Preface

This document describes how to install and configure Oracle WebCenter Content.

[Audience](#)

[Documentation Accessibility](#)

[Related Documents](#)

[Conventions](#)

Audience

This guide is intended for system administrators or application developers who are installing and configuring Oracle WebCenter Content. It is assumed that readers are familiar with web technologies and have a general understanding of Windows and UNIX platforms.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

Refer to the Oracle Fusion Middleware Library for additional information.

- For Oracle WebCenter Content information, see Oracle WebCenter Content Documentation.
- For installation information, see Fusion Middleware Installation Documentation.
- For upgrade information, see Fusion Middleware Upgrade Documentation.
- For administration-related information, see Fusion Middleware Administration Documentation.

- For release-related information, see Fusion Middleware Release Notes.

Conventions

This document uses the following text conventions:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

About the Oracle WebCenter Content Installation

The standard installation for Oracle WebCenter Content described in this guide creates the standard topology, which represents a sample starting topology for this product.

[Using the Standard Installation Topology as a Starting Point](#)

The standard installation topology is a flexible topology that you can use as a starting point in production environments.

[Using This Document to Extend an Existing Domain](#)

The procedures in this guide describe how to create a new domain. The assumption is that no other Oracle Fusion Middleware products are installed on your system.

1.1 Using the Standard Installation Topology as a Starting Point

The standard installation topology is a flexible topology that you can use as a starting point in production environments.

The information in this guide helps you to create a standard installation topology for Oracle WebCenter Content. If appropriate and required, you can later extend the standard installation topology to create a secure and highly available production environment (see [Next Steps After Configuring the Domain](#)).

The standard installation topology represents a sample topology for this product. It is not the only topology that this product supports. For more information, see *About the Standard Installation Topology* in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*.

[About the WebCenter Content Standard Installation Topology](#)

This topology represents a standard WebLogic Server domain that contains an Administration Server and a cluster that contains two Managed Servers.

[About Elements in the Standard Installation Topology Illustration](#)

The standard installation topology typically includes common elements.

[About Installing Oracle User Messaging Service](#)

Oracle User Messaging Service (UMS) is a software technology that enables two-way communication between users and deployed applications.

[About Oracle WebCenter Content Scale Up](#)

Oracle WebCenter Content supports only one Inbound Refinery Managed Server per node per domain, and one WebCenter Content Managed Server per node, per domain.

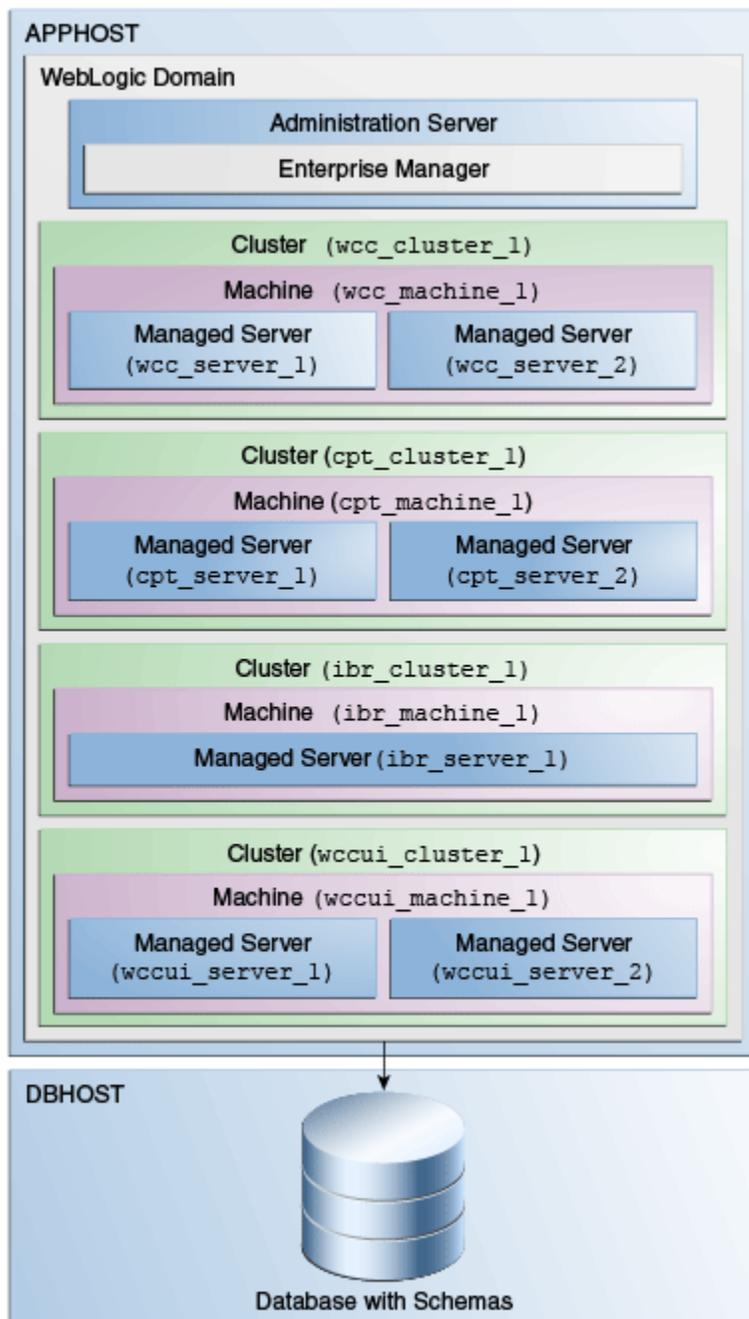

1.1.1 About the WebCenter Content Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and a cluster that contains two Managed Servers.

The following figure shows the standard installation topology for WebCenter Content.

See [Table 1-1](#) for information on the elements for this topology.

Figure 1-1 WebCenter Content Standard Installation Topology

1.1.2 About Elements in the Standard Installation Topology Illustration

The standard installation topology typically includes common elements.

The following table describes all elements of the topology illustration:

Table 1-1 Description of Elements in Standard Installation Topologies

Element	Description and Links to Related Documentation
APPHOST	A standard term used in Oracle documentation to refer to the machine that hosts the application tier.
DBHOST	A standard term used in Oracle documentation to refer to the machine that hosts the database.
WebLogic Domain	A logically related group of Java components (in this case, the Administration Server, Managed Servers, and other related software components). For more information about WebLogic domain, see <i>What Is an Oracle WebLogic Server Domain?</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Administration Server	Central control entity of a WebLogic domain. It maintains configuration objects for that domain and distributes configuration changes to Managed Servers. For more information about Administration Server, see <i>What Is the Administration Server?</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Enterprise Manager	The Oracle Enterprise Manager Fusion Middleware Control is a primary tool used to manage a domain. For more information about Enterprise Manager Fusion Middleware Control, see <i>Oracle Enterprise Manager Fusion Middleware Control</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Cluster	A collection of multiple WebLogic Server instances running simultaneously and working together. For more information about Clusters, see <i>Overview of Managed Servers and Managed Server Clusters</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Machine	A logical representation of the computer that hosts one or more WebLogic Server instances (servers). Machines are also the logical glue between the Managed Servers and the Node Manager. In order to start or stop the Managed Servers using the Node Manager, associate the Managed Servers with a machine.
Managed Server	A host for your applications, application components, web services, and their associated resources. For more information about Managed Servers, see <i>Overview of Managed Servers and Managed Server Clusters</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .

Table 1-1 (Cont.) Description of Elements in Standard Installation Topologies

Element	Description and Links to Related Documentation
Infrastructure	<p>A collection of services that include the following:</p> <ul style="list-style-type: none"> • Metadata repository (MDS) contains the metadata for Oracle Fusion Middleware components, such as the Oracle Application Developer Framework. For more information about Metadata repository, see <i>What Is the Metadata Repository?</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i>. • Oracle Application Developer Framework (Oracle ADF) • Oracle Web Services Manager (OWSM)

1.1.3 About Installing Oracle User Messaging Service

Oracle User Messaging Service (UMS) is a software technology that enables two-way communication between users and deployed applications.

For more information, see *Introduction to Oracle User Messaging Service* in *Oracle Fusion Middleware Administering Oracle User Messaging Service*.

UMS is included in the Oracle Fusion Middleware Infrastructure distribution. It installs as part of the Oracle Fusion Middleware Infrastructure standard installation topology, as described in *About Installing Oracle User Messaging Service (UMS)* in *Oracle Fusion Middleware Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

UMS runtime components consist of an Oracle Fusion Middleware Configuration Wizard template and an Oracle Fusion Middleware schema, which is installed into a supported database by using the Repository Creation Utility (RCU).

For development, you can install and use Oracle JDeveloper 12c to develop applications that can take advantage of UMS features. For more information, see *Introducing Oracle JDeveloper* in *Oracle Fusion Middleware Installing Oracle JDeveloper*.

1.1.4 About Oracle WebCenter Content Scale Up

Oracle WebCenter Content supports only one Inbound Refinery Managed Server per node per domain, and one WebCenter Content Managed Server per node, per domain.

You cannot scale up Inbound Refinery or WebCenter Content. To add Managed Servers in a cluster, see *Scaling Out a Topology (Machine Scale Out)* in the *Oracle Fusion Middleware High Availability Guide* to add a Managed Server to a new node.

1.2 Using This Document to Extend an Existing Domain

The procedures in this guide describe how to create a new domain. The assumption is that no other Oracle Fusion Middleware products are installed on your system.

If you have installed and configured other Oracle Fusion Middleware products on your system (for example, Fusion Middleware Infrastructure, with a domain that is up and running) and wish to extend the same domain to include Oracle WebCenter Content, read [Installing Multiple Products in the Same Domain](#) for detailed information.

Preparing to Install and Configure Oracle WebCenter Content

To prepare for your Oracle WebCenter Content installation, verify that your system meets the basic requirements, then obtain the correct installation software.

[Mandatory Steps for Installing WebCenter Content on Windows Operating Systems](#)

There are two procedures you must run before you install Oracle WebCenter Content.

[Roadmap for Installing and Configuring the Standard Installation Topologies](#)

Installing and configuration standard installation topology requires certain steps.

[Roadmap for Verifying Your System Environment](#)

Before you begin the installation and configuration process, you must verify your system environment.

[Obtaining the Product Distribution](#)

You can obtain the Oracle Fusion Middleware Infrastructure and Oracle WebCenter Content distribution on the Oracle Technology Network (OTN).

[About Product Distributions](#)

You create the initial Oracle WebCenter Content domain using the Oracle Fusion Middleware Infrastructure distribution, which contains both Oracle WebLogic Server software and Oracle Java Required Files (JRF) software.

2.1 Mandatory Steps for Installing WebCenter Content on Windows Operating Systems

There are two procedures you must run before you install Oracle WebCenter Content.

[Disabling the 8.3 File Naming Convention on a Windows Operating System](#)

Before you install Oracle WebCenter Content on a Windows Operating System, you must disable the 8.3 file naming convention (maximum 8-character file name and 3-character extension).

[Downloading Visual C++ Libraries](#)

WebCenter Content and Inbound Refinery require the Visual C++ libraries included in Microsoft's Visual C++ Redistributable Package.

[Downloading Microsoft .Net Framework 4.x](#)

The WinNativeConverter uses vb.Net code, so it requires Microsoft .NET Framework 4.x.

2.1.1 Disabling the 8.3 File Naming Convention on a Windows Operating System

Before you install Oracle WebCenter Content on a Windows Operating System, you must disable the 8.3 file naming convention (maximum 8-character file name and 3-character extension).

If the WebCenter Content `weblayout` directory is on a file system with 8.3 semantics, the legacy 16-bit 8.3 file names conflict with revision labels, causing file loss.

To disable the 8.3 file naming convention on a Windows Operating System:

1. Open the Windows Registry Editor (`regedit`), and go to the following key:

```
HKEY_LOCAL_MACHINE/SYSTEM/CurrentControlSet/Control/FileSystem
```

2. Set the value of the `NtfsDisable8dot3NameCreation` key to **1**.
3. Restart the Windows Operating System to make the change take effect.

2.1.2 Downloading Visual C++ Libraries

WebCenter Content and Inbound Refinery require the Visual C++ libraries included in Microsoft's Visual C++ Redistributable Package.

You must download two packages (Microsoft Visual C++ 2005 SP1 and Microsoft Visual C++ 2008 SP1) that contain the libraries.

To download the packages:

1. Go to the Microsoft Download Center at <http://www.microsoft.com/downloads>
2. Search for **Microsoft Visual C++ 2005 SP1 Redistributable Package (x64)**.
3. Download the `vc_redist_x64.exe` file.
4. Search for **Microsoft Visual C++ 2008 SP1 Redistributable Package (x64)**
5. Download the `vc_redist_x64.exe` file.

Note: For a list of platforms that support PDF Searchable Document Output Format, go to the Oracle Fusion Middleware Supported System Configurations page. In the table, on the row **Oracle Fusion Middleware 12c certifications**, select the **System Requirements and Supported Platforms for WebLogic Server 12c (12.2.1.2)** (.xls) file.

2.1.3 Downloading Microsoft .Net Framework 4.x

The WinNativeConverter uses vb.Net code, so it requires Microsoft .NET Framework 4.x.

Download Microsoft .NET Framework 4.x at <http://www.microsoft.com/downloads>

2.2 Roadmap for Installing and Configuring the Standard Installation Topologies

Installing and configuration standard installation topology requires certain steps.

This document has all steps required to install and configure standard installation topologies. The guide also refers to additional information that you can use if you want to create a modified version of this topology.

The following table shows the steps required to install and configure the topology.

Table 2-1 Standard Installation Roadmap

Task	Description	Documentation
Verify your system environment	Before beginning the installation, verify that the minimum system and network requirements are met.	See Roadmap for Verifying Your System Environment .
Check for any mandatory patches that will be required before or after the installation	Review the Oracle Fusion Middleware Infrastructure release notes to see if there are any mandatory patches required for the software products you are installing.	See <i>Install and Configure</i> in <i>Release Notes for Oracle Fusion Middleware Infrastructure</i> .
Obtain the appropriate distributions	Install Oracle Fusion Middleware Infrastructure to create the Oracle Home for Oracle WebCenter Content	See About Product Distributions .
Determine your installation directories	Verify that the installer can access or create the installer directories that it must access or create. Also, verify that the directories exist on systems that meet the minimum requirements.	See <i>What are the Key Oracle Fusion Middleware Directories?</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Install prerequisite software	Install Oracle Fusion Middleware Infrastructure to create the Oracle home directory.	For Oracle Fusion Middleware Infrastructure, see <i>Installing and Configuring the Oracle Fusion Middleware Infrastructure</i> . You only need to perform the installation for Infrastructure. You do not need to configure a domain for Infrastructure.
Install the software	Run the Oracle Universal Installer to install Oracle WebCenter Content. Installing the software transfers the software to your system and creates the Oracle home directory.	See Installing the Oracle WebCenter Content Software .
Select a database profile and review any required custom variables.	Before you install required schemas in the database, review the information about any custom variables you will need to set for the Oracle WebCenter Content schemas.	See Understanding Database Requirements for an Oracle Fusion Middleware Installation .
Create the schemas	Run the Repository Creation Utility to create the schemas required for configuration.	See Creating the Database Schemas .

Table 2-1 (Cont.) Standard Installation Roadmap

Task	Description	Documentation
Create a WebLogic domain	Use the Configuration Wizard to create and configure the WebLogic domain.	See Configuring the Domain if you are creating the topology for Oracle WebCenter Content.
Administer and prepare your domain for high availability	Discover additional tools and resources to administer your domain and configure your domain to be highly available.	See Next Steps After Configuring the Domain .

2.3 Roadmap for Verifying Your System Environment

Before you begin the installation and configuration process, you must verify your system environment.

[Table 2-2](#) identifies important tasks and checks to perform to ensure that your environment is prepared to install and configure Oracle WebCenter Content.

Table 2-2 Roadmap for Verifying Your System Environment

Task	Description	Documentation
Verify certification and system requirements.	Verify that your operating system is certified and configured for installation and configuration.	See Verifying Certification, System, and Interoperability Requirements .
Identify a proper installation user.	Verify that the installation user has the required permissions to install and configure the software.	See Selecting an Installation User .
Select the installation and configuration directories on your system.	Verify that you can create the necessary directories to install and configure the software, according to the recommended directory structure.	See Understanding Directories for Installation and Configuration .
Install a certified JDK.	The installation program for the distribution requires a certified JDK present on your system.	See Understanding JDK Requirements for an Oracle Fusion Middleware Installation .
Install and configure a database for mid-tier schemas.	To configure your WebLogic domain, you must have access to a certified database that is configured for the schemas required by Oracle WebCenter Content.	See Understanding Database Requirements for an Oracle Fusion Middleware Installation .

[Verifying Certification, System, and Interoperability Requirements](#)

Oracle recommends that you use the certification matrix and system requirements documents with each other to verify that your environment meets the requirements for installation.

[Selecting an Installation User](#)

The user who installs and configures your system must have the required permissions and privileges.

Understanding Directories for Installation and Configuration

During the installation and domain configuration process, you must plan on providing the locations for these directories: Oracle home, Domain home, and the Application home.

Understanding JDK Requirements for an Oracle Fusion Middleware Installation

Most Fusion Middleware products are in .jar file format. These distributions do *not* include a JDK. To run a .jar distribution installer, you must have a certified JDK already installed on your system.

Understanding Database Requirements for an Oracle Fusion Middleware Installation

Many Oracle Fusion Middleware products require database schemas prior to configuration. If you do not already have a database where you can install these schemas, you must install and configure a certified database.

2.3.1 Verifying Certification, System, and Interoperability Requirements

Oracle recommends that you use the certification matrix and system requirements documents with each other to verify that your environment meets the requirements for installation.

1. Verifying that your environment meets certification requirements

Make sure that you install your product on a supported hardware and software configuration. For more information, see the certification document for your release on the *Oracle Fusion Middleware Supported System Configurations* page.

Oracle has tested and verified the performance of your product on all certified systems and environments. Whenever new certifications are released, they are added to the certification document right away. New certifications can be released at any time. Therefore, the certification documents are kept outside the documentation libraries and are available on Oracle Technology Network.

2. Using the system requirements document to verify certification

Oracle recommends that you use the *Oracle Fusion Middleware System Requirements and Specifications* document to verify that the certification requirements are met. For example, if the certification document indicates that your product is certified for installation on 64-Bit Oracle Linux 6.5, use this document to verify that your system meets the required minimum specifications. These include disk space, available memory, specific platform packages and patches, and other operating system-specific requirements. System requirements can change in the future. Therefore, the system requirement documents are kept outside of the documentation libraries and are available on Oracle Technology Network.

3. Verifying interoperability among multiple products

To learn how to install and run multiple Fusion Middleware products from the same release or mixed releases with each other, see Oracle Fusion Middleware 12c Interoperability and Compatibility in *Oracle Fusion Middleware Understanding Interoperability and Compatibility*.

2.3.2 Selecting an Installation User

The user who installs and configures your system must have the required permissions and privileges.

Understanding User Permissions

The user who installs a Fusion Middleware product owns the files and has certain permissions on the files.

Understanding Non-Default User Permissions on UNIX Operating Systems

Changing the default permissions setting reduces the security of the installation and possibly your system. Oracle does not recommend changing default permission settings.

Verifying that the Installation User has Administrator Privileges on Windows Operating Systems

To update the Windows Registry, you must have administrator privileges.

2.3.2.1 Understanding User Permissions

The user who installs a Fusion Middleware product owns the files and has certain permissions on the files.

- Read and write permissions on all non-executable files (for example, `.jar`, `.properties`, or `.xml`). All other users in the same group as the file owner have read permissions only.
- Read, write, and execute permissions on all executable files (for example, `.exe`, `.sh`, or `.cmd`). All other users in the same group as the file owner have read and execute permissions only.

This means that someone other than the person who installs the software can use the installed binaries in the Oracle home to configure a domain or set of Fusion Middleware products.

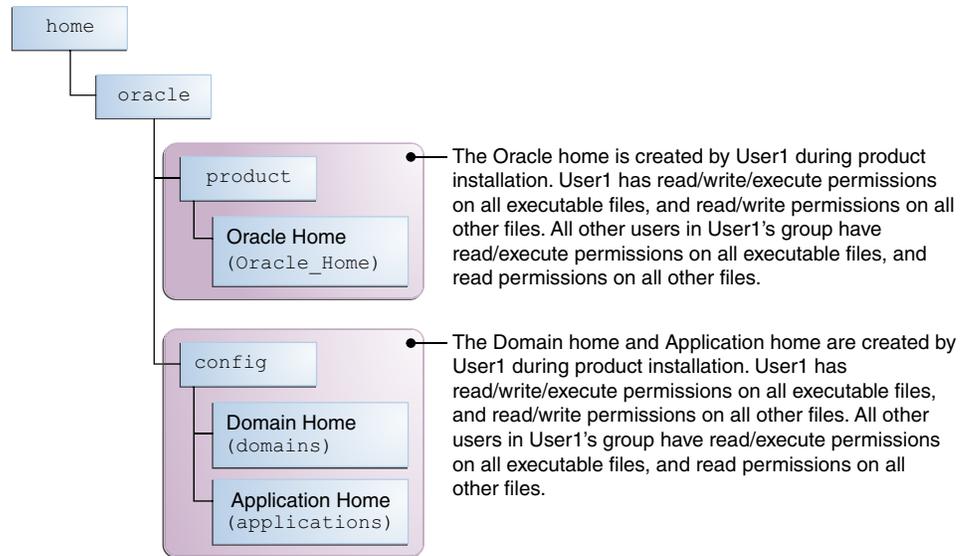

During configuration, the files generated by the configuration process are owned by the user who ran the Configuration Wizard, with the same permissions as described above for the installation user. However, security-sensitive files are not created with group permissions. Only the user that created the domain has read and write permissions and can administer the domain.

Consider the following examples:

- **Example 1: A Single User Installs the Software and Configures the Domain**

This example shows the permissions if the same user installs the software and configures the domain.

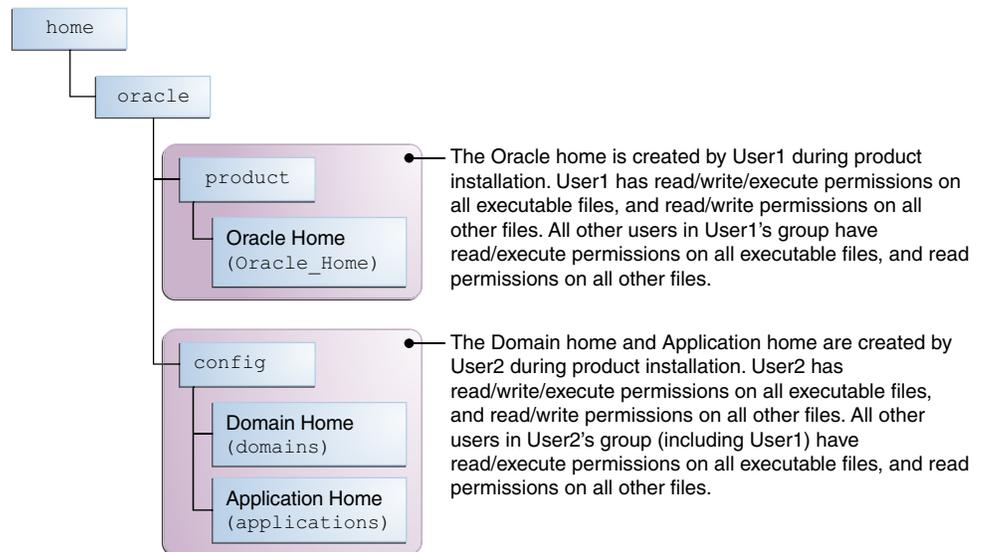

To ensure the proper permissions and privileges for all files, Oracle recommends that the same owner perform both tasks: install the Oracle Fusion Middleware product and configure the WebLogic Server domain using the Configuration Wizard.

If the user who creates the domain is different than the user who installed the software, then both users must have the same privileges, as shown in the next example.

- **Example 2: The Oracle Home and Domain are Created by Different Users**

This example shows the permissions where one user creates the Oracle home and another user configures the domain.

Note: Certain domain files do not have group permissions. For example, `cwallet.sso`.

Consider the following items before running the installer:

- On UNIX operating systems, Oracle recommends that you set `umask` to `027` on your system before you install the software. This ensures that file permissions are set properly during installation. Use the following command:

```
umask 027
```

You must enter this command in the same terminal window from which you plan to run the product installer.

- On UNIX operating systems, do not run the installation program as the `root` user. If you run the installer as a root user, the startup validation may fail and you cannot continue the installation.
- When you manage a product installation (for example, applying patches or starting managed Servers), use the same user ID that you used to install the product.
- On Windows operating systems, you must have Administrative privileges to install the product. See [Verifying the Installation User has Administrator Privileges on Windows Operating Systems](#) for more information.

2.3.2.2 Understanding Non-Default User Permissions on UNIX Operating Systems

Changing the default permissions setting reduces the security of the installation and possibly your system. Oracle does not recommend changing default permission settings.

If other users require access to particular files or executable, consider using the UNIX `sudo` command (or other similar command) in lieu of changing file permissions.

Refer to your UNIX operating system Administrator's Guide or contact your operating system vendor if you need further assistance.

2.3.2.3 Verifying that the Installation User has Administrator Privileges on Windows Operating Systems

To update the Windows Registry, you must have administrator privileges.

By default, users with the administrator privilege sign in to the system with regular privileges, but can request elevated permissions to perform administrative tasks.

To perform a task with elevated privileges:

1. Find the Command Prompt icon, either from the Start menu or the Windows icon in the lower-left corner.
2. Right-click Command Prompt and select **Run as administrator**.

This opens a new command prompt window, and all actions performed in this window are done with administrator privileges.

Note: If you have User Access Control enabled on your system, you may see an additional window asking you to confirm this action. Confirm and continue with this procedure.

3. Perform the desired task.

For example, to start the product installer:

For a jar file, enter:

```
java -jar distribution_name.jar
```

For an executable (`.exe`, `.bin`, or `.sh` file), enter:

```
distribution_name.exe
```

2.3.3 Understanding Directories for Installation and Configuration

During the installation and domain configuration process, you must plan on providing the locations for these directories: Oracle home, Domain home, and the Application home.

[Understanding the Recommended Directory Structure](#)

Oracle recommends specific locations for the Oracle Home, Domain Home, and Application Home.

[About the Oracle Home Directory](#)

When you install any Oracle Fusion Middleware product, you must use an Oracle home directory.

[About the Domain Home Directory](#)

The Domain home is the directory where domains that you configure are created.

[About the Application Home Directory](#)

The Application home is the directory where applications for domains you configure are created.

[Installing Multiple Products in the Same Domain](#)

There are two methods to install and configure multiple products in one domain. This is also known as *extending* a domain.

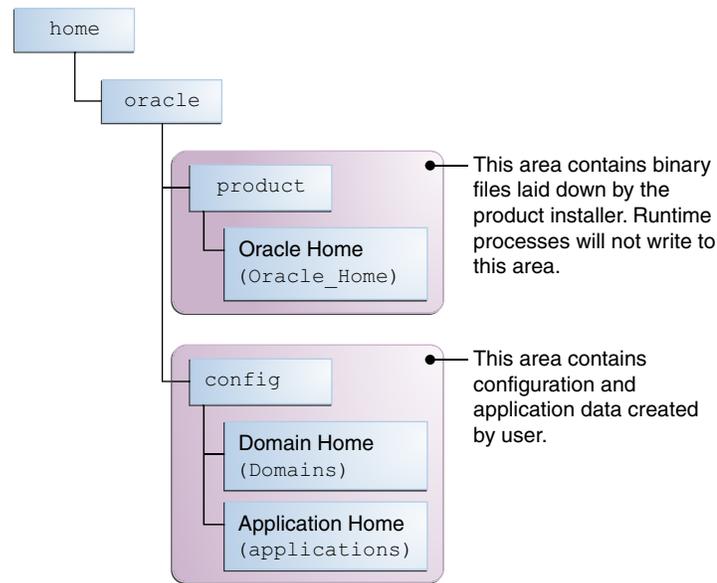

[Preparing for Shared Storage](#)

Oracle Fusion Middleware enables you to configure multiple Oracle WebLogic Server domains from a single Oracle home. This allows you to install the Oracle home in a single location on a shared volume and reuse the Oracle home for multiple host installations.

2.3.3.1 Understanding the Recommended Directory Structure

Oracle recommends specific locations for the Oracle Home, Domain Home, and Application Home.

Oracle recommends a directory structure similar to the one shown in [Figure 2-1](#).

Figure 2-1 Recommended Oracle Fusion Middleware Directory Structure

A base location (Oracle base) should be established on your system (for example, `/home/oracle`) and from there, two separate branches should be created. The `product` directory should contain the product binary files and all of the Oracle home directories. The `config` directory should contain your domain and application data.

Oracle recommends that you do not keep your configuration data anywhere underneath the Oracle home; if you upgrade your product to another major release, you will be required to create a new Oracle home for binaries. You must also make sure that your configuration data exist in a location to which the binaries in the Oracle home have access.

The `/home/oracle/product` (for the Oracle home) and `/home/oracle/config` (for the application and configuration data) directories are used in examples throughout the documentation; be sure to replace these directories with the actual directories on your system.

2.3.3.2 About the Oracle Home Directory

When you install any Oracle Fusion Middleware product, you must use an Oracle home directory.

This directory is a repository for common files that are used by multiple Fusion Middleware products installed on the same machine. These files are essential to ensuring that Fusion Middleware operates correctly on your system. They facilitate checking of cross-product dependencies during installation. For this reason, you can consider the Oracle home directory a *central support directory* for all Oracle Fusion Middleware products installed on your system.

Fusion Middleware documentation refers to the Oracle home directory as `ORACLE_HOME`.

Oracle Home Considerations

Keep the following in mind when you create the Oracle home directory and install Fusion Middleware products:

- Do not include spaces in the name of your Oracle home directory; the installer gives you an error message if your Oracle home directory path contains spaces.

- You can install only one instance of each Oracle Fusion Middleware product in a single Oracle home directory. If you need to maintain separate versions of a product on the same machine, each version must be in its own Oracle home directory.

Although you can have several different products in a single Oracle home, only one version of each product can be in the Oracle home.

Multiple Home Directories

Although in most situations, a single Oracle home directory is sufficient, it is possible to create more than one Oracle home directory. For example, you need to maintain multiple Oracle home directories in the following situations:

- You prefer to maintain separate development and production environments, with a separate product stack for each. With two directories, you can update your development environment without modifying the production environment until you are ready to do so.
- You want to maintain two different versions of a Fusion Middleware product at the same time. For example, you may want to install a new version of a product while keeping your existing version intact. In this case, you must install each product version in its own Oracle home directory.
- You need to install multiple products that are not compatible with each other. See Oracle Fusion Middleware 12c (12.2.1.2) Interoperability and Compatibility in *Oracle Fusion Middleware Understanding Interoperability and Compatibility* for more information.

Note: If you create more than one Oracle home directory, you must provide non-overlapping port ranges during the configuration phase for each product.

2.3.3.3 About the Domain Home Directory

The Domain home is the directory where domains that you configure are created.

The default Domain home location is `ORACLE_HOME/user_projects/domains/domain_name`. However, Oracle strongly recommends that you do not use this default location. Put your Domain home *outside* of the Oracle home directory, for example, in `/home/oracle/config/domains`. The `config` directory should contain domain and application data. Oracle recommends a separate domain directory so that new installs, patches, and other operations update the `ORACLE_HOME` only, *not* the domain configuration.

See [Understanding the Recommended Directory Structure](#) for more information about the recommended directory structure and locating your Domain home.

Fusion Middleware documentation refers to the Domain home directory as `DOMAIN_HOME` and includes all folders up to and including the domain name. For example, if you name your domain `exampledomain` and locate your domain data in the `/home/oracle/config/domains` directory, the documentation would use `DOMAIN_HOME` to refer to `/home/oracle/config/domains/exampledomain`.

2.3.3.4 About the Application Home Directory

The Application home is the directory where applications for domains you configure are created.

The default Application home location is `ORACLE_HOME/user_projects/applications/domain_name`. However, Oracle strongly recommends that you locate your Application home *outside* of the Oracle home directory; if you upgrade your product to another major release, you must create a new Oracle home for binaries.

See [Understanding the Recommended Directory Structure](#) for more information about the recommended directory structure and locating your Application home.

Fusion Middleware documentation refers to the Application home directory as `APPLICATION_HOME` and includes all folders up to and including the domain name. For example, if you name your domain `exampledomain` and you locate your application data in the `/home/oracle/config/applications` directory, the documentation uses `APPLICATION_HOME` to refer to `/home/oracle/config/applications/exampledomain`.

2.3.3.5 Installing Multiple Products in the Same Domain

There are two methods to install and configure multiple products in one domain. This is also known as *extending* a domain.

- **Method 1.**

Install and configure Product A, including creating the schemas and starting all servers in the domain to verify a successful domain configuration.

This is the method used in all installation guides in the Fusion Middleware library. You can repeat this process for as many products as necessary. It allows you to validate one product at a time and add more products incrementally.

To install Product B in the same domain as Product A:

1. Stop all servers to prevent any updates to the domain while you add the new product.

For more information, see Starting and Stopping Oracle Fusion Middleware in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

2. Follow the instructions in the installation guide for Product B, including creating the necessary schemas.

3. Run the Configuration Wizard to configure the domain.

During configuration, the Configuration Wizard automatically detects the components that have been installed and offers you the option to extend the existing Product A domain to include Product B.

- **Method 2.**

Install all of the required products, then create the schemas for all of the products. After you create the schemas, configure the domain by using the necessary product templates, then start all the servers.

This method of creating a multi-product domain may be slightly faster than Method 1; however, the installation guides in the Fusion Middleware library do not provide specific instructions for this method of domain creation.

See Also:

- For more information about updating WebLogic domains, see *Updating WebLogic Domains in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.
 - For important information regarding the ability of Oracle Fusion Middleware products to function with previous versions of other Oracle Fusion Middleware, Oracle, or third-party products, see *Oracle Fusion Middleware 12c (12.2.1.2) Interoperability and Compatibility in Oracle Fusion Middleware Understanding Interoperability and Compatibility*
-

2.3.3.6 Preparing for Shared Storage

Oracle Fusion Middleware enables you to configure multiple Oracle WebLogic Server domains from a single Oracle home. This allows you to install the Oracle home in a single location on a shared volume and reuse the Oracle home for multiple host installations.

If you plan to use shared storage in your environment, see *Using Shared Storage in Oracle Fusion Middleware High Availability Guide* for more information.

2.3.4 Understanding JDK Requirements for an Oracle Fusion Middleware Installation

Most Fusion Middleware products are in `.jar` file format. These distributions do *not* include a JDK. To run a `.jar` distribution installer, you must have a certified JDK already installed on your system.

Make sure that the JDK is installed *outside* of the Oracle home. If you install the JDK under the Oracle home, you will encounter problems when you try to perform tasks in the future. Oracle Universal Installer validates that the Oracle home directory is empty; the install will not progress until you specify an empty directory. Oracle recommends that you locate your JDK installation in the `/home/oracle/products/jdk` directory.

Some products (such as Oracle HTTP Server and Oracle JDeveloper) are available as **platform-specific distributions**. Platform-specific distributions have a `.bin` (for UNIX operating systems) or `.exe` (for Windows operating systems) installer; in these cases, a platform-specific JDK is in the distribution and you do not need to install a JDK separately. However, you may need to upgrade this JDK to a more recent version, depending on the JDK versions that are certified.

Always verify the required JDK version by reviewing the certification information on the *Oracle Fusion Middleware Supported System Configurations* page. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

To download the required JDK, navigate to the following URL and download the Java SE JDK:

<http://www.oracle.com/technetwork/java/javase/downloads/index.html>

2.3.5 Understanding Database Requirements for an Oracle Fusion Middleware Installation

Many Oracle Fusion Middleware products require database schemas prior to configuration. If you do not already have a database where you can install these schemas, you must install and configure a certified database.

To find a certified database for your operating system, see the certification document for your release on the *Oracle Fusion Middleware Supported System Configurations* page.

To make sure your database is properly configured for schema creation, see "Repository Creation Utility Requirements" in the *Oracle Fusion Middleware System Requirements and Specifications* document.

After your database is properly configured, you use the Repository Creation Utility (RCU) to create product schemas in your database. This tool is available in the Oracle home for your Oracle Fusion Middleware product. For more information about the RCU, see Understanding Repository Creation Utility in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

2.4 Obtaining the Product Distribution

You can obtain the Oracle Fusion Middleware Infrastructure and Oracle WebCenter Content distribution on the Oracle Technology Network (OTN).

To prepare to install Oracle Fusion Middleware Infrastructure and Oracle WebCenter Content:

1. Enter `java -version` on the command line to verify that a certified JDK is installed on your system. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later. For more information, see [Understanding JDK Requirements for an Oracle Fusion Middleware Installation](#).
2. Locate and download the Oracle Fusion Middleware Infrastructure and Oracle WebCenter Content software.

See Obtaining Product Distributions in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*.

2.5 About Product Distributions

You create the initial Oracle WebCenter Content domain using the Oracle Fusion Middleware Infrastructure distribution, which contains both Oracle WebLogic Server software and Oracle Java Required Files (JRF) software.

Oracle JRF software consists of:

- Oracle Web Services Manager
- Oracle Application Development Framework (Oracle ADF)
- Oracle Enterprise Manager Fusion Middleware Control
- Repository Creation Utility (RCU)
- Other libraries and technologies required to support Oracle Fusion Middleware products

Installing Oracle Fusion Middleware Infrastructure is a prerequisite to installing Oracle WebCenter Content.

Installing the Oracle WebCenter Content Software

Follow the steps in this section to install the Oracle WebCenter Content software.

Before beginning the installation, ensure that you have verified the prerequisites and completed all steps covered in [Preparing to Install and Configure Oracle WebCenter Content](#).

Verifying the Installation Checklist

The installation process requires specific information.

Starting the Installation Program

Before running the installation program, you must verify the JDK and prerequisite software is installed.

Navigating the Installation Screens

The installer shows a series of screens where you verify or enter information.

Verifying the Installation

After you complete the installation, verify it was successful by completing a series of tasks.

3.1 Verifying the Installation Checklist

The installation process requires specific information.

[Table 3-1](#) lists important items that you must know before, or decide during, Oracle WebCenter Content installation.

Table 3-1 Installation Checklist

Information	Example Value	Description
JAVA_HOME	/home/Oracle/Java/ jdk1.8.0_101	Environment variable that points to the Java JDK home directory.
Database host	examplehost.exampledomain	Name and domain of the host where the database is running.
Database port	1521	Port number that the database listens on. The default Oracle database listen port is 1521.

Table 3-1 (Cont.) Installation Checklist

Information	Example Value	Description
Database service name	orcl.oracle.com	Oracle databases require a unique service name. The default service name is orcl.
DBA username	SYS	Name of user with database administration privileges. The default DBA user on Oracle databases is SYS.
DBA password	myDBApw957	Password of the user with database administration privileges.
<i>ORACLE_HOME</i>	/home/Oracle/product/ ORACLE_HOME	Directory in which you will install your software. This directory will include Oracle Fusion Middleware Infrastructure and Oracle WebCenter Content, as needed.
WebLogic Server hostname	examplehost.exampledomain.com	Host name for Oracle WebLogic Server and Oracle WebCenter Content consoles.
Console port	7001	Port for Oracle WebLogic Server and Oracle WebCenter Content consoles.
<i>DOMAIN_HOME</i>	/home/Oracle/config/ domains/wcc_domain	Location in which your domain data is stored.
<i>APPLICATION_HOME</i>	/home/Oracle/config/ applications/ wcc_domain	Location in which your application data is stored.
Administrator user name for your WebLogic domain	weblogic	Name of the user with Oracle WebLogic Server administration privileges. The default administrator user is weblogic.
Administrator user password	myADMpw902	Password of the user with Oracle WebLogic Server administration privileges.
RCU	<i>ORACLE_HOME</i> / oracle_common/bin	Path to the Repository Creation Utility (RCU).

Table 3-1 (Cont.) Installation Checklist

Information	Example Value	Description
RCU schema prefix	SHORT_PRODUCT_NAME	Prefix for names of database schemas used by Oracle WebCenter Content.
RCU schema password	myRCUpw674	Password for the database schemas used by Oracle WebCenter Content.
Configuration utility	ORACLE_HOME/ oracle_common/ common/bin	Path to the Configuration Wizard for domain creation and configuration.

3.2 Starting the Installation Program

Before running the installation program, you must verify the JDK and prerequisite software is installed.

To start the installation program:

1. Sign in to the host system.
2. If you have not already done so, verify that a certified JDK is installed on your system: enter `java -version` on the command line. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

For more information, see [Understanding JDK Requirements for an Oracle Fusion Middleware Installation](#).

3. Verify that you have installed all prerequisite software, such as Oracle Fusion Middleware Infrastructure.
4. Go to the directory where you downloaded the installation program.
5. Start the installation program by running the `java` executable from the JDK directory. For example:

- (UNIX) `/home/Oracle/Java/jdk1.8.0_101/bin/java -jar fmw_12.2.1.2.0_wcontent_generic.jar`
- (Windows) `C:\home\Oracle\Java\jdk1.8.0_101\bin\java -jar fmw_12.2.1.2.0_wcontent_generic.jar`

Note:

You can also start the installer in silent mode using a saved response file instead of launching the installer screens. For more about silent or command line installation, see *Using the Oracle Universal Installer in Silent Mode in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer*.

When the installation program appears, you are ready to begin the installation.

3.3 Navigating the Installation Screens

The installer shows a series of screens where you verify or enter information.

The following table lists the order in which installer screens appear. If you need additional help with an installation screen, click **Help**.

Table 3-2 Oracle WebCenter Content Install Screens

Screen	Description
Installation Inventory Setup	<p>On UNIX operating systems, this screen opens if this is the first time you are installing any Oracle product on this host. Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location.</p> <p>For more about the central inventory, see <i>About the Oracle Central Inventory in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer</i>. This screen does not appear on Windows operating systems.</p>
Welcome	Review the information to make sure that you have met all the prerequisites, then click Next .
Auto Updates	Select to skip automatic updates, select patches, or search for the latest software updates, including important security updates, through your My Oracle Support account.
Installation Location	<p>Specify your Oracle home directory location.</p> <p>You can click View to verify and ensure that you are installing Oracle WebCenter Content in the correct Oracle home.</p>
Installation Type	
Prerequisite Checks	<p>This screen verifies that your system meets the minimum necessary requirements.</p> <p>To view the list of tasks that gets verified, select View Successful Tasks. To view log details, select View Log. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click Rerun to try again. To ignore the error or the warning message and continue with the installation, click Skip (not recommended).</p>
Installation Summary	<p>Use this screen to verify installation options you selected. If you want to save these options to a response file, click Save Response File and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.</p> <p>Click Install to begin the installation.</p>
Installation Progress	<p>This screen shows the installation progress.</p> <p>When the progress bar reaches 100% complete, click Finish to dismiss the installer, or click Next to see a summary.</p>

Table 3-2 (Cont.) Oracle WebCenter Content Install Screens

Screen	Description
Installation Complete	This screen displays the Installation Location and the Feature Sets that are installed. Review this information and click Finish to close the installer.

3.4 Verifying the Installation

After you complete the installation, verify it was successful by completing a series of tasks.

Reviewing the Installation Log Files

Review the contents of the installation log files to make sure that the installer did not encounter any problems.

Checking the Directory Structure

The contents of your installation vary based on the options that you selected during the installation.

Viewing the Contents of the Oracle Home

You can view the contents of the Oracle home directory by using the `viewInventory` script.

3.4.1 Reviewing the Installation Log Files

Review the contents of the installation log files to make sure that the installer did not encounter any problems.

By default, the installer writes logs files to the *Oracle_Inventory_Location/logs* (on UNIX operating systems) or *Oracle_Inventory_Location\logs* (on Windows operating systems) directory.

For a description of the log files and where to find them, see *Installation Log Files in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer*.

3.4.2 Checking the Directory Structure

The contents of your installation vary based on the options that you selected during the installation.

For more information about the directory structure after installation, see *What Are the Key Oracle Fusion Middleware Directories?* in *Oracle Fusion Middleware Understanding Oracle Fusion Middleware*.

3.4.3 Viewing the Contents of the Oracle Home

You can view the contents of the Oracle home directory by using the `viewInventory` script.

For more information, see *Viewing the Contents of an Oracle Home* in *Oracle Fusion Middleware Installing Software with the Oracle Universal Installer*.

Configuring the WebCenter Content Domain

After you have installed WebCenter Content, you can configure the domain, which you can also extend for high availability.

The configuration steps presented here assume that you have completed the installation steps covered in:

- [Preparing to Install and Configure Oracle WebCenter Content](#)
- [Installing the Oracle WebCenter Content Software](#)

Refer to the following sections to create the database schemas, configure a WebLogic domain, and verify the configuration:

[Creating the Database Schemas](#)

Before you can configure an Oracle WebCenter Content domain, you must install required schemas on a certified database for use with this release of Oracle Fusion Middleware.

[Configuring the Domain](#)

Use the Configuration Wizard to create and configure a domain.

[Starting the Servers](#)

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

[Verifying the Configuration](#)

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

[Configuring Inbound Refinery Settings \(Single Node\)](#)

After you start the Inbound Refinery Managed Servers, configure the settings on the post-installation configuration screen. In most cases, you can accept the default settings.

[Configuring WebCenter Content Settings](#)

You must complete the WebCenter Content configuration on the post-installation configuration page in Content Server.

4.1 Creating the Database Schemas

Before you can configure an Oracle WebCenter Content domain, you must install required schemas on a certified database for use with this release of Oracle Fusion Middleware.

[Installing and Configuring a Certified Database](#)

Before you create the database schemas, you must install and configure a certified database, and verify that the database is up and running.

[Starting the Repository Creation Utility](#)

Start the Repository Creation Utility (RCU) after you verify that a certified JDK is installed on your system.

[Navigating the Repository Creation Utility Screens to Create Schemas](#)

Enter required information in the RCU screens to create the database schemas.

4.1.1 Installing and Configuring a Certified Database

Before you create the database schemas, you must install and configure a certified database, and verify that the database is up and running.

For more information, see [Understanding Database Requirements for an Oracle Fusion Middleware Installation](#).

4.1.2 Starting the Repository Creation Utility

Start the Repository Creation Utility (RCU) after you verify that a certified JDK is installed on your system.

To start the RCU:

1. Verify that a certified JDK already exists on your system by running `java -version` from the command line. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

For more information, see [Understanding JDK Requirements for an Oracle Fusion Middleware Installation](#).

2. Ensure that the `JAVA_HOME` environment variable is set to the location of the certified JDK. For example:

- (UNIX) `setenv JAVA_HOME/home/Oracle/Java/jdk1.8.0_101`
- (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_101`

3. Go to the `/oracle_common/bin` directory:

- (UNIX) `ORACLE_HOME/oracle_common/bin`
- (Windows) `ORACLE_HOME\oracle_common\bin`

4. Enter the following command:

- (UNIX) `./rcu`
- (Windows) `rcu.bat`

4.1.3 Navigating the Repository Creation Utility Screens to Create Schemas

Enter required information in the RCU screens to create the database schemas.

[Introducing the RCU](#)

The Welcome screen is the first screen that appears when you start the RCU.

[Selecting a Method of Schema Creation](#)

Use the Create Repository screen to select a method to create and load component schemas into the database.

Providing Database Connection Details

On the Database Connection Details screen, provide the database connection details for the RCU to connect to your database.

Specifying a Custom Prefix and Selecting Schemas

You must enter a custom prefix to group schemas together, then select schemas you need.

Specifying Schema Passwords

On the Schema Passwords screen, specify how you want to set the schema passwords on your database, then enter and confirm your passwords.

Completing Schema Creation

Navigate through the remaining RCU screens to complete schema creation.

4.1.3.1 Introducing the RCU

The Welcome screen is the first screen that appears when you start the RCU.

Click **Next**.

4.1.3.2 Selecting a Method of Schema Creation

Use the Create Repository screen to select a method to create and load component schemas into the database.

On the Create Repository screen:

- If you have the necessary permissions and privileges to perform DBA activities on your database, select **System Load and Product Load**. This procedure assumes that you have SYSDBA privileges.
- If you do *not* have the necessary permissions or privileges to perform DBA activities in the database, you must select **Prepare Scripts for System Load** on this screen. This option generates a SQL script that you can give to your database administrator. For more information about system load and product load, see *About System Load and Product Load* in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.
- If the DBA has already run the SQL script for System Load, select **Perform Product Load**.

4.1.3.3 Providing Database Connection Details

On the Database Connection Details screen, provide the database connection details for the RCU to connect to your database.

Note:

If you are unsure of the service name for your database, you can obtain it from the `SERVICE_NAMES` parameter in the initialization parameter file of the database. If the initialization parameter file does not contain the `SERVICE_NAMES` parameter, then the service name is the same as the global database name, which is specified in the `DB_NAME` and `DB_DOMAIN` parameters.

For example:

```

Database Type: Oracle Database
Name: examplehost.exampledomain.com
Port: 1521
Service Name: Orcl.exampledomain.com
User Name: sys
Password: *****
Role: SYSDBA
    
```

Click **Next** to proceed, then click **OK** in the dialog window that confirms a successful database connection.

4.1.3.4 Specifying a Custom Prefix and Selecting Schemas

You must enter a custom prefix to group schemas together, then select schemas you need.

Select **Create new prefix**, specify a custom prefix, then select the **WebCenter Content** schema. This action automatically selects the following schemas as dependencies:

- Oracle WebCenter Content Server — Complete
- Oracle WebCenter Enterprise Capture
- Oracle WebCenter Content Server — Search Only

The following schemas are selected by default:

- Metadata Services
- Oracle Platform Security Services
- Audit Services
- Audit Services Append
- Audit Services Viewer

Tip:

You must make a note of the custom prefix you choose to enter here; you will need this later on during the domain creation process.

Note: If you install WebCenter Content only and select the **Oracle WebCenter Content Server — Complete** schema (but no other schemas), you must select the **Metadata Services** schema. You must select the **Metadata Services** because WebCenter Content User Interface requires it.

The schema Common Infrastructure Services is also created automatically. It enables you to retrieve information from RCU during domain configuration. This schema is grayed out; you cannot select or deselect it. For more information, see *Understanding the Service Table Schema in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

The custom prefix logically groups these schemas together for use in this domain only; you must create a unique set of schemas for each domain because schema sharing across domains is not supported.

Tip:

For more information about custom prefixes, see Understanding Custom Prefixes in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

For more information about how to organize your schemas in a multi-domain environment, see Planning Your Schema Creation in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

Click **Next** to proceed, then click **OK** on the dialog window confirming that prerequisite checking for schema creation was successful.

4.1.3.5 Specifying Schema Passwords

On the Schema Passwords screen, specify how you want to set the schema passwords on your database, then enter and confirm your passwords.

Tip:

You must make a note of the passwords you set on this screen; you will need them later on during the domain creation process.

4.1.3.6 Completing Schema Creation

Navigate through the remaining RCU screens to complete schema creation.

On the Map Tablespaces screen, the Encrypt Tablespace check box appears *only* if you enabled Transparent Data Encryption (TDE) in the database (Oracle or Oracle EBR) when you start the RCU. Select the **Encrypt Tablespace** check box if you want to encrypt all new tablespaces that the RCU creates.

When you reach the Completion Summary screen, click **Close** to dismiss the RCU.

4.2 Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

4.2.1 Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Go to the `/oracle_common/common/bin` directory:

(UNIX) `ORACLE_HOME/oracle_common/common/bin`

(Windows) `ORACLE_HOME\oracle_common\common\bin`

where `ORACLE_HOME` is your 12c (12.2.1.2) Oracle home.

2. Enter the following command:

(UNIX) `./config.sh`

(Windows) `config.cmd`

4.2.2 Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

Note:

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.

Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Selecting Configuration Templates for Oracle WebCenter Content

Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the *Application home* directory.

Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

Specifying JDBC Data Sources

Use this screen to specify JDBC Data Sources.

Testing the JDBC Data Source

Use this screen to test the data source connections you configured in the previous screens.

Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

Entering Credentials

Use this screen to set credentials for each key in the domain.

Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Configuring Managed Servers for Oracle WebCenter Content

You create and configure new Managed Servers on the Managed Servers Screen.

Configuring a Cluster for WebCenter Content

Use the Clusters screen to create a new cluster.

Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

Assigning WebCenter Content Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new *configured cluster*. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a *dynamic cluster*, a cluster that contains one or more generated server instances that are based on a server template.

Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Creating a New WebCenter Content Machine

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Assigning Servers to WebCenter Content Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select **Next**.

Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select **Next** without selecting any options.

[Reviewing Your Configuration Specifications and Configuring the Domain](#)

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

[Writing Down Your Domain Home and Administration Server URL](#)

The End of Configuration screen shows information about the domain you just configured.

4.2.2.1 Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in *What Are the Key Oracle Fusion Middleware Directories?* in *Oracle Fusion Middleware Understanding Oracle Fusion Middleware*, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select **Create a new domain**.
2. In the Domain Location field, specify your Domain home directory.

Tip:

For more information about this screen, see Configuration Type in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.2 Selecting Configuration Templates for Oracle WebCenter Content

On the Templates screen, make sure **Create Domain Using Product Templates** is selected, then select the following templates:

- **Oracle Universal Content Management - Inbound Refinery - 12.2.1.2.0[wcontent]**
- **Oracle Universal Content Management - Content Server - 12.2.1.2.0 [wcontent]**

Selecting this template automatically selects the following as dependencies:

- Oracle Enterprise Manager - 12.2.1.2.0 [em]
- Oracle JRF - 12.2.1.2.0 [oracle_common]
- WebLogic Coherence Cluster Extension - 12.2.1.2.0 [wlserver]
- **Oracle WebCenter Enterprise Capture - 12.2.1.2.0 [wccapture]**
- **Oracle WebCenter Content - Web UI - 12.2.1.2.0 [wcontent]**

Tip:

For more information about options on this screen, see Templates in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.3 Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the *Application home* directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in *What Are the Key Oracle Fusion Middleware Directories?* in *Oracle Fusion Middleware Understanding Oracle Fusion Middleware*, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.

Tip:

For more about the Application home directory, see [About the Application Home Directory](#).

For more information about this screen, see Application Location in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.4 Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain's Administration Server.

4.2.2.5 Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

- Select **Production** in the **Domain Mode** field.
- Select the **Oracle HotSpot JDK** in the **JDK** field.

Tip:

For more information about this screen, see Domain Mode and JDK in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.6 Specifying JDBC Data Sources

Use this screen to specify JDBC Data Sources.

If you use a DB2 database, you must check system requirements before you select a DB2 driver. See the document *Oracle Fusion Middleware System Requirements and Specifications*.

1. Select the default Data Source, mds-WCCUIMDSREPO.
2. Enter values for DBMS/Service, Host Name, Port and Password and Username.
3. Click **Next**.

4.2.2.7 Testing the JDBC Data Source

Use this screen to test the data source connections you configured in the previous screens.

Note: To test database connections, the database you are connecting to must be running. If you don't want to test the connections at this time, do not select any data sources and click **Next** to continue.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

To test the data source:

1. Select the check box next to the data source you want to test.
2. Select **Test Selected Connections**.
3. If the test is successful, then click **Next**. If it fails, click **Back**, correct the details and retest it.

4.2.2.8 Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select **RCU Data**. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

Note:

If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting **RCU Data**, fill in the following fields:

Field	Description
DBMS/Service	Enter the database DBMS name, or service name if you selected a service type driver. Example: <code>orcl.exampledomain.com</code>
Host Name	Enter the name of the server hosting the database. Example: <code>examplehost.exampledomain.com</code>
Port	Enter the port number on which the database listens. Example: 1521
Schema Owner Schema Password	Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is <code>prefix_STB</code> , where <code>prefix</code> is the custom prefix that you defined in the RCU.

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

```
Connecting to the database server...OK
Retrieving schema data from database server...OK
Binding local schema components with retrieved data...OK
```

Successfully Done.

Tip:

For more information about the schema installed when the RCU is run, see *About the Service Table Schema* in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

For more information about this screen, see *Database Configuration Type* in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.9 Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected **RCU Data** on the previous screen, the schema table should already be populated appropriately.

Tip:

For high availability environments, see the following sections in *Oracle Fusion Middleware High Availability Guide* for additional information on configuring data sources for Oracle RAC databases:

- [Configuring Active GridLink Data Sources with Oracle RAC](#)
- [Configuring Multi Data Sources](#)

For more information about this screen, see *JDBC Component Schema* in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.10 Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the **Schema Password** column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

Tip:

For more information about this screen, see *JDBC Component Schema Test in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.11 Entering Credentials

Use this screen to set credentials for each key in the domain.

The Store Name column shows the credential store associated with each key.

(Optional) You can click **Add** to enter additional key credentials.

1. Enter the User Name to use for the key.
2. Enter the Password to use for the key.
3. Select **Next**.

4.2.2.12 Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

On the Advanced Configuration screen, select:

- Administration Server
Required to properly configure the listen address of the Administration Server.
- Node Manager
Required to configure Node Manager.
- Topology
Required to configure the WebCenter Content Managed Server.

Optionally, select other available options as required for your desired installation environment. The steps in this guide describe a standard installation topology, but you may choose to follow a different path. If your installation requirements extend to additional options outside the scope of this guide, you may be presented with additional screens to configure those options. For information about all Configuration Wizard screens, see *Configuration Wizard Screens in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.13 Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to **Listen Address** and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do *not* use `All Local Addresses`.

Do *not* specify any server groups for the Administration Server.

Note: Use Mozilla Firefox to access Internet Protocol Version 6 (IPv6) URLs. You must enter the Global IPv6 address to create a domain and access URLs. (You should not use the local IPv6 address.)

4.2.2.14 Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

Tip:

For more information about this screen, see Node Manager in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

4.2.2.15 Configuring Managed Servers for Oracle WebCenter Content

You create and configure new Managed Servers on the Managed Servers Screen.

You create two Managed Servers for each component, with the exception of Inbound Refinery.

1. In the Listen Address drop-down list, select the IP address of the host on that the Managed Servers will reside on or use the system name or DNS name that maps to a single IP address. Do not use "All Local Addresses."
2. Select **Enable SSL** to enable an SSL (https) connection for WebCenter Content and WebCenter Content User Interface. Revise the **SSL Listen Port** value as needed.
3. Leave the Server Groups settings as they appear; the Configuration Wizard assigns the correct server group automatically. A server group ensures that the correct services target Managed Servers you are creating.

Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. You can map a given application service group to multiple server groups if needed. Any application services that map to a certain server group are automatically targeted to all servers assigned to that group. For more information, see Application Service Groups, Server Groups, and Application Service Mappings in *Oracle Fusion Middleware Domain Template Reference*.

4. Click **Add** and repeat this process to create a second Managed Server for each component except for Inbound Refinery. For example, `cpt_server_2`.

You must configure a second Managed Server to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

For more about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in *Oracle Fusion Middleware High Availability Guide*.

For more information about the next steps to prepare for high availability after your domain is configured, see [Preparing Your Environment for High Availability](#).

Examples and procedures in the rest of this document refer to these server names; if you choose different names be sure to replace them as needed.

Server Name	Listen Address	Listen Port	Enable SSL	SSL Listen Port	Server Groups
wccui_server_1	11.222.333.444	16225	<input checked="" type="checkbox"/>	16226	UCM-ADF-MGD-SVR
cpt_server_1	11.222.333.444	16400	<input type="checkbox"/>	Disabled	CAPTURE-MGD-SVR
wcc_server_1	11.222.333.444	16200	<input checked="" type="checkbox"/>	16201	UCM-MGD-SVR
ibr_server_1	11.222.333.444	16250	<input type="checkbox"/>	Disabled	IBR-MGD-SVR
wccui_server_2	11.222.333.444	7003	<input checked="" type="checkbox"/>	16227	UCM-ADF-MGD-SVR
cpt_server_2	11.222.333.444	7004	<input type="checkbox"/>	Disabled	CAPTURE-MGD-SVR

Tip:

For more about options on this screen, see *Managed Servers in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.16 Configuring a Cluster for WebCenter Content

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click **Add**.
2. Specify `wcc_cluster_1` in the Cluster Name field.
3. Leave the Cluster Address field blank.

Repeat the preceding steps to create three more clusters: `cpt_cluster_1`, `ibr_cluster_1`, and `wccui_cluster_1`.

By default, server instances in a cluster communicate with one another using unicast. If you want to change your cluster communications to use multicast, see *Considerations for Choosing Unicast or Multicast in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server*.

You can also create clusters using Fusion Middleware Control. In this case, you can configure cluster communication (unicast or multicast) when you create the new cluster. For more information, see *Create and configure clusters in Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help*.

Tip:

For more information about this screen, see *Clusters in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.17 Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

To continue configuring the domain, click **Next**.

For steps to create a dynamic cluster for a high availability setup, see *Using Dynamic Clusters in Oracle Fusion Middleware High Availability Guide*.

4.2.2.18 Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

If you are *not* configuring a dynamic cluster, click **Next** to continue configuring the domain.

Note: When you create dynamic clusters, keep in mind that after you assign the **Machine Name Match Expression**, you do not need to create machines for your dynamic cluster.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in *Oracle Fusion Middleware High Availability Guide*.

4.2.2.19 Assigning WebCenter Content Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new *configured cluster*. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a *dynamic cluster*, a cluster that contains one or more generated server instances that are based on a server template.

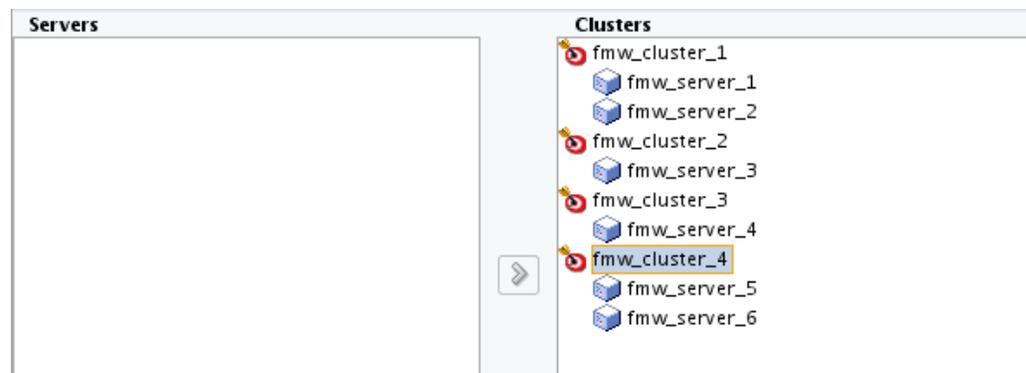

For more on configured cluster and dynamic cluster terms, see About Dynamic Clusters in *Oracle Fusion Middleware Understanding Oracle WebLogic Server*.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, `wcc_cluster_1`.
2. In the Servers pane, assign `wcc_server_1` to `wcc_cluster_1` by doing one of the following:
 - Click once on `wcc_server_1` to select it, then click the right arrow to move it beneath the selected cluster (`wcc_cluster_1`) in the Clusters pane.
 - Double-click on `wcc_server_1` to move it beneath the selected cluster (`wcc_cluster_1`) in the Clusters pane.
3. Repeat to assign `wcc_server_2` to `wcc_cluster_1`.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.

Figure 4-1 Managed Servers Assigned to Clusters

Tip:

For more information about this screen, see *Assign Servers to Clusters in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.20 Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.

Note:

Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

See [Table 5-2](#) for more information and next steps for configuring Coherence.

Note:

For Coherence licensing information, see *Oracle Coherence Products in Licensing Information*.

4.2.2.21 Creating a New WebCenter Content Machine

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Tip:

If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the instructions in this section to create all the machines at this time. For more information, see *Optional Scale Out Procedure in Oracle Fusion Middleware High Availability Guide*.

To create a new WebCenter Content machine so that Node Manager can start and stop servers:

1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click **Add** to create a new machine.
2. In the Name field, specify a machine name, such as `wcc_machine_1`.
3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.

You must select a specific interface and not `localhost`. This allows Coherence cluster addresses to be dynamically calculated.

4. Verify the port in the Node Manager Listen Port field.

- Repeat these steps to add more machines, if required.

Note:

If you are extending an existing domain, you can assign servers to any existing machine. It is not necessary to create a new machine unless your situation requires it.

Tip:

For more information about this screen, see *Machines* in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.22 Assigning Servers to WebCenter Content Machines

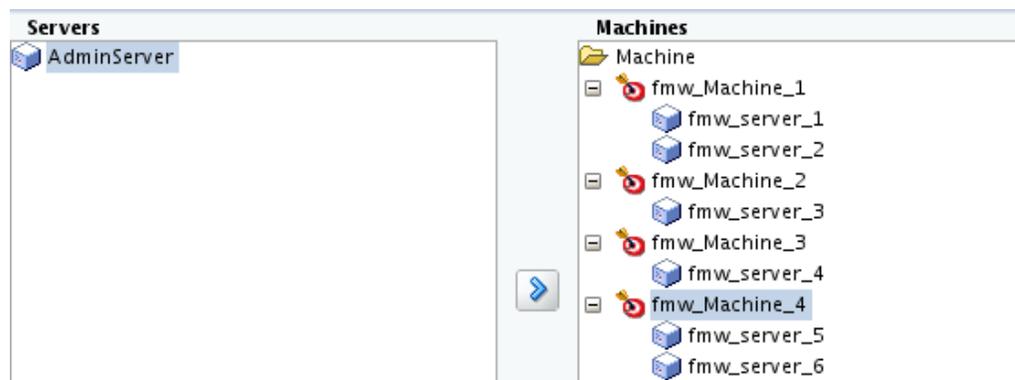

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

On the Assign Servers to Machines screen:

- In the Machines pane, select the machine to which you want to assign the servers; in this case, `wcc_machine_1`.
- In the Servers pane, assign `AdminServer` to `wcc_machine_1` by doing one of the following:
 - Click once on `AdminServer` to select it, then click the right arrow to move it beneath the selected machine (`wcc_machine_1`) in the Machines pane.
 - Double-click on `AdminServer` to move it beneath the selected machine (`wcc_machine_1`) in the Machines pane.
- Repeat these steps to assign all Managed Servers to their respective machines.

The following figure shows a generic example of the Machines pane after Managed Servers are assigned to machines.

Figure 4-2 Assign Managed Servers to Machines

**Tip:**

For more information about this screen, see *Assign Servers to Machines* in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.23 Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select **Next**.

Tip: For more information about this screen, see Virtual Targets in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.24 Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select **Next** without selecting any options.

Tip: For more information about this screen, see Partitions in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.25 Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the **Back** button or selecting the screen in the navigation pane. Domain creation does not start until you click **Create**.

Tip:

For more information about this screen, see Configuration Summary in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

4.2.2.26 Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click **Finish** to dismiss the Configuration Wizard.

4.3 Starting the Servers

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

Note:

For more information on additional tools you can use to manage your domain, see Overview of Oracle Fusion Middleware Administration Tools in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

[Starting Node Manager](#)

[Starting the Administration Server](#)

[Starting the Managed Servers](#)

[Oracle WebCenter Content Managed Server Locations \(URLs\)](#)

After you start the Managed Servers, use this topic to refer to Oracle WebCenter Content Managed Server locations.

4.3.1 Starting Node Manager

To start the per-domain Node Manager:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
 - (UNIX) Using `nohup` and `nm.out` as an example output file:

```
nohup ./startNodeManager.sh > LOG_DIR/nm.out&
```

where `LOG_DIR` is the location of directory in which you want to store the log files.

- (Windows) `startNodeManager.cmd`

Note:

On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

See *Running Node Manager as a Startup Service* in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

4.3.2 Starting the Administration Server

To start the Administration Server:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
 - (UNIX)

```
./startWebLogic.sh
```

- (Windows)

```
startWebLogic.cmd
```

If you selected **Production Mode** on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as provided on the Administrator Account screen.

Tip:

For more information about starting the Administration Server, see *Starting and Stopping Administration Server* in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see *Creating a Boot Identity File for an Administration Server* in *Oracle Fusion Middleware Administering Server Startup and Shutdown for Oracle WebLogic Server*.

You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen (`http://
administration_server_host:administration_server_port/console`). The default Administration Server port number is 7001.

Note:

Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.

For more information about how to use the Administration Console, see *Getting Started Using Oracle WebLogic Server Administration Console* in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

4.3.3 Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:

`http://administration_server_host:administration_server_port/em`

The Administration Server host and port number were in the URL on the End of Configuration screen ([Writing Down Your Domain Home and Administration Server URL](#)). The default Administration Server port number is 7001.

The login credentials were provided on the Administrator Account screen ([Configuring the Administrator Account](#)).

2. The Enterprise Manager landing page lists the servers configured for this domain and displays their status (such as **Running** or **Shutdown**). For a newly configured domain, only the **AdminServer(admin)** will be running.

Select the first Managed Server.

3. Next to the **WebLogic Server** menu, select **Start Up**.
4. Repeat Steps 3 and 4 to start all Managed Servers.
5. On the main landing page, verify that all the Managed Servers are up and running.

4.3.4 Oracle WebCenter Content Managed Server Locations (URLs)

After you start the Managed Servers, use this topic to refer to Oracle WebCenter Content Managed Server locations.

Server	URL
WebCenter Content	<code>http://hostname:wcc-server-port/cs</code> Example: <code>http://host1:16200/cs</code>
WebCenter Content User Interface	<code>http://hostname:wccui-server-port/wcc</code> Example: <code>http://host1:16225/wcc</code>
Inbound Refinery	<code>http://hostname:ibr-server-port/ibr</code> Example: <code>http://host1:16250/ibr</code>
Capture	<code>http://hostname:cpt-server-port/</code> Example: <code>http://host1:7004/cpt</code>

4.4 Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see [Performing Additional Domain Configuration Tasks](#).

4.5 Configuring Inbound Refinery Settings (Single Node)

After you start the Inbound Refinery Managed Servers, configure the settings on the post-installation configuration screen. In most cases, you can accept the default settings.

To configure the settings:

1. Access the Inbound Refinery post-installation configuration screen at the following URL:
`http://managedServerHost:managedServerPort/ibr/`
2. Review the settings. See [Inbound Refinery Configuration Page](#) for a description of each field.
3. Click **Submit**.
4. Restart the Inbound Refinery Managed Server, using the WebLogic Server Administration Console.

[Inbound Refinery Configuration Page](#)

Use descriptions of Inbound Refinery configuration page fields as you complete configuration steps in [Configuring Inbound Refinery Settings \(Single Node\)](#).

4.5.1 Inbound Refinery Configuration Page

Use descriptions of Inbound Refinery configuration page fields as you complete configuration steps in [Configuring Inbound Refinery Settings \(Single Node\)](#).

The following table describes Inbound Refinery configuration page fields.

Field	Description
Inbound Refinery Instance Folder	<p>Absolute path to the Oracle instance directory of Inbound Refinery. Default is <code>DomainHome/ucm/</code>. The default Oracle instance directory for Inbound Refinery is <code>ORACLE_HOME/user_projects/domains/DomainHome/ucm/ibr</code>. The top-level folder in the folder hierarchy for the Content Server instance is <code>ibr</code>.</p> <p>The path to the Oracle instance directory is the value of the <code>IntradocDir</code> variable for the Inbound Refinery instance. Oracle recommends that you make this directory path unique to this Managed Server, or node. For installations that you will probably upgrade, Oracle strongly recommends that you change the location of the Oracle instance directory to a directory outside any Oracle WebLogic Server domain directories or installation directories.</p>
Native File Repository Location	<p>Directory that stores conversion jobs during their processing. After a job converts and Content Server picks it up, it is removed from this directory. You do not need to change this path.</p>
Weblayout Folder	<p>URL for the Inbound Refinery web interface. You do not need to change this path.</p>
Register Start Menu Actions	<p>Whether or not to register Start Menu actions.</p>
Server Socket Port	<p>Number of the port to call top-level services. To set up a provider from Inbound Refinery back to Content Server, you can leave the default Server Socket Port value 5555 or change it to an unused port number.</p> <p>Changing this field value also changes the <code>IntradocServerPort</code> entry in <code>ORACLE_HOME/user_projects/domains/DomainHome/ucm/ibr/config/config.cfg</code></p> <hr/> <p>Note: You must set Server Socket Port correctly to use Inbound Refinery.</p> <hr/> <p>Note: The default port number for Node Manager and Inbound Refinery is 5555. If both run on the same server, you must configure a different port number for Node Manager or Inbound Refinery.</p>

Field	Description
Incoming Socket Connection Address Security Filter	<p>Restricts Inbound Refinery access to a computer or computers with a specified IP address or addresses.</p> <p>To enable access from Content Server, enter a value for this field. For example:</p> <pre>127.0.0.1 0:0:0:0:0:0:0:1 your.server.IP.address</pre> <p>This value should be the Content Server instance IP address of the or instances that will send jobs to Inbound Refinery, not the IP address of Inbound Refinery. (In a test or demo environment, these IP addresses could be the same.)</p> <p>This field accepts wildcards such as 10.*.*. You can change this value by setting <code>SocketHostAddressSecurityFilter</code> in <code>DomainHome/ucm/ibr/config/config.cfg</code> and restarting Inbound Refinery.</p> <hr/> <p>Note: To use Inbound Refinery, you must set the Incoming Socket Connection Address Security Filter value correctly.</p>
Web Server HTTP/HTTPS Address	The name of the web server. (<code>HttpServerAddress</code> property).
WebAddress Is HTTPS	Whether or not the URL for the web server starts with HTTPS, for a server that has SSL enabled.
Inbound Refinery URL Prefix	Relative URL for the Inbound Refinery instance.
Server Instance Name	Inbound Refinery instance name.
Server Instance Label	Instance name shown for Inbound Refinery.
Service Instance Description	Inbound Refinery Instance description

4.6 Configuring WebCenter Content Settings

You must complete the WebCenter Content configuration on the post-installation configuration page in Content Server.

WebCenter Content shows the configuration page when you first log in to Managed Server at `http://managedServerHost:managedServerPort/cs`

Note: The domain administrator must be the first user to log into the WebCenter Content Managed Server so that they can complete configuration. For more information, see *Oracle Fusion Middleware Administering Oracle WebCenter Content*

To complete WebCenter Content configuration:

1. Start the Administration Server. See [Starting the Administration Server](#).
2. Start the WebCenter Content Managed Server. See [Starting the Managed Servers](#).
3. Go to the Content Server post-installation page at `http://managedServerHost:16200/cs/`
4. Enter or edit any configuration values you want to change.

You can select a full-text search engine in the **FullText Search Option** field. Leave the field blank to set up the system as metadata only.

5. Enter a value in **Incoming Socket Connection Address Security Filter** to enable access from Inbound Refinery. For example:

```
127.0.0.1|your.server.IP.address|0:0:0:0:0:0:0:1|
```

This field accepts wildcards such as `10.*.*.*` You can change this value later by setting `SocketHostAddressSecurityFilter` in `DomainHome/ucm/cs/config/config.cfg` and restarting WebCenter Content Managed Server.

For Oracle WSM security, the `SocketHostAddressSecurityFilter` value must be set as follows:

```
SocketHostAddressSecurityFilter=*. *.*.*|0:0:0:0:0:0:0:1
```

6. Verify that the **Server Socket Port** setting is 4444. The Managed Server configuration file stores this value as `IntradocServerPort=4444`
7. Click **Submit**.
8. Restart the WebCenter Content Managed Server. See [Starting the Managed Servers](#)

[WebCenter Content Configuration Page](#)

You enter or verify values in the WebCenter Content configuration page fields to complete WebCenter Content configuration.

4.6.1 WebCenter Content Configuration Page

You enter or verify values in the WebCenter Content configuration page fields to complete WebCenter Content configuration.

You can use descriptions of these fields while completing steps in [Configuring WebCenter Content Settings](#)

Field	Description
Content Server Instance Folder	<p>Absolute path to the Oracle instance directory of WebCenter Content. Default is <code>DomainHome/ucm/</code>. The default Oracle instance directory for Inbound Refinery is <code>ORACLE_HOME/user_projects/domains/DomainHome/ucm/cs</code>. The top-level folder in the folder hierarchy for the Content Server instance is <code>cs</code>.</p> <p>The path to the Oracle instance directory is the value of the <code>IntradocDir</code> variable for the WebCenter Content instance. Oracle recommends that you make this directory path unique to this Managed Server, or node. For installations that you will probably upgrade, Oracle strongly recommends that you change the location of the Oracle instance directory to a directory outside any Oracle WebLogic Server domain directories or installation directories.</p>
Native File Repository Location	Path to the vault directory for storing native content checked into WebCenter Content.
Weblayout Folder	Path to the weblayout directory for storing web-viewable renditions of native and alternate files.
Register Start Menu Actions	Whether or not to register Start Menu actions.
Is New Content Server Instance	Whether or not the WebCenter Content instance is new.
Server Socket Port	<p>Number of the port to call top-level services. Default: 5555</p> <p>To set up a provider from Inbound Refinery back to Content Server, you can leave the default</p> <p>Changing this field value also changes the <code>IntradocServerPort</code> entry in <code>DOMAIN_HOME/ucm/ibr/config/config.cfg</code></p>
Incoming Socket Connection Address Security Filter	<p>Restricts WebCenter Content access to a computer or computers with a specified IP address or addresses. The default value of this field is the local host's IP address, such as <code>127.0.0.1</code>.</p> <p>You can specify multiple IP addresses, separated by pipes (<code> </code>). Make sure that there are no spaces on either side of the pipe character. For example:</p> <pre>127.0.0.1 0:0:0:0:0:0:0:1 your.server.IP.address</pre> <p>This field accepts wildcards <code>*</code> for zero or many characters, and <code>?</code> for any one character. (For example, <code>10.10.3.*</code>)</p> <p>Typically, use the IP Address Filter field only (most common) or Hostname Filter field, not both.</p>
Web Server HTTP/HTTPS Address	Name of the web server. (<code>HttpServerAddress</code> property).

Field	Description
WebAddress Is HTTPS	Whether or not the URL for the web server starts with HTTPS, for a server that has SSL enabled.
Inbound Refinery URL Prefix	Relative URL for the Inbound Refinery instance.
Server Instance Name	Inbound Refinery instance name.
Server Instance Label	Instance name shown for Inbound Refinery.
Service Instance Description	Inbound Refinery Instance description
Is Auto Number Enabled	Whether or not automatic numbering of WebCenter Content instances is enabled.
Auto Number Prefix	Unique prefix for an WebCenter Content instance number, to avoid conflicts among multiple WebCenter Content instances (Auto Number Prefix system property).
FullText Search Option	Search engine for full-text search: None: The Oracle Content Server instance uses DATABASE.METADATA as the search engine. Internal: If using Oracle Database, the WebCenter Content instance uses OracleTextSearch with the system database. If using Microsoft SQL Server, it will use DATABASE.FULLTEXT. External: The Oracle Content Server instance uses OracleTextSearch with an external provider to an Oracle Database (not the system database). If you select this option, you must enter the Data Source name in the External DataSource field.
External DataSource	Name of the Data Source, which you must create in Oracle WebLogic Server and target to the Managed Server, using an OCSSEARCH schema created with Repository Creation Utility (RCU).

Next Steps After Configuring the Domain

After you configure a product domain, there are additional tasks that you may want to perform.

Performing Basic Administrative Tasks

After you configure your new domain, there are administration tasks that Oracle recommends you perform on the domain.

Performing Additional Domain Configuration Tasks

Review additional configuration tasks you will likely want to perform on a new domain.

Preparing Your Environment for High Availability

Scaling out for high availability requires additional steps.

Configuring WebCenter Content User Interface on Additional Nodes

If you install WebCenter Content User Interface on one node, its configuration is complete. However, if you scale out WebCenter Content User Interface to a second node (in a high availability or enterprise deployment topology, for example), you must complete additional configuration steps.

Setting the WebCenter Content User Interface Server Socket Port

If you are scaling out WebCenter Content User Interface you must change the server socket port.

Configuring WebCenter Content User Interface Settings

You set WebCenter Content User Interface connection and configuration settings with WLST or Fusion Middleware Control.

5.1 Performing Basic Administrative Tasks

After you configure your new domain, there are administration tasks that Oracle recommends you perform on the domain.

The following table lists common administration tasks to perform on your new domain.

Table 5-1 Basic Administration Tasks for a New Domain

Task	Description	More Information
Getting familiar with Fusion Middleware administration tools	Get familiar with various tools that you can use to manage your environment.	See Overview of Oracle Fusion Middleware Administration Tools in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .

Table 5-1 (Cont.) Basic Administration Tasks for a New Domain

Task	Description	More Information
Starting and stopping products and servers	Learn how to start and stop Oracle Fusion Middleware, including the Administration Server, Managed Servers, and components.	See Starting and Stopping Oracle Fusion Middleware in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .
Configuring Secure Sockets Layer (SSL)	Learn how to set up secure communications between Oracle Fusion Middleware components using SSL.	See Configuring SSL in Oracle Fusion Middleware in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .
Monitoring Oracle Fusion Middleware	Learn how to keep track of the status of Oracle Fusion Middleware components.	See Monitoring Oracle Fusion Middleware in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .
Understanding Backup and Recovery Procedures	Learn recommended backup and recovery procedures for Oracle Fusion Middleware.	See Introducing Backup and Recovery in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .

5.2 Performing Additional Domain Configuration Tasks

Review additional configuration tasks you will likely want to perform on a new domain.

Table 5-2 Additional Domain Configuration Tasks

Task	Description	More Information
Deploying Applications	Learn how to deploy your applications to Oracle Fusion Middleware.	See Deploying Applications in <i>Oracle Fusion Middleware Administering Oracle Fusion Middleware</i> .
Adding a Web Tier front-end to your domain	Oracle Web Tier hosts Web pages (static and dynamic), provides security and high performance along with built-in clustering, load balancing, and failover features. In particular, the Web Tier contains Oracle HTTP Server.	To install and configure Oracle HTTP Server in the WebLogic Server domain, see Configuring Oracle HTTP Server in a WebLogic Server Domain in <i>Oracle Fusion Middleware Installing and Configuring Oracle HTTP Server</i> . See also Installing Multiple Products in the Same Domain for important information.

Table 5-2 (Cont.) Additional Domain Configuration Tasks

Task	Description	More Information
Tuning and configuring Coherence for your topology	The standard installation topology includes a Coherence cluster that contains storage-enabled Managed Coherence Servers. This configuration is a good starting point for using Coherence, but depending upon your specific requirements, consider tuning and reconfiguring Coherence to improve performance in a production environment.	<p>For more about Coherence clusters, see <i>Configuring and Managing Coherence Clusters in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server</i>.</p> <p>For information on tuning Coherence, see <i>Performance Tuning in Oracle Fusion Middleware Administering Oracle Coherence</i>.</p> <p>For information on storing HTTP session data in Coherence, see <i>Using Coherence*Web with WebLogic Server in Oracle Fusion Middleware Administering HTTP Session Management with Oracle Coherence*Web</i>.</p> <p>For more about creating and deploying Coherence applications, see <i>Getting Started in Oracle Fusion Middleware Developing Oracle Coherence Applications for Oracle WebLogic Server</i>.</p>

5.3 Preparing Your Environment for High Availability

Scaling out for high availability requires additional steps.

[Table 5-3](#) provides a list of tasks to perform if you want to scale out your standard installation environment for high availability.

Table 5-3 Tasks Required to Prepare Your Environment for High Availability

Task	Description	More Information
Scaling out to multiple host computers	To enable high availability, it is important to provide failover capabilities to another host computer. That way, if one computer goes down, your environment can continue to serve the consumers of your deployed applications.	See <i>Scaling Out a Topology (Machine Scale Out) in the Oracle Fusion Middleware High Availability Guide</i> .
Configuring high availability for your Web Tier components.	If you have added a Web tier front-end, then you must configure the Web Tier for high availability, as well as the WebLogic Server software.	See <i>Configuring High Availability for Web Tier Components in Oracle Fusion Middleware High Availability Guide</i> .
Setting up a front-end load balancer	A load balancer can be used to distribute requests across servers more evenly.	See <i>Server Load Balancing in a High Availability Environment and Configuring Load Balancer Virtual Server Names and Ports in Oracle Fusion Middleware High Availability Guide</i> .

Table 5-3 (Cont.) Tasks Required to Prepare Your Environment for High Availability

Task	Description	More Information
Configuring Node Manager	Node Manager enables you to start, shut down, and restart the Administration Server and Managed Server instances from a remote location. This document assumes you have configured a per-domain Node Manager. Review the Node Manager documentation, for information on advanced Node Manager configuration options and features.	See Advanced Node Manager Configuration in <i>Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server</i> .

5.4 Configuring WebCenter Content User Interface on Additional Nodes

If you install WebCenter Content User Interface on one node, its configuration is complete. However, if you scale out WebCenter Content User Interface to a second node (in a high availability or enterprise deployment topology, for example), you must complete additional configuration steps.

To run WebCenter Content User Interface on additional nodes, you must:

- Enable WebCenter Content User Interface components.
- Set the server socket port to 4444.

To enable WebCenter Content User Interface components:

1. Log in to WebCenter Content as a WebCenter Content administrator.
2. From the Administration tray or menu, choose **Admin Server**, then **Component Manager**.
3. On the Component Manager page, select all three components under WebCenter Content UI Components:
 - **AutoSuggestConfig**
 - **DynamicConverter**
 - **FrameworkFolders**
4. Click **Update** then click **OK** to confirm that you want to enable the components.
5. Restart WebCenter Content. See Starting and Stopping Managed Servers in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

Continue to the topic [Setting the WebCenter Content User Interface Server Socket Port](#).

5.5 Setting the WebCenter Content User Interface Server Socket Port

If you are scaling out WebCenter Content User Interface you must change the server socket port.

To change the server socket port:

1. Open `WCC_DOMAIN/ucm/cs/config/config.cfg`

2. Set `IntradocServerPort` to 4444.

```
IntradocServerPort=4444
```

5.6 Configuring WebCenter Content User Interface Settings

You set WebCenter Content User Interface connection and configuration settings with WLST or Fusion Middleware Control.

Setting Connection Attributes with WLST

You can use `displayRIDCConnection` and `updateRIDCConnection` WLST commands to read and update connection properties.

Setting Connection Attributes with Fusion Middleware Control

Instead of using WLST, you can set connection attributes for WebCenter Content User Interface Managed Server with the Fusion Middleware Control System MBean Browser.

Setting Configuration Attributes with WLST

You can use WLST commands `displayWccAdfConfig` and `updateWccAdfConfig` to read and update WebCenter Content User Interface configuration parameters.

Setting Configuration Attributes with Fusion Middleware Control

Instead of using WLST, you can set configuration (**WccAdfConfiguration**) attributes for WebCenter Content User Interface Managed Server with the Fusion Middleware Control System MBean Browser.

5.6.1 Setting Connection Attributes with WLST

You can use `displayRIDCConnection` and `updateRIDCConnection` WLST commands to read and update connection properties.

For example, to update the RIDC connection to the WebCenter Content User Interface Managed Server:

1. Run WLST from `ORACLE_HOME/oracle_common/common/bin/wlst.sh`.
2. Enter `wls:/offline> connect()` and enter your username and password at the prompt.
3. Enter the Managed Server URL, for example, `t3://localhost:16225`
4. Update the RIDC connection to the WebCenter Content User Interface Managed Server. For example:

```
wls:/mydomain/serverConfig>updateRIDCConnection('Oracle
WebCenter Content - Web
UI','WccAdfServerConnection',connUrl='idc://
contentserver_host:intradoc_port',credUsername='ucm_admin_use
r')
```

5. Restart the Managed Server.

5.6.2 Setting Connection Attributes with Fusion Middleware Control

Instead of using WLST, you can set connection attributes for WebCenter Content User Interface Managed Server with the Fusion Middleware Control System MBean Browser.

To set connection attributes through Fusion Middleware Control:

1. Log in to Fusion Middleware Control for the WebCenter Content User Interface Managed Server.
2. In the navigation tree on the left, expand **WebLogic Domain**, then the WebCenter Content User Interface domain folder, then the cluster name, and then click Managed Server name.
3. From the WebLogic Domain drop-down menu at the top of the Managed Server page, choose System MBean Browser.
4. In the System MBean Browser navigation tree, navigate to the **WccAdfServerConnection** MBean. To do this, expand **Application Defined MBeans** —> **oracle.adf.share.connections** —> **Server: WCCADF_server1** —> **Application: Oracle WebCenter Content – Web UI**. Expand the Mbean **ADFConnections** then the folder **WccConnection**.
 - Instead of opening up the folder, you can enter the connection name **WccAdfServerConnection** in the MBean filtered search.
5. Click the MBean **WccAdfServerConnection**.
6. In the **Attributes** tab, select **PropConnectionURL**. Enter a URL to set up the RIDC connection. Click **Apply** (top right)

If you leave the **PropConnectionSocketTimeout** attribute blank, the default (60 seconds) becomes the RIDC Connection Socket Timeout value. This value can create problems if you download large files that are being converted to TIFF or PDF documents with annotations burned in. You can set the attribute to a larger value if you have large files.

7. Go back to the **ADFConnections** page (**Application Defined MBeansoracle.adf.share.connectionsServer: WCCADF_server1Application: Oracle WebCenter Content – Web UIADFConnections**).
8. On the **Operations** tab, click **save**. Then click **Invoke**.
9. Restart the WebCenter Content User Interface Managed Server.

5.6.3 Setting Configuration Attributes with WLST

You can use WLST commands `displayWccAdfConfig` and `updateWccAdfConfig` to read and update WebCenter Content User Interface configuration parameters.

For example, to use `updateWccAdfConfig` to update the application's URL:

1. Run WLST from `ORACLE_HOME/oracle_common/common/bin/wlst.sh`.
2. Enter `wls:/offline> connect()` and enter your username and password at the prompt.

3. Enter the Managed Server URL, for example, `t3://localhost:16225`
4. Update the WebCenter Content User Interface Managed Server. For example:

```
wls:/mydomain/serverConfig>updateWccAdfConfig('Oracle
WebCenter Content - Web UI',applicationUrl='idc://
contentserver_host:intradoc_port')
```
5. Restart the WebCenter Content User Interface Managed Server.

5.6.4 Setting Configuration Attributes with Fusion Middleware Control

Instead of using WLST, you can set configuration (**WccAdfConfiguration**) attributes for WebCenter Content User Interface Managed Server with the Fusion Middleware Control System MBean Browser.

For example, to set the WebCenter Content User Interface application URL:

1. Log in to Fusion Middleware Control for the WebCenter Content User Interface Managed Server.
2. In the navigation tree on the left, expand **WebLogic Domain**, then the WebCenter Content User Interface domain folder, then the cluster name, and then click Managed Server name.
3. From the WebLogic Domain drop-down menu at the top of the Managed Server page, choose System MBean Browser.
4. In the System MBean Browser navigation tree, navigate to the **WccAdfConfiguration** MBean. To do this, expand **Application Defined MBeans** —> **oracle.adf.share.config** —> **Server: WCCADF_server1** —> **Application: Oracle WebCenter Content – Web UI**. Expand the folder **ADFConfig**, the Mbean **ADFConfig**, then the folder **ADFConfig**.
 - Instead of opening up a series of folders to reach the MBean, you can enter the connection name **WccAdfConfiguration** in the MBean filtered search.
5. Click the MBean **WccAdfConfiguration**.
6. In the **Attributes** tab, select **ApplicationUrl**. In the **Value** field, enter the base application URL. For example: `https://wcc.example.com:16225`. Click **Apply** (top right)
7. Go back to the **ADFConfig** MBean page (**Application Defined MBeans** —> **oracle.adf.share.config** —> **Server: WCCADF_server1** —> **Application: Oracle WebCenter Content – Web UI** —> **ADFConfig**).
8. On the **Operations** tab, click **save** then **Invoke**.
9. Restart the WebCenter Content User Interface Managed Server.

Deinstalling or Reinstalling Oracle WebCenter Content

Follow the instructions in this section to deinstall or reinstall Oracle WebCenter Content.

Oracle recommends that you always use the instructions in this section to remove the software. If you try to remove the software manually, you may encounter problems when you try to reinstall the software again at a later time. Following the procedures in this section ensures that the software is properly removed.

About Product Deinstallation

The Oracle Fusion Middleware deinstaller removes the software from the Oracle home directory.

Stopping Oracle Fusion Middleware

Before running the deinstaller, Oracle recommends that you stop all servers and processes associated with the Oracle home you are going to remove.

Removing Your Database Schemas

Before you remove the Oracle home, Oracle recommends that you run the Repository Creation Utility (RCU) to remove database schemas associated with this domain.

Deinstalling the Software

Follow the instructions in this section to start the product deinstaller and remove the software.

Removing the Oracle Home Directory Manually

After you deinstall the software, you must manually remove your Oracle home directory and any existing subdirectories that the deinstaller did not remove.

Removing the Program Shortcuts on Windows Operating Systems

On Windows operating systems, you must also manually remove the program shortcuts; the deinstaller does not remove them for you.

Removing the Domain and Application Data

After you deinstall the software, you must remove the domain and application data.

Reinstalling the Software

You can reinstall your software into the same Oracle home as a previous installation only if you deinstalled the software by following the instructions in this section, including manually removing the Oracle home directory.

6.1 About Product Deinstallation

The Oracle Fusion Middleware deinstaller removes the software from the Oracle home directory.

The following table summarizes the deinstallation tasks.

Table 6-1 Roadmap for Product Deinstallation

Task	Description	Documentation
Stop Oracle Fusion Middleware	All servers and processes in your domain should be stopped before running the deinstaller.	See Stopping Oracle Fusion Middleware .
Remove your database schemas	Run Repository Creation Utility to remove your database schemas.	See Removing Your Database Schemas .
Remove the software	Run the product deinstaller to remove Oracle Fusion Middleware Infrastructure. Note that if your Oracle home contains multiple products, you must run the deinstaller multiple times, once for each product.	See Deinstalling the Software .
Remove the Oracle home directory	The deinstaller does not remove all files and folders from the Oracle home directory. After the deinstaller is finished, you must manually remove the Oracle home to complete your product removal.	See Removing the Oracle Home Directory Manually .
Remove your domain and application data	The deinstaller does not remove data contained in your Domain home or Application home directories, even if they are located inside the Oracle home. You must remove these directories manually.	See Removing the Domain and Application Data .

6.2 Stopping Oracle Fusion Middleware

Before running the deinstaller, Oracle recommends that you stop all servers and processes associated with the Oracle home you are going to remove.

For more information, see *Stopping an Oracle Fusion Middleware Environment* in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

6.3 Removing Your Database Schemas

Before you remove the Oracle home, Oracle recommends that you run the Repository Creation Utility (RCU) to remove database schemas associated with this domain.

Each domain has its own set of schemas, uniquely identified by a custom prefix. For more information about custom prefixes, see *About Custom Prefixes* in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*. This set of schemas cannot be shared with any other domain. For more information, see *Planning Your Schema Creation* in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

If there are multiple sets of schemas on your database, be sure to identify the schema prefix associated with the domain that you are removing.

For schema removal steps, see *Dropping Schemas in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

6.4 Deinstalling the Software

Follow the instructions in this section to start the product deinstaller and remove the software.

If you want to perform a silent (command-line) deinstallation, see *Running the Oracle Universal Installer for Silent Deinstallation in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer*.

[Starting the Deinstallation Program](#)

[Selecting the Product to Deinstall](#)

[Navigating the Deinstallation Screens](#)

6.4.1 Starting the Deinstallation Program

To start the deinstaller:

- **On UNIX**

On the command line, enter the following commands:

```
cd ORACLE_HOME/oui/bin
./deinstall.sh
```

- **On Windows**

Do one of the following:

- Use a file manager window to navigate to the `ORACLE_HOME\oui\bin` directory, and double-click on `deinstall.cmd`.

- Open a command prompt and enter the following commands:

```
cd %ORACLE_HOME%\oui\bin
deinstall.cmd
```

- From the **Start** menu, select **All Programs**, then **Oracle**, then **OracleHome**, and then **Uninstall Oracle Software**.

6.4.2 Selecting the Product to Deinstall

Because multiple products exist in the Oracle home, ensure that you are deinstalling the correct product.

After you run the deinstaller, the Distribution to Uninstall screen opens. From the drop-down list, select **WebCenter Content 12.2.1.2.0** and click **Uninstall**. The deinstallation program shows the screens listed in [Navigating the Deinstallation Screens](#).

Note:

You can deinstall Oracle Fusion Middleware Infrastructure after you deinstall Oracle WebCenter Content software by running the deinstallation wizard again. Before doing so, make sure that there are no other products using the Infrastructure; those products will no longer function once the Infrastructure is removed. You will not encounter the Distribution to Uninstall screen if no other software depends on Oracle Fusion Middleware Infrastructure. For deinstallation instructions, see *Deinstalling Oracle Fusion Middleware Infrastructure* in *Oracle Fusion Middleware Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

6.4.3 Navigating the Deinstallation Screens

The deinstaller shows a series of screens to confirm the deinstallation of the software.

If you need help on screen listed in [Table 6-2](#), click **Help** on the screen.

Table 6-2 Deinstallation Screens and Descriptions

Screen	Description
Welcome	Introduces you to the product deinstaller.
Deinstallation Summary	Shows the Oracle home directory and its contents that are deinstalled. Verify that this is the correct directory. If you want to save these options to a response file, click Save Response File and enter the response file location and name. You can use the response file later during a silent deinstallation. For more information on silent or command-line deinstallation, see <i>Running the Oracle Universal Installer for Silent Deinstallation</i> in <i>Installing Software with the Oracle Universal Installer</i> . Click Deinstall , to begin removing the software.
Deinstallation Progress	Shows the deinstallation progress.
Deinstallation Complete	Appears when the deinstallation is complete. Review the information on this screen, then click Finish to close the deinstaller.

6.5 Removing the Oracle Home Directory Manually

After you deinstall the software, you must manually remove your Oracle home directory and any existing subdirectories that the deinstaller did not remove.

For example, if your Oracle home directory is `/home/Oracle/product/ORACLE_HOME` on a UNIX operating system, enter the following commands:

```
cd /home/Oracle/product
rm -rf ORACLE_HOME
```

On a Windows operating system, if your Oracle home directory is `C:\Oracle\Product\ORACLE_HOME`, use a file manager window and navigate to the `C:\Oracle\Product` directory. Right-click on the `ORACLE_HOME` folder and select **Delete**.

6.6 Removing the Program Shortcuts on Windows Operating Systems

On Windows operating systems, you must also manually remove the program shortcuts; the deinstaller does not remove them for you.

To remove the program shortcuts on Windows:

1. Go to the `C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Oracle\ORACLE_HOME\Product` directory.
2. If you only have one product installed in your Oracle home, delete the `ORACLE_HOME` directory. If you have multiple products installed in your Oracle home, delete all products before you delete the `ORACLE_HOME` directory.

6.7 Removing the Domain and Application Data

After you deinstall the software, you must remove the domain and application data.

To remove the domain and application data:

1. Manually remove your Domain home directory. For example:

On a UNIX operating system, if your Domain home directory is `/home/Oracle/config/domains/wcc_domain`, enter the following command:

```
cd /home/Oracle/config/domains
rm -rf wcc_domain
```

On a Windows operating system, if your Domain home directory is `C:\Oracle\Config\domains\wcc_domain`, use a file manager window and navigate to the `C:\Oracle\Config\domains` directory. Right-click on the `wcc_domain` folder and select **Delete**.

2. Manually remove your Application home directory. For example:

On a UNIX operating system, if your Application home directory is `/home/Oracle/config/applications/wcc_domain`, enter the following commands:

```
cd /home/Oracle/config/applications
rm -rf wcc_domain
```

On a Windows operating system, if your Application home directory is `C:\Oracle\Config\applications\wcc_domain`, use a file manager window and navigate to the `C:\Oracle\Config\applications` directory. Right-click on the `wcc_domain` folder and select **Delete**.

3. Back up the `domain_registry.xml` file in your Oracle home, then edit the file and remove the line associated with the domain that you are removing. For example, to remove the `wcc_domain`, find the following line and remove it:

```
<domain location="/home/Oracle/config/domains/wcc_domain"/>
```

Save and exit the file when you are finished.

6.8 Reinstalling the Software

You can reinstall your software into the same Oracle home as a previous installation only if you deinstalled the software by following the instructions in this section, including manually removing the Oracle home directory.

When you reinstall, you can then specify the same Oracle home as your previous installation.

Consider the following cases where the Oracle home is not empty:

- Installing in an existing Oracle home that contains the same feature sets.

The installer warns you that the Oracle home that you specified during installation already contains the same software you are trying to install.

- Installing in an existing, non-empty Oracle home.

For example, suppose you chose to create your Domain home or Application home somewhere inside your existing Oracle home. This data is not removed during the deinstallation process, so if you try to reinstall into the same Oracle home, the installer does not allow it. Your options are:

1. Deinstall your software from the Oracle home (as this section describes) and then remove the Oracle home directory. After you deinstall the software and remove the Oracle home directory, you can reinstall and reuse the same Oracle home location. Any domain or application data that was in the Oracle home must be re-created.
2. Select a different Oracle home directory.

Configuring the Content Server for Desktop

You need to make sure the CoreWebdav system component is enabled, before the client can use the WebCenter Content Desktop with the Content Server.

Additionally, you must enable the following components:

- DesktopIntegrationSuite
- DesktopTag
- FolderStructureArchive
- FrameworkFolders

You can also enable the EmailMetadata, which maps the e-mail message fields to the e-mail metadata fields.

Note: When you enable the FrameworkFolders component (Folders feature), verify that the Folders_g component (Contribution Folders feature) is disabled; CoreWebdav will not work correctly with both enabled.

To configure the Content Server for Desktop:

1. Login to WebCenter Content as an administrator.
2. In the Content Server Administration menu, select **Admin Server** then select **Component Manager**.
3. On the Component Manager page, select **Folders** to display the Folders category of components.
4. Select the following components:
 - FrameworkFolders
 - DesktopIntegrationSuite
 - DesktopTag
 - (Optional) EmailMetadata
5. Click **Update** then click **OK** to confirm your selections.
6. In the Component Manager page, click **advanced component manager**.
7. In the Disabled Components box on the Advanced Component Manager page, select FolderStructureArchive, and click **Enable**.

8. If Folders_g is in the Enabled Components box, select this component and click the **Disable**.
9. Make sure that the CoreWebdav component is enabled:
 - Under Category Filters on the Advanced Component Manager page, select **Show System Components**.
 - If CoreWebdav is not in the Enabled Components box, select **CoreWebdav** in the Disabled Components box and click **Enable**.
10. Restart the Content Server, as Starting and Stopping Managed Servers describes.

See the remaining topics in this section for more on configuration tasks.

[About Installing and Configuring the Desktop on a Client Workstation](#)

WebCenter Content for desktop has a set of embedded applications that help users integrate desktop experiences with Content Server, Oracle Content Database, or other WebDAV-based content repositories.

[Opening Files from Microsoft Office 2010 Over a Non-SSL Connection](#)

By default, Microsoft Office 2010 will not open files over WebDAV using basic authentication over a non-SSL connection.

[Configuring the Records Management in Content Server](#)

If you are licensed to configure the Records Management in a WebCenter Content Managed Server, you can configure either standalone Records Management or the Oracle URM Adapter in Content Server after the WebCenter Content Records Managed Server is configured.

[About Configuring Oracle iPlanet Web Server as a Web Tier and Configuring Shared Folders](#)

You can configure the Oracle iPlanet Web Server as a web tier for WebCenter Content. If you are using a cluster of WebCenter Content Managed Servers, you need to configure a shared file system for the WebCenter Content cluster.

A.1 About Installing and Configuring the Desktop on a Client Workstation

WebCenter Content for desktop has a set of embedded applications that help users integrate desktop experiences with Content Server, Oracle Content Database, or other WebDAV-based content repositories.

These applications provide convenient access to content repositories directly from Microsoft Windows Explorer, Microsoft Office applications, and supported e-mail clients (Microsoft Outlook and Lotus Notes). To install Desktop on a client workstation, see Setting Up the Desktop Client Software on Your Computer.

A.2 Opening Files from Microsoft Office 2010 Over a Non-SSL Connection

By default, Microsoft Office 2010 will not open files over WebDAV using basic authentication over a non-SSL connection.

You can create the following registry entry and set its value to 2:

```
HKEY_CURRENT_USER\Software\Microsoft\Office\14.0\Common\Internet  
\BasicAuthLevel
```

For more information, see the Microsoft Knowledge Base article 2123563 at: <http://support.microsoft.com/kb/2123563>.

A.3 Configuring the Records Management in Content Server

If you are licensed to configure the Records Management in a WebCenter Content Managed Server, you can configure either standalone Records Management or the Oracle URM Adapter in Content Server after the WebCenter Content Records Managed Server is configured.

- The ContentFolios component is required for access to the Records Management web interface. This component is enabled automatically when you configure Records Management in the Content Server.
- Do not disable the ContentFolios component.

If you don't want to use Records Management in the Content Server, you can remove the configuration user interface by disabling the RMFeatureConfig component. Before you disable the Records Management and restart the Content Server, you need to delete the Report template files that Records Management installs. You cannot delete them after Records Management is disabled.

To configure Records Management in the Content Server:

1. From the **Administration** menu, choose **Configure Records Settings** to go to the Records Management Setup checklist, then click **Configure Installation**.
2. On the Enabled Features page, select a Records Management option and click **Submit**.
 - None
 - Standalone
 - Adapter
3. Restart the WebCenter Content Managed Server. See Starting and Stopping Managed Servers.

After you restart the WebCenter Content, Records Management Setup checklist appears.

4. If you selected **Adapter**, click **Register Source** on the Enabled Features page then enter values for the fields on the Register Source page:

Option	Description
Provider Name	<p>Outgoing provider used to connect to the Records Managed Server. You can choose from the list of current outgoing providers, or you can click Add and create one. The provider dialog box shows an abbreviated list of provider fields.</p> <p>You can also add providers from the regular Providers page. To view information about an existing provider, click Info in the Action column.</p>

Option	Description
Source Name	Name of the external source to be added to the Records Managed Server. The source name is required and cannot contain spaces.
Source Table Name	Prefix to use for creating database tables. The default value is the source name.
Source Display Name	Caption to use for showing the source name. Default value is the source name.

5. Click **Register**.

Before the source is registered, the following tests are run:

- Validate the provider and test the connection to the Records Managed Server.
- Validate the specified source values

Compare the retention schedules of the adapter and the Records Managed Server to determine if any items in the adapter are missing in the Records server. Before you can register the source, you must resolve any differences on the Import Retention Schedule page.

The retention schedule needs to be synchronized between the adapter and server. By default, all of the items that need to be resolved will be imported into the Records server. You will also have the option of deleting any of the items instead of importing them into the server. Before any items are imported or deleted, backups of retention schedules are made on both the adapter and the Records server, and the backups are checked in to Content Server.

6. After the source is successfully registered, click **OK** on the confirmation page.

After the source is registered, the Retention Schedule and Upload Content task will run in the background.

7. Configure the adapter in the Configuration Wizard:

Table A-1 Adapter Options

Option	Description
Configure Custom Fields	<p>Page where you enter custom fields on the external source. When you add or edit custom fields, you map them to existing document metadata fields defined in Content Server. You can use the same name for each field as defined in Content Serve, or you can rename the field. When the content is uploaded to the Records server as external content items, these fields map to their external field names.</p> <p>You can configure the following custom fields:</p> <ul style="list-style-type: none"> • Add or edit an external custom field • Configure the disposition actions or scheduled events • View the external source information

Table A-1 (Cont.) Adapter Options

Option	Description
Configure Scheduled Times	Page where you enter when the scheduled tasks run. You can specify the interval at which the tasks are run (in hours, days, or weeks) and the time of day.

8. From the **Records** menu, select **Configure** then **Enabled Features**.

On the Enabled Features page, you can change the selection of features and dispositions. For the adapter, the features you select cannot be more than the features selected on the Records server..

Note: If you have changed any features or dispositions, restart the WebCenter Content.

A.4 About Configuring Oracle iPlanet Web Server as a Web Tier and Configuring Shared Folders

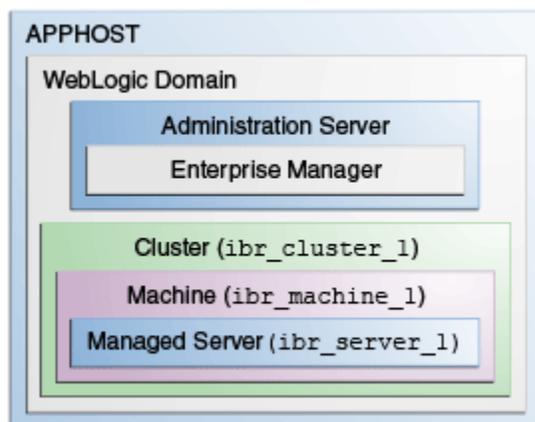

You can configure the Oracle iPlanet Web Server as a web tier for WebCenter Content. If you are using a cluster of WebCenter Content Managed Servers, you need to configure a shared file system for the WebCenter Content cluster.

Inbound Refinery Standalone Topology

The most common installation topology for Inbound Refinery is a standalone instance of one Inbound Refinery Managed Server on its own host. There are no other components in the domain.

The following figure shows a typical installation topology for Inbound Refinery. This topology consists of an Administration Server and one Oracle WebLogic Server domain on a single host. The cluster has one Inbound Refinery Managed Server.

Note: Inbound Refinery in a standalone topology does not need a database connection or database installation. However, you must still run RCU and select certain options.

[Roadmap for Installing and Configuring the Inbound Refinery Standalone Topology](#)

B.1 Roadmap for Installing and Configuring the Inbound Refinery Standalone Topology

This roadmap has the steps required to install and configure a standalone instance of Inbound Refinery .

Complete each roadmap task in the order that the following table describes.

Table B-1 Standard Installation Roadmap

Task	Description	More Information
Verify your system environment	Before beginning the installation, verify that the minimum system and network requirements are met.	See Roadmap for Verifying Your System Environment .
Check for any mandatory patches that will be required before or after the installation	Review the Oracle Fusion Middleware Infrastructure release notes to see if there are any mandatory patches required for Inbound Refinery.	See <i>Install and Configure in Release Notes for Oracle Fusion Middleware Infrastructure</i> .
Obtain the appropriate distributions	Install Oracle Fusion Middleware Infrastructure to create the Oracle Home for Oracle WebCenter Content	See About Product Distributions .
Determine your installation directories	Verify that the installer can access or create the installer directories that it must access or create. Also, verify that the directories exist on systems that meet the minimum requirements.	See <i>What are the Key Oracle Fusion Middleware Directories?</i> in <i>Oracle Fusion Middleware Understanding Oracle Fusion Middleware</i> .
Install prerequisite software	Install Oracle Fusion Middleware Infrastructure to create the Oracle home directory for Inbound Refinery.	For Oracle Fusion Middleware Infrastructure, see <i>Installing the Infrastructure Software</i> . You only need to perform the installation for Infrastructure. You do not need to configure a domain for Infrastructure.
Install the software	Run the Oracle Universal Installer to install Inbound Refinery. Installing the software transfers the software to your system and creates the Oracle home directory.	See Installing the Oracle WebCenter Content Software . Return to this roadmap for instructions on RCU.
Create the schemas	Run the Repository Creation Utility to create the schemas required for configuration. Note: Configuration Requires requires that you run RCU. However, the Inbound Refinery standalone installation does not require a database connection.	<ol style="list-style-type: none"> 1. Navigate to the <code>ORACLE_HOME/oracle_common/bin</code> directory on your system. 2. Run RCU. On UNIX systems, enter <code>./rcu</code>. On Microsoft Windows, run <code>rcu.bat</code> 3. Select System Load and Product Load. 4. Click Next. 5. Enter database connection details. 6. Select Oracle Platform Security Services, which selects other required schemas such as Audit Services.

Table B-1 (Cont.) Standard Installation Roadmap

Task	Description	More Information
Create a WebLogic domain	Use the Configuration Wizard to create and configure the WebLogic domain. Note that the domain will have a cluster that has only <i>one</i> Managed Server.	See Configuring the Domain if you are creating the topology for Oracle WebCenter Content.

Installing Libraries on UNIX Platforms

Before you start a WebCenter Content, Inbound Refinery, or Imaging Managed Server, the libraries required for your platform need to be available on your system.

Many of the required libraries are normally installed on the machine, including the C, math, X11, dynamic loader, and pthreads libraries, among others.

Solaris SPARC 32-bit or 64-bit

```
/usr/platform/SUNW,Ultra-60/lib/libc_psr.so.1  
libICE.so.6  
libSM.so.6  
libX11.so.4  
libXext.so.0  
libXm.so.4  
libXt.so.4  
libc.so.1  
libdl.so.1  
libgen.so.1  
libm.so.1  
libmp.so.2  
libnsl.so.1  
libpthread.so.1  
libsocket.so.1  
libthread.so.1
```

HPUX ia64

```
libCsup.so.1  
libICE.so.1  
libSM.so.1  
libX11.so.1  
libXext.so.1  
libXm.so.1  
libXp.so.1  
libXt.so.1  
libc.so.1  
libdl.so.1  
libm.so.1  
libpthread.so.1  
libstd_v2.so.1  
libuca.so.1  
libunwind.so.1
```

AIX 32-bit

```
/usr/lib/libC.a(ansi_32.o)  
/usr/lib/libC.a(shr.o)  
/usr/lib/libC.a(shr2.o)  
/usr/lib/libC.a(shr3.o)  
/usr/lib/libICE.a(shr.o)
```

```
/usr/lib/libIM.a(shr.o)
/usr/lib/libSM.a(shr.o)
/usr/lib/libX11.a(shr4.o)
/usr/lib/libXext.a(shr.o)
/usr/lib/libXi.a(shr.o)
/usr/lib/libXm.a(shr_32.o)
/usr/lib/libXt.a(shr4.o)
/usr/lib/libc.a(shr.o)
/usr/lib/libcrypt.a(shr.o)
/usr/lib/libgaimisc.a(shr.o)
/usr/lib/libgair4.a(shr.o)
/usr/lib/libi18n.a(shr.o)
/usr/lib/libiconv.a(shr4.o)
/usr/lib/libodm.a(shr.o)
/usr/lib/libpthreads.a(shr.o)
/usr/lib/libpthreads.a(shr_comm.o)
/usr/lib/libpthreads.a(shr_xpg5.o)
/usr/lib/libpthreads_compat.a(shr.o)

/usr/lib/libstream.2
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libICE.2
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libSM.2
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libX11.3
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libXext.3
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libXp.2
/view/x_r6hp700_1111/vobs/swdev/pvt/r6hp700_1111/X11R6/lib/libXt.3
```

SUSE Linux

For an SUSE Linux operating system, the file `/usr/lib/libstdc++.so.5` is required. You can find this file in the `compat-libstdc++` or `libstdc++33` package.

Linux variants

For Linux variants, the file `/lib/libz.so.1` is required.

Setting Library Paths in Environment Variables on UNIX Platforms

Before Inbound Refinery or the WebCenter Content Dynamic Converter uses Outside In Technology for document and image conversions, the following environment variables must be set for the WebCenter Content Managed Server on the specified UNIX platforms:

- Environment variables for library paths for Imaging
 - Add the following line to the Inbound Refinery `intradoc.cfg` file at `DomainHome/ucm/ibr/bin`
`ContentAccessExtraLibDir=/usr/local/packages/gcc-3.4.2/lib`

Restart inbound Refinery.
 - AIX:
`LIBPATH=DomainHome/oracle/imaging/imaging-server`
 - HP-UX Itanium:
`LD_LIBRARY_PATH=DomainHome/oracle/imaging/imaging-server:$LD_LIBRARY_PATH`
 -
- DISPLAY environment variable

On a UNIX operating system running XWindows, when redirecting the display to a system with suitable graphic capabilities, export DISPLAY to a valid X Server before starting the Imaging or Inbound Refinery Managed Server or the WebCenter Content Dynamic Converter.

Additional Configuration Steps

See the following topics for additional Oracle WebCenter Content configuration steps.

[Converting Vector Graphics and Spreadsheet Text in UNIX](#)

Dynamic Converter requires access to a running X-Server in UNIX in order to convert vector graphics and to properly measure text that spans multiple columns in spreadsheets.

[Setting up Fonts on a UNIX System](#)

On a UNIX operating system, you need to make sure TrueType fonts are set up for Imaging, Inbound Refinery, and WebCenter Content Dynamic Converter. If you are using a language other than English, you also need to set up fonts for national language support.

[Reassociating the Identity Store with an External LDAP Authentication Provider](#)

In a production system, Oracle WebCenter Content applications need to use an external Lightweight Directory Application Protocol (LDAP) authentication provider rather than the Oracle WebLogic Server embedded LDAP server, which is part of the default configuration. You need to reassociate the identity store for your application with one of the following external LDAP authentication providers before you complete the configuration of a Managed Server, before you connect a Managed Server to a repository, and before the first user logs in to the application:

[Configuring OracleTextSearch for Content Server](#)

If you have a license to use OracleTextSearch (with Oracle Database 11g), then you can configure it to use Oracle Text 11g as the primary full-text search engine for WebCenter Content. Oracle Text 11g offers state-of-the-art indexing capabilities and provides the underlying search capabilities for Oracle Secure Enterprise Search (Oracle SES). To search auxiliary metadata in Oracle WebCenter Content: Records with Oracle Text 11g, you must configure it to use OracleTextSearch as the search engine.

[About Completing the Oracle WebCenter Enterprise Capture Configuration](#)

The Capture System Administrator who performs the installation and initial configuration must have system administration permissions, including access to Oracle Enterprise Manager Fusion Middleware Control and Oracle WebLogic Server. Before anyone can use Oracle WebCenter Enterprise Capture, a system administrator must associate users from the LDAP credential store for the WebLogic Server domain with the Capture roles in Fusion Middleware Control.

[Completing the Initial Configuration of Oracle WebCenter Enterprise Capture](#)

To complete the initial configuration of Capture in a WebLogic Server domain, the Capture System Administrator needs to do these tasks:

[Creating a Hash Partition to Improve Database Performance](#)

Use a hash partition of the EBATCTITEMS table to minimize the database wait event enq: HW- contention, which prevents the database from scaling.

[Extracting and Running the Installation File for Desktop Client Software](#)

After Oracle WebCenter Content is installed, you can use the `desktop_content_setup.exe` command with the `/export` parameter to extract the Desktop installer files:

E.1 Converting Vector Graphics and Spreadsheet Text in UNIX

Dynamic Converter requires access to a running X-Server in UNIX in order to convert vector graphics and to properly measure text that spans multiple columns in spreadsheets.

Access to a running X-server is required only if the OIT internal rendering engine is not used because of either of the following reasons:

- The **Use X-Windows for Rasterization** option is checked on the Dynamic Converter configuration page.
- The OIT internal rendering engine isn't supported on the platform being used.

The internal OIT rendering engine is supported in Linux, Solaris Sparc, AIX, and HP-UX RISC.

E.2 Setting up Fonts on a UNIX System

On a UNIX operating system, you need to make sure TrueType fonts are set up for Imaging, Inbound Refinery, and WebCenter Content Dynamic Converter. If you are using a language other than English, you also need to set up fonts for national language support.

[Setting Up TrueType Fonts on a UNIX System](#)

For Imaging and WebCenter Content Dynamic Converter to work best on a UNIX operating system, you can set up TrueType fonts on the machine where Imaging, Inbound Refinery, or the Dynamic Converter is running. If these fonts are not available on your system, you need to install them. Inbound Refinery and Content Server default to the TrueType fonts in the JRE, at `JAVA_HOME/lib/fonts`.

[Installing Fonts for National Language Support on a UNIX System](#)

For languages other than English, the following installation steps need to be done on a UNIX operating system before you start a Managed Server:

E.2.1 Setting Up TrueType Fonts on a UNIX System

For Imaging and WebCenter Content Dynamic Converter to work best on a UNIX operating system, you can set up TrueType fonts on the machine where Imaging, Inbound Refinery, or the Dynamic Converter is running. If these fonts are not available on your system, you need to install them. Inbound Refinery and Content Server default to the TrueType fonts in the JRE, at `JAVA_HOME/lib/fonts`.

Some standard font locations on different UNIX platforms follow:

- Solaris SPARC: `/usr/openwin/lib/X11/fonts/TrueType`

- Solaris X64: `/usr/openwin/lib/X11/fonts/TrueType`
- AIX: `/usr/lpp/X11/lib/X11/fonts/TrueType`
- HP-UX Itanium: `/usr/lib/X11/fonts/TrueType`
- HP-UX PARISC64: `/usr/lib/X11/fonts/TrueType`
- Linux: `/usr/lib/X11/fonts/TrueType`

To set the path to the font directory in Inbound Refinery::

1. Log in to Inbound Refinery.
2. Select **Conversion Settings**, then **Third-Party Application Settings**, and then **General OutsideIn Filter Options**.
3. Click Options
4. Enter the path to the TrueType fonts in the Path to fonts field. For example, `/usr/share/x11/fonts/FTP`
5. Click Update.

E.2.2 Installing Fonts for National Language Support on a UNIX System

For languages other than English, the following installation steps need to be done on a UNIX operating system before you start a Managed Server:

- Copy `MW_HOME/oracle_common/jdk/jre/lib/fonts` to the `/jre/lib/fonts` directory in the Sun JDK installation directory for the Middleware home
- Copy `MW_HOME/oracle_common/jdk/jre/lib/fonts` to the `/jre/lib/fonts` directory in the Oracle JRockit JDK directory for the Middleware home.

E.3 Reassociating the Identity Store with an External LDAP Authentication Provider

In a production system, Oracle WebCenter Content applications need to use an external Lightweight Directory Application Protocol (LDAP) authentication provider rather than the Oracle WebLogic Server embedded LDAP server, which is part of the default configuration. You need to reassociate the identity store for your application with one of the following external LDAP authentication providers before you complete the configuration of a Managed Server, before you connect a Managed Server to a repository, and before the first user logs in to the application:

- Oracle Internet Directory
- Oracle Virtual Directory
- Oracle Unified Directory
- Third-party LDAP server

For an Imaging application, the user who logs in first to an Imaging Managed Server is provisioned with full security throughout the server. It is easier to reassociate the identity store for Imaging with an external LDAP authentication provider before the first user logs in, completes the configuration of the Imaging Managed Server, and connects it to the Oracle WebCenter Content repository.

For a production installation, Oracle Internet Directory (OID) or Oracle Database 11g is required for using Oracle WebCenter Enterprise Capture because Capture uses Oracle Platform Security Services (OPSS), which works only with Oracle Database for its schema.

For an AXF for BPM application, before you can access the AXF Solution Administration page, you need to set up an axfadmin group in the external LDAP authentication provider and assign the AXF users you want to the group.

For an Oracle IRM application, the Oracle IRM domain gets created the first time a user logs in to the Oracle IRM Management Console. An Oracle IRM domain is different from an Oracle WebLogic Server domain. The first user who logs in to the console is made the domain administrator for the Oracle IRM domain. Before you migrate user data for Oracle IRM, the users need to be in the target LDAP identity store. If you do not reassociate the identity store with an external LDAP authentication provider before the first user logs in to the Oracle IRM console, the general process for reassociating Oracle IRM users and migrating data follows:

1. Back up existing data with the `setIRMExportFolder` script.
2. Reassociate the identity store with an external LDAP directory.
3. Verify that all users and groups exist in target LDAP identity store
4. Migrate data with the `setIRMImportFolder` script.

[Reassociating the Identity Store with Oracle Internet Directory](#)

You can reassociate the identity store for an Oracle WebLogic Server domain with Oracle Internet Directory and migrate users from the embedded LDAP directory to Oracle Internet Directory. The following procedure describes how to reassociate the identity store with Oracle Internet Directory.

[Refreshing GUID Values in Imaging Security Tables](#)

If you have already configured your Imaging Managed Server and you change the LDAP provider, the global user IDs (GUIDs) in the Imaging security tables will be invalid. Imaging caches the GUIDs from an external LDAP provider in its local security tables and uses these IDs for authentication. You can refresh the GUID values in the Imaging security tables with WLST commands or with Fusion Middleware Control.

E.3.1 Reassociating the Identity Store with Oracle Internet Directory

You can reassociate the identity store for an Oracle WebLogic Server domain with Oracle Internet Directory and migrate users from the embedded LDAP directory to Oracle Internet Directory. The following procedure describes how to reassociate the identity store with Oracle Internet Directory.

You can use a similar procedure to reassociate the identity store with other LDAP authentication providers. Each provider has a specific authenticator type, and only that type should be configured.

LDAP Authentication Provider	Authentication Type
Microsoft AD	ActiveDirectoryAuthenticator
SunOne LDAP	IPlanetAuthenticator

Directory Server Enterprise Edition (DSEE)	IPlanetAuthenticator
Oracle Internet Directory	OracleInternetDirectoryAuthenticator
Oracle Virtual Directory	OracleVirtualDirectoryAuthenticator
Oracle Unified Directory	IPlanetAuthenticator
EDIRECTORY	NovellAuthenticator
OpenLDAP	OpenLDAPAuthenticator
EmbeddedLDAP	DefaultAuthenticator

To reassociate the identity store with Oracle Internet Directory:

1. Ensure that there is no user in Oracle Internet Directory with the same name as the administrator of the Oracle WebLogic Server domain, which is weblogic by default.
2. Set the embedded LDAP provider to SUFFICIENT.
3. For Oracle IRM, log in to the management console as a user from Oracle Internet Directory, to be the Oracle IRM domain administrator.

Do not log in to the management console with the user name of the Oracle WebLogic Server domain administrator. The Oracle recommendation is to not use the weblogic user account as the Oracle IRM administrator user account. If you use a different account for the Oracle IRM domain administrator, you can use the Oracle WebLogic Server domain administrator, weblogic by default, to start and stop Oracle WebLogic Server as well as to alter server settings. If you have a problem with Oracle Internet Directory, you will not need to fix it before you can do maintenance on Oracle WebLogic Server.

4. For an Oracle IRM Managed Server, if a user has already logged into the Oracle IRM Management Console, you need to run the WebLogic Scripting Tool (WLST) `setIRMExportFolder` command before identity store reassociation.

Use this command to set an export folder for exporting the user and group details referenced by Oracle IRM, which uses the export folder path to decide where to write out the user and group details. The Oracle IRM Managed Server must have write access to the folder path. The export folder must exist before you run the `setIRMExportFolder` command.

The following example sets `/user/irm-data` as the export folder:

```
cd WCC_ORACLE_HOME/common/bin
./wlst.sh
> connect('weblogic', 'password', 't3://adminServerHost:adminServerPort')
> setIRMExportFolder('/user/irm-data')
```

In the example, `adminServerHost` is the host name and `adminServerPort` is the port number for the Administration Server of the Oracle WebLogic Server domain.

Note: If SSL is enabled, before you use WLST to connect to the Administration Server, you must either append the following parameters to the JVM_ARGS section of the wlst.sh file or set them in the CONFIG_JVM_ARGS environment variable:

```
-Dweblogic.security.SSL.ignoreHostnameVerification=true  
-Dweblogic.security.TrustKeyStore=KeyStoreName
```

KeyStoreName is the name of the keystore in use (DemoTrust for the built-in demonstration certificate). The wlst.sh file is in the bin subdirectory of the common directory in the WebCenter Content Oracle home directory.

After the Oracle IRM Managed Server picks up this configuration change, normally right away, it will write out a series of XML documents in the export folder. This process is complete when a folder named accounts appears under the export folder. The accounts folder will contain one or more folders named batchXXX, with each batch folder containing a set of XML documents that include the user and group details. For example:

```
/user  
  /irm-data  
    /accounts  
      /batch1  
        user1.xml  
        user2.xml  
        group1.xml
```

The batch folders are used to ensure that the operating system limit of the maximum number of files in a folder is not exceeded.

After this process is complete, reset the export folder:

```
setIRMEExportFolder('')
```

This reset ensures that Oracle IRM does not perform any further data exporting when the Managed Server restarts.

5. Configure the Oracle Internet Directory authentication provider:
 - a. Start the Administration Server for your Oracle WebLogic Server domain.
 - b. Log in to the Oracle WebLogic Server Administration Console as the domain administrator user, at this URL: `http://adminServerHost:adminServerPort/console`
 - c. Under Domain Structure on the left, select Security Realms.
 - d. In the Realms table on the Summary of Security Realms page, click myrealm in the Name column to open the Settings for myrealm page.
 - e. Click the Providers tab, and then click New under the Authentication Providers table on the Authentication tab.
 - f. In the Create a new Authentication Provider dialog box, enter a provider name in the Name field, change the type to OracleInternetDirectoryAuthenticator, and then click OK.
 - g. In the Authentication Providers table, click Reorder, move the provider you just created to the top of the list, and then click OK

- h. Click `DefaultAuthenticator`, change the `Control Flag` value to `OPTIONAL`, and then click `Save`
- i. Click `Providers` in the breadcrumb trail along the top of the page to navigate back to the `Providers` tab.
- j. Click the name of the authentication provider you just created to navigate to the `Configuration` tab for the provider. On the `Common` tab, change the `Control Flag` value to `SUFFICIENT`, and then click `Save`.

`SUFFICIENT` means that if a user can be authenticated against Oracle Internet Directory, no further authentication is processed.

`REQUIRED` means that the authentication provider must succeed even if another provider already authenticated the user. If the embedded LDAP has been set to `OPTIONAL` and Oracle Internet Directory has been set to `REQUIRED`, the embedded LDAP user is no longer valid.

- k. Click the `Provider Specific` tab. Set `Provider Specific` values in the following fields, and leave default values in the other fields:
 - `Host`: The host name or IP address of the LDAP server.
 - `Port`: The Oracle Internet Directory Port, 389 by default.
 - `Principal`: The Distinguished Name (DN) of the LDAP user that Oracle WebLogic Server should use to connect to the LDAP server; for example `cn=orcladmin`
 - `Credential`: The credential used to connect to the LDAP server (usually a password)
 - `Confirm Credential`: The same value as for the `Credential` field.
 - `User Base DN`: The base distinguished name (DN) of the tree in the LDAP directory that contains users; for example `cn=users,dc=example,dc=com`. In Oracle Internet Directory, this is the value of the `User Search Base` attribute, which you can look up in the OIDDAS administration dialog.
 - `Use Retrieved User Name as Principal`: Specifies whether or not the user name retrieved from the LDAP server should be used as the `Principal` value. Select this attribute for Oracle IRM.
 - `Group Base DN`: The base distinguished name (DN) of the tree in the LDAP directory that contains groups; for example: `cn=groups,dc=example,dc=com`. In Oracle Internet Directory, this is the value of the `Group Search Base` attribute, which you can look up in the OIDDAS administration dialog.

Note: Use an exact DN rather than a top-level DN. Using a top-level DN would provide access to all the default users and groups under the DN, giving access to more users than required by the application.

 - `Propagate Cause For Login Exception`: Propagates exceptions thrown by Oracle Internet Directory, like password expired exceptions, to Oracle WebLogic Server so they show in the console and the logs. For Oracle IRM, select this attribute in the `General` area of the tab.

- l. Click **Save**.

6. Restart the Administration Server.

Note: Authentication providers in an Oracle WebLogic Server domain are chained. This means that user authentication needs to run successfully through all authentication providers. With the Control Flag value set to OPTIONAL for the default provider, it is allowed to fail without a server startup or user authentication failure.

- 7.** After the server is up again, log in to the Administration Console again, and click Security Realms under Domain Structure.
- 8.** In the Realms table on the Summary of Security Realms page, click myrealm in the Name column to open the Settings for myrealm page.
- 9.** Click the Users and Groups tab to see a list of users contained in the configured authentication providers, on the Users subtab, and then click the Groups subtab to see a list of groups. You should see user names from the Oracle Internet Directory configuration, which implicitly verifies that the configuration is working
- 10.** Check that you have switched the security provider successfully, with either or both of these basic tests:
- 11.** For an Oracle IRM Managed Server, if a user has already logged into the Oracle IRM Management Console, you need to run the `setIRMImportFolder WLST` command after identity store reassociation. Use this command to set the import folder to point to the export folder that was set before identity store reassociation.

Note: take a backup of the export folder before performing the import process because the import process deletes the contents of the folder during successful processing of the user and group details.

This operation should be performed with only one Managed Server running a deployed Oracle IRM application, to ensure that only one Managed Server performs the user and group processing. After the import process is complete, all Managed Servers running the Oracle IRM application can be started. The following example sets `/user/irm-data` as the import folder:

```
cd WCC_ORACLE_HOME/common/bin
./wlst.sh
> connect('weblogic', 'password', 't3://adminServerHost:adminServerPort')
> setIRMImportFolder('/user/irm-data')
```

After the Oracle IRM Managed Server picks up this configuration change, it will read the contents of the folder and update the global user ID (GUID) values in the Oracle IRM system to reflect the values in the new identity store. When a user or group has been processed, the import process deletes the corresponding XML file. After the import process is complete, the import folder will be empty:

```
/user
  /irm-data
```

If an error occurs during the processing of a user or group, the import process writes the error to a file that matches the user or group name. For example, if the user details in `user1.xml` cause an error during processing, the import process writes the error details to the file `user1.xml.fail`:

```
/user
  /irm-data
    /accounts
```

```
/batch1
  user1.xml
  user1.xml.fail
```

If you can fix the error, then rerun the `setIRMImportFolder` WLST command to rerun the import process. For example, if user or group processing fails because the user or group does not exist in the new identity store, adding the user or group to Oracle Internet Directory will fix the error, and you can rerun the import process:

```
connect('weblogic', 'password', 'adminServerHost:adminServerPort')
> setIRMImportFolder('/user/irm-data')
```

After this process is complete, reset the import folder:

```
setIRMImportFolder('')
```

This reset ensures that Oracle IRM does not perform any further data importing when the Managed Server restarts.

After the reassociation of the identity store, users in Oracle Internet Directory have the same rights that their namesakes had in the Oracle WebLogic Server embedded LDAP server before the migration of user data. For example, if a user existed in the embedded LDAP server before the migration with the user name `weblogic` and an Oracle IRM role of Domain Administrator, then, after migration, the user in Oracle Internet Directory with the user name `weblogic` would have the Oracle IRM role of Domain Administrator.

E.3.2 Refreshing GUID Values in Imaging Security Tables

If you have already configured your Imaging Managed Server and you change the LDAP provider, the global user IDs (GUIDs) in the Imaging security tables will be invalid. Imaging caches the GUIDs from an external LDAP provider in its local security tables and uses these IDs for authentication. You can refresh the GUID values in the Imaging security tables with WLST commands or with Fusion Middleware Control.

Only users and groups that exist in both LDAP providers will have GUIDs refreshed. Imaging permissions assigned to users and groups from the previous LDAP will be refreshed to the users and groups that match in the new LDAP. If users and/or groups do not match any users and/or groups in the new LDAP provider, `refreshIPMSecurity` will ignore them.

Note: During the refresh, users or groups for whom matching identifying information is not found are ignored. As security changes are made, invalid users or groups are removed from the Imaging database.

[Refreshing GUID values in Imaging Security Tables with WLST](#)

If you want to refresh GUID values from a command line, you can use the Oracle WebLogic Scripting Tool (WLST).

E.3.2.1 Refreshing GUID values in Imaging Security Tables with WLST

If you want to refresh GUID values from a command line, you can use the Oracle WebLogic Scripting Tool (WLST).

To refresh GUID values in Imaging security tables with WLST:

1. Start the Administration Server for your Oracle WebLogic Server domain.
2. Log in to the Oracle WebLogic Server Administration Server.
3. Navigate to the Oracle WebCenter Content home directory: MW_HOME/WCC_ORACLE_HOME.
4. Run WLST.

```
cd common/bin
./wlst.sh
```

5. At the WLST command prompt, enter these commands:

```
wls:/offline> connect()
Please enter your username :weblogic
Please enter your password : XXXXXXXXXXXXX
Please enter your server URL [t3://localhost:7001]
:t3://host_name:16000
Connecting to t3://host_name:16000 with userid weblogic ...
Successfully connected to Managed Server 'IPM_server1' that belongs to domain
'domainName'.
```

```
Warning: An insecure protocol was used to connect to the
server. To ensure on-the-wire security, the SSL port or
Admin port should be used instead.
```

```
wls:/domainName/serverConfig> listIPMConfig() <This is just to check
that the connection is to the right Imaging server>
```

```
wls:/domainName/serverConfig>
refreshIPMSecurity() <This is the command that will refresh the GUIDs in the
Security tables.>
```

```
wls:/domainName/serverConfig> exit()
```

6. Log in to Imaging to verify user and group security.

E.4 Configuring OracleTextSearch for Content Server

If you have a license to use OracleTextSearch (with Oracle Database 11g), then you can configure it to use Oracle Text 11g as the primary full-text search engine for WebCenter Content. Oracle Text 11g offers state-of-the-art indexing capabilities and provides the underlying search capabilities for Oracle Secure Enterprise Search (Oracle SES). To search auxiliary metadata in Oracle WebCenter Content: Records with Oracle Text 11g, you must configure it to use OracleTextSearch as the search engine.

If you have a license to use Oracle SES, you can configure it for use with OracleTextSearch on WebCenter Content and configure Content Server to use Oracle SES as its back-end search engine.

OracleTextSearch enables administrators to specify certain metadata fields to be optimized for the search index as well as to customize additional fields. OracleTextSearch also enables a fast index rebuild and index optimization.

You can set OracleTextSearch on the WebCenter Content postinstallation configuration page.

To configure OracleTextSearch for Content Server on the postinstallation configuration page:

1. Select Internal or External in the FullText Search Option field.
2. If you selected the External option, provide the name of the external data source in the External DataSource field.

If you have Oracle Database 11g, and you specify Internal for Fulltext Search Option, you do not need to run the Repository Creation Utility (RCU) to create a search schema.

You might want to use an external data source so you can put the search engine on another system or in another database. Before you can use an external data source with OracleTextSearch, you need to create a search schema in a database other than the system database and configure the data source.

Creating a Search Schema and Configuring an External Data Source

You might want to use an external data source so you can put the search engine on another system or in another database. Before you can use an external data source with OracleTextSearch, you need to create a search schema in a database other than the system database and configure the data source.

Configuring OracleTextSearch for Content Server in a Configuration File

If you did not configure OracleTextSearch on the configuration page for Content Server or you want to change the configuration, you can configure this search option in the DomainHome/ucm/cs/config/config.cfg configuration file for the Content Server instance.

E.4.1 Creating a Search Schema and Configuring an External Data Source

You might want to use an external data source so you can put the search engine on another system or in another database. Before you can use an external data source with OracleTextSearch, you need to create a search schema in a database other than the system database and configure the data source.

To create a search schema and configure an external data source:

1. Run RCU to create a search schema (prefix_OCSSEARCH in the database where you want the search engine,
2. Create a JDBC data source that points to the search schema. You can use the Administration Console, WebLogic Scripting Tool Command, or Fusion Middleware Control to create a data source.
3. Use the Administration Console to target the data source to the WebCenter Content Managed Server (UCM_server1 by default).

If you did not configure OracleTextSearch on the configuration page for Content Server or you want to change the configuration, you can configure this search option in the DomainHome/ucm/cs/config/config.cfg configuration file for the Content Server instance. After changing the search option, you need to restart Content Server and rebuild the search index.

Note: If you plan to use the WebCenter Content user interface), you may want to optimize the `dOriginalName` field for the search index. The WebCenter Content user interface leverages the file name as its primary identifier presented in the interface. You can sort presentations by file name, which is the value of the `dOriginalName` field in Content Server.

By default, Content Server configures only the document title (`dDocTitle`) as a field available for searching and sorting. The WebCenter Content user interface, by default, does not use document titles in its displays.

The process of enabling `dOriginalName` as a new search or sort field requires a full rebuild of the fulltext index.

E.4.2 Configuring OracleTextSearch for Content Server in a Configuration File

If you did not configure OracleTextSearch on the configuration page for Content Server or you want to change the configuration, you can configure this search option in the `DomainHome/ucm/cs/config/config.cfg` configuration file for the Content Server instance.

To configure OracleTextSearch for Content Server in the configuration file:

1. Open the `DomainHome/ucm/cs/config/config.cfg` file for the Content Server instance in a text editor.
2. Set the following values:

```
SearchIndexerEngineName=OracleTextSearch
```

```
IndexerDatabaseProviderName=SystemDatabase
```

Note:

- You can specify a separate Oracle Database as the value of `IndexerDatabaseProviderName`, instead of `SystemDatabase`. The driver jar `ojdbc6.jar` is provided by Oracle in the `MW_HOME/wlserver_10.3/server/lib` directory. Before Oracle Text Search can function properly with the separate Oracle Database, however, you need to manually copy the `ojdbc6.jar` file from the `MW_HOME/wlserver_10.3/server/lib` directory to the `DomainHome/lib` directory.
 - OracleTextSearch requires a JDBC driver version of 10.2.0.4 or higher. The component will not work with older JDBC driver versions.
-

3. Save the file.
4. Restart Content Server.
5. Rebuild the search index using the Indexer tab of the Repository Manager, located under Administration, in Admin Applets.

E.5 About Completing the Oracle WebCenter Enterprise Capture Configuration

The Capture System Administrator who performs the installation and initial configuration must have system administration permissions, including access to Oracle Enterprise Manager Fusion Middleware Control and Oracle WebLogic Server. Before anyone can use Oracle WebCenter Enterprise Capture, a system administrator must associate users from the LDAP credential store for the WebLogic Server domain with the Capture roles in Fusion Middleware Control.

The roles `CaptureWorkspaceManager`, `CaptureWorkspaceViewer`, and `CaptureUser` are automatically added to the default WebLogic Server policy store for the domain.

The Capture System Administrator can use the file/XML-based policy store, an Oracle Internet Directory policy store, or an Oracle Database policy store and manage the policy store through Fusion Middleware Control.

Through Fusion Middleware Control, you can also configure system settings and loggers for Capture.

E.6 Completing the Initial Configuration of Oracle WebCenter Enterprise Capture

To complete the initial configuration of Capture in a WebLogic Server domain, the Capture System Administrator needs to do these tasks:

The following provides a summary of the steps to initially configure and monitor an Oracle WebCenter Enterprise Capture system environment:

1. Start the Capture Managed Server.
2. Assign roles to Capture users in Fusion Middleware Control.
3. Modify system-level settings through MBeans.

Starting the Capture Managed Server

The first step to complete Capture configuration is to start Capture Managed Servers.

Assigning Roles to Capture Users

Before anyone can use Capture, the Capture System Administrator needs to assign users from the LDAP credential store to the Capture roles in the policy store. You can do this through the Application Roles page in Fusion Middleware Control.

Modifying System-Level Settings

You can modify system-level configuration settings for Capture, including system properties and SMTP settings for e-mail, through Fusion Middleware Control. The settings on this page configure the Capture MBeans for the domain, which you can also modify with Oracle WebLogic Scripting Tool (WLST) commands.

E.6.1 Starting the Capture Managed Server

The first step to complete Capture configuration is to start Capture Managed Servers.

To start Capture Managed Servers, see [Starting the Managed Servers](#).

E.6.2 Assigning Roles to Capture Users

Before anyone can use Capture, the Capture System Administrator needs to assign users from the LDAP credential store to the Capture roles in the policy store. You can do this through the Application Roles page in Fusion Middleware Control.

To assign roles to Capture users, see [Assigning Capture Roles in Oracle Enterprise Manager](#) in Oracle Fusion Middleware Administering Oracle WebCenter Enterprise Capture.

E.6.3 Modifying System-Level Settings

You can modify system-level configuration settings for Capture, including system properties and SMTP settings for e-mail, through Fusion Middleware Control. The

settings on this page configure the Capture MBeans for the domain, which you can also modify with Oracle WebLogic Scripting Tool (WLST) commands.

The following WLST commands also enable you to access or modify system-level settings:

- `listCaptureConfig`
- `getCaptureConfig`
- `setCaptureConfig`

These are online WLST commands that you can use while connected to the Administration Server for the domain. To connect, you need to run the `wlst.sh` script from the Oracle WebCenter Content home directory.

To modify a Capture system-level setting with a WLST command:

1. Start the Administration Server for your Oracle WebLogic Server domain.
2. Log in to the Oracle WebLogic Server Administration Server.
3. Navigate to the Oracle WebCenter Content home directory at `MW_HOME/WCC_ORACLE_HOME`
4. Run WLST.

```
cd common/bin
./wlst.sh
```

5. Log in and then enter a custom Capture command:

```
wls:/offline> connect()
Please enter your username :weblogic
Please enter your password : XXXXXXXXXXXXX
Please enter your server URL [t3://localhost:7001]
:t3://host_name:16401
Connecting to t3://host_name:16401 with userid weblogic ...
Successfully connected to Managed Server 'capture_server1' that belongs to domain
'domainName'.

wls:/domainName/serverConfig> setCaptureConfig('CaptureSystemID','CAPTURE_02')

Attribute 'CaptureSystemID' changed to "CAPTURE_02"

wls:/domainName/serverConfig> exit()
```

E.7 Creating a Hash Partition to Improve Database Performance

Use a hash partition of the `EBATCHITEMS` table to minimize the database wait event `enq: HW-` contention, which prevents the database from scaling.

This event occurs when many threads are trying to update and add new BLOB items to `ECBATCHITEMS`, as follows:

```
table - "UPDATE ECBATCHITEMS SET ECITEMDATA=:1 WHERE ECITEMID=:2"
```

Creating a hash partition minimizes this contention because different items will be in eight different partitions.

To create a hash partition:

1. Get the definition of the table:

```
SELECT dbms_metadata.get_ddl('OBJECT TYPE','OBJECT NAME', OWNER) FROM DUAL;
```

2. Append partitioning syntax to the table definition. The following table definition creates a hash partition for the ECBATCHITEMS table:

```
SQL> create table "CAPCLIENT_CAPTURE"."ECBATCHITEMS2"
 2      ( "ECTENANTID" VARCHAR2(36 CHAR),
        "ECITEMID" VARCHAR2(36) NOT NULL ENABLE,
 3      4      "ECORIGINALITEMID" VARCHAR2(36),
 5          "ECORIGINALITEMINDEX" NUMBER(10,0),
 6          "ECBARCODES" BLOB,
 7          "ECBARCODECOUNT" NUMBER(10,0),
 8          "ECSTATUS" VARCHAR2(255),
 9          "ECSOURCEFORMAT" VARCHAR2(255),
        "ECANNOTATION" VARCHAR2(255),
10  11      "ECFILELENGTH" NUMBER(19,0),
12          "ECDOCUMENTLINKCOUNT" NUMBER(10,0),
13          "ECPATCHCODE" NUMBER(10,0),
14          "ECENDORSEMENT" VARCHAR2(255),
15          "ECSOURCEFILENAME" VARCHAR2(255),
16          "ECBATCHID" NUMBER(19,0),
17          "ECLASTMODIFIED" NUMBER(19,0),
18          "ECITEMDATA" BLOB,
        PRIMARY KEY ("ECITEMID")) partition by hash(ECITEMID) partitions 8
;

```

E.8 Extracting and Running the Installation File for Desktop Client Software

After Oracle WebCenter Content is installed, you can use the `desktop_content_setup.exe` command with the `/export` parameter to extract the Desktop installer files:

```
desktop_content_setup.exe /export [path]/existing_extraction_directory/
```

You can specify an existing directory to extract the files into. If you omit the directory from the command, it extracts the files into the current directory.

Note: If you have an earlier version of Desktop installed, uninstall it before you proceed with the installation.

The `desktop_content_setup.exe` command extracts three files:

- package.ini
- contentdesktop.msi
- contentdesktop_x64.msi

To install Desktop on a client system, use only one of the MSI files in the Desktop installer command. The Desktop client software installers support a number of custom installation options that can help system administrators roll out the software:

Using Command-Line Parameters for Automation

You can use several command-line parameters to automate part of the installation process. If you need to pass any public property to MSI

through `desktop_content_setup.exe`, you can do that with the following command:

Disabling Integrations

The Desktop installer provides a number of command-line options to disable specific software integrations. If the installer detects that an integration can be applied to existing software on the computer (Microsoft Word, PowerPoint, Excel, and so on), it usually will automatically attempt to install an integration. To prevent an integration from being installed for a specific software product, you can disable that integration using one of these command-line switches:

Performing Silent Roll-Outs

The Desktop installer enables an administrator to roll out the Desktop client software to multiple client machines with the help of third-party tools such as SMS or netOctopus, which are capable of executing one executable on many machines. The installer for the Desktop client software supports a silent installation option that you can configure with SMS.

Configuring Content Server Connections Through the Registry on a Windows System

You can add Content Server connections by creating a registry file on a Windows system. The file is not included as part of the standard installation files; you must create it.

E.8.1 Using Command-Line Parameters for Automation

You can use several command-line parameters to automate part of the installation process. If you need to pass any public property to MSI through `desktop_content_setup.exe`, you can do that with the following command:

```
desktop_content_setup.exe /msi  
ONE_PUBLIC_PROPERTY=public_property_value
```

E.8.2 Disabling Integrations

The Desktop installer provides a number of command-line options to disable specific software integrations. If the installer detects that an integration can be applied to existing software on the computer (Microsoft Word, PowerPoint, Excel, and so on), it usually will automatically attempt to install an integration. To prevent an integration from being installed for a specific software product, you can disable that integration using one of these command-line switches:

- EXPLORER=0
- WORD=0
- POWERPOINT=0
- EXCEL=0
- OUTLOOK=0
- NOTES=0

Use capital letters for the switch names.

These switches are only for disabling software integrations. They are not necessary to enable software integrations for applications found on client computers.

E.8.3 Performing Silent Roll-Outs

The Desktop installer enables an administrator to roll out the Desktop client software to multiple client machines with the help of third-party tools such as SMS or netOctopus, which are capable of executing one executable on many machines. The installer for the Desktop client software supports a silent installation option that you can configure with SMS.

For silent install, you can use the following command to control the level of user interface displayed.

```
desktop_content_setup.exe /s UI=user_interface_level
```

In the command, `user_interface_level` can be 1, 2, 3, or 4:

- 1: No user interface during install.
- 2: Displays only a progress bar during install.
- 3: Presents an install screen with different dialog boxes but doesn't require user input to run.
- 4: Runs a fully interactive installer requiring user input.

For example, to silently and selectively disable installing Outlook, PowerPoint, and Lotus Notes, the command would be as follows:

```
desktop_content_setup.exe /s UI=1 /msi OUTLOOK=0 POWERPOINT=0 NOTES=0
```

You will also need to add the `REBOOT=ReallySuppress` and `MSIRESTARTMANAGERCONTROL=Disable` properties to prevent reboots and to prevent any dialogs asking to shut down applications. For example:

```
desktop_content_setup.exe /s UI=2 /msi OUTLOOK=0  
POWERPOINT=0 NOTES=0 REBOOT=ReallySuppress MSIRESTARTMANAGERCONTROL=Disable
```

The properties after the `/msi` switch can also be used with the

```
msiexec
```

with the MSI files. For example:

```
start /wait msiexec /i contentdesktop_x64.msi OUTLOOK=0 WORD=0 EXCEL=0  
POWERPOINT=0 NOTES=0 REBOOT=ReallySuppress MSIRESTARTMANAGERCONTROL=Disable /l*v  
DISUpgrade_x64.log /qn
```

E.8.4 Configuring Content Server Connections Through the Registry on a Windows System

You can add Content Server connections by creating a registry file on a Windows system. The file is not included as part of the standard installation files; you must create it.

Adding servers in a registry file automates the setup process by saving your users from setting up connections on their computers. When you add a server connection in this manner, the user cannot delete the server connection from their desktop (Windows Explorer, the email client, or any desktop application).

Sample Registry File Entries

The following sample registry file entries are examples for Content Servers instances, WebDAV servers, and Content DB servers, with comments below the code lines. The sample file registry entries are under HKEY_LOCAL_MACHINE. If you would like the user to run the installer, use HKEY_CURRENT_USER instead of HKEY_LOCAL_MACHINE.

Using HKEY_LOCAL_MACHINE means that users cannot change the ServerAuth or RememberMetaData values because they will not have permission to change HKEY_LOCAL_MACHINE entries (unless a Windows policy is set to allow this, or the user is an administrator).

```
REGEDIT4
[HKEY_LOCAL_MACHINE\SOFTWARE\Oracle\WebCenter Desktop\Content\WebDAV\Servers
\Corporate]
"ServerType"="ucm"
"ServerURL"="http://corporate/cs/idcplg/webdav"
```

(In this registry entry, the server is a Content Server instance, the display name of the server is Corporate, and the server WebDAV URL is http://corporate/cs/idcplg/webdav.)

```
[HKEY_LOCAL_MACHINE\Software\ORACLE\WebCenter Desktop\Content\Shared\Config
\Corporate]
"HostCgiUrl"="http://corporate/cs/idcplg"
"ServerAuth"=REG_DWORD:0x00000000 (0)
"RememberMetaData"=REG_DWORD:0x00000000 (0)
```

In this registry entry, the server is a Content Server instance, the name of the server is Corporate, the CGI URL is http://corporate/cs/idcplg, and the user interface URL is http://corporate/wcc/faces. Content DB servers and WebDAV servers do not use these registry entries.)

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Oracle\WebCenter Desktop\Content\WebDAV\Servers
\Department]
"ServerType"="dav"
"ServerURL"="http://corporate/content/app/explorerPage.jspx"
"Single Sign-On Url"="http://section/content/app/explorerPage.jspx"
"Use Single Sign-On"=REG_DWORD:0x00000001 (1)
```

(In this registry entry, the server is a WebDAV server, the display name of the server is Department, the server WebDAV URL is http://corporate/content/app/explorerPage.jspx, a single sign-on page has been identified, and single sign-on has been implemented.)

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Oracle\WebCenter Desktop\Content\WebDAV\Servers\Section]
"ServerType"="cdb"
"ServerURL"="http://section/content/dav"
"Single Sign-On Url"="http://section/content/app/explorerPage.jspx"
"Use Single Sign-On"=REG_DWORD:0x00000001 (1)
```

(In this registry entry, the server is a Content DB server, the display name of the server is Section, the server WebDAV URL is http://section/content/dav, a single sign-on page has been identified, and single sign-on has been implemented.)
