBeans/{name}/start

The resource supports the following methods:

- POST
POST

Starts a data source that has a health state of **Shutdown**
If successful, the health state is set to **Running**
This is a privileged operation that can only be invoked by an authorized user.

Roles
Admin

Response Body
Contains an empty JSON object.
The resource supports the following methods:

- POST
POST

Synchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. If graceful suspend is done as part of a graceful shutdown operation, connections are immediately closed when no longer reserved or at the end of the timeout period. If not done as part of a shutdown operation, these connections remain in the pool and are not closed because the pool may be resumed.

By default, the timeout period is 60 seconds. You can change the value of this timeout period by configuring or dynamically setting Inactive Connection Timeout Seconds to a non-zero value.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended

This is a privileged operation that can only be invoked by an authorized user.

/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JMSSRuntime/JMSServers/{name}/pauseConsumption

The resource supports the following methods:

- POST
POST

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination is in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

Contains an empty JSON object.
The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

The resource supports the following methods:

- POST
POST

Pauses the new message production on all the destinations hosted by the JMSServer. When the production paused, it would prevent any new produce operations from both new and existing producers attached to the destinations. When the destination is "resumed from production pause", all the new message production is allowed from both new and existing producers attached to that destination.

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

The resource supports the following methods:

- POST
Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in...
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- RECOVERED MESSAGES
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- REDELIVERED MESSAGES
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

Immediately invalidates the cached security keys for the specified WebLogic Server user.

An SNMP security key is an encrypted version of an SNMP agent's engine ID and an authentication password or privacy password. WebLogic Server generates one security key for each entry that you create in the SNMP credential map. When a WebLogic Server SNMP agent receives an SNMPv3 request, it compares the key that is in the request with its WebLogic Server keys. If it finds a match, it processes the request. The SNMP agent also encodes these keys in its responses and notifications. (You configure which keys are encoded when you create a trap destination.)

Instead of regenerating the keys for each SNMPv3 communication, WebLogic Server caches the keys. To make sure that the cache contains the latest set of SNMP credentials, WebLogic Server periodically invalidates the cache. After the cache is invalidated, the next time an SNMP agent requests credentials, WebLogic Server regenerates the cache.

Note that making a change to the credential map does not automatically update the cache. Instead, the cache is updated only after it has been invalidated.

Instead of waiting for WebLogic Server to invalidate the cached entry for a key, you can invalidate it immediately.

Returns WebLogic Server’s MIB module for custom MBeans as a `java.lang.String`. You can save the `String` to a file and then load the file into a MIB browser.

When you register custom MBeans in the WebLogic Server Runtime MBean Server, WebLogic Server adds entries to a runtime MIB module that it maintains for custom MBeans. For each custom MBean type, WebLogic Server adds a table to the MIB module. For each instance of the custom MBean, it adds a table row. While WebLogic Server does not persist the MIB module as a file or other data structure, the OIDs in the module remain constant across server sessions.

weblogic.management.runtime.ApplicationRuntimeMBean

An application represents a Java EE enterprise application packaged in an EAR file or EAR exploded directory. The EAR file or directory contains a set of components such as WAR, EJB, and RAR connector components, each of which can be deployed on one or more targets. A target is a server or a cluster. Modules in the application can have one of the following states:

- **UNPREPARED** - Indicates that none of the modules in this application are currently prepared or active.
- **PREPARED** - Indicates that none of the modules in this application are currently prepared or active.
- **ACTIVATED** - Indicates that at least one module in this application is currently active.

ApplicationRuntimeMBean encapsulates runtime information about a deployed enterprise application.

The properties of the weblogic.management.runtime.ApplicationRuntimeMBean entity are as follows:

**activeVersionState**
Specifies whether this application version is the currently active version.

An application can be the only version currently deployed, or it can have more than one version currently deployed, using the side-by-side deployment feature. If more than one version is deployed, only one version can be active. This attribute specifies the state the current application version is in.

An application can be in an INACTIVE state, which means that it has not been activated yet, or that there is more than one version of the application deployed (using side-by-side deployment) and this version is retiring.

An application can be in ACTIVE_ADMIN state, which means that it is the currently active version for administrative channel requests.

An application can be in ACTIVE state, which means that it is the currently active version for normal (non-administrative) channel requests.

The properties of the weblogic.management.runtime.JDBCReplayStatisticsRuntimeMBean entity are as follows:

**deploymentState**
The current deployment state of the module.

A module can be in one and only one of the following states. State can be changed via deployment or administrator console.

- **NEW.** State indicating this module has just been created and is being initialized.

**Type:** int

**Constraints:** Read Only, Restart Required

**failedReplayCount**
Obtains the number of replays that failed.

When replay fails, it rethrows the original SQLRecoverableException to the application, with the reason for the failure chained to that original exception. Application can call `getNextException` to retrieve the reason.

**Type:** long

**Constraints:** Read Only, Restart Required

**moduleId**
Returns the identifier for this Component. The identifier is unique within the application.

Typical modules will use the URI for their id. Web Modules will return their context-root since the web-uri may not be unique within an EAR.

**replayDisablingCount**
Obtains the number of times that replay is disabled. When replay is disabled in the middle of a request, the remaining calls in that request are no longer protected by AC. *Type*: long
*Constraints*: Read Only, Restart Required

**totalProtectedCalls**

**weblogic.management.runtime.QueryCacheRuntimeMBean**  
This interface contains accessor methods for all query cache runtime information collected for an EJB. The cache miss counts need some explaining. A query-cache miss can occur due to one of the following reasons:

- The query result was not found in the query-cache
- The query result has timed out
- A bean which satisfies the query was not found in the entity cache
- A query with relationship-caching turned on did not find the related-beans query result
- A query which loads multiple EJBs could not load one or more of them

To better aid tuning, there are separate counters provided for each of the last four of the above causes. The fifth counter is a total cache miss counter. This counter takes into account all five causes of a cache miss.

weblogic.management.runtime.ServerMigrationRuntimeMBean

ServerMigrationRuntimeMBean provides runtime monitoring information about the past migrations performed by this server as the cluster master. If this server was never the cluster master then no information would be available. This RuntimeMBean would be hosted on all cluster members and can be queried for the location of the cluster master which is just another peer in the cluster. JMX clients can make another call to the server hosting the cluster master functionality to get the migration history.

Please note that the migration history is not persisted and is lost when a server is shutdown.

*Note:* The default protocol, listen address and listen port are persisted in the domain's config.xml file, however when a server instance is started, command-line options can override these persisted values. This `getDefaultURL` method returns the URL values that are currently being used, not necessarily the values that are specified in config.xml

weblogic.management.runtime.TaskRuntimeMBean

Exposes monitoring information about an ongoing and potentially long-running administrative process. This should be taken to mean, at minimum, any OA&M
operation involving I/O. Examples include starting and stopping servers, deploying and undeploying applications, or migrating services.

An MBean operation of this sort should fork a separate thread to perform the actual work and immediately return an instance of TaskRuntimeMBean to the caller. The caller can then use this to track the task's progress as desired. Users can also query for all instances of TaskRuntimeMBean to get a summary of both currently-running and recently-completed tasks.

Instance of TaskRuntimeMBean continue to exist in the MBeanServer after the completion of the work they describe. They will eventually either be explicitly deregistered by the user, or removed by a scavenger process which periodically purges instances of TaskRuntimeMBean that have been completed for some time.

**weblogic.management.runtime.TriggerRuntimeMBean**

The `weblogic.management.runtime.TriggerRuntimeMBean` holds runtime state (for the current Server instance) for a Trigger that has been configured in the Resource Consumption Management policy of the current Domain Partition.

The WebLogic Resource Consumption Management feature automatically initiates the configured recourse action of a Trigger when the Trigger's configured usage limits are exceeded by a Domain Partition. When a usage limit is exceeded, and the configured recourse action has been successfully executed, the Trigger is *Activated*.

When the current resource usage by the Domain Partition falls below the Trigger's configured usage limit, the feature automatically withdraws the recourse action where possible. When the current usage is below the configured usage limit, and the configured recourse action has been successfully withdrawn, the Trigger is said to be *not Activated*.

The MBean captures the following states for a Trigger when the current resource consumption usage by the Domain Partition exceeds or goes below the configured usage limit for the Domain Partition:

- Whether the Trigger is *Activated* (usage has exceeded the limit and the recourse action was successfully executed) or not
- The time when the last recourse action was executed successfully for the Trigger
- Whether a recourse action has been initiated in response to the resource usage by the Domain Partition exceeding the configured usage limits

weblogic.management.runtime.WLDFImageCreationTaskRuntimeMBean

Exposes monitoring information about a potentially long-running request for the generation of a diagnostic image. Remote clients, as well as clients running within a server, can access this information.

weblogic.management.runtime.WLDFImageRuntimeMBean
WLDFImageRuntimeMBean supports operations to request the generation of a diagnostic image for capturing a running server’s internal state information. These operations will fork a separate thread to perform the actual work and immediately return an instance of this MBean to the caller. The caller can then use that instance to track the task’s progress.

weblogic.management.runtime.WLDFWatchNotificationSourceRuntimeMBean

Attaches an action listener in order to receive action events when a policy evaluates to true. Note that the listener will receive all actions; the caller must filter the output.

Unlike the deprecated WLDFWatchJMXNotificationRuntimeMBean, the action generated by this source is a Java Map object comprised of simple JDK types, and does not require a client dependency on any WLDF code.

Note: As of WebLogic Server 12.2.1, the terms watch and notification are replaced by policy and action, respectively. However, the definition of these terms has not changed.

Encapsulates runtime information about a particular Web Service. The name attribute of this MBean will be the value of the webservice-description-name element in webservices.xml

The properties of the weblogic.management.runtime.WseeV2RuntimeMBean entity are as follows:

**URI**
Specifies the URI of this Web service.

This attribute corresponds to the final part of the endpoint address in the WSDL that describes the Web Services. It is specified at development time for JAX-RPC services using the serviceURI attribute of the @WLXXXTransport JWS annotation, where XXX refers to the transport, such as HTTP, HTTPS, or JMS. For JAX-WS services, this can be set during compilation.

If this MBean is parented by a WseePortRuntimeMBean instance, this MBean represents WS-RM resources contained in a particular Web Service or web service client. If this MBean is parented by ServerRuntimeMBean, this MBean represents WS-RM resources for the entire server/VM (spanning across applications, web services, clients, etc.)

The properties of the weblogic.management.runtime.WseeWsrmRuntimeMBean entity are as follows:
