BEA-002002: Failed to parse method name {0}.

**Cause:** This can happen for a variety of reasons. Normally, it is because the caller made a request for a non-existent method. Alternatively, the IDL mangling of the method name may be ambiguous, so WebLogic Server cannot decide which method to call.

**BEA-003105:** The asynchronous replication request timed out while attempting to add object {0} to the replication queue. This session has not been replicated to any backup at this point.
**Cause:** The asynchronous replication request timed out while attempting to add object {0} to the replication queue. Once full, the queue waits until it has space for the object. This wait took longer than the ClusterMBean specified

Action: The message contains the cause of the error. See message body and resolve the reported error.

BEA-011098: No generated primary key was returned from the database insert statement as expected. Verify that the primary key database column for this EJB is an IDENTITY column as declared in the CMP deployment descriptor for this EJB.

Cause: This is most likely caused by a database configuration error. It may also be caused by a JDBC driver that does not support the getGeneratedKeys() method on java.sql.Statement.

Action: Verify that the primary key column in the database is marked as an IDENTITY column (or a functional equivalent is setup for the column such as a database trigger to insert a value into the primary key column).

BEA-011099: Multiple generated keys were returned from the database insert statement. The EJB container is unable to determine which generated key corresponds to the primary key column. To use the IDENTITY primary key generator, you must only have a single automatically generated database column per EJB.

Cause: This is most likely caused by a database configuration error. Each EJB may only have a single automatically generated database column.

Action: Verify that the database table corresponding to the EJB only has a single generated column.

BEA-011109: Failed to register JACC policy context handlers for the EJB container.

Cause: An unexpected error condition occurred while registering JACC context policy handlers.

Action: See the error message stack trace for details on how to resolve this issue.

BEA-011110: The SEQUENCE named {0} has key-cache-size set to {1}, which is less than the INCREMENT_BY value for the sequence in the database. This may generate missing keys.
Cause: The SEQUENCE named {0} has key-cache-size set to {1}, which is less than the INCREMENT_BY value for the sequence in the database.
Action: In the <automatic-key-generation> tag, re-examine the <key-cache-size> and verify that it is set correctly.

Level: 1
Type: WARNING
Impact: EJB

BEA-011111: The SEQUENCE named {0} has key-cache-size set to {1} which is greater than the INCREMENT_BY value for the sequence in the database. This is not allowed as it may generate duplicate keys.
Cause: The key-cache-set size for the SEQUENCE is not valid.
Action: in the <automatic-key-generation> tag, re-examine the <key-cache-size> and set it to a value less than or equal to the INCREMENT_BY value for the sequence in the database.

BEA-011125: An unexpected error was encountered while attempting to remove any EJB timers from the persistent store for the EJB {0}.
  Cause: An unexpected error occurred while attempting to remove EJB timers from the persistent store.
  Action: See the particular error message for details about the error. If your application is failing to deploy because of this error, it may be necessary to manually remove the timers from the store.

BEA-011126: The same exception has consecutively caused the expiration to fail for EJB timer {0}. Consecutive errors of this type will no longer be logged for the current timer expiration.
  Cause: The same exception has consecutively caused expiration of an EJB timer to fail.
  Action: Investigate what caused the ejbTimeout method to fail. The original exception will be logged in a previous error message.

BEA-011127: Error deserializing one or more EJB timers from the persistent store for the EJB deployment {0}. An incompatible change to the class of a Serializable object associated with the timer may be the cause. If this is the case, you can either undeploy your application entirely to remove the EJB timers from the persistent store or revert the incompatible changes to the Serializable class so the EJB timer can be deserialized. The error was: {1}
Cause: A common cause of this error is an incompatible serializable class change in your application.

Action: If the error is due to an incompatible serializable class change in your application, there are two options for dealing with the serialization errors. The first option is to completely undeploy the EJB, which will cause all of the EJB timers in the persistent store to be permanently removed. The second option is to revert changes to the serializable class that is associated with the EJB timer and redeploy the application. This allows the EJB timer to be deserialized.

BEA-014003: EJB {0} uses optimistic concurrency and contains a finder or select method, {1}, for which include-updates is true. This combination of features does not work properly with database {2}.
Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks, unless Oracle is used as the database. Oracle read consistency does not hold read locks, so in this case reads are performed using the current JTA transaction. When reads are performed in a local transaction updates that have been flushed prior to commit of the transaction are not visible.
Action: Set include-updates for the query to false to avoid this warning message, or if you are using Oracle as your database, set the database-type to Oracle in weblogic-cmp-jar.xml.

BEA-014005: The configured dispatch policy {1} for Message-Driven Bean (MDB) {0} will be ignored: the MDB is not running in a WebLogic thread.
Cause: The queue MDB is driven asynchronously by a non-WebLogic JMS implementation and runs in a non-WebLogic thread mechanism, so the MDBs application thread pool is not configurable.
Action: To disable this warning, remove the dispatch-policy setting from the MDBs WebLogic descriptor file.

BEA-014009: The Message-Driven Bean {0} of application {1} will now be suspended, as it listens to global JMS destination {2} and a new application version {3} is being redeployed.

Action: No action is required.

Level: 1

BEA-014010: The Message-Driven Bean {0} of application {1} will now be suspended, as it listens to global JMS topic {2} and a new application version {3} is being redeployed. Note also that the current Message-Driven Bean is not a durable subscriber to the topic, and messages published by the topic after the currently active version of the Message-Driven Bean is suspended may not be received by the new application version.

Cause: The specified Message-Driven Bean listens to the specified global JMS topic and a new application version is being redeployed.

Action: To ensure that the new application version will receive all messages published while the Message-Driven Bean was suspended, set the activation config property "subscriptionDurability" to "durable" in the deployment descriptor or annotation.

Level: 1
Type: WARNING
Impact: EJB

BEA-014011: EJB {0} uses optimistic-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. This combination of features is incompatible. The use-select-for-update is turned off by the EJB container in this case.

Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks. The element use-select-for-update in the RDBMS deployment descriptor when set to true, will cause SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the table. This conflicts with the Optimistic Concurrency strategy.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB
BEA-014012: EJB \{0\} uses optimistic-concurrency and disables cluster invalidation, but does not have verify-rows set to Read. This combination will prevent detection of stale data if the bean is never modified in a transaction.

**Cause:** Optimistic concurrency beans verify consistency of data only if the bean has been modified, unless verify-rows is set to Read. If some other member of a cluster modifies a bean, other members will not be notified of this modification and will continue to store stale data unless the other members also attempt to modify the bean.

**Action:** Set either of the elements verify-rows to Read or cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014013: EJB \{0\} does not have a concurrency-strategy of either optimistic or readOnly and disables cluster invalidation. Cluster invalidation is relevant only for these concurrency strategies.

**Cause:** When an EJB is using either optimistic or readOnly concurrency-strategy and is deployed to a cluster, the container invalidates such beans on modification to avoid throwing OptimisticConcurrencyExceptions. This invalidation can be turned off by setting the cluster-invalidation-disabled to true in the RDBMS deployment descriptor.

**Action:** Set cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014014: The Message-Driven Bean (MDB) named \{0\} has a dispatch policy \{1\} that refers to an unknown work manager. The default work manager will be used instead.

**Cause:** The specified MDB has a dispatch policy that refers to an unknown work manager.

**Action:** Create a work manager for the server named \{1\}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing work manager.

**Level:** 1  
**Type:** WARNING  
**Impact:** EJB

BEA-014016: EJB \{0\} uses readonly-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is read-only, select-for-update is unnecessary.

**Cause:** Read-only beans cannot be updated. Therefore, use-select-for-update is unnecessary.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.
Level: 1
Type: WARNING
Impact: EJB

BEA-014017: EJB {0} uses exclusive-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is locked at the server level during a transaction, select-for-update on the database is unnecessary.

Cause: Exclusive concurrency is implemented by locking the bean at the server level when the bean participates in a transaction. Setting the element use-select-for-update in the RDBMS deployment descriptor to true causes SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the row in the database too. This may be unnecessary, as the bean is locked by the container.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014018: EJB {0} uses a verify-columns element in the RDBMS deployment descriptor. This element is applicable only for optimistic concurrency beans. Since this bean does not use optimistic concurrency, this element will be ignored.

BEA-040450: The "PagingStore" attribute on the JMSServerMBean "\{0\}" has been deprecated. It is being replaced in the configuration with the new "PagingDirectory" attribute.
Cause: A deprecated MBean attribute was replaced in the configuration.
Action: No action is required.

Level: 1
Type: WARNING
Impact: JMS
BEA-040451: The PagingStore attribute on the JMSServerMBean \{0\} has been deprecated. Since it currently refers to a JMSJDBCStoreMBean, and paging to a JDBC store is not supported, the JMS server will page messages to its local working directory.
Cause: A deprecated MBean attribute was replaced in the configuration.
**BEA-040452:** The server session pool feature has been deprecated, and it will be removed in an upcoming release. New applications should use message-driven beans (MDBs) instead.

**Cause:** A deprecated feature was detected in the configuration.

**Action:** Plan to replace use of server session pools in your application.

**BEA-040453:** The BytesPagingEnabled and MessagesPagingEnabled parameters on the JMS server \(0\) have been deprecated. These parameters are now ignored. The MessageBufferSize parameter should be used to configure paging in this release.

**Cause:** A deprecated parameter was encountered.

**Action:** Plan to use the new MessageBufferSize to control paging.

**BEA-040455:** Flow control has been enabled on JMS server "\(0\)" because memory is low

**Cause:** Too much memory is being used.

**Action:** Either increase the amount of memory available to the server, or decrease the MessageBufferSize parameter on the JMS server so that fewer messages remain in memory.

**BEA-040456:** An entity of type "\(3\)" with name "\(2\)" in JMS module "\(0\)" is not targeted. There is no subdeployment with name "\(1\)" in the configuration repository (config.xml). Therefore, this entity will not exist anywhere in the domain.

**Cause:** The entity of the given name and type in the given JMS module does not have a corresponding subdeployment in the configuration repository (config.xml). In order for this entity to exist in the domain, it must be targeted with a sub-deployment element.

**Action:** Add a sub-deployment stanza to the appropriate deployment descriptor in config.xml. This will either be a jms-system-resource for a system module, or an app-deployment for a stand-alone JMS deployable module. If the JMS module is inside a Java EE application (an EAR file), then you must add the sub-deployment stanza to the subdeployment that represents this JMS module in the Java EE application. You do not necessarily have to target the subdeployment yet. Simply
adding the subdeployment with no targets will remove this warning. However, if you wish for this entity to exist somewhere in your domain you must target the sub-deployment.

BEA-040475: The destination {0} does not have an associated quota object. The setting of bytesMaximum to {1} will have no effect.
   Cause: Quotas have been reworked. They are no longer hierarchical in nature. Instead, they are objects that can be pointed to explicitly and can be optionally shared between destinations. Hence quotas no longer work as they did in previous releases. When converting from older releases, a decision is made about how to handle quotas based on the setting of the old parameters. Action: Review your application code and configuration. Level: 1
Type: WARNING
Impact: JMS

BEA-040505: The JMS module named "{0}" inside application "{1}" does not have a sub-deployment stanza named "{0}". Without such a stanza, no entities inside the module will be deployed, since the subdeployments inside of the sub-deployment stanza named "{0}" control where JMS entities inside this module are targeted.

Cause: When a JMS module is inside an EAR file, the targeting information for entities inside that module are nested within a sub-deployment named after the name of the JMS module found in the weblogic-application.xml file of the EAR file. If no sub-deployment exists with the name of the JMS module, then no targeted entities inside the module will become available. This is usually an oversight on the part of the administrator.

Action: Add a sub-deployment stanza with the name of the JMS module as specified in the weblogic-application.xml file to the app-deployment stanza. Nested inside that sub-deployment, you can target the entities in the module as you normally would.

Cause: For hosting the entity of type "[0]" with name "[1]" , with default targeting enabled defined in the JMS module "[2]" deployed to [3], there should be exactly one SAF agent with persistent store having distribution policy "Distributed" defined in [3]. However, no candidate SAF agent was found to host that entity.

Action: Create an SAF agent in [3] with a persistent store having the distribution policy set to "Distributed".

BEA-090109: The server was unable to find the configured private key on server {0} in the file specified by the SSL Server Key File Name attribute.

Cause: The server looks at the Server Key File Name attribute to load the private key of the server when it cannot find the private key in a configured keystore using the alias that is specified in the Server Private Key Alias attribute as the alias string. One possible cause of this error is that server is not configured with a private key keystore or the server is configured to use the pre-7.0 SSL attribute Server Key File Name.

Action: A pre-7.0 configuration is being used for SSL connections, however that configuration does not specify a value for the Server Key File Name attribute. Either provide a value for the Server Key File Name attribute or configure a keystore for the server. SSL will not be able to initialize until the configuration is corrected. For more information, see the security documentation available at http://www.oracle.com/technology/products/weblogic/index.html.

-Dweblogic.security.TrustKeyStore=DemoTrust defaults to DemoTrust
-Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=passphrase defaults to no passphrase which means read-only access to the JDK’s cacerts. To use the trusted CAs in the JDK’s cacerts, specify:
-Dweblogic.security.TrustKeyStore=JavaStandardTrust
-Dweblogic.security.JavaStandardTrustKeyStorePassPhrase=passphrase defaults to no passphrase which means read-only access to the JDK’s cacerts. To use the trusted CAs from another keystore, specify:

BEA-090482: BAD_CERTIFICATE alert was received from [0]. Check the peer to determine why it rejected the certificate chain (trusted CA configuration, hostname verification). SSL debug tracing may be required to determine the exact reason for which the certificate was rejected.
Cause: The certificate chain sent to the peer may not be valid, or the peer may not be configured to accept the certificates.
**Action:** Check the peer configuration to see if the certificate chain was rejected because the certificate was not trusted or because there was a hostname violation. Verify that the certificate chain sent to the peer had valid dates and had the correct issuer ordering. This action may require enabling SSL debug tracing to determine the exact cause.

**Type:** WARNING  
**Impact:** Security

BEA-090483: CERTIFICATE_REVOKED alert was received from {0}. The certificate chain sent to the peer was rejected because it was revoked by the certificate authority.  
**Cause:** A certificate in the configured certificate chain was revoked by the certificate authority and is no longer valid.

**Level:** 1  
**Type:** WARNING  
**Impact:** Security

BEA-090484: CERTIFICATE_EXPIRED alert was received from {0}. A certificate in the certificate chain expired or is not yet valid, or the peer and local machine have a date/time mismatch.  
**Cause:** A certificate in the chain is either expired or is not yet valid. Another possible cause is the peer machine date/time is not set properly causing the check to fail.  
**Action:** Verify the certificate validity and expiration dates in the certificate chain are correct. If they are not, obtain new certificates issued by the certificate authority and update the SSL configuration with the new certificates and private key. If the dates are valid, check the peer machine date/time setup.

**Level:** 1  
**Type:** WARNING  
**Impact:** Security

BEA-090485: CERTIFICATE_UNKNOWN alert was received from {0}. The peer has an unspecified issue with the certificate. SSL debug tracing should be enabled on the peer to determine what the issue is.

BEA-090486: UNSUPPORTED_CERTIFICATE alert was received from {0}. The peer rejected a certificate in the chain because it was an unsupported type. Verify all certificates in the chain are valid X.509 RSA certificates.
**Cause:** This problem could be caused by an incorrect type of certificate in the certificate chain or the peer not being able to handle certain attributes in a valid certificate.

**Action:** The certificate chain should first be checked to ensure the certificates are all valid X.509 RSA certificates and are using the proper strength. If that is correct, SSL debug tracing may be required on the peer to see if it gives more detail on what was specifically not supported.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090487:** UNKNOWN_CA alert received from {0}. The peer is rejecting the certificate chain as being untrusted or incomplete.

**Cause:** The peer is not configured to trust the CA that signed the certificate chain.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090488:** PROTOCOL_VERSION alert received from {0}. Check that the peer supports the same level of the SSL/TLS protocol being used (SSL V3.0 and TLS V1.0).

**Cause:** The peer may not support the same level of the SSL/TLS protocol, or there was some sort of data corruption occurring with the low-level SSL records.

**Action:** The peer needs to be checked to determine whether it supports SSL V3.0 and TLS V1.0. If it does, SSL debug tracing may be required to see if the SSL record was rejected for another reason.

**Level:** 1

**Type:** WARNING

**Impact:** Security

**BEA-090489:** NO_RENEGOTIATION alert was received from {0}. The peer does not support renegotiation.

BEA-090547: The certificate chain received from {0} contained a V3 CA certificate which had basic constraints that were not marked critical. This is being rejected due to the strict enforcement of basic constraints.

Cause: Strict basic constraints checking was explicitly enabled, and a certificate chain received by the peer contained a CA that failed due to the strict check but would have passed the strong check.

Action: If strict compliance of RFC 2459 for basic constraints is really required, then the peer certificate chain was correctly rejected and needs to be corrected. If strict compliance is not really required, consider setting the constraints checking back to the default value of strong to accept the certificate chain.

Level: 1
Type: WARNING
Impact: Security

BEA-090548: The certificate chain received from {0} contained a V3 CA certificate that was missing the basic constraints extension

Cause: The certificate chain received by the peer contained a V3 CA certificate that does not contain a basic constraints extension indicating that it really is a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

Action: The peer certificate chain needs to be looked at carefully to determine which CA was missing the basic constraints extension. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

Level: 1
Type: WARNING
Impact: Security

BEA-090549: The certificate chain received from {0} contained a V3 CA certificate that did not indicate it really is a CA.

Cause: The certificate chain received by the peer contained a V3 CA certificate that contained a basic constraints extension which was not marked as being a CA. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

Action: The peer certificate chain needs to be looked at carefully to determine which CA is not correct. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**BEA-090550:** The certificate chain received from {0} contained a V3 CA certificate that indicated a certificate chain path length in the basic constraints that was exceeded.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that specified a path length in the basic constraints that was exceeded. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to determine which CA indicated the path length limit that was exceeded. The path length, if specified, limits how many CA certificates are allowed to follow a CA certificate in a certificate chain. A path length of 0 indicates only an end entity certificate may follow it in the chain, positive values indicate how many CA certificates may be in the chain between that CA and the end entity certificate. If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

**BEA-090551:** The certificate chain received from {0} contained a V3 CA certificate that could not be converted to be checked for basic constraints.

**Cause:** The certificate chain received by the peer contained a V3 CA certificate that could not be converted to a format which allows the basic constraints to be checked. This is rejected by the basic constraints checking for strong and strict, which protects against a specific certificate chain attack on SSL.

**Action:** The peer certificate chain needs to be looked at carefully to confirm that they are valid. If the certificates are all valid, this indicates an internal coding error or limitation in the server. Contact My Oracle Support. If the certificate cannot be processed, you can disable the basic constraints checking as a workaround to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

Level: 1
Type: WARNING

**BEA-090552:** The public and private key could not be checked for consistency.

**Cause:** The failure could be due to a keystore being used to hold the private key that does not allow access to private key material. Hardware keystores generally do not give access to the private key material that is needed to perform this operation.

**Action:** If a keystore is being used the warning should be ignored. If handshaking errors occur with all clients, check that the private key and public key match.

**BEA-090823:** Could not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory for this JVM.

**Cause:** The WebLogic Server X509CertificateFactory could not be registered as the default X509CertificateFactory for this JVM.

**Action:** The WebLogic Server X509CertificateFactory orders the certificates in a CertPath that was created from PKCS7. Specify `-Dweblogic.security.RegisterX509CertificateFactory=false` on the command line for booting this server to indicate that WebLogic Server should not register the WebLogic Server X509CertificateFactory as the default X509CertificateFactory when the server boots (since your JDK does not support this). Also, since the WebLogic Server X509CertificateFactory cannot be registered with the JDK as the default X509CertificateFactory, the JDK will use its current default X509CertificateFactory. The default one (for example, the SUN implementation) may not properly convert PKCS7 to an ordered CertPath.

BEA-150000: An error occurred while establishing a connection back to the Administration Server {0} during startup. Since bootstrap succeeded, check that {0} uniquely identifies the Administration Server.

Cause: An improper Administration Server URL has been specified, or the Administration Server is not available at the specified URL. Commonly this is because the Managed Server shares an administration URL with the Administration Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

Action: Verify that the URL specified for the Administration Server is valid, unique and that the Administration Server is available and listening at the specified URL. A common problem is that the administration port is enabled and both the Administration Server and Managed Server are running on the same machine. In this instance a different administration port should be selected for the Managed Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

BEA-280069: JDBC store failed to initialize. It did not find an already existing database table and failed to create a new empty table because the JDBC driver is unknown and/or unsupported. BEA-280070: JDBC store failed to initialize. It did not find an already existing database table and failed to create a new empty table because it could not locate the configured DDL file "[0]".
Cause: The configured file is located in the server file path.
Action: For supported databases, consider the option of not configuring a custom DDL file. There is usually no need to configure a custom DDL file unless custom database-specific tuning commands have been added to the file. Impact: Store

BEA-280096: Opening existing store "{2}". The direct IO mode "{1}" specified by the property "{0}" is invalid and will be ignored. Using the default value "{3}".
Cause: See the message body.
Action: Use a valid direct I/O mode. The valid values are: "read-buffered", "single-handle-unbuffered", and "single-handle-buffered".
Level: 1
Type: WARNING
Impact: Store

BEA-280097: A file store failed to open file "{0}" in the Direct-Write read-buffered/write-unbuffered mode and is instead opening the file in a purely unbuffered mode. When there are high request loads, this may reduce file store performance. However, the store is still operating in a transactionally safe synchronous mode.
Cause: See the message body.
Action: To fix this problem, configure a different synchronous write policy, or if using the Direct-Write policy, force the store into read-write-buffered mode using the AvoidDirectIO command line property documented in the store chapter of the Performance and Tuning Guide.
Level: 1
Type: WARNING
Impact: Store

BEA-280101: The persistent file store "{0}" is forced to use buffered I/O because the Operating System or hardware environment does not support unbuffered I/O. The store is still operating in a transactionally safe synchronous mode. See store open log messages for the final write policy.
Cause: See the message body.
Action: See the documentation for store synchronous write policy configuration.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280102: The persistent file store "[0]" must reinitialize its cache: recovery may take longer than usual. The signature in the cache file "[2]" for the persistent store file "[1]" could not be verified, or the cache file is missing. Ignore this Warning if this is the first time the store has ever booted. Possible causes include: first boot of store (potentially after using a write policy different from Direct-Write-With-Cache), store migration, unclean shutdown, off-line store compression, and manual removal of cache files.

Cause: The cache file is missing, or the signature stored in the cache file does not match the signature of the primary file.

Action: Make sure that the configuration is correct, do not delete cache files, and ensure a clean shutdown.

Level: 1
Type: WARNING
Impact: Store

BEA-280103: The persistent file store "[0]" will cache in {1}.

Cause: This is an informational message.

Action: No action is required.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280104: The persistent file store "[0]" will use buffered writes instead of direct IO because the configured block size "[2]" is not a multiple of the environment's direct IO alignment "[1]". When there are high request loads, this may reduce file store performance. The store is still operating in a transactionally safe synchronous mode.

Cause: Direct I/O requires the block size to be a multiple of directIO granularity.

Action: Reconfigure the store with a block size that is a multiple of the direct I/O alignment for your environment. If the store is not empty and contains useful data, use the store admin compact utility to change block size, otherwise make sure that all storage areas are removed before starting WebLogic Server again.

A corresponding log event is also produced to the FlightRecorder.  
**Action:** Enable DiagnosticContext debug and review the FlightRecorder data to look for JFRDebugEvents which indicate extreme RID growth and where it is seen. Pay particular attention to the scheduling of work from daemon threads.
