This document describes how to install and configure Oracle SOA Suite and Oracle Business Process Management.

Audience

This guide is intended for system administrators or application developers who are installing and configuring Oracle SOA Suite and Oracle Business Process Management. It is assumed that readers are familiar with web technologies and have a general understanding of Windows and UNIX platforms.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Refer to the Oracle Fusion Middleware Library for additional information.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
The standard installation for Oracle SOA Suite and Oracle Business Process Management described in this guide creates the standard topology, which represents a sample starting topology for this product.

**About Installing a Development Environment**

You can use the Oracle SOA Suite and Business Process Management distribution to install and configure a standard installation topology as a starting point for a *production* environment.

**Using the Standard Installation Topology as a Starting Point**

The standard installation topology is a flexible topology that you can use as a starting point in production environments.

**Understanding Secondary Topologies**

Secondary topologies include configurations with components that require additional installation or configuration steps on top of the standard topology.

**Using This Document to Extend an Existing Domain**

The procedures in this guide describe how to create a new domain. The assumption is that no other Oracle Fusion Middleware products are installed on your system.

### 1.1 About Installing a Development Environment

You can use the Oracle SOA Suite and Business Process Management distribution to install and configure a standard installation topology as a starting point for a *production* environment.

To install Oracle SOA Suite and Business Process Management in a *development* environment, Oracle recommends that you download and install the Oracle SOA Suite or Oracle Business Process Quick Start distribution, which provides an integrated development environment (IDE), preconfigured with the design-time software to develop SOA Suite and Business Process Management applications.

With Oracle JDeveloper, you can test your applications from within JDeveloper using the integrated Oracle WebLogic Server, or you can create a compact domain to use as runtime environment for your custom applications.

For more information, see *Installing SOA Suite and Business Process Management Quick Start for Developers*.

### 1.2 Using the Standard Installation Topology as a Starting Point

The standard installation topology is a flexible topology that you can use as a starting point in production environments.
The information in this guide helps you to create a standard installation topology for Oracle SOA Suite and Oracle Business Process Management. If appropriate and required, you can later extend the standard installation topology to create a secure and highly available production environment (see Next Steps After Configuring the Domain).

The standard installation topology represents a sample topology for this product. It is not the only topology this product supports. For more information, see About the Standard Installation Topology in Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware.

About the Oracle SOA Suite Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and one or more clusters containing one or more Managed Servers.

About the Oracle Business Process Management Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and a cluster containing two Managed Servers.

About the Oracle Business Activity Monitoring Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and two clusters, each containing two Managed Servers.

About the Oracle Real-Time Integration Business Insight Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and two clusters, each containing two Managed Servers.

About Elements in the Standard Installation Topology Illustration

The standard installation topology typically includes common elements.

1.2.1 About the Oracle SOA Suite Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and one or more clusters containing one or more Managed Servers.

The following figure shows the standard installation topology for Oracle SOA Suite. See Table 1-1 for information on elements of this topology.
For configuration instructions, see Configuring the Oracle SOA Suite Domain.

1.2.2 About the Oracle Business Process Management Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and a cluster containing two Managed Servers. Figure 1-1 shows the standard installation topology for Oracle Business Process Management (BPM). See Table 1-1 for information on elements of this topology.
For configuration instructions, see Configuring the Oracle Business Process Management Domain.

### 1.2.3 About the Oracle Business Activity Monitoring Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and two clusters, each containing two Managed Servers.

Oracle Business Activity Monitoring (BAM) monitors your business processes in real time to help you make informed tactical and strategic business decisions. For information about BAM, see Oracle Fusion Middleware Monitoring Business Activity with Oracle BAM.

For production systems, the BAM software is included as part of the Oracle SOA Suite and Oracle Business Process Management distribution, and it is installed automatically when you install the Oracle SOA Suite or Oracle Business Process Management software.

In addition, for an enterprise deployment topology that includes BAM, see Diagram of the Oracle SOA Suite and Oracle Business Activity Monitoring Topology in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite.

Figure 1-2 shows the standard installation topology for Oracle SOA Suite and BAM. Use this topology to implement Oracle Business Activity Monitoring in your Oracle SOA Suite domain. The Oracle Business Activity Monitoring software is targeted to its
own cluster; this ensures that there is no resource contention between the Oracle SOA Suite and Oracle Business Activity Monitoring software.

See Table 1-1 for information on elements of this topology.

**Figure 1-2  BAM Standard Installation Topology**

For configuration instructions, see Configuring the Oracle Business Activity Monitoring Domain.

1.2.4 About the Oracle Real-Time Integration Business Insight Standard Installation Topology

This topology represents a standard WebLogic Server domain that contains an Administration Server and two clusters, each containing two Managed Servers.

Oracle Real-Time Integration Business Insight (Insight) allows business users to model, collect, and monitor business-level metrics using web-based dashboards and reports, without the need to modify their already-deployed integrations and applications.

Insight is collocated with the BAM Managed Server. The business metrics are collected by Insight agents that are collocated with Oracle SOA Suite or Oracle Service Bus Managed Servers and made available to the central application, viewed using BAM dashboards and reports.

**Note:** You can add Insight agents only to domains created with 12c (12.2.1) and later.
For more information about Insight, see:

- Oracle Fusion Middleware Oracle Real-Time Integration Business Insight Concepts
- Oracle Fusion Middleware Real-Time Integration Business Insight Getting Started Guide
- Oracle Fusion Middleware Oracle Real-Time Integration Business Insight User’s Guide
- Oracle Fusion Middleware Oracle Real-Time Integration Business Insight Administrator’s Guide
- Understanding Insight Integration with Oracle Service Bus in Oracle Fusion Middleware Installing and Configuring Oracle Service Bus.

Figure 1-3 shows the standard installation topology for Oracle SOA Suite and Insight. Use this topology to implement Insight in your Oracle SOA Suite domain. The Insight server software is targeted to the BAM cluster; this ensures that there is no resource contention between the Oracle SOA Suite and Insight software.

See Table 1-1 for information on elements of this topology.

**Figure 1-3 Insight Standard Installation Topology**

For configuration instructions, see Configuring the Oracle Real-Time Integration Business Insight Domain.
1.2.5 About Elements in the Standard Installation Topology Illustration

The standard installation topology typically includes common elements.

The following table describes all elements of the topology illustration:

<table>
<thead>
<tr>
<th>Table 1-1 Description of Elements in Standard Installation Topologies</th>

</tbody>
</table>

1.3 Understanding Secondary Topologies

Secondary topologies include configurations with components that require additional installation or configuration steps on top of the standard topology.

The main chapters of this guide describe how to install and configure a standard topology. For guidelines to install and configure secondary topologies, see Understanding the Secondary Topologies for Oracle SOA Suite and Business Process Management.

About Installing Oracle User Messaging Service
Oracle User Messaging Service (UMS) is a software technology that enables two-way communication between users and deployed applications.

About Installing Oracle Business Process Management Standalone
When you require a simple domain that offers only the Oracle Business Process Management (BPM) software capabilities and no cluster, you can install BPM standalone.

About Installing Oracle Enterprise Scheduler
Oracle Enterprise Scheduler provides the ability to run different job types, including: Java, PL/SQL, binary scripts, web services, and EJBs distributed across the nodes in an Oracle WebLogic Server cluster.

About Installing Oracle Business Process Management and Oracle Application Development Framework
If you are deploying applications that take advantage of both Oracle Business Process Management (BPM) and a custom user interface developed using Oracle Application Development Framework (ADF), you can use a secondary topology that allows you to target the Oracle Business Process Management software to one cluster and the Oracle Application Development Framework software to another cluster, so there is no resource contention between the two products.

1.3.1 About Installing Oracle User Messaging Service

Oracle User Messaging Service (UMS) is a software technology that enables two-way communication between users and deployed applications.

For more information, see Introduction to Oracle User Messaging Service in Oracle Fusion Middleware Administering Oracle User Messaging Service.
UMS is included in the Oracle Fusion Middleware Infrastructure distribution. It installs as part of the Oracle Fusion Middleware Infrastructure standard installation topology, as described in About Installing Oracle User Messaging Service (UMS) in Oracle Fusion Middleware Installing and Configuring the Oracle Fusion Middleware Infrastructure.

UMS runtime components consist of an Oracle Fusion Middleware Configuration Wizard template and an Oracle Fusion Middleware schema, which is installed into a supported database by using the Repository Creation Utility (RCU).

For development, you can install and use Oracle JDeveloper 12c to develop applications that can take advantage of UMS features. For more information, see Introducing Oracle JDeveloper in Oracle Fusion Middleware Installing Oracle JDeveloper.

1.3.2 About Installing Oracle Business Process Management Standalone

When you require a simple domain that offers only the Oracle Business Process Management (BPM) software capabilities and no cluster, you can install BPM standalone.

A secondary topology that includes BPM is described in Oracle Business Process Management Standalone Topology.

1.3.3 About Installing Oracle Enterprise Scheduler

Oracle Enterprise Scheduler provides the ability to run different job types, including: Java, PL/SQL, binary scripts, web services, and EJBs distributed across the nodes in an Oracle WebLogic Server cluster.

For more information, see About Oracle Enterprise Scheduler in Oracle Fusion Middleware Developing Applications for Oracle Enterprise Scheduler.

For production systems, the Oracle Enterprise Scheduler runtime software is included as part of the Oracle SOA Suite and Oracle Business Process Management distribution, and it is installed automatically when you install the Oracle SOA Suite or Oracle Business Process Management software.

To install and configure the Oracle Enterprise Scheduler runtime software, see the secondary topology that includes Oracle Enterprise Scheduler in Secondary Topologies for Oracle SOA Suite and Oracle Business Process Management.

In addition, for an enterprise deployment topology that includes Oracle Enterprise Scheduler, see Diagram of the Oracle SOA Suite and Oracle Service Bus Topology in the Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite.

If you are developing Oracle Enterprise Scheduler applications, see Configuring a Compact Domain in Oracle Fusion Middleware Installing SOA Suite and Business Process Management Suite Quick Start for Developers.

1.3.4 About Installing Oracle Business Process Management and Oracle Application Development Framework

If you are deploying applications that take advantage of both Oracle Business Process Management (BPM) and a custom user interface developed using Oracle Application Development Framework (ADF), you can use a secondary topology that allows you to target the Oracle Business Process Management software to one cluster and the Oracle Application Development Framework software to another cluster, so there is no resource contention between the two products.
A secondary topology that includes BPM and ADF is described in Oracle Business Process Management and Application Development Framework (ADF) Topology.

1.4 Using This Document to Extend an Existing Domain

The procedures in this guide describe how to create a new domain. The assumption is that no other Oracle Fusion Middleware products are installed on your system.

If you have installed and configured other Oracle Fusion Middleware products on your system (for example, Fusion Middleware Infrastructure, with a domain that is up and running), use the same instructions to extend your existing domain. If you choose to extend an existing domain, read Installing Multiple Products in the Same Domain for detailed information.
Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management

To prepare for your Oracle SOA Suite and Oracle Business Process Management installation, verify that your system meets the basic requirements, then obtain the correct installation software.

Roadmap for Installing and Configuring a Standard Installation Topology
This roadmap provides all the steps required to install and configure a standard Oracle SOA Suite and Oracle Business Process Management installation topology.

Roadmap for Verifying Your System Environment
Before you begin the installation and configuration process, you must verify your system environment.

About Product Distributions
You create the initial Oracle SOA Suite and Oracle Business Process Management domain using the Oracle Fusion Middleware Infrastructure distribution, which contains both Oracle WebLogic Server software and Oracle Java Required Files (JRF) software.

Obtaining the Product Distribution
You can obtain the Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Oracle Business Process Management distribution on the Oracle Technology Network (OTN).

2.1 Roadmap for Installing and Configuring a Standard Installation Topology
This roadmap provides all the steps required to install and configure a standard Oracle SOA Suite and Oracle Business Process Management installation topology.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify your system environment.</td>
<td>Before beginning the installation, verify that the minimum system and network requirements are met.</td>
<td>See Roadmap for Verifying Your System Environment.</td>
</tr>
<tr>
<td>Task</td>
<td>Description</td>
<td>Documentation</td>
</tr>
<tr>

<td>See Configuring the Domain (for Oracle SOA Suite) and Configuring the Domain (for Business Process Management).</td>
</tr>
</tbody>
</table>
2.2 Roadmap for Verifying Your System Environment

Before you begin the installation and configuration process, you must verify your system environment.

The following table identifies important tasks and checks to perform to ensure that your environment is properly prepared for installing and configuring Oracle SOA Suite and Oracle Business Process Management.

**Table 2-2 Roadmap for Verifying Your System Environment**

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify certification and system requirements.</td>
<td>Verify that your operating system is certified and properly configured for installation and configuration.</td>
<td>See Verifying Certification, System, and Interoperability Requirements.</td>
</tr>
<tr>
<td>Identify a proper installation user.</td>
<td>Verify that the installation user has the proper permissions to install and configure the software.</td>
<td>See Selecting an Installation User.</td>
</tr>
<tr>
<td>Select the installation and configuration directories on your system.</td>
<td>Verify that you can create the necessary directories for installation and configuration, according to the recommended directory structure.</td>
<td>See Understanding Directories for Installation and Configuration.</td>
</tr>
<tr>
<td>Install a certified JDK.</td>
<td>The installation program for the distribution requires a certified JDK present on your system.</td>
<td>See About JDK Requirements for an Oracle Fusion Middleware Installation.</td>
</tr>
<tr>
<td>Install and configure a database for mid-tier schemas.</td>
<td>To configure your WebLogic domain, you must have access to a certified database that is properly configured for schemas required by Oracle SOA Suite and Oracle Business Process Management.</td>
<td>See About Database Requirements for an Oracle Fusion Middleware Installation.</td>
</tr>
</tbody>
</table>

**Verifying Certification, System, and Interoperability Requirements**

Oracle recommends that you use the certification matrix and system requirements documents with each other to verify that your environment meets the requirements for installation.

**Selecting an Installation User**

The user who performs installation and configuration on your system requires sufficient permissions and privileges.
Understanding Directories for Installation and Configuration
During the installation and domain configuration process, you must plan on providing the locations for these directories: Oracle Home, Domain Home, and the Application Home.

About JDK Requirements for an Oracle Fusion Middleware Installation
Most Fusion Middleware products are in .jar file format. These distributions do not include a JDK. To run a .jar distribution installer, you must have a certified JDK already installed on your system.

About Database Requirements for an Oracle Fusion Middleware Installation
Many Oracle Fusion Middleware products require database schemas prior to configuration. If you do not already have a database where you can install these schemas, you must install and configure a certified database.

2.2.1 Verifying Certification, System, and Interoperability Requirements
Oracle recommends that you use the certification matrix and system requirements documents with each other to verify that your environment meets the requirements for installation.

1. Verifying your environment meets certification requirements
   Make sure that you are installing your product on a supported hardware and software configuration. For more information, see the certification document for your release on the Oracle Fusion Middleware Supported System Configurations page.
   Oracle has tested and verified the performance of your product on all certified systems and environments. Whenever new certifications occur, they are added to the proper certification document right away. New certifications can be released at any time. Therefore, the certification documents are kept outside the documentation libraries and are available on Oracle Technology Network.

2. Using the system requirements document to verify certification
   Oracle recommends that you use the Oracle Fusion Middleware System Requirements and Specifications document to verify that the certification requirements are met. For example, if the certification document indicates that your product is certified for installation on 64-Bit Oracle Linux 6.5, use this document to verify that your system meets the required minimum specifications. These include disk space, available memory, specific platform packages and patches, and other operating system-specific items. System requirements can change in the future. Therefore, the system requirement documents are kept outside of the documentation libraries and are available on Oracle Technology Network.

3. Verifying interoperability among multiple products
   See Oracle Fusion Middleware 12c Interoperability and Compatibility in Oracle Fusion Middleware Understanding Interoperability and Compatibility to learn how to install and run multiple Fusion Middleware products from the same release or mixed releases with each other.

2.2.2 Selecting an Installation User
The user who performs installation and configuration on your system requires sufficient permissions and privileges.
Understanding User Permissions
The user who installs a Fusion Middleware product owns the files and has certain permissions on the files.

Understanding Non-Default User Permissions on UNIX Operating Systems
Changing the default permissions setting reduces the security of the installation and possibly your system. Oracle does not recommend changing default permission settings.

Verifying the Installation User has Administrator Privileges on Windows Operating Systems
To update the Windows Registry, you must have Administrator privileges.

2.2.2.1 Understanding User Permissions
The user who installs a Fusion Middleware product owns the files and has certain permissions on the files.

- Read and write permissions on all non-executable files (for example, .jar, .properties, or .xml). All other users in the same group as the file owner have read permissions only.

- Read, write, and execute permissions on all executable files (for example, .exe, .sh, or .cmd). All other users in the same group as the file owner have read and execute permissions only.

This means that someone other than the person who installs the software can use the installed binaries in the Oracle home to configure a domain or set of Fusion Middleware products.

During configuration, the files generated by the configuration process are owned by the user who ran the Configuration Wizard, with the same permissions as described above for the installation user. However, security-sensitive files are not created with group permissions. Only the user that created the domain has read and write permissions and can administer the domain.

Consider the following examples:

- Example 1: A Single User Installs the Software and Configures the Domain
  This example shows the permissions if the same user installs the software and configures the domain.

  To ensure the proper permissions and privileges for all files, Oracle recommends that the same owner perform both tasks: install the Oracle Fusion Middleware product and configure the WebLogic Server domain using the Configuration Wizard.
The Oracle home is created by User1 during product installation. User1 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User1’s group have read/execute permissions on all executable files, and read permissions on all other files.

The Domain home and Application home are created by User1 during product installation. User1 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User1’s group have read/execute permissions on all executable files, and read permissions on all other files.

If the user who creates the domain is different than the user who installed the software, then both users must have the same privileges, as shown in the next example.

- **Example 2: The Oracle Home and Domain are Created by Different Users**

  This example shows the permissions where one user creates the Oracle home and another user configures the domain.

  The Oracle home is created by User1 during product installation. User1 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User1’s group have read/execute permissions on all executable files, and read permissions on all other files.

  The Domain home and Application home are created by User2 during product installation. User2 has read/write/execute permissions on all executable files, and read/write permissions on all other files. All other users in User2’s group (including User1) have read/execute permissions on all executable files, and read permissions on all other files.

*Note:* Certain domain files do not have group permissions. For example, cwallet.sso.

Consider the following items before running the installer:

- On UNIX operating systems, Oracle recommends that you set `umask` to 027 on your system before you install the software. This ensures that file permissions are set properly during installation. Use the following command:
You must enter this command in the same terminal window from which you plan to run the product installer.

- On UNIX operating systems, do not run the installation program as the root user. If you run the installer as a root user, the startup validation may fail and you cannot continue the installation.

- When you manage a product installation (for example, applying patches or starting managed Servers), use the same user ID that you used to install the product.

- On Windows operating systems, you must have Administrative privileges to install the product. See Verifying the Installation User has Administrator Privileges on Windows Operating Systems for more information.

### 2.2.2.2 Understanding Non-Default User Permissions on UNIX Operating Systems

Changing the default permissions setting reduces the security of the installation and possibly your system. Oracle does not recommend changing default permission settings.

If other users require access to particular files or executable, consider using the UNIX `sudo` command (or other similar command) in lieu of changing file permissions.

Refer to your UNIX operating system Administrator’s Guide or contact your operating system vendor if you need further assistance.

### 2.2.2.3 Verifying the Installation User has Administrator Privileges on Windows Operating Systems

To update the Windows Registry, you must have Administrator privileges.

By default, members with the Administrator privilege sign in to the system with regular privileges, but can request elevated permissions to perform administrative tasks.

To perform a task with elevated privileges:

1. Find the Command Prompt item, either from the Start menu or the Windows icon in the lower-left hand corner.

2. Right-click Command Prompt and select Run as administrator.

   This opens a new command prompt window, and all actions performed in this window will be done with administrator privileges.

   **Note:** If you have User Access Control enabled on your system, you may see an additional window asking you to confirm this action. Confirm and continue with this procedure.

3. Perform the desired task.

   For example, to start the product installer:

   - For a jar file, enter:
     ```
     java -jar distribution_name.jar
     ```

   - For an executable (*.exe, *.bin, or *.sh file), enter:
2.2.3 Understanding Directories for Installation and Configuration

During the installation and domain configuration process, you must plan on providing the locations for these directories: Oracle Home, Domain Home, and the Application Home.

The following sections provide information to help you decide where you want to create these directories:

Understanding the Recommended Directory Structure
Oracle recommends specific locations for the Oracle Home, Domain Home, and Application Home.

About the Oracle Home Directory
When you install any Oracle Fusion Middleware product, you must use an Oracle home directory.

About the Domain Home Directory
The Domain home is the directory where domains that you configure are created.

About the Application Home Directory
The Application home is the directory where applications for domains you configure are created.

Installing Multiple Products in the Same Domain
There are two methods for installing and configuring multiple products in one domain.

Preparing for Shared Storage
Oracle Fusion Middleware enables you to configure multiple Oracle WebLogic Server domains from a single Oracle home. This allows you to install the Oracle home in a single location on a shared volume and reuse the Oracle home for multiple host installations.

2.2.3.1 Understanding the Recommended Directory Structure
Oracle recommends specific locations for the Oracle Home, Domain Home, and Application Home.

Oracle recommends a directory structure similar to the one shown in Figure 2-1.
A base location (Oracle base) should be established on your system (for example, `/home/oracle`) and from there, two separate branches should be created. The `product` directory should contain the product binary files and all of the Oracle home directories. The `config` directory should contain your domain and application data. Oracle recommends that you do not keep your configuration data anywhere underneath the Oracle home; if you upgrade your product to another major release, you will be required to create a new Oracle home for binaries. You must also make sure that your configuration data exist in a location to which the binaries in the Oracle home have access.

The `/home/oracle/product` (for the Oracle home) and `/home/oracle/config` (for the application and configuration data) directories are used in examples throughout the documentation; be sure to replace these directories with the actual directories on your system.

### 2.2.3.2 About the Oracle Home Directory

When you install any Oracle Fusion Middleware product, you must use an Oracle home directory.

This directory is a repository for common files that are used by multiple Fusion Middleware products installed on the same machine. These files are essential to ensuring that Fusion Middleware operates correctly on your system. They facilitate checking of cross-product dependencies during installation. For this reason, you can consider the Oracle home directory a *central support directory* for all Oracle Fusion Middleware products installed on your system.

Fusion Middleware documentation refers to the Oracle home directory as `ORACLE_HOME`.

**Oracle Home Considerations**

Keep the following in mind when creating the Oracle home directory and installing Fusion Middleware products:

- Do not include spaces in the name of your Oracle home directory; the installer gives you an error message if your Oracle home directory path contains spaces.
• You can install only one instance of each Oracle Fusion Middleware product in a single Oracle home directory. If you need to maintain separate versions of a product on the same machine, each version must be in its own Oracle home directory.

Although you can have several different products in a single Oracle home, only one version of each product can be in the Oracle home.

Multiple Home Directories

Although in most situations, a single Oracle home directory is sufficient, it is possible to create more than one Oracle home directory. For example, you need to maintain multiple Oracle home directories in the following situations:

• You prefer to maintain separate development and production environments, with a separate product stack for each. With two directories, you can update your development environment without modifying the production environment until you are ready to do so.

• You want to maintain two different versions of a Fusion Middleware product at the same time. For example, you may want to install a new version of a product while keeping your existing version intact. In this case, you must install each product version in its own Oracle home directory.

• You need to install multiple products that are not compatible with each other. See Oracle Fusion Middleware 12c (12.2.1.2) Interoperability and Compatibility in Oracle Fusion Middleware Understanding Interoperability and Compatibility for more information.

Note: If you create more than one Oracle home directory, you must provide non-overlapping port ranges during the configuration phase for each product.

2.2.3.3 About the Domain Home Directory

The Domain home is the directory where domains that you configure are created.

The default Domain home location is ORACLE_HOME/user_projects/domains/domain_name. However, Oracle strongly recommends that you do not use this default location. Put your Domain home outside of the Oracle home directory, for example, in /home/oracle/config/domains. The config directory should contain domain and application data. Oracle recommends a separate domain directory so that new installs, patches, and other operations update the ORACLE_HOME only, not the domain configuration.

See Understanding the Recommended Directory Structure for more about the recommended directory structure and locating your Domain home.

Fusion Middleware documentation refers to the Domain home directory as DOMAIN_HOME and includes all folders up to and including the domain name. For example, if you name your domain exampledomain and locate your domain data in the /home/oracle/config/domains directory, the documentation would use DOMAIN_HOME to refer to /home/oracle/config/domains/exampledomain.

2.2.3.4 About the Application Home Directory

The Application home is the directory where applications for domains you configure are created.
The default Application home location is ORACLE_HOME/user_projects/applications/domain_name. However, Oracle strongly recommends locating your Application home outside of the Oracle home directory; if you upgrade your product to another major release, you must create a new Oracle home for binaries.

See Understanding the Recommended Directory Structure for more about the recommended directory structure and locating your Application home.

Fusion Middleware documentation refers to the Application home directory as APPLICATION_HOME and includes all folders up to and including the domain name. For example, if you name your domain exampledomain and you locate your application data in the /home/oracle/config/applications directory, the documentation uses APPLICATION_HOME to refer to /home/oracle/config/applications/exampledomain.

### 2.2.3.5 Installing Multiple Products in the Same Domain

There are two methods for installing and configuring multiple products in one domain.

- **Method 1.**
  
  Install and configure Product A, including creating the schemas and starting all servers in the domain to verify a successful domain configuration.

  This is the method used in all installation guides in the Fusion Middleware library. You can repeat this process for as many products as necessary. It allows you to validate one product at a time and add more products incrementally.

  To install Product B, you stop the Administration Server to prevent any updates to the domain while you are adding the new product. Then, follow instructions in the installation guide for Product B, including creating the necessary schemas. Finally, extend the Product A domain to include Product B before starting all of the servers again.

- **Method 2.**

  Install all of the necessary products, then create the schemas for all of the products. After creating the schemas, configure the domain using all of the necessary product templates, then start all the servers.

  This method of creating a multi-product domain may be slightly faster; however, the installation guides in the Fusion Middleware library do not provide specific instructions for this method of domain creation. You will need to refer to the supporting documentation as appropriate.

### 2.2.3.6 Preparing for Shared Storage

Oracle Fusion Middleware enables you to configure multiple Oracle WebLogic Server domains from a single Oracle home. This allows you to install the Oracle home in a single location on a shared volume and reuse the Oracle home for multiple host installations.

If you plan to use shared storage in your environment, see Using Shared Storage in Oracle Fusion Middleware High Availability Guide for more information.

For configuration requirements specific to Managed File Transfer, see High Availability Properties in Oracle Fusion Middleware Using Oracle Managed File Transfer.
2.2.4 About JDK Requirements for an Oracle Fusion Middleware Installation

Most Fusion Middleware products are in .jar file format. These distributions do not include a JDK. To run a .jar distribution installer, you must have a certified JDK already installed on your system.

Make sure that the JDK is installed outside of the Oracle home. If you install the JDK under the Oracle home, you will encounter problems when you try to perform tasks in the future. Oracle Universal Installer validates that the Oracle home directory is empty; the install will not progress until you specify an empty directory. Oracle recommends that you locate your JDK installation in the /home/oracle/products/jdk directory.

Some products (such as Oracle HTTP Server and Oracle JDeveloper) are available as platform-specific distributions. Platform-specific distributions have a .bin (for UNIX operating systems) or .exe (for Windows operating systems) installer; in these cases, a platform-specific JDK is in the distribution and you do not need to install a JDK separately. However, you may need to upgrade this JDK to a more recent version, depending on the JDK versions that are certified.

Always verify the required JDK version by reviewing the certification information on the Oracle Fusion Middleware Supported System Configurations page. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

To download the required JDK, navigate to the following URL and download the Java SE JDK:

2.2.5 About Database Requirements for an Oracle Fusion Middleware Installation

Many Oracle Fusion Middleware products require database schemas prior to configuration. If you do not already have a database where you can install these schemas, you must install and configure a certified database.

To find a certified database for your operating system, see the certification document for your release on the Oracle Fusion Middleware Supported System Configurations page on the Oracle Technology Network (OTN).

To make sure your database is properly configured for schema creation, see "Repository Creation Utility Requirements" in the Oracle Fusion Middleware System Requirements and Specifications document.

After your database is properly configured, you use the Repository Creation Utility (RCU) to create product schemas in your database. This tool is available in the Oracle home for your Oracle Fusion Middleware product. For more information, see About the Repository Creation Utility in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

About the Custom Variables Required for the SOA Suite Schemas

When you install the Oracle SOA Suite schemas, you are prompted to set two custom variables, which affect the way in which these schemas are created in the database.

2.2.5.1 About the Custom Variables Required for the SOA Suite Schemas

When you install the Oracle SOA Suite schemas, you are prompted to set two custom variables, which affect the way in which these schemas are created in the database.
These variables are explained further in the following sections:

**About the Database Profile Custom Variable**
The Database Profile custom variable on the Repository Creation Utility (RCU) Custom Variables screen allows you to identify the predicted size or "profile" of the database on which you are installing the SOA Infrastructure schema.

**About the Healthcare Integration Custom Variable**
The Healthcare Integration custom variable helps to activate the Healthcare Integration User Interface for Oracle SOA Suite. The interface is not supported for Oracle Business Process Management.

### 2.2.5.1.1 About the Database Profile Custom Variable
The Database Profile custom variable on the Repository Creation Utility (RCU) Custom Variables screen allows you to identify the predicted size or "profile" of the database on which you are installing the SOA Infrastructure schema.

To estimate the size of the database required for your Oracle SOA Suite configuration, consider the information in Developing a Database Growth Management Strategy in Oracle Fusion Middleware Administering Oracle SOA Suite and Oracle Business Process Management Suite.

If you enter **SMALL** or **MEDIUM** as the database profile, the RCU performs no special actions when the schema is created. The **SMALL** and **MEDIUM** options should be entered for informational purposes only.

If you enter **LARGE** as the database profile, the RCU creates the SOA Infrastructure schema using an Oracle database feature called Interval Partitioning. Interval partitioning improves the efficiency of the database when large numbers of composite applications must be processed. When you select the **LARGE** database profile, the RCU creates the interval partitioned tables in a manner supported by the Oracle SOA Suite purging scripts and guidelines.

For more information about database partitioning, see the following sections of the Oracle Database VLDB and Partitioning Guide:

- Partitioning Concepts
- Interval Partitioning

### 2.2.5.1.2 About the Healthcare Integration Custom Variable
The Healthcare Integration custom variable helps to activate the Healthcare Integration User Interface for Oracle SOA Suite. The interface is not supported for Oracle Business Process Management.

If you are *not* planning to use the Healthcare Integration User Interface for Oracle SOA Suite, then set the value of the Healthcare Integration custom variable to **NO**. If you *are* planning to use the Healthcare Integration User Interface for Oracle SOA Suite, set it to **YES**. Otherwise, the Healthcare Integration User Interface will not function properly after it is installed and configured.
When set to **YES**, the RCU creates additional materialized views in the database, which are required by the Healthcare Integration User Interface. When set to **NO**, you can perform these additional schema configuration tasks later by running the following SQL script on the database. This script is installed in the Oracle Fusion Middleware Oracle home when you select the Healthcare with B2B installation type:

```
ORACLE_HOME/common/sql/soainfra/sql/oracle/b2b_mv.sql
```

For more information, see Using the Oracle SOA for Healthcare Integration User Interface in *Oracle Fusion Middleware Healthcare Integration User’s Guide for Oracle SOA Suite*.

### 2.3 About Product Distributions

You create the initial Oracle SOA Suite and Oracle Business Process Management domain using the Oracle Fusion Middleware Infrastructure distribution, which contains both Oracle WebLogic Server software and Oracle Java Required Files (JRF) software.

Oracle JRF software consists of:

- Oracle Web Services Manager
- Oracle Application Development Framework (Oracle ADF)
- Oracle Enterprise Manager Fusion Middleware Control
- Repository Creation Utility (RCU)
- Other libraries and technologies required to support Oracle Fusion Middleware products

Installing Oracle Fusion Middleware Infrastructure is a prerequisite to installing Oracle SOA Suite and Oracle Business Process Management.

### 2.4 Obtaining the Product Distribution

You can obtain the Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Oracle Business Process Management distribution on the Oracle Technology Network (OTN).

To prepare to install Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Oracle Business Process Management:

1. Enter `java -version` on the command line to verify that a certified JDK is installed on your system. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

   For more information, see *About JDK Requirements for an Oracle Fusion Middleware Installation*.

2. Locate and download the Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Oracle Business Process Management software.

   See *Obtaining Product Distributions* in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*. 

---

---
Installing the Oracle SOA Suite and Oracle Business Process Management Software

Follow the steps in this section to install the Oracle SOA Suite and Oracle Business Process Management software.

Before beginning the installation, ensure that you have verified the prerequisites and completed all steps covered in Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management.

Verifying the Installation Checklist
The installation process requires specific information.

Starting the Installation Program
Before running the installation program, you must verify the JDK and prerequisite software is installed.

Navigating the Installation Screens
The installer shows a series of screens where you verify or enter information.

Verifying the Installation
After you complete the installation, verify it was successful by completing a series of tasks.

3.1 Verifying the Installation Checklist
The installation process requires specific information.

Table 3-1 lists important items that you must know before, or decide during, Oracle SOA Suite and Oracle Business Process Management installation.

Table 3-1   Installation Checklist

<table>
<thead>
<tr>
<th>Information</th>
<th>Example Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JAVA_HOME</td>
<td>/home/Oracle/Java/jdk1.8.0_101</td>
<td>Environment variable that points to the Java JDK home directory.</td>
</tr>
<tr>
<td>Database host</td>
<td>examplehost.exampledomain</td>
<td>Name and domain of the host where the database is running.</td>
</tr>
<tr>
<td>Database port</td>
<td>1521</td>
<td>Port number that the database listens on. The default Oracle database listen port is 1521.</td>
</tr>
</tbody>
</table>
Table 3-1 (Cont.) Installation Checklist

<table>
<thead>
<tr>
<th>Information</th>
<th>Example Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database service name</td>
<td>orcl</td>
<td>Oracle databases require a unique service name. The default service name is orcl.</td>
</tr>
<tr>
<td>DBA username</td>
<td>SYS</td>
<td>Name of user with database administration privileges. The default DBA user on Oracle databases is SYS.</td>
</tr>
<tr>
<td>DBA password</td>
<td>myDBApw957</td>
<td>Password of the user with database administration privileges.</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>/home/Oracle/product/ORACLE_HOME</td>
<td>Directory in which you will install your software.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This directory will include Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Oracle Business Process Management, as needed.</td>
</tr>
<tr>
<td>Console port</td>
<td>7001</td>
<td>Port for Oracle WebLogic Server and Oracle SOA Suite and Oracle Business Process Management consoles.</td>
</tr>
<tr>
<td>DOMAIN_HOME</td>
<td>/home/Oracle/config/domains/soa_domain</td>
<td>Location in which your domain data is stored.</td>
</tr>
<tr>
<td>APPLICATION_HOME</td>
<td>/home/Oracle/config/applications/soa_domain</td>
<td>Location in which your application data is stored.</td>
</tr>
<tr>
<td>Administrator user name for your WebLogic domain</td>
<td>weblogic</td>
<td>Name of the user with Oracle WebLogic Server administration privileges. The default administrator user is weblogic.</td>
</tr>
<tr>
<td>Administrator user password</td>
<td>myADMpw902</td>
<td>Password of the user with Oracle WebLogic Server administration privileges.</td>
</tr>
</tbody>
</table>
### Table 3-1  (Cont.) Installation Checklist

<table>
<thead>
<tr>
<th>Information</th>
<th>Example Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP Port</td>
<td>7021</td>
<td>Port for embedded FTP server.</td>
</tr>
<tr>
<td>RCU</td>
<td>ORACLE_HOME/oracle_common/bin</td>
<td>Path to the Repository Creation Utility (RCU).</td>
</tr>
<tr>
<td>RCU schema prefix</td>
<td>soa or bpm</td>
<td>Prefix for names of database schemas used by Oracle SOA Suite and Oracle Business Process Management.</td>
</tr>
<tr>
<td>RCU schema password</td>
<td>myRCUpw674</td>
<td>Password for the database schemas used by Oracle SOA Suite and Oracle Business Process Management.</td>
</tr>
<tr>
<td>Configuration utility</td>
<td>ORACLE_HOME/oracle_common/common/bin</td>
<td>Path to the Configuration Wizard for domain creation and configuration.</td>
</tr>
<tr>
<td>$FTP_ROOT</td>
<td>$DOMAIN_HOME/product/ftp_root</td>
<td>Embedded FTP server root directory.</td>
</tr>
</tbody>
</table>

### 3.2 Starting the Installation Program

Before running the installation program, you must verify the JDK and prerequisite software is installed.

To start the installation program:

1. Sign in to the host system.

2. If you have not already done so, verify that a certified JDK is installed on your system: enter `java -version` on the command line. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

   For more information, see About JDK Requirements for an Oracle Fusion Middleware Installation.

3. Verify that you have installed all prerequisite software, such as Oracle Fusion Middleware Infrastructure.

4. Go to the directory where you downloaded the installation program.

5. Start the installation program by running the `java` executable from the JDK directory. For example:

   - (UNIX) `/home/Oracle/Java/jdk1.8.0_101/bin/java -jar fmw_12.2.1.2.0_soa_generic.jar`
   - (Windows) `C:\home\Oracle\Java\jdk1.8.0_101\bin\java -jar fmw_12.2.1.2.0_soa_generic.jar`
When the installation program appears, you are ready to begin the installation.

### 3.3 Navigating the Installation Screens

The installer shows a series of screens where you verify or enter information. The following table lists the order in which installer screens appear. If you need additional help with an installation screen, click **Help**.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installation Inventory</td>
<td>On UNIX operating systems, this screen opens if this is the first time you are installing any Oracle product on this host. Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location. For more about the central inventory, see About the Oracle Central Inventory in <em>Oracle Fusion Middleware Installing Software with the Oracle Universal Installer</em>. This screen does not appear on Windows operating systems.</td>
</tr>
<tr>
<td>Setup</td>
<td></td>
</tr>
<tr>
<td>Welcome</td>
<td>On this screen, review the information to make sure that you have met all the prerequisites, then click <strong>Next</strong>.</td>
</tr>
<tr>
<td>Auto Updates</td>
<td>On this screen, select to skip automatic updates, select patches, or search for the latest software updates, including important security updates, through your My Oracle Support account.</td>
</tr>
<tr>
<td>Installation Location</td>
<td>Use this screen to specify your Oracle home directory location. This Oracle home should already contain Oracle Fusion Middleware Infrastructure and any other 12c (12.2.1.2) products that have been installed. You can click <strong>View</strong> to verify and ensure that you are installing Oracle SOA Suite and Oracle Business Process Management in the correct Oracle home.</td>
</tr>
<tr>
<td>Installation Type</td>
<td>Select <strong>SOA Suite</strong> to create the Oracle SOA Suite standard topology. Select <strong>BPM</strong> to create the Oracle Business Process Management standard topology. Note that when you select <strong>BPM</strong> as the installation type, Oracle SOA Suite gets automatically installed, too. If you installed only SOA Suite and want to include BPM in your installation set, run the installer again and select <strong>BPM</strong>.</td>
</tr>
</tbody>
</table>
Table 3-2  (Cont.) Oracle SOA Suite and Oracle Business Process Management Install Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
</table>
| Prerequisite Checks | This screen verifies that your system meets the minimum necessary requirements.  
To view the list of tasks that gets verified, select **View Successful Tasks**. To view log details, select **View Log**. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click **Rerun** to try again. To ignore the error or the warning message and continue with the installation, click **Skip** (not recommended). |
| Installation Summary | Use this screen to verify installation options you selected. If you want to save these options to a response file, click **Save Response File** and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.  
Click **Install** to begin the installation. |
| Installation Progress | This screen shows the installation progress.  
When the progress bar reaches 100% complete, click **Finish** to dismiss the installer, or click **Next** to see a summary. |
| Installation Complete | This screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer. |

### 3.4 Verifying the Installation

After you complete the installation, verify it was successful by completing a series of tasks.

**Reviewing the Installation Log Files**  
Review the contents of the installation log files to make sure that the installer did not encounter any problems.

**Checking the Directory Structure**  
The contents of your installation vary based on the options you selected during the installation.

**Viewing the Contents of the Oracle Home**  
You can view the contents of the Oracle home using the `viewInventory` script.

### 3.4.1 Reviewing the Installation Log Files

Review the contents of the installation log files to make sure that the installer did not encounter any problems.

By default, the installer writes logs files to the `Oracle_Inventory_Location/logs` (on UNIX operating systems) or `Oracle_Inventory_Location\logs` (on Windows operating systems) directory.

For a description of the log files and where to find them, see Installation Log Files in *Oracle Fusion Middleware Installing Software with the Oracle Universal Installer*. 
3.4.2 Checking the Directory Structure

The contents of your installation vary based on the options you selected during the installation.

For more information about the directory structure after installation, see What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware.

3.4.3 Viewing the Contents of the Oracle Home

You can view the contents of the Oracle home using the viewInventory script.

For more information, see Viewing the Contents of an Oracle Home in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer.
Configuring the Oracle SOA Suite Domain

After you have installed Oracle SOA Suite, you can configure the domain, which you can also extend for high availability.

The configuration steps presented here assume that you have completed the installation steps covered in:

- Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management
- Installing the Oracle SOA Suite and Oracle Business Process Management Software

Refer to the following sections to create the database schemas, configure a WebLogic domain, and verify the configuration:

**Creating the Database Schemas**
Before you can configure an Oracle SOA Suite and Oracle Business Process Management domain, you must install required schemas on a certified database for use with this release of Oracle Fusion Middleware.

**Configuring the Domain**
Use the Configuration Wizard to create and configure a domain.

**Starting the Servers**
After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

**Verifying the Configuration**
After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

### 4.1 Creating the Database Schemas
Before you can configure an Oracle SOA Suite and Oracle Business Process Management domain, you must install required schemas on a certified database for use with this release of Oracle Fusion Middleware.

**Installing and Configuring a Certified Database**
Before creating the database schemas, you must install and configure a certified database, and verify that the database is up and running.

**Starting the Repository Creation Utility**
Start the Repository Creation Utility (RCU) after verifying that a certified JDK is installed on your system.

**Navigating the Repository Creation Utility Screens to Create the Schemas**
Enter required information in the RCU screens to create the database schemas.
4.1.1 Installing and Configuring a Certified Database

Before creating the database schemas, you must install and configure a certified database, and verify that the database is up and running.

For more information, see About Database Requirements for an Oracle Fusion Middleware Installation.

4.1.2 Starting the Repository Creation Utility

Start the Repository Creation Utility (RCU) after verifying that a certified JDK is installed on your system.

To start the RCU:

1. Verify that a certified JDK already exists on your system by running `java -version` from the command line. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

   For more information, see About JDK Requirements for an Oracle Fusion Middleware Installation.

2. Ensure that the `JAVA_HOME` environment variable is set to the location of the certified JDK. For example:

   - (UNIX) `setenv JAVA_HOME /home/Oracle/Java/jdk1.8.0_101`
   - (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_101`

3. Go to the `/oracle_common/bin` directory:

   - (UNIX) `ORACLE_HOME/oracle_common/bin`
   - (Windows) `ORACLE_HOME\oracle_common\bin`

4. Enter the following command:

   - (UNIX) `./rcu`
   - (Windows) `rcu.bat`

4.1.3 Navigating the Repository Creation Utility Screens to Create the Schemas

Enter required information in the RCU screens to create the database schemas.

**Introducing the RCU**

The Welcome screen is the first screen that appears when you start the RCU.

**Selecting a Method of Schema Creation**

Use the Create Repository screen to select a method to create and load component schemas into the database.

**Providing Database Connection Details**

On the Database Connection Details screen, provide the database connection details for the RCU to connect to your database.
Specifying a Custom Prefix and Selecting Schemas
On the Select Components screen, specify a custom prefix and select the product database schema.

Specifying Schema Passwords
On the Schema Passwords screen, specify how you want to set the schema passwords on your database, then enter and confirm your passwords.

Specifying Custom Variables
On the Custom Variables screen, specify the custom variables for the SOA Infrastructure schema.

Completing Schema Creation
Navigate through the remaining RCU screens to complete schema creation.

4.1.3.1 Introducing the RCU
The Welcome screen is the first screen that appears when you start the RCU.
Click Next.

4.1.3.2 Selecting a Method of Schema Creation
Use the Create Repository screen to select a method to create and load component schemas into the database.
On the Create Repository screen:

• If you have the necessary permission and privileges to perform DBA activities on your database, select System Load and Product Load. This procedure assumes that you have SYSDBA privileges.

• If you do not have the necessary permission or privileges to perform DBA activities in the database, you must select Prepare Scripts for System Load on this screen. This option generates a SQL script that you can give to your database administrator. See About System Load and Product Load in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

• If the DBA has already run the SQL script for System Load, select Perform Product Load.

4.1.3.3 Providing Database Connection Details
On the Database Connection Details screen, provide the database connection details for the RCU to connect to your database.

Note:
If you are unsure of the service name for your database, you can obtain it from the SERVICE_NAMES parameter in the initialization parameter file of the database. If the initialization parameter file does not contain the SERVICE_NAMES parameter, then the service name is the same as the global database name, which is specified in the DB_NAME and DB_DOMAIN parameters.

For example:
Database Type: Oracle Database
Name: examplehost.exampledomain.com
Port: 1521
Service Name: Orcl.exampledomain.com
User Name: sys
Password: ******
Role: SYSDBA

Click Next to proceed, then click OK in the dialog window that confirms a successful database connections.

4.1.3.4 Specifying a Custom Prefix and Selecting Schemas

On the Select Components screen, specify a custom prefix and select the product database schema.

Select Create new prefix, specify a custom prefix, then select SOA Suite schema. This will automatically select SOA Infrastructure, along with the following schemas as dependencies:

- User Messaging Service
- Metadata Services
- WebLogic Services
- Oracle Platform Security Services
- Audit Services
- Audit Services Append
- Audit Services Viewer

**Tip:**
Make a note of the custom prefix you choose to enter here; you will need this later on during the domain creation process.

A schema called Common Infrastructure Services is also automatically created; this schema is grayed out (you can’t select it or deselect it). This schema enables you to retrieve information from the RCU during domain configuration. For more information, see Understanding the Service Table Schema in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

The custom prefix logically groups these schemas together for use in this domain only; you must create a unique set of schemas for each domain as schema sharing across domains is not supported.

---

**See Also:**

For more information, see the following topics in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility:

- Understanding Custom Prefixes
- Planning Your Schema Creation
Click **Next** to proceed, then click **OK** to confirm that prerequisite checking for schema creation was successful.

### 4.1.3.5 Specifying Schema Passwords

On the Schema Passwords screen, specify how you want to set the schema passwords on your database, then enter and confirm your passwords.

**Tip:**

You must make a note of the passwords you set on this screen; you will need them later on during the domain creation process.

### 4.1.3.6 Specifying Custom Variables

On the Custom Variables screen, specify the custom variables for the SOA Infrastructure schema.

For the Oracle SOA Suite standard installation topology, accept both default values for Database Profile (**Small**) and Healthcare Integration (**No**).

For more information, see About the Custom Variables Required for the SOA Suite Schemas.

**Tip:**

For more information about the options on this screen, see Custom Variables in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

### 4.1.3.7 Completing Schema Creation

Navigate through the remaining RCU screens to complete schema creation.

On the Map Tablespaces screen, the Encrypt Tablespace check box appears only if you enabled TDE (Transparent Data Encryption) in the database (Oracle or Oracle EBR) when you start the RCU. Select the Encrypt Tablespace check box if you want to encrypt all new tablespaces that the RCU will create.

When you reach the Completion Summary screen, click **Close** to dismiss the RCU.

### 4.2 Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

- **Starting the Configuration Wizard**
  Start the Configuration Wizard to begin configuring a domain.

- **Navigating the Configuration Wizard Screens to Create and Configure the Domain**
  Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

### 4.2.1 Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:
1. Go to the `/oracle_common/common/bin` directory:

   *(UNIX) `ORACLE_HOME/oracle_common/common/bin`

   *(Windows) `ORACLE_HOME\oracle_common\common\bin`

   where `ORACLE_HOME` is your 12c (12.2.1.2) Oracle home.

2. Enter the following command:

   *(UNIX) `./config.sh`

   *(Windows) `config.cmd`

### 4.2.2 Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

**Note:**

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.

**Selecting the Domain Type and Domain Home Location**

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

**Selecting the Configuration Template for Oracle SOA Suite**

Use the Templates screen to select the templates you require.

**Selecting the Application Home Location**

Use the Application Location screen to select the location to store applications associated with your domain, also known as the *Application home* directory.

**Configuring the Administrator Account**

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

**Specifying the Domain Mode and JDK**

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

**Specifying the Database Configuration Type**

Use the Database Configuration type screen to specify details about the database and database schema.

**Specifying JDBC Component Schema Information**

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

**Testing the JDBC Connections**

Use the JDBC Component Schema Test screen to test the data source connections.
Selecting Advanced Configuration
Use the Advanced Configuration screen to complete the domain configuration.

Configuring the Administration Server Listen Address
Use the Administration Server screen to select the IP address of the host.

Configuring Node Manager
Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Configuring Managed Servers for Oracle SOA Suite
Use the Managed Servers screen to configure Managed Servers.

Configuring a Cluster for Oracle SOA Suite
Use the Clusters screen to create a new cluster.

Defining Server Templates
If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

Configuring Dynamic Servers
If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

Assigning Oracle SOA Suite Managed Servers to the Cluster
Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

Configuring Coherence Clusters
Use the Coherence Clusters screen to configure the Coherence cluster.

Creating a New Oracle SOA Suite Machine
Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Assigning Servers to Oracle SOA Suite Machines
Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

Virtual Targets
If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

Partitions
The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

Reviewing Your Configuration Specifications and Configuring the Domain
The Configuration Summary screen shows detailed configuration information for the domain you are about to create.
Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

4.2.2.1 Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select Create a new domain.
2. In the Domain Location field, specify your Domain home directory.

   Tip:
   For more information about this screen, see Configuration Type in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.2 Selecting the Configuration Template for Oracle SOA Suite

Use the Templates screen to select the templates you require.

On the Templates screen, make sure Create Domain Using Product Templates is selected, then select the following template:

- Oracle SOA Suite - 12.2.1.2.0 [soa]

Selecting this template automatically selects the following as dependencies:

- Oracle Enterprise Manager
- Oracle WSM Policy Manager
- Oracle JRF
- WebLogic Coherence Cluster Extension

   Tip:
   For more information about this screen, see Templates in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.3 Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.
Tip:
For more about the Application home directory, see About the Application Home Directory.

For more information about this screen, see Application Location in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.4 Configuring the Administrator Account
Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain's Administration Server.

4.2.2.5 Specifying the Domain Mode and JDK
Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

- Select Production in the Domain Mode field.
- Select the Oracle HotSpot JDK in the JDK field.

Tip:
For more information about this screen, see Domain Mode and JDK in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.6 Specifying the Database Configuration Type
Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select RCU Data. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

Note:
If you select Manual Configuration on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting RCU Data, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBMS/Service  | Enter the database DBMS name, or service name if you selected a service type driver.  
Example: orcl.exampledomain.com |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Enter the name of the server hosting the database. Example: examplehost.exampledomain.com</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the database listens. Example: 1521</td>
</tr>
<tr>
<td>Schema Owner</td>
<td>Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is prefix_STB, where prefix is the custom prefix that you defined in the RCU.</td>
</tr>
<tr>
<td>Schema Password</td>
<td></td>
</tr>
</tbody>
</table>

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

Connecting to the database server...OK
Retrieving schema data from database server...OK
Binding local schema components with retrieved data...OK
Successfully Done.

**Tip:**

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

For more information about this screen, see Database Configuration Type in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 4.2.2.7 Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected **RCU Data** on the previous screen, the schema table should already be populated appropriately.

**Tip:**

For high availability environments, see the following sections in *Oracle Fusion Middleware High Availability Guide* for additional information on configuring data sources for Oracle RAC databases:

- Configuring Active GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

For more information about this screen, see JDBC Component Schema in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*. 

---

4-10 Installing and Configuring Oracle SOA Suite and Oracle Business Process Management
4.2.2.8 Testing the JDBC Connections
Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the Schema Password column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

Tip:
For more information about this screen, see JDBC Component Schema Test in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.9 Selecting Advanced Configuration
Use the Advanced Configuration screen to complete the domain configuration.
On the Advanced Configuration screen, select:

- Administration Server
  Required to properly configure the listen address of the Administration Server.

- Node Manager
  Required to configure Node Manager.

- Topology
  Required to configure the Oracle SOA Suite Managed Server.

Optionally, select other available options as required for your desired installation environment. The steps in this guide describe a standard installation topology, but you may choose to follow a different path. If your installation requirements extend to additional options outside the scope of this guide, you may be presented with additional screens to configure those options. For information about all Configuration Wizard screens, see Configuration Wizard Screens in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.10 Configuring the Administration Server Listen Address
Use the Administration Server screen to select the IP address of the host.
Select the drop-down list next to Listen Address and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do not use All Local Addresses.
Do not specify any server groups for the Administration Server.

4.2.2.11 Configuring Node Manager
Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.
Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

**Tip:**
For more information about this screen, see Node Manager in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

### 4.2.2.12 Configuring Managed Servers for Oracle SOA Suite

Use the Managed Servers screen to configure Managed Servers.

To configure Managed Servers for Oracle SOA Suite:

1. Click **Add** and create a Managed Server named **soa_server1**.

2. In the Listen Address drop-down list, select the IP address of the host on which the Managed Server will reside or use the system name or DNS name that maps to a single IP address. Do not use **All Local Addresses**.

3. In the Server Groups drop-down list, make sure that **SOA-MGD-SVRS** is selected. This server group ensures that SOA and Oracle Web Services Manager (OWSM) services are targeted to the Managed Servers you are creating.

There is another server group called **SOA-MGD-SVRS-ONLY** that targets only SOA but not Oracle Web Services Manager (OWSM) to the server. This is typically used if you want to have Oracle Web Services Manager (OWSM) in a different server rather than with the SOA server.

Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. A given application service group may be mapped to multiple server groups if needed. Any application services that are mapped to a given server group are automatically targeted to all servers that are assigned to that group. For more information, see Application Service Groups, Server Groups, and Application Service Mappings in *Oracle Fusion Middleware Domain Template Reference*.

4. Configuring a second Managed Server is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

Click **Add** and select **SOA-MGD-SVRS** to create a second Managed Server named **soa_server2**.

**Note:**
If you plan to configure a cluster that includes both SOA and OSB Managed Servers on the same machine, you must assign both the **OSB-MGD-SVRS-COMBINED** and **SOA-MGD-SVRS** server groups to each Managed Server. Otherwise, domain creation will fail.

For more information about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in *Oracle Fusion Middleware High Availability Guide*.
For more information about the next steps to prepare for high availability after your domain is configured, see Preparing Your Environment for High Availability.

These server names are referenced in examples throughout this document; if you choose different names be sure to replace them as needed.

**Tip:**
For more information about this screen, see Managed Servers in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.13 Configuring a Cluster for Oracle SOA Suite

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click Add.
2. Specify soa_cluster1 in the Cluster Name field.
3. Leave the Cluster Address field blank.

By default, server instances in a cluster communicate with one another using unicast. If you want to change your cluster communications to use multicast, see Considerations for Choosing Unicast or Multicast in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server.

You can also create clusters using Fusion Middleware Control. In this case, you can configure cluster communication (unicast or multicast) when you create the new cluster. For more information, see Create and configure clusters in Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help.

**Tip:**
For more information about this screen, see Clusters in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.14 Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

To continue configuring the domain, click Next.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in Oracle Fusion Middleware High Availability Guide.

4.2.2.15 Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

If you are not configuring a dynamic cluster, click Next to continue configuring the domain.

**Note:** When you create dynamic clusters, keep in mind that after you assign the Machine Name Match Expression, you do not need to create machines for your dynamic cluster.
For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in *Oracle Fusion Middleware High Availability Guide*.

### 4.2.2.16 Assigning Oracle SOA Suite Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new *configured cluster*. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a *dynamic cluster*, a cluster that contains one or more generated server instances that are based on a server template.

For more on configured cluster and dynamic cluster terms, see About Dynamic Clusters in *Oracle Fusion Middleware Understanding Oracle WebLogic Server*.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, *soa_cluster1*.

2. In the Servers pane, assign *soa_server1* to *soa_cluster1* by doing one of the following:

   - Click once on *soa_server1* to select it, then click the right arrow to move it beneath the selected cluster (*soa_cluster1*) in the Clusters pane.

   - Double-click on *soa_server1* to move it beneath the selected cluster (*soa_cluster1*) in the Clusters pane.

3. Repeat to assign *soa_server2* to *soa_cluster1*.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.

![Managed Servers Assigned to Clusters](image)

**Tip:**

For more information about this screen, see Assign Servers to Clusters in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 4.2.2.17 Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.
Note:
Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

See Table 5-2 for more information and next steps for configuring Coherence.

Note:
For Coherence licensing information, see Oracle Coherence Products in Licensing Information.

4.2.2.18 Creating a New Oracle SOA Suite Machine

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Tip:
If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the instructions in this section to create all the machines at this time. For more information, see Optional Scale Out Procedure in Oracle Fusion Middleware High Availability Guide.

To create a new Oracle SOA Suite machine so that Node Manager can start and stop servers:

1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click Add to create a new machine.
2. In the Name field, specify a machine name, such as soa_machine1.
3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.
   You must select a specific interface and not localhost. This allows Coherence cluster addresses to be dynamically calculated.
4. Verify the port in the Node Manager Listen Port field.
5. Repeat these steps to add more machines, if required.

Note:
If you are extending an existing domain, you can assign servers to any existing machine. It is not necessary to create a new machine unless your situation requires it.

Tip:
For more information about this screen, see Machines in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.
4.2.2.19 Assigning Servers to Oracle SOA Suite Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

On the Assign Servers to Machines screen:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, soa_machine1.

2. In the Servers pane, assign AdminServer to soa_machine1 by doing one of the following:
   - Click once on AdminServer to select it, then click the right arrow to move it beneath the selected machine (soa_machine1) in the Machines pane.
   - Double-click on AdminServer to move it beneath the selected machine (soa_machine1) in the Machines pane.

3. Repeat these steps to assign all Managed Servers to their respective machines.

The following figure shows a generic example of the Machines pane after Managed Servers are assigned to machines.

**Figure 4-2 Assign Managed Servers to Machines**

<table>
<thead>
<tr>
<th>Servers</th>
<th>Machines</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="AdminServer" /></td>
<td><img src="image" alt="Machine" /></td>
</tr>
<tr>
<td><img src="image" alt="AdminServer" /></td>
<td><img src="image" alt="Machine" /></td>
</tr>
<tr>
<td><img src="image" alt="AdminServer" /></td>
<td><img src="image" alt="Machine" /></td>
</tr>
<tr>
<td><img src="image" alt="AdminServer" /></td>
<td><img src="image" alt="Machine" /></td>
</tr>
<tr>
<td><img src="image" alt="AdminServer" /></td>
<td><img src="image" alt="Machine" /></td>
</tr>
</tbody>
</table>

**Tip:**
For more information about this screen, see Assign Servers to Machines in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.20 Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

**Tip:** For more information about this screen, see Virtual Targets in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.21 Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.
Tip: For more information about this screen, see Partitions in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.22 Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the Back button or selecting the screen in the navigation pane. Domain creation does not start until you click Create.

Tip:
For more information about this screen, see Configuration Summary in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

4.2.2.23 Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click Finish to dismiss the Configuration Wizard.

4.3 Starting the Servers

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

Note:
For more information on additional tools you can use to manage your domain, see Overview of Oracle Fusion Middleware Administration Tools in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

Starting Node Manager
Starting the Administration Server
Starting the Managed Servers

4.3.1 Starting Node Manager

To start the per-domain Node Manager:

1. Go to the \texttt{DOMAIN\_HOME/bin} directory.

2. Enter the following command:

   - (UNIX) Using \texttt{nohup} and \texttt{nm.out} as an example output file:
nohup ./startNodeManager.sh > LOG_DIR/nm.out&

where LOG_DIR is the location of directory in which you want to store the log files.

• (Windows) startNodeManager.cmd

---

**Note:**

On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

See Running Node Manager as a Startup Service in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

---

### 4.3.2 Starting the Administration Server

To start the Administration Server:

1. Go to the `DOMAIN_HOME/bin` directory.

2. Enter the following command:

   • (UNIX)
     ```bash
     ./startWebLogic.sh
     ```

   • (Windows)
     ```bash
     startWebLogic.cmd
     ```

If you selected **Production Mode** on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as provided on the Administrator Account screen.

**Tip:**

For more information about starting the Administration Server, see Starting and Stopping Administration Server in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see Creating a Boot Identity File for an Administration Server in *Oracle Fusion Middleware Administering Server Startup and Shutdown for Oracle WebLogic Server*.

You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen ([http://administration_server_host:administration_server_port/console](http://administration_server_host:administration_server_port/console)). The default Administration Server port number is 7001.
Note:
Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.

For more information about how to use the Administration Console, see Getting Started Using Oracle WebLogic Server Administration Console in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

4.3.3 Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:
   
   http://administration_server_host:administration_server_port/em

   The Administration Server host and port number were in the URL on the End of Configuration screen (Writing Down Your Domain Home and Administration Server URL). The default Administration Server port number is 7001.

   The login credentials were provided on the Administrator Account screen (Configuring the Administrator Account).

2. The Enterprise Manager landing page lists the servers configured for this domain and displays their status (such as Running or Shutdown). For a newly configured domain, only the AdminServer(admin) will be running.

   Select the first Managed Server.

4. Repeat Steps 3 and 4 to start all Managed Servers.

5. On the main landing page, verify that all the Managed Servers are up and running.

4.4 Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
After you have installed Oracle Business Process Management, you can configure the domain, which you can also extend for high availability.

The configuration steps presented here assume that you have completed the installation steps covered in:

- Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management
- Installing the Oracle SOA Suite and Oracle Business Process Management Software

Refer to the following sections to create the database schemas, configure a WebLogic domain, and test the configuration:

**Creating the Database Schemas**
Before you can configure an Oracle Business Process Management domain, you must create the required Oracle schemas on a certified database for use with this release of Oracle Fusion Middleware.

**Configuring the Domain**
Use the Configuration Wizard to create and configure a domain.

**Starting the Servers**
After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

**Verifying the Configuration**
After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

### 5.1 Creating the Database Schemas

Before you can configure an Oracle Business Process Management domain, you must create the required Oracle schemas on a certified database for use with this release of Oracle Fusion Middleware.

Follow the instructions in Creating the Database Schemas to create the required schemas.

### 5.2 Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

For information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.
Starting the Configuration Wizard
Start the Configuration Wizard to begin configuring a domain.

Navigating the Configuration Wizard Screens to Create and Configure the Domain
Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

5.2.1 Starting the Configuration Wizard
Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Go to the \oracle_common\common\bin directory:
   (UNIX) $ORACLE_HOME/oracle_common/common/bin
   (Windows) $ORACLE_HOME\oracle_common\common\bin

   where $ORACLE_HOME is your 12c (12.2.1.2) Oracle home.

2. Enter the following command:
   (UNIX) ./config.sh
   (Windows) config.cmd

5.2.2 Navigating the Configuration Wizard Screens to Create and Configure the Domain
Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

**Note:**
You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.

---

**Selecting the Domain Type and Domain Home Location for Oracle Business Process Management**
Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

**Selecting the Configuration Template for Oracle Business Process Management**
Use the Templates screen to select the templates you require.

**Selecting the Application Home Location**
Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

**Configuring the Administrator Account**
Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.
Specifying the Domain Mode and JDK
Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

Specifying the Database Configuration Type
Use the Database Configuration type screen to specify details about the database and database schema.

Specifying JDBC Component Schema Information
Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Testing the JDBC Connections
Use the JDBC Component Schema Test screen to test the data source connections.

Selecting Advanced Configuration
Use the Advanced Configuration screen to complete the domain configuration.

Configuring the Administration Server Listen Address
Use the Administration Server screen to select the IP address of the host.

Configuring Node Manager
Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Configuring Managed Servers for Oracle Business Process Management
Use the Managed Servers screen to configure Managed Servers.

Configuring a Cluster for Oracle Business Process Management
Use the Clusters screen to create a new cluster.

Defining Server Templates
If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

Configuring Dynamic Servers
If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

Assigning Oracle Business Process Management Managed Servers to the Cluster
Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

Configuring Coherence Clusters
Use the Coherence Clusters screen to configure the Coherence cluster.

Creating a New Oracle Business Process Management Machine
Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Assigning Servers to Oracle Business Process Management Machines
Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.
Virtual Targets
If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

Partitions
The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

Reviewing Your Configuration Specifications and Configuring the Domain
The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Writing Down Your Domain Home and Administration Server URL
The End of Configuration screen shows information about the domain you just configured.

5.2.2.1 Selecting the Domain Type and Domain Home Location for Oracle Business Process Management
Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select Create a new domain.

   Note: You can also extend your existing Oracle SOA Suite domain to include BPM by selecting Update an existing domain. For more information, see Extending the Domain with Business Process Management in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite.

2. In the Domain Location field, specify your Domain home directory.

   Tip:

   For more information about this screen, see Configuration Type in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.2 Selecting the Configuration Template for Oracle Business Process Management
Use the Templates screen to select the templates you require.

On the Templates screen, make sure Create Domain Using Product Templates is selected, then select the following template:

- Oracle BPM Suite - 12.2.1.2.0 [soa]

   Selecting this template automatically selects the following as dependencies:
5.2.2.3 Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.

Tip:
For more about the Application home directory, see About the Application Home Directory.

For more information about this screen, see Application Location in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.4 Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain's Administration Server.

5.2.2.5 Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

• Select Production in the Domain Mode field.

• Select the Oracle HotSpot JDK in the JDK field.

Tip:
For more information about this screen, see Domain Mode and JDK in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.
5.2.2.6 Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select **RCU Data**. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

**Note:**

If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting **RCU Data**, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS/Service</td>
<td>Enter the database DBMS name, or service name if you selected a service type driver.</td>
</tr>
<tr>
<td></td>
<td>Example: orcl.exampledomain.com</td>
</tr>
<tr>
<td>Host Name</td>
<td>Enter the name of the server hosting the database.</td>
</tr>
<tr>
<td></td>
<td>Example: examplehost.exampledomain.com</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the database listens.</td>
</tr>
<tr>
<td></td>
<td>Example: 1521</td>
</tr>
<tr>
<td>Schema Owner</td>
<td>Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords).</td>
</tr>
<tr>
<td>Schema Password</td>
<td>The default username is prefix_STB, where prefix is the custom prefix that you defined in the RCU.</td>
</tr>
</tbody>
</table>

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

- Connecting to the database server...OK
- Retrieving schema data from database server...OK
- Binding local schema components with retrieved data...OK

Successfully Done.
Tip:
For more information about the schema installed when the RCU is run, see About the Service Table Schema in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

For more information about this screen, see Database Configuration Type in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.7 Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected RCU Data on the previous screen, the schema table should already be populated appropriately.

Tip:
For high availability environments, see the following sections in Oracle Fusion Middleware High Availability Guide for additional information on configuring data sources for Oracle RAC databases:

• Configuring Active GridLink Data Sources with Oracle RAC
• Configuring Multi Data Sources

For more information about this screen, see JDBC Component Schema in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.8 Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the Schema Password column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

Tip:
For more information about this screen, see JDBC Component Schema Test in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.9 Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

On the Advanced Configuration screen, select:

• Administration Server
Required to properly configure the listen address of the Administration Server.

- Node Manager
  Required to configure Node Manager.

- Topology
  Required to configure the Oracle Business Process Management Managed Server.

5.2.2.10 Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to **Listen Address** and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do **not** use **All Local Addresses**.

Do **not** specify any server groups for the Administration Server.

5.2.2.11 Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

**Tip:**

For more information about this screen, see Node Manager in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

5.2.2.12 Configuring Managed Servers for Oracle Business Process Management

Use the Managed Servers screen to configure Managed Servers.

On the Managed Servers screen, a Managed Server named **bpm_server1** is automatically created by default.

**Note:** When deployed on a SOA server, the default Managed Server name is **soa_server1** instead of **bpm_server1**. In this guide, **bpm_server1** is used to readily identify this Managed Server.

To configure Managed Servers for Oracle Business Process Management:

1. In the Listen Address drop-down list, select the IP address of the host on which the Managed Server will reside. Do not use **All Local Addresses**.

2. In the Server Groups drop-down list, make sure that **SOA-MGD-SVRS** is selected. This server group ensures that SOA and Oracle Web Services Manager (OWSM) services are targeted to the Managed Servers you are creating.

   There is another server group called **SOA-MGD-SVRS-ONLY** that targets only SOA but not Oracle Web Services Manager (OWSM) to the server. This is typically used if you want to have Oracle Web Services Manager (OWSM) in a different server rather than with the SOA server.
Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. A given application service group may be mapped to multiple server groups if needed. Any application services that are mapped to a given server group are automatically targeted to all servers that are assigned to that group. For more information, see Application Service Groups, Server Groups, and Application Service Mappings in Oracle Fusion Middleware Domain Template Reference.

3. Configuring a second Managed Server is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

Click Add and select SOA-MGD-SVRS to create a second Managed Server named bpm_server2.

For more information about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in Oracle Fusion Middleware High Availability Guide.

For more information about the next steps to prepare for high availability after your domain is configured, see Preparing Your Environment for High Availability.

These server names are referenced in examples throughout this document.

Tip:

For more information about this screen, see Managed Servers in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.13 Configuring a Cluster for Oracle Business Process Management

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click Add.

2. Specify bpm_cluster1 in the Cluster Name field.

3. Leave the Cluster Address field blank.

By default, server instances in a cluster use unicast to communicate with one another. If you want to change your cluster communications to use multicast, see Considerations for Choosing Unicast or Multicast in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server.

You can also use Oracle Fusion Middleware Control to create clusters. In this case, you can configure cluster communication (unicast or multicast) as you go through cluster creation steps. For more information, see Create and configure clusters in Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help.

Tip:

For more information about this screen, see Clusters in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.14 Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.
To continue configuring the domain, click **Next**.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in *Oracle Fusion Middleware High Availability Guide*.

### 5.2.2.15 Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

If you are **not** configuring a dynamic cluster, click **Next** to continue configuring the domain.

---

**Note:** When you create dynamic clusters, keep in mind that after you assign the Machine Name Match Expression, you do not need to create machines for your dynamic cluster.

---

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in *Oracle Fusion Middleware High Availability Guide*.

### 5.2.2.16 Assigning Oracle Business Process Management Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

See About Dynamic Clusters for more on configured cluster and dynamic cluster terms.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, *bpm_cluster1*.

2. In the Servers pane, assign *bpm_server1* to *bpm_cluster1* by doing one of the following:
   - Click once on *bpm_server1* to select it, then click the right arrow to move it beneath the selected cluster (*bpm_cluster1*) in the Clusters pane.
   - Double-click on *bpm_server1* to move it beneath the selected cluster (*bpm_cluster1*) in the Clusters pane.

3. Repeat to assign *bpm_server2* to *bpm_cluster1*.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.
5.2.2.17 Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.

**Note:**

Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

See Table 5-2 for more information and next steps for configuring Coherence.

**Note:**

For Coherence licensing information, see Oracle Coherence Products in Licensing Information.

5.2.2.18 Creating a New Oracle Business Process Management Machine

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

**Tip:**

If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the directions in this section to create all of the machines at this time. For more information, see Optional Scale Out Procedure in Oracle Fusion Middleware High Availability Guide.
1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click **Add** to create a new machine.

2. In the Name field, specify a machine name, such as `bpm_machine1`.

3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.

   You must select a specific interface and not `localhost`. This allows Coherence cluster addresses to be dynamically calculated.

4. Verify the port in the Node Manager Listen Port field.

5. Repeat these steps to add more machines, if required.

---

**Note:**

If you are extending an existing domain, you can assign servers to any existing machine; you don’t need to create a new machine unless your situation requires it.

---

**Tip:**

For more information about this screen, see Machines in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

---

### 5.2.2.19 Assigning Servers to Oracle Business Process Management Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to the new machine you just created.

On the Assign Servers to Machines screen:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, `bpm_machine1`.

2. In the Servers pane, assign **AdminServer** to `bpm_machine1` by doing one of the following:
   - Click once on **AdminServer** to select it, then click the right arrow to move it beneath the selected machine (`bpm_machine1`) in the Machines pane.
   - Double-click on **AdminServer** to move it beneath the selected machine (`bpm_machine1`) in the Machines pane.

3. Repeat these steps to assign both `bpm_server1` and `bpm_server2` to `bpm_machine1`.

The following figure shows a generic example of the Machines pane after Managed Servers for a product are assigned to machines.
Figure 5-2 Assign Managed Servers to Machines

<table>
<thead>
<tr>
<th>Servers</th>
<th>Machines</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdminServer</td>
<td>Machine</td>
</tr>
<tr>
<td></td>
<td>fmw_Machine_1</td>
</tr>
<tr>
<td></td>
<td>fmw_server_1</td>
</tr>
<tr>
<td></td>
<td>fmw_server_2</td>
</tr>
<tr>
<td></td>
<td>fmw_Machine_2</td>
</tr>
<tr>
<td></td>
<td>fmw_server_3</td>
</tr>
<tr>
<td></td>
<td>fmw_server_4</td>
</tr>
<tr>
<td></td>
<td>fmw_Machine_3</td>
</tr>
<tr>
<td></td>
<td>fmw_server_5</td>
</tr>
<tr>
<td></td>
<td>fmw_server_6</td>
</tr>
</tbody>
</table>

Tip:
For more information about this screen, see Assign Servers to Machines in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.20 Virtual Targets
If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

Tip: For more information about this screen, see Virtual Targets in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.21 Partitions
The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

Tip: For more information about this screen, see Partitions in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.22 Reviewing Your Configuration Specifications and Configuring the Domain
The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the Back button or selecting the screen in the navigation pane. Domain creation does not start until you click Create.

Tip:
For more information about this screen, see Configuration Summary in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

5.2.2.23 Writing Down Your Domain Home and Administration Server URL
The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:
• Domain Location
• Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click **Finish** to dismiss the Configuration Wizard.

### 5.3 Starting the Servers

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

#### 5.3.1 Starting Node Manager

To start the per-domain Node Manager:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
   - (UNIX) Using `nohup` and `nm.out` as an example output file:
     
     ```sh
     nohup ./startNodeManager.sh > LOG_DIR/nm.out &
     ```
     
     where `LOG_DIR` is the location of directory in which you want to store the log files.
   - (Windows) `startNodeManager.cmd`

    **Note:**

    On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

    See **Running Node Manager as a Startup Service in Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server**.

#### 5.3.2 Starting the Administration Server

To start the Administration Server:

1. Go to the `DOMAIN_HOME/bin` directory.

Starting Node Manager
Starting the Administration Server
Starting the Managed Servers
2. Enter the following command:

- (UNIX)
  ```
  ./startWebLogic.sh
  ```

- (Windows)
  ```
  startWebLogic.cmd
  ```

If you selected **Production Mode** on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as provided on the Administrator Account screen.

**Tip:**

For more information about starting the Administration Server, see Starting and Stopping Administration Server in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see Creating a Boot Identity File for an Administration Server in *Oracle Fusion Middleware Administering Server Startup and Shutdown for Oracle WebLogic Server*.

You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen (`http://administration_server_host:administration_server_port/console`). The default Administration Server port number is 7001.

**Note:**

Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.

For more information about how to use the Administration Console, see Getting Started Using Oracle WebLogic Server Administration Console in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

### 5.3.3 Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:

   ```
   http://administration_server_host:administration_server_port/em
   ```

   The Administration Server host and port number were in the URL on the End of Configuration screen (*Writing Down Your Domain Home and Administration Server URL*). The default Administration Server port number is 7001.

   The login credentials were provided on the Administrator Account screen (*Configuring the Administrator Account*).
2. The Enterprise Manager landing page lists the servers configured for this domain and displays their status (such as **Running** or **Shutdown**). For a newly configured domain, only the **AdminServer(admin)** will be running.

Select the first Managed Server.

3. Next to the **WebLogic Server** menu, select **Start Up**.

4. Repeat Steps 3 and 4 to start all Managed Servers.

5. On the main landing page, verify that all the Managed Servers are up and running.

### 5.4 Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see [Performing Additional Domain Configuration Tasks](#).
After you have installed Oracle Business Activity Monitoring (as part of Oracle SOA Suite and Oracle Business Process Management installation), you can configure the domain, which you can also extend for high availability.

The configuration steps presented here assume that you have completed the installation steps covered in:

- Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management
- Installing the Oracle SOA Suite and Oracle Business Process Management Software

Refer to the following sections to configure a WebLogic domain and test the configuration:

**Configuring the Domain**
Use the Configuration Wizard to create and configure a domain.

**Starting the Servers**
After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

**Verifying the Configuration**
After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

### 6.1 Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

**Note:** BAM uses the Oracle SOA Suite schema. Therefore, you will not create a database schema during BAM domain configuration.

For more information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

**Starting the Configuration Wizard**
Start the Configuration Wizard to begin configuring a domain.

**Navigating the Configuration Wizard Screens to Create and Configure the Domain**
Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.
6.1.1 Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Go to the /oracle_common/common/bin directory:
   (UNIX) ORACLE_HOME/oracle_common/common/bin
   (Windows) ORACLE_HOME/oracle_common/common\bin
   where ORACLE_HOME is your 12c (12.2.1.2) Oracle home.

2. Enter the following command:
   (UNIX) ./config.sh
   (Windows) config.cmd

6.1.2 Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

---

**Note:**

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.

---

**Selecting the Domain Type and Domain Home Location**

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

**Selecting the Configuration Templates for Oracle Business Activity Monitoring**

Use the Templates screen to select the templates you require.

**Selecting the Application Home Location**

Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

**Configuring the Administrator Account**

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

**Specifying the Domain Mode and JDK**

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

**Specifying the Database Configuration Type**

Use the Database Configuration type screen to specify details about the database and database schema.
Specifying JDBC Component Schema Information
Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Testing the JDBC Connections
Use the JDBC Component Schema Test screen to test the data source connections.

Selecting Advanced Configuration
Use the Advanced Configuration screen to complete the domain configuration.

Configuring the Administration Server Listen Address
Use the Administration Server screen to select the IP address of the host.

Configuring Node Manager
Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Configuring Managed Servers for Oracle Business Activity Monitoring
Use the Managed Servers screen to configure Managed Servers.

Configuring a Cluster for Oracle Business Activity Monitoring
Use the Clusters screen to create a new cluster.

Defining Server Templates
If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

Configuring Dynamic Servers
If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

Assigning Oracle Business Activity Monitoring Managed Servers to the Cluster
Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

Configuring Coherence Clusters
Use the Coherence Clusters screen to configure the Coherence cluster.

Assigning Servers to Oracle Business Activity Monitoring Machines
Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to a new machine.

Creating New Oracle Business Activity Monitoring Machines
Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Virtual Targets
If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.
Partitions
The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

Reviewing Your Configuration Specifications and Configuring the Domain
The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Writing Down Your Domain Home and Administration Server URL
The End of Configuration screen shows information about the domain you just configured.

6.1.2.1 Selecting the Domain Type and Domain Home Location
Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

To specify the Domain type and Domain home directory:

1. On the Configuration Type screen, select Create a new domain.

   **Note:** You can also extend your existing Oracle SOA Suite domain to include BAM by selecting Update an existing domain. For more information, see Extending the Domain with Business Activity Monitoring in Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite.

2. In the Domain Location field, specify your Domain home directory.

   **Tip:** For more information about this screen, see Configuration Type in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.2 Selecting the Configuration Templates for Oracle Business Activity Monitoring
Use the Templates screen to select the templates you require.

On the Templates screen, make sure Create Domain Using Product Templates is selected, then select the following template(s):

- Business Activity Monitoring - 12.2.1.2.0 [soa]

- If you are installing BAM in a SOA domain (for example, if you plan to use BAM for monitoring SOA using the built-in BAM dashboards), also select:

  Oracle SOA Suite - 12.2.1.2.0 [soa]

  Selecting this template automatically selects the following as dependencies:

  - Oracle Enterprise Manager
  - Oracle WSM Policy Manager
– Oracle JRF
– WebLogic Coherence Cluster Extension

Tip:
For more information about this screen, see Templates in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.3 Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.

Tip:
For more about the Application home directory, see About the Application Home Directory.

For more information about this screen, see Application Location in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.4 Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain’s Administration Server.

6.1.2.5 Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

• Select Production in the Domain Mode field.
• Select the Oracle HotSpot JDK in the JDK field.

Tip:
For more information about this screen, see Domain Mode and JDK in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.6 Specifying the Database Configuration Type

Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select RCU Data. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.
Note:

If you select **Manual Configuration** on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting **RCU Data**, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| DBMS/Service      | Enter the database DBMS name, or service name if you selected a service type driver.  
Example: orcl.exampledomain.com |
| Host Name         | Enter the name of the server hosting the database.                          
Example: examplehost.exampledomain.com |
| Port              | Enter the port number on which the database listens.                        
Example: 1521 |
| Schema Owner      | Enter the username and password for connecting to the database's Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is `prefix_STB`, where `prefix` is the custom prefix that you defined in the RCU. |
| Schema Password   |                                                                                   |

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

```
Connecting to the database server...OK
Retrieving schema data from database server...OK
Binding local schema components with retrieved data...OK
Successfully Done.
```

**Tip:**

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

For more information about this screen, see Database Configuration Type in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 6.1.2.7 Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values populated on the JDBC Component Schema screen are correct for all schemas. If you selected **RCU Data** on the previous screen, the schema table should already be populated appropriately.
Tip:
For high availability environments, see the following sections in Oracle Fusion Middleware High Availability Guide for additional information on configuring data sources for Oracle RAC databases:

- Configuring Active GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

For more information about this screen, see JDBC Component Schema in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.8 Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the Schema Password column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

Tip:
For more information about this screen, see JDBC Component Schema Test in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.9 Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.

On the Advanced Configuration screen, select:

- Administration Server
  Required to properly configure the listen address of the Administration Server.

- Node Manager
  Required to configure Node Manager.

- Topology
  Required to configure the Oracle Business Activity Monitoring (BAM) Managed Server.

6.1.2.10 Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to Listen Address and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do not use All Local Addresses.

Do not specify any server groups for the Administration Server.
6.1.2.11 Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

**Tip:**

For more information about this screen, see Node Manager in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

6.1.2.12 Configuring Managed Servers for Oracle Business Activity Monitoring

Use the Managed Servers screen to configure Managed Servers.

The selections described here reflect the standard installation topology shown in Using the Standard Installation Topology as a Starting Point. The standard installation topology represents a sample topology for this product, installing BAM in a SOA domain. It is not the only topology this product supports. For example, if you are creating a BAM-only domain, you will not see the SOA selections.

On the Managed Servers screen, two Managed Servers named *soa_server1* and *bam_server1* are already created by default.

To configure Managed Servers for Oracle Business Activity Monitoring:

1. In the Listen Address drop-down list, select the IP address of the host on which the Managed Servers will reside. Do not use *All Local Addresses*.

2. In the Server Groups drop-down list, select **SOA-MGD-SVRS** for *soa_server1* and **BAM-MGD-SVRS-ONLY** for *bam_server1*.

   There is another server group called **SOA-MGD-SVRS-ONLY** that targets only SOA but not Oracle Web Services Manager (OWSM) to the server. This is typically used if you want to have Oracle Web Services Manager (OWSM) in a different server rather than with the SOA server.

   Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. A given application service group may be mapped to multiple server groups if needed. Any application services that are mapped to a given server group are automatically targeted to all servers that are assigned to that group. For more information, see Application Service Groups, Server Groups, and Application Service Mappings in *Oracle Fusion Middleware Domain Template Reference*.

3. Configuring second Managed Servers is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

   Repeat these steps to create two more Managed Servers named *soa_server2* and *bam_server2*.

   For more information about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in *Oracle Fusion Middleware High Availability Guide*.
For more information about the next steps to prepare for high availability after your domain is configured, see Preparing Your Environment for High Availability.

These server names are referenced in examples throughout this document.

**Tip:**
For more information about this screen, see Managed Servers in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 6.1.2.13 Configuring a Cluster for Oracle Business Activity Monitoring

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click **Add**.
2. Specify `bam_cluster1` in the Cluster Name field.
3. Leave the Cluster Address field blank.

By default, server instances in a cluster use unicast to communicate with one another. If you want to change your cluster communications to use multicast, see Considerations for Choosing Unicast or Multicast in *Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server*.

You can also use Oracle Fusion Middleware Control to create clusters. In this case, you can configure cluster communication (unicast or multicast) as you go through cluster creation steps. For more information, see Create and configure clusters in *Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help*.

**Tip:**
For more information about this screen, see Clusters in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 6.1.2.14 Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

BAM does not support dynamic clusters in this release. Therefore, you can bypass this screen.

To continue configuring the domain, click **Next**.

### 6.1.2.15 Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

BAM does not support dynamic clusters in this release. Therefore, you can bypass this screen.

To continue configuring the domain, click **Next**.

### 6.1.2.16 Assigning Oracle Business Activity Monitoring Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not
use this screen if you are configuring a *dynamic cluster*, a cluster that contains one or more generated server instances that are based on a server template.

See About Dynamic Clusters for more on configured cluster and dynamic cluster terms.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, *bam_cluster1*.

2. In the Servers pane, assign *bam_server1* to *bam_cluster1* by doing one of the following:
   
   - Click once on *bam_server1* to select it, then click the right arrow to move it beneath the selected cluster (*bam_cluster1*) in the Clusters pane.
   
   - Double-click on *bam_server1* to move it beneath the selected cluster (*bam_cluster1*) in the Clusters pane.

3. Repeat to assign *bam_server2* to *bam_cluster1*.

4. If you are configuring BAM in a SOA domain, repeat these steps to assign *soa_server1* and *soa_server2* to *soa_cluster1*.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.

*Figure 6-1  Managed Servers Assigned to Clusters*

<table>
<thead>
<tr>
<th>Servers</th>
<th>Clusters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><em>fmw_cluster_1</em></td>
</tr>
<tr>
<td></td>
<td><em>fmw_cluster_2</em></td>
</tr>
<tr>
<td></td>
<td><em>fmw_cluster_3</em></td>
</tr>
<tr>
<td></td>
<td><em>fmw_cluster_4</em></td>
</tr>
<tr>
<td></td>
<td><em>fmw_cluster_5</em></td>
</tr>
<tr>
<td></td>
<td><em>fmw_cluster_6</em></td>
</tr>
</tbody>
</table>

**Tip:**

For more information about this screen, see Assign Servers to Clusters in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 6.1.2.17 Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.
Note:

Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

See Table 5-2 for more information and next steps for configuring Coherence.

Note:

For Coherence licensing information, see Oracle Coherence Products in Licensing Information.

6.1.2.18 Assigning Servers to Oracle Business Activity Monitoring Machines

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to a new machine.

On the Assign Servers to Machines screen:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, bam_machine1.

2. In the Servers pane, assign AdminServer to bam_machine1 by doing one of the following:
   - Click once on AdminServer to select it, then click the right arrow to move it beneath the selected machine (bam_machine1) in the Machines pane.
   - Double-click on AdminServer to move it beneath the selected machine (bam_machine1) in the Machines pane.

3. Repeat these steps to assign both bam_server1 and bam_server2 to bam_machine1.

4. If you are configuring BAM in a SOA domain, repeat these steps to assign both soa_server1 and soa_server2 to soa_machine1.

The following figure shows a generic example of the Machines pane after Managed Servers are assigned to machines.

Figure 6-2 Assign Managed Servers to Machines
6.1.2.19 Creating New Oracle Business Activity Monitoring Machines

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

**Tip:**

If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the directions in this section to create all of the machines at this time. For more information, see Optional Scale Out Procedure in Oracle Fusion Middleware High Availability Guide.

1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click **Add** to create a new machine.

2. In the Name field, specify a machine name, such as `bam_machine1`.

3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.

   You must select a specific interface and not localhost. This allows Coherence cluster addresses to be dynamically calculated.

4. Verify the port in the Node Manager Listen Port field.

5. Repeat these steps to add more machines, if required. For example, if you are configuring BAM in a SOA domain, repeat these steps for a second machine named `soa_machine2`.

**Note:**

If you are extending an existing domain, you can assign servers to any existing machine; you don’t need to create a new machine unless your situation requires it.

**Tip:**

For more information about this screen, see Machines in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.20 Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select **Next**.

**Tip:** For more information about this screen, see Virtual Targets in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.
6.1.2.21 Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

**Tip:** For more information about this screen, see Partitions in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.22 Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the Back button or selecting the screen in the navigation pane. Domain creation does not start until you click Create.

**Tip:**

For more information about this screen, see Configuration Summary in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

6.1.2.23 Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:

- Domain Location
- Administration Server URL

You need the domain location to access scripts that start Node Manager and Administration Server, and you need the URL to access the Administration Server.

Click Finish to dismiss the Configuration Wizard.

6.2 Starting the Servers

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

**Note:**

For more information on additional tools you can use to manage your domain, see Overview of Oracle Fusion Middleware Administration Tools in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

- Starting Node Manager
- Starting the Administration Server
- Starting the Managed Servers

6.2.1 Starting Node Manager

To start the per-domain Node Manager:
1. Go to the `DOMAIN_HOME/bin` directory.

2. Enter the following command:
   
   • (UNIX) Using `nohup` and `nm.out` as an example output file:
     
     ```bash
     nohup ./startNodeManager.sh > LOG_DIR/nm.out&
     ```
     
     where `LOG_DIR` is the location of directory in which you want to store the log files.

   • (Windows) `startNodeManager.cmd`

   **Note:**
   
   On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

   See Running Node Manager as a Startup Service in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

### 6.2.2 Starting the Administration Server

To start the Administration Server:

1. Go to the `DOMAIN_HOME/bin` directory.

2. Enter the following command:
   
   • (UNIX)
     
     ```bash
     ./startWebLogic.sh
     ```
   
   • (Windows)
     
     ```bash
     startWebLogic.cmd
     ```

   If you selected **Production Mode** on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as provided on the Administrator Account screen.

   **Tip:**
   
   For more information about starting the Administration Server, see Starting and Stopping Administration Server in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

   In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server.

   For more information, see Creating a Boot Identity File for an Administration Server in *Oracle Fusion Middleware Administering Server Startup and Shutdown for Oracle WebLogic Server*.

   You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen (`http://administration_server_host:administration_server_port/console`). The default Administration Server port number is 7001.
Note:

Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.

For more information about how to use the Administration Console, see Getting Started Using Oracle WebLogic Server Administration Console in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

6.2.3 Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:

   http://administration_server_host:administration_server_port/em

   The Administration Server host and port number were in the URL on the End of Configuration screen (Writing Down Your Domain Home and Administration Server URL). The default Administration Server port number is 7001.

   The login credentials were provided on the Administrator Account screen (Configuring the Administrator Account).

2. The Enterprise Manager landing page lists the servers configured for this domain and displays their status (such as Running or Shutdown). For a newly configured domain, only the AdminServer(admin) will be running.

   Select the first Managed Server.

4. Repeat Steps 3 and 4 to start all Managed Servers.

5. On the main landing page, verify that all the Managed Servers are up and running.

6.3 Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
Configuring the Oracle Real-Time Integration Business Insight Domain

After you have installed Oracle Real-Time Integration Business Insight (Insight), you can configure the domain, which you can also extend for high availability.

The configuration steps presented here assume that you have completed the installation steps covered in:

- Preparing to Install and Configure Oracle SOA Suite and Oracle Business Process Management
- Installing the Oracle SOA Suite and Oracle Business Process Management Software

Refer to the following sections to configure a WebLogic domain and test the configuration:

- **Configuring the Domain**
  Use the Configuration Wizard to create and configure a domain.

- **Starting the Servers**
  After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

- **Verifying the Configuration**
  After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

### 7.1 Configuring the Domain

Use the Configuration Wizard to create and configure a domain.

**Note:**

As shown in Figure 1-3, Insight is collocated with Oracle Business Activity Monitoring (BAM), deployed on the BAM Managed Server. Therefore, Insight reuses the BAM database schema owner, and you will not create a database schema during Insight domain configuration.

For more information on other methods to create domains, see Additional Tools for Creating, Extending, and Managing WebLogic Domains in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

- **Starting the Configuration Wizard**
  Start the Configuration Wizard to begin configuring a domain.
Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

7.1.1 Starting the Configuration Wizard

Start the Configuration Wizard to begin configuring a domain.

To start the Configuration Wizard:

1. Go to the `/oracle_common/common/bin` directory:
   - (UNIX) `ORACLE_HOME/oracle_common/common/bin`
   - (Windows) `ORACLE_HOME\oracle_common\common\bin`

   where `ORACLE_HOME` is your 12c (12.2.1.2) Oracle home.

2. Enter the following command:
   - (UNIX) `./config.sh`
   - (Windows) `config.cmd`

7.1.2 Navigating the Configuration Wizard Screens to Create and Configure the Domain

Enter required information in the Configuration Wizard screens to create and configure the domain for the topology.

---

**Note:**

You can use this procedure to extend an existing domain. If your needs do not match the instructions in the procedure, be sure to make your selections accordingly, or see the supporting documentation for more details.

---

Selecting the Domain Type and Domain Home Location

Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Selecting the Configuration Templates for Oracle Real-Time Integration Business Insight

Use the Templates screen to select the templates you require.

Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the Application home directory.

Configuring the Administrator Account

Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Specifying the Domain Mode and JDK

Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).
Specifying the Database Configuration Type
Use the Database Configuration type screen to specify details about the database and database schema.

Specifying JDBC Component Schema Information
Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Testing the JDBC Connections
Use the JDBC Component Schema Test screen to test the data source connections.

Selecting Advanced Configuration
Use the Advanced Configuration screen to complete the domain configuration.

Configuring the Administration Server Listen Address
Use the Administration Server screen to select the IP address of the host.

Configuring Node Manager
Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Configuring Managed Servers for Oracle Business Activity Monitoring
Use the Managed Servers screen to configure Managed Servers.

Configuring a Cluster for Oracle Business Activity Monitoring
Use the Clusters screen to create a new cluster.

Defining Server Templates
If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

Configuring Dynamic Servers
If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

Assigning Oracle Business Activity Monitoring Managed Servers to the Cluster
Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

Configuring Coherence Clusters
Use the Coherence Clusters screen to configure the Coherence cluster.

Creating New Oracle Business Activity Monitoring Machines
Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

Assigning Servers to Oracle Business Activity Monitoring Machines
Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to a new machine.

Virtual Targets
If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this
installation (not a WebLogic Server MT environment), you do not enter any values; just select Next.

Partitions
The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select Next without selecting any options.

Reviewing Your Configuration Specifications and Configuring the Domain
The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Writing Down Your Domain Home and Administration Server URL
The End of Configuration screen shows information about the domain you just configured.

7.1.2.1 Selecting the Domain Type and Domain Home Location
Use the Configuration Type screen to select a Domain home directory location, optimally outside the Oracle home directory.

Oracle recommends that you locate your Domain home in accordance with the directory structure in What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Domain home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or reinstall software.

Notes:
If you want to use an Insight SOA agent to collect business metrics:

- Insight must be collocated in the same domain as BAM. See About the Oracle Real-Time Integration Business Insight Standard Installation Topology.

- If you configure BAM and Insight in a separate domain from the SOA domain, then the SOA domain cannot also include BAM. If SOA and BAM are collocated in the same domain, then the BAM data source entries must reference the local SOA schema. Insight agents (in the SOA and Oracle Service Bus domains) access the remote BAM/Insight domain’s SOA schema through the BAM data source entries. However, if the BAM data source must reference the local SOA schema for BAM to work in the SOA domain, then the Insight agents cannot access the remote BAM/Insight domain’s SOA schema.

- If you configure a SOA domain to include an Insight SOA agent that communicates with a remote BAM/Insight domain, then you will need to manually edit the BAM data source entries to reference the SOA schema of the BAM/Insight domain. For more information, see Specifying JDBC Component Schema Information.

- If BAM and Insight are collocated in the same domain as SOA, then the BAM data source entries reference the correct SOA schema (in the SOA domain), and no manual updates are necessary.

To specify the Domain type and Domain home directory:
1. On the Configuration Type screen, select **Create a new domain**.

   **Note:** You can also *extend* your existing Oracle SOA Suite domain to include BAM and Insight (or extend a BAM-only domain to include Insight) by selecting **Update an existing domain**. For more information, see Extending the Domain with Business Activity Monitoring and Extending the Domain with Oracle Real-Time Integration Business Insight in *Oracle Fusion Middleware Enterprise Deployment Guide for Oracle SOA Suite*. When an existing domain is extended to include the Insight template or Insight SOA Agent template, you will need to repack and unpack the domain in all the machines that host the servers of that cluster.

2. In the Domain Location field, specify your Domain home directory.

   **Tip:**

   For more information about this screen, see Configuration Type in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

---

### 7.1.2.2 Selecting the Configuration Templates for Oracle Real-Time Integration Business Insight

Use the Templates screen to select the templates you require.

On the Templates screen, make sure **Create Domain Using Product Templates** is selected, then select the following templates:

- **Insight - 12.2.1.2.0 [soa]**
  
  Selecting this template automatically selects the following as dependencies:
  
  - Business Activity Monitoring
  - Oracle Enterprise Manager
  - Oracle WSM Policy Manager
  - Oracle JRF
  - WebLogic Coherence Cluster Extension

- **Insight SOA Agent - 12.2.1.2.0 [soa]** if you want to include an Insight agent with Oracle SOA Suite
  
  Selecting this template automatically selects the following as a dependency:
  
  - Oracle SOA Suite

   **Tip:**

   For more information about this screen, see Templates in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

---

### 7.1.2.3 Selecting the Application Home Location

Use the Application Location screen to select the location to store applications associated with your domain, also known as the **Application home** directory.

Oracle recommends that you locate your Application home in accordance with the directory structure in *What Are the Key Oracle Fusion Middleware Directories?* in *Configuring the Domain*.
Oracle Fusion Middleware Understanding Oracle Fusion Middleware, where the Application home is located outside the Oracle home directory. This directory structure helps avoid issues when you need to upgrade or re-install your software.

Tip:
For more about the Application home directory, see About the Application Home Directory.

For more information about this screen, see Application Location in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

7.1.2.4 Configuring the Administrator Account
Use the Administrator Account screen to specify the user name and password for the default WebLogic Administrator account for the domain.

Oracle recommends that you make a note of the user name and password that you enter on this screen; you need these credentials later to boot and connect to the domain’s Administration Server.

7.1.2.5 Specifying the Domain Mode and JDK
Use the Domain Mode and JDK screen to specify the domain mode and Java Development Kit (JDK).

On the Domain Mode and JDK screen:

- Select Production in the Domain Mode field.
- Select the Oracle HotSpot JDK in the JDK field.

Tip:
For more information about this screen, see Domain Mode and JDK in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

7.1.2.6 Specifying the Database Configuration Type
Use the Database Configuration type screen to specify details about the database and database schema.

On the Database Configuration type screen, select RCU Data. This option instructs the Configuration Wizard to connect to the database and Service Table (STB) schema to automatically retrieve schema information for schemas needed to configure the domain.

Note:
If you select Manual Configuration on this screen, you must manually fill in parameters for your schema on the next screen.

After selecting RCU Data, fill in the following fields:
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS/Service</td>
<td>Enter the database DBMS name, or service name if you selected a service type driver. Example: orcl.exampledomain.com</td>
</tr>
<tr>
<td>Host Name</td>
<td>Enter the name of the server hosting the database. Example: examplehost.exampledomain.com</td>
</tr>
<tr>
<td>Port</td>
<td>Enter the port number on which the database listens. Example: 1521</td>
</tr>
<tr>
<td>Schema Owner</td>
<td>Enter the username and password for connecting to the database’s Service Table schema. This is the schema username and password entered for the Service Table component on the Schema Passwords screen in the RCU (see Specifying Schema Passwords). The default username is prefix_STB, where prefix is the custom prefix that you defined in the RCU.</td>
</tr>
<tr>
<td>Schema Password</td>
<td></td>
</tr>
</tbody>
</table>

Click **Get RCU Configuration** when you finish specifying the database connection information. The following output in the Connection Result Log indicates that the operation succeeded:

- Connecting to the database server...OK
- Retrieving schema data from database server...OK
- Binding local schema components with retrieved data...OK

Successfully Done.

**Tip:**

For more information about the schema installed when the RCU is run, see About the Service Table Schema in *Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility*.

For more information about this screen, see Database Configuration Type in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

### 7.1.2.7 Specifying JDBC Component Schema Information

Use the JDBC Component Schema screen to verify or specify details about the database schemas.

Verify that the values on the JDBC Component Schema screen are correct for all schemas. Review the following to understand when the schema table may not be populated correctly for BAM:

- If you configure a SOA domain to include an Insight SOA agent that communicates with a remote BAM/Insight domain, then you will need to manually edit the BAM data source entries to reference the SOA schema of the BAM/Insight domain. The data sources that you will need to edit are:
  - BamDataSource (SOAINFRA schema)
  - BamJobSchedDataSource (WLS schema)
- BamLeasingDataSource (WLS_RUNTIME schema)
- BamNonJTADatasource (SOAINFRA schema)
- mds-bam (MDS schema)

**Note:** If you deselect the BAM template on the Templates screen (see Selecting the Configuration Templates for Oracle Real-Time Integration Business Insight), then the data sources that you will need to edit are:

- BamDataSource (SOAINFRA schema)
- BamNonJTADatasource (SOAINFRA schema)
- mds-bam (MDS schema)

**•** If BAM and Insight are collocated in the same domain as SOA, then the BAM data source entries reference the correct SOA schema (in the SOA domain), and no manual updates are necessary.

**Tip:**

For high availability environments, see the following sections in *Oracle Fusion Middleware High Availability Guide* for additional information on configuring data sources for Oracle RAC databases:

- Configuring GridLink Data Sources with Oracle RAC
- Configuring Multi Data Sources

For more information about this screen, see JDBC Component Schema in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

7.1.2.8 Testing the JDBC Connections

Use the JDBC Component Schema Test screen to test the data source connections.

A green check mark in the Status column indicates a successful test. If you encounter any issues, see the error message in the Connection Result Log section of the screen, fix the problem, then try to test the connection again.

By default, the schema password for each schema component is the password you specified while creating your schemas. If you want different passwords for different schema components, manually edit them in the previous screen (JDBC Component Schema) by entering the password you want in the **Schema Password** column, against each row. After specifying the passwords, select the check box corresponding to the schemas that you changed the password in and test the connection again.

**Tip:**

For more information about this screen, see JDBC Component Schema Test in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

7.1.2.9 Selecting Advanced Configuration

Use the Advanced Configuration screen to complete the domain configuration.
On the Advanced Configuration screen, select:

- **Administration Server**
  Required to properly configure the listen address of the Administration Server.

- **Node Manager**
  Required to configure Node Manager.

- **Topology**
  Required to configure the Oracle Business Activity Monitoring (BAM) Managed Server. Note that you can edit the default name of the BAM Managed Server if you wish to give it a different name.

### 7.1.2.10 Configuring the Administration Server Listen Address

Use the Administration Server screen to select the IP address of the host.

Select the drop-down list next to **Listen Address** and select the IP address of the host where the Administration Server will reside, or use the system name or DNS name that maps to a single IP address. Do not use **All Local Addresses**.

Do not specify any server groups for the Administration Server.

### 7.1.2.11 Configuring Node Manager

Use the Node Manager screen to select the type of Node Manager you want to configure, along with the Node Manager credentials.

Select **Per Domain Default Location** as the Node Manager type, then specify Node Manager credentials.

**Tip:**

For more information about this screen, see Node Manager in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

For more about Node Manager types, see Node Manager Overview in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server*.

### 7.1.2.12 Configuring Managed Servers for Oracle Business Activity Monitoring

Use the Managed Servers screen to configure Managed Servers.

The selections described here reflect the standard installation topology shown in *Using the Standard Installation Topology as a Starting Point*. The standard installation topology represents a sample topology for this product, installing BAM in a SOA domain. It is not the only topology this product supports. For example, if you are creating a BAM-only domain, you will not see the SOA selections.

On the Managed Servers screen, two Managed Servers named **soa_server1** and **bam_server1** are already created by default.

To configure Managed Servers for Oracle Business Activity Monitoring:

1. In the Listen Address drop-down list, select the IP address of the host on which the Managed Servers will reside. Do not use **All Local Addresses**.

2. In the Server Groups drop-down list, select **SOA-MGD-SVRS** for **soa_server1** and **BAM-MGD-SVRS-ONLY** for **bam_server1**.
There is another server group called `SOA-MGD-SVRS-ONLY` that targets only SOA but not Oracle Web Services Manager (OWSM) to the server. This is typically used if you want to have Oracle Web Services Manager (OWSM) in a different server rather than with the SOA server.

Server groups target Fusion Middleware applications and services to one or more servers by mapping defined application service groups to each defined server group. A given application service group may be mapped to multiple server groups if needed. Any application services that are mapped to a given server group are automatically targeted to all servers that are assigned to that group. For more information, see Application Service Groups, Server Groups, and Application Service Mappings in Oracle Fusion Middleware Domain Template Reference.

3. Configuring second Managed Servers is one of the steps needed to configure the standard topology for high availability. If you are not creating a highly available environment, then this step is optional.

Repeat these steps to create two more Managed Servers named `soa_server2` and `bam_server2`.

For more information about the high availability standard topology, see Understanding the Fusion Middleware Standard HA Topology in Oracle Fusion Middleware High Availability Guide.

For more information about the next steps to prepare for high availability after your domain is configured, see Preparing Your Environment for High Availability.

These server names are referenced in examples throughout this document.

**Tip:**
For more information about this screen, see Managed Servers in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

### 7.1.2.13 Configuring a Cluster for Oracle Business Activity Monitoring

Use the Clusters screen to create a new cluster.

On the Clusters screen:

1. Click **Add**.

2. Specify `bam_cluster1` in the Cluster Name field.

3. Leave the Cluster Address field blank.

By default, server instances in a cluster use unicast to communicate with one another. If you want to change your cluster communications to use multicast, see Considerations for Choosing Unicast or Multicast in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server.

You can also use Oracle Fusion Middleware Control to create clusters. In this case, you can configure cluster communication (unicast or multicast) as you go through cluster creation steps. For more information, see Create and configure clusters in Oracle Fusion Middleware Oracle WebLogic Server Administration Console Online Help.

**Tip:**
For more information about this screen, see Clusters in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.
7.1.2.14 Defining Server Templates

If you are creating dynamic clusters for a high availability setup, use the Server Templates screen to define one or more server templates for domain.

To continue configuring the domain, click Next.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in Oracle Fusion Middleware High Availability Guide.

7.1.2.15 Configuring Dynamic Servers

If you are creating dynamic clusters for a high availability setup, use the Dynamic Servers screen to configure the dynamic servers.

If you are not configuring a dynamic cluster, click Next to continue configuring the domain.

Note: When you create dynamic clusters, keep in mind that after you assign the Machine Name Match Expression, you do not need to create machines for your dynamic cluster.

For steps to create a dynamic cluster for a high availability setup, see Using Dynamic Clusters in Oracle Fusion Middleware High Availability Guide.

7.1.2.16 Assigning Oracle Business Activity Monitoring Managed Servers to the Cluster

Use the Assign Servers to Clusters screen to assign Managed Servers to a new configured cluster. A configured cluster is a cluster you configure manually. You do not use this screen if you are configuring a dynamic cluster, a cluster that contains one or more generated server instances that are based on a server template.

See About Dynamic Clusters for more on configured cluster and dynamic cluster terms.

On the Assign Servers to Clusters screen:

1. In the Clusters pane, select the cluster to which you want to assign the Managed Servers; in this case, bam_cluster1.

2. In the Servers pane, assign bam_server1 to bam_cluster1 by doing one of the following:
   - Click once on bam_server1 to select it, then click the right arrow to move it beneath the selected cluster (bam_cluster1) in the Clusters pane.
   - Double-click on bam_server1 to move it beneath the selected cluster (bam_cluster1) in the Clusters pane.

3. Repeat to assign bam_server2 to bam_cluster1.

4. If you are configuring BAM in a SOA domain, repeat these steps to assign soa_server1 and soa_server2 to soa_cluster1.

The following image shows a generic example of the Clusters pane after Managed Servers are assigned to clusters.
7.1.2.17 Configuring Coherence Clusters

Use the Coherence Clusters screen to configure the Coherence cluster.

Leave the default port number as the Coherence cluster listen port. After configuration, the Coherence cluster is automatically added to the domain.

---

Note:

Setting the unicast listen port to 0 creates an offset for the Managed Server port numbers. The offset is 5000, meaning the maximum allowed value that you can assign to a Managed Server port number is 60535, instead of 65535.

---

See Table 5-2 for more information and next steps for configuring Coherence.

---

Note:

For Coherence licensing information, see Oracle Coherence Products in Licensing Information.

---

7.1.2.18 Creating New Oracle Business Activity Monitoring Machines

Use the Machines screen to create new machines in the domain. A machine is required so that Node Manager can start and stop servers.

---

Tip:

If you plan to create a high availability environment and know the list of machines your target topology requires, you can follow the directions in this section to create all of the machines at this time. For more information, see Optional Scale Out Procedure in Oracle Fusion Middleware High Availability Guide.

---
1. Select the Machine tab (for Windows) or the UNIX Machine tab (for UNIX), then click Add to create a new machine.

2. In the Name field, specify a machine name, such as bam_machine1.

3. In the Node Manager Listen Address field, select the IP address of the machine in which the Managed Servers are being configured.

   You must select a specific interface and not localhost. This allows Coherence cluster addresses to be dynamically calculated.

4. Verify the port in the Node Manager Listen Port field.

5. Repeat these steps to add more machines, if required. For example, if you are configuring BAM in a SOA domain, repeat these steps for a second machine named soa_machine2.

   **Note:**

   If you are extending an existing domain, you can assign servers to any existing machine; you don’t need to create a new machine unless your situation requires it.

   **Tip:**

   For more information about this screen, see Machines in Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard.

**7.1.2.19 Assigning Servers to Oracle Business Activity Monitoring Machines**

Use the Assign Servers to Machines screen to assign the Administration Server and Managed Servers to a new machine.

On the Assign Servers to Machines screen:

1. In the Machines pane, select the machine to which you want to assign the servers; in this case, bam_machine1.

2. In the Servers pane, assign AdminServer to bam_machine1 by doing one of the following:

   - Click once on AdminServer to select it, then click the right arrow to move it beneath the selected machine (bam_machine1) in the Machines pane.

   - Double-click on AdminServer to move it beneath the selected machine (bam_machine1) in the Machines pane.

3. Repeat these steps to assign both bam_server1 and bam_server2 to bam_machine1.

4. If you are configuring BAM in a SOA domain, repeat these steps to assign both soa_server1 and soa_server2 to soa_machine1.

The following figure shows a generic example of the Machines pane after Managed Servers are assigned to machines.
7.1.2.20 Virtual Targets

If you have a WebLogic Server Multitenant (MT) environment, you use the Virtual Targets screen to add or delete virtual targets. For this installation (not a WebLogic Server MT environment), you do not enter any values; just select *Next*.

**Tip:** For more information about this screen, see Virtual Targets in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

7.1.2.21 Partitions

The Partitions screen is used to configure partitions for virtual targets in WebLogic Server Multitenant (MT) environments. Select *Next* without selecting any options.

**Tip:** For more information about this screen, see Partitions in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

7.1.2.22 Reviewing Your Configuration Specifications and Configuring the Domain

The Configuration Summary screen shows detailed configuration information for the domain you are about to create.

Review each item on the screen and verify that the information is correct. To make any changes, go back to a screen by clicking the *Back* button or selecting the screen in the navigation pane. Domain creation does not start until you click *Create*.

**Tip:**

For more information about this screen, see Configuration Summary in *Oracle Fusion Middleware Creating WebLogic Domains Using the Configuration Wizard*.

7.1.2.23 Writing Down Your Domain Home and Administration Server URL

The End of Configuration screen shows information about the domain you just configured.

Make a note of the following items because you need them later:
7.2 Starting the Servers

After configuration is complete, start Node Manager, then the WebLogic Administration Server and Managed Servers.

**Note:**
For more information on additional tools you can use to manage your domain, see Overview of Oracle Fusion Middleware Administration Tools in *Oracle Fusion Middleware Administering Oracle Fusion Middleware.*

Starting Node Manager

Starting the Administration Server

Starting the Managed Servers

7.2.1 Starting Node Manager

To start the per-domain Node Manager:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
   - (UNIX) Using `nohup` and `nm.out` as an example output file:
     ```bash
     nohup ./startNodeManager.sh > LOG_DIR/nm.out
     ```
     where `LOG_DIR` is the location of directory in which you want to store the log files.
   - (Windows) `startNodeManager.cmd`

**Note:**
On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted.

See Running Node Manager as a Startup Service in *Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server.*

7.2.2 Starting the Administration Server

To start the Administration Server:

1. Go to the `DOMAIN_HOME/bin` directory.
2. Enter the following command:
   - (UNIX)
     ```bash
     ./startWebLogic.sh
     ```
   - (Windows)
     ```cmd
     startWebLogic.cmd
     ```

   If you selected **Production Mode** on the Domain Mode and JDK screen when you created the domain, you see a prompt for the Administrator user login credentials as provided on the Administrator Account screen.

   **Tip:**
   For more information about starting the Administration Server, see Starting and Stopping Administration Server in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

   In production mode, a boot identity file can be created to bypass the need to provide a user name and password when starting the Administration Server. For more information, see Creating a Boot Identity File for an Administration Server in *Oracle Fusion Middleware Administering Server Startup and Shutdown for Oracle WebLogic Server*.

   You can verify that the Administration Server is up and running by accessing the Administration Server Console. The URL is provided on the End of Configuration screen (http://administration_server_host:administration_server_port/console). The default Administration Server port number is 7001.

   **Note:**
   Make sure that the database hosting your product schemas is up and running and accessible by the Administration Server.

   For more information about how to use the Administration Console, see Getting Started Using Oracle WebLogic Server Administration Console in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

### 7.2.3 Starting the Managed Servers

To start the Managed Servers:

1. Log in to Oracle Fusion Middleware Control:
   ```
   http://administration_server_host:administration_server_port/em
   ```

   The Administration Server host and port number were in the URL on the End of Configuration screen (Writing Down Your Domain Home and Administration Server URL). The default Administration Server port number is 7001.

   The login credentials were provided on the Administrator Account screen (Configuring the Administrator Account).
2. The Enterprise Manager landing page lists the servers configured for this domain and displays their status (such as Running or Shutdown). For a newly configured domain, only the AdminServer(admin) will be running.

Select the first Managed Server.

4. Repeat Steps 3 and 4 to start all Managed Servers.

5. On the main landing page, verify that all the Managed Servers are up and running.

7.3 Verifying the Configuration

After completing all configuration steps, you can perform additional steps to verify that your domain is properly configured.

To verify that the domain is configured properly, see Performing Additional Domain Configuration Tasks.
Next Steps After Configuring the Domain

After configuring a product domain, there are additional tasks that you may want to perform.

**Performing Basic Administrative Tasks**
Review the administrative tasks you will likely want to perform on a new domain.

**Performing Additional Domain Configuration Tasks**
Review additional configuration tasks you will likely want to perform on a new domain.

**Preparing Your Environment for High Availability**
Scaling out for high availability requires additional steps.

### 8.1 Performing Basic Administrative Tasks
Review the administrative tasks you will likely want to perform on a new domain.

#### Table 8-1 Basic Administration Tasks for a New Domain

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Getting familiar with Fusion Middleware</td>
<td>Get familiar with various tools that you can use to manage your environment.</td>
<td>See Overview of Oracle Fusion Middleware Administration Tools in Oracle Fusion Middleware Administering Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Starting and stopping products and servers</td>
<td>Learn how to start and stop Oracle Fusion Middleware, including the Administration Server, Managed Servers, and components.</td>
<td>See Starting and Stopping Oracle Fusion Middleware in Oracle Fusion Middleware Administering Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Configuring Secure Sockets Layer (SSL)</td>
<td>Learn how to set up secure communications between Oracle Fusion Middleware components using SSL.</td>
<td>See Configuring SSL in Oracle Fusion Middleware Administering Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Monitoring Oracle Fusion Middleware</td>
<td>Learn how to keep track of the status of Oracle Fusion Middleware components.</td>
<td>See Monitoring Oracle Fusion Middleware in Oracle Fusion Middleware Administering Oracle Fusion Middleware.</td>
</tr>
</tbody>
</table>
Table 8-1  (Cont.) Basic Administration Tasks for a New Domain

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Getting familiar with database purging</td>
<td>Get familiar with scheduling and running purge jobs that automatically remove older flow instances, adapter reports, and fault alerts data from the database.</td>
<td>See Managing Database Growth in Oracle Fusion Middleware Administering Oracle SOA Suite and Oracle Business Process Management Suite.</td>
</tr>
</tbody>
</table>

8.2 Performing Additional Domain Configuration Tasks

Review additional configuration tasks you will likely want to perform on a new domain.

Table 8-2  Additional Domain Configuration Tasks

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deploying Applications</td>
<td>Learn how to deploy your applications to Oracle Fusion Middleware.</td>
<td>See Deploying Applications in Oracle Fusion Middleware Administering Oracle Fusion Middleware.</td>
</tr>
<tr>
<td>Adding a Web Tier front-end to your domain</td>
<td>Oracle Web Tier hosts Web pages (static and dynamic), provides security and high performance along with built-in clustering, load balancing, and failover features. In particular, the Web Tier contains Oracle HTTP Server.</td>
<td>To install and configure Oracle HTTP Server in the WebLogic Server domain, see Configuring Oracle HTTP Server in a WebLogic Server Domain in Oracle Fusion Middleware Installing and Configuring Oracle HTTP Server. See also Installing Multiple Products in the Same Domain for important information.</td>
</tr>
<tr>
<td>Tuning and configuring Coherence for your topology</td>
<td>The standard installation topology includes a Coherence cluster that contains storage-enabled Managed Coherence Servers. This configuration is a good starting point for using Coherence, but depending upon your specific requirements, consider tuning and reconfiguring Coherence to improve performance in a production environment.</td>
<td>For more about Coherence clusters, see Configuring and Managing Coherence Clusters in Oracle Fusion Middleware Administering Clusters for Oracle WebLogic Server. For information on tuning Coherence, see Performance Tuning in Oracle Fusion Middleware Administering Oracle Coherence. For information on storing HTTP session data in Coherence, see Using Coherence<em>Web with WebLogic Server in Oracle Fusion Middleware Administering HTTP Session Management with Oracle Coherence</em>Web. For more about creating and deploying Coherence applications, see Getting Started in Oracle Fusion Middleware Developing Oracle Coherence Applications for Oracle WebLogic Server.</td>
</tr>
</tbody>
</table>
### 8.3 Preparing Your Environment for High Availability

Scaling out for high availability requires additional steps.

Table 8-3 provides a list of tasks to perform if you want to scale out your standard installation environment for high availability.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scaling out to multiple host computers</td>
<td>To enable high availability, it is important to provide failover capabilities to another host computer. That way, if one computer goes down, your environment can continue to serve the consumers of your deployed applications.</td>
<td>See Scaling Out a Topology (Machine Scale Out) in the Oracle Fusion Middleware High Availability Guide.</td>
</tr>
<tr>
<td>Configuring high availability for your Web Tier components.</td>
<td>If you have added a Web tier front-end, then you must configure the Web Tier for high availability, as well as the WebLogic Server software.</td>
<td>See Configuring High Availability for Web Tier Components in Oracle Fusion Middleware High Availability Guide.</td>
</tr>
<tr>
<td>Setting up a front-end load balancer</td>
<td>A load balancer can be used to distribute requests across servers more evenly.</td>
<td>See Server Load Balancing in a High Availability Environment and Configuring Load Balancer Virtual Server Names and Ports in Oracle Fusion Middleware High Availability Guide.</td>
</tr>
<tr>
<td>Configuring Node Manager</td>
<td>Node Manager enables you to start, shut down, and restart the Administration Server and Managed Server instances from a remote location. This document assumes you have configured a per-domain Node Manager. Review the Node Manager documentation for information on advanced Node Manager configuration options and features.</td>
<td>See Advanced Node Manager Configuration in Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server.</td>
</tr>
</tbody>
</table>
Deinstalling or Reinstalling Oracle SOA Suite and Oracle Business Process Management

Follow the instructions in this section to deinstall or reinstall Oracle SOA Suite and Oracle Business Process Management.

Oracle recommends that you always use the instructions in this section to remove the software. If you try to remove the software manually, you may encounter problems when you try to reinstall the software again at a later time. Following the procedures in this section ensures that the software is properly removed.

Stopping Oracle Fusion Middleware
Before running the deinstaller, Oracle recommends that you stop all servers and processes associated with the Oracle home you are going to remove.

Removing Your Database Schemas
Before you remove the Oracle home, Oracle recommends that you run the Repository Creation Utility (RCU) to remove database schemas associated with this domain.

Deinstalling the Software
Follow the instructions in this section to start the product deinstaller and remove the software.

Removing the Oracle Home Directory Manually
After deinstalling the software, you must manually remove your Oracle home directory and any existing subdirectories that the deinstaller did not remove.

Removing the Program Shortcuts on Windows Operating Systems
On Windows operating systems, you must also manually remove the program shortcuts; the deinstaller does not remove them for you.

Removing the Domain and Application Data
After deinstalling the software, you must remove the domain and application data.

Reinstalling the Software
You can reinstall your software into the same Oracle home as a previous installation only if you deinstalled the software by following the instructions in this section, including manually removing the Oracle home directory.
9.1 Stopping Oracle Fusion Middleware
Before running the deinstaller, Oracle recommends that you stop all servers and processes associated with the Oracle home you are going to remove.

For more information, see Stopping an Oracle Fusion Middleware Environment in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

9.2 Removing Your Database Schemas
Before you remove the Oracle home, Oracle recommends that you run the Repository Creation Utility (RCU) to remove database schemas associated with this domain.

Each domain has its own set of schemas, uniquely identified by a custom prefix (see About Custom Prefixes in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility). This set of schemas cannot be shared with any other domain (see Planning Your Schema Creation in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility).

If there are multiple sets of schemas on your database, be sure to identify the schema prefix associated with the domain you are removing.

For schema removal steps, see Dropping Schemas in Oracle Fusion Middleware Creating Schemas with the Repository Creation Utility.

9.3 Deinstalling the Software
Follow the instructions in this section to start the product deinstaller and remove the software.

If you want to perform a silent (command-line) deinstallation, see Running the Oracle Universal Installer for Silent Deinstallation in Oracle Fusion Middleware Installing Software with the Oracle Universal Installer.

Starting the Deinstallation Program
Selecting the Product to Deinstall
Navigating the Deinstallation Screens

9.3.1 Starting the Deinstallation Program
To start the deinstaller:

• On UNIX
  On the command line, enter the following commands:
  
  ```bash
  cd $ORACLE_HOME/oui/bin
  ./deinstall.sh
  ```

• On Windows
  Do one of the following:

  – Use a file manager window to navigate to the `ORACLE_HOME\oui\bin` directory and double-click on `deinstall.cmd`.

  – Open a command prompt and enter the following commands:

  ```cmd
  cd %ORACLE_HOME%\oui\bin
deinstall.cmd
  ```
– From the **Start** menu, select **All Programs**, then **Oracle**, then **OracleHome**, and then **Uninstall Oracle Software**.

**9.3.2 Selecting the Product to Deinstall**

Because multiple products exist in the Oracle home, ensure that you are deinstalling the correct product.

After you run the deinstaller, the Distribution to Uninstall screen opens. From the drop-down list, select **BPM_SOA 12.2.1.2.0** and click **Uninstall**. The deinstallation program shows the screens listed in **Navigating the Deinstallation Screens**.

---

**Note:**

You can deinstall Oracle Fusion Middleware Infrastructure after you deinstall Oracle SOA Suite and Oracle Business Process Management software by running the deinstallation wizard again. Before doing so, make sure there are no other products using the Infrastructure; those products will no longer function once the Infrastructure is removed. You will not encounter the Distribution to Uninstall screen if no other software depends on Oracle Fusion Middleware Infrastructure. For deinstallation instructions, see **Deinstalling Oracle Fusion Middleware Infrastructure** in *Oracle Fusion Middleware Installing and Configuring the Oracle Fusion Middleware Infrastructure*.

---

**9.3.3 Navigating the Deinstallation Screens**

The deinstaller shows a series of screens to confirm the deinstallation of the software.

If you need help on screen listed in Table 9-1, click **Help** on the screen.

**Table 9-1 Deinstallation Screens and Descriptions**

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome</td>
<td>Introduces you to the product deinstaller.</td>
</tr>
<tr>
<td>Deinstallation</td>
<td>Shows the Oracle home directory and its contents that will be deinstalled.</td>
</tr>
<tr>
<td>Summary</td>
<td>Verify that this is the correct directory.</td>
</tr>
<tr>
<td></td>
<td>If you want to save these options to a response file, click <strong>Save Response File</strong> and enter the response file location and name. You can use response file later during a silent deinstallation. For more on silent or command line deinstallation, see Running the Oracle Universal Installer for Silent Deinstallation in <em>Installing Software with the Oracle Universal Installer</em>.</td>
</tr>
<tr>
<td></td>
<td>Click <strong>Deinstall</strong> to begin removing the software.</td>
</tr>
<tr>
<td>Deinstallation</td>
<td>Shows the deinstallation progress.</td>
</tr>
<tr>
<td>Progress</td>
<td>Appears when the deinstallation is complete. Review the information on this screen, then click <strong>Finish</strong> to dismiss the deinstaller.</td>
</tr>
<tr>
<td>Deinstallation</td>
<td></td>
</tr>
<tr>
<td>Complete</td>
<td></td>
</tr>
</tbody>
</table>

**9.4 Removing the Oracle Home Directory Manually**

After deinstalling the software, you must manually remove your Oracle home directory and any existing subdirectories that the deinstaller did not remove.
For example, if your Oracle home directory is /home/Oracle/product/ ORACLE_HOME on a UNIX operating system, enter the following commands:

```
cd /home/Oracle/product
rm -rf ORACLE_HOME
```

On a Windows operating system, if your Oracle home directory is C:\Oracle \Product \ORACLE_HOME, use a file manager window and navigate to the C:\ Oracle \Product directory, then right-click on the ORACLE_HOME folder and select Delete.

### 9.5 Removing the Program Shortcuts on Windows Operating Systems

On Windows operating systems, you must also manually remove the program shortcuts; the deinstaller does not remove them for you.

To remove the program shortcuts on Windows:

1. Go to the C:\ProgramData\Microsoft\Windows\Start Menu\Programs \Oracle \ORACLE_HOME\Product directory.

2. If you only have one product installed in your Oracle home, delete the ORACLE_HOME directory. If you have multiple products installed in your Oracle home, delete all products before deleting the ORACLE_HOME directory.

### 9.6 Removing the Domain and Application Data

After deinstalling the software, you must remove the domain and application data.

To remove the domain and application data:

1. Manually remove your Domain home directory. For example:

   On a UNIX operating system, if your Domain home directory is /home/Oracle/config/domains/soa_domain, enter the following command:

   ```
   cd /home/Oracle/config/domains
   rm -rf soa_domain
   ```

   On a Windows operating system, if your Domain home directory is C:\Oracle \Config\domains\soa_domain, use a file manager window and navigate to the C:\Oracle\Config\domains directory, then right-click on the soa_domain folder and select Delete.

2. Manually remove your Application home directory. For example:

   On a UNIX operating system, if your Application home directory is /home/Oracle/config/applications/soa_domain, enter the following commands:

   ```
   cd /home/Oracle/config/applications
   rm -rf soa_domain
   ```

   On a Windows operating system, if your Application home directory is C:\Oracle\Config\applications\soa_domain, use a file manager window and navigate to the C:\Oracle\Config\applications directory, then right-click on the soa_domain folder and select Delete.

3. Back up the domain_registry.xml file in your Oracle home, then edit the file and remove the line associated with the domain you are removing. For example, to remove the soa_domain, find the following line and remove it:
Save and exit the file when you are finished.

9.7 Reinstalling the Software

You can reinstall your software into the same Oracle home as a previous installation only if you deinstalled the software by following the instructions in this section, including manually removing the Oracle home directory.

When you reinstall, you can then specify the same Oracle home as your previous installation.

Consider the following cases where the Oracle home is not empty:

- Installing in an existing Oracle home that contains the same feature sets.
  The installer warns you that the Oracle home you specified during installation already contains the same software you are trying to install.
  Your options are:
  - Select a different installation type. In this case, only the feature sets that do not exist in the Oracle home directory are installed.
  - Select a different Oracle home directory.

- Installing in an existing, non-empty Oracle home.
  For example, suppose that you chose to create your Domain home or Application home somewhere inside your existing Oracle home. This data is not removed during the deinstallation process, so if you try to reinstall into the same Oracle home, the installer does not allow it. Your options are:
  1. Deinstall your software from the Oracle home (as this section describes) and then remove the Oracle home directory. After you deinstall the software and remove the Oracle home directory, you can reinstall and reuse the same Oracle home location. Any domain or application data that was in the Oracle home must be re-created.
  2. Select a different Oracle home directory.
This appendix describes secondary (alternate) topologies for Oracle SOA Suite and Oracle Business Process Management.

- **Oracle Business Process Management Standalone Topology**
- **Oracle SOA Suite and Enterprise Scheduler Topology**

### A.1 Oracle Business Process Management Standalone Topology

An alternate topology for Oracle SOA Suite is the Oracle Business Process Management (BPM) standalone topology.

- **About the Oracle Business Process Management Standalone Topology**
- **Roadmap for Installing and Configuring the Oracle Business Process Management Standalone Topology**

#### A.1.1 About the Oracle Business Process Management Standalone Topology

**Figure A-1** illustrates the Oracle Business Process Management standalone topology.

Use this topology when you require a simple domain that offers only the Oracle Business Process Management software capabilities and no cluster.

Note that there might be licensing implications for domains where you deploy Oracle Business Process Management to a cluster. For more information, see the Oracle Business Process Management in *Licensing Information*.

This topology consists of an Administration Server and one Managed Server in a Oracle WebLogic Server domain on a single host (SOAHOST1). Both the Oracle SOA Suite software and Oracle Business Process Management software are targeted to the Managed Server.

The required product database schemas are installed in a supported Oracle database on a separate host (DBHOST1).
A.1.2 Roadmap for Installing and Configuring the Oracle Business Process Management Standalone Topology

Table A-1 describes the roadmap needed to configure this topology on your system.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
<th>Special instructions</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
A.2 Oracle SOA Suite and Enterprise Scheduler Topology

You can integrate the capabilities of Oracle Enterprise Scheduler with Oracle SOA Suite.

About the Oracle SOA Suite and Oracle Enterprise Scheduler Topology

Roadmap for Installing and Configuring the Oracle SOA Suite and Oracle Enterprise Scheduler Topology

A.2.1 About the Oracle SOA Suite and Oracle Enterprise Scheduler Topology

Figure A-2 shows the Oracle SOA Suite and Enterprise Schedule Services (ESS) topology.

Use this topology to integrate the capabilities of Oracle Enterprise Scheduler with Oracle SOA Suite.

The topology is similar to the Oracle SOA Suite standard installation topology, described in About the Oracle SOA Suite Standard Installation Topology; however, in this topology, the Oracle Enterprise Scheduler software is targeted to the Oracle WebLogic Server cluster, in addition to the Oracle Fusion Middleware Infrastructure and Oracle SOA Suite software.

Figure A-2  Oracle SOA Suite and Oracle Enterprise Scheduler Services Topology
A.2.2 Roadmap for Installing and Configuring the Oracle SOA Suite and Oracle Enterprise Scheduler Topology

Table A-2 describes the roadmap needed to configure this topology on your system.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
<th>More Information</th>
<th>Special Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify your system environment</td>
<td>Before beginning the installation, verify that the minimum system and network requirements are met.</td>
<td>See Roadmap for Verifying Your System Environment.</td>
<td>None.</td>
</tr>
<tr>
<td>Obtain the appropriate distribution</td>
<td>Both Oracle SOA Suite and Oracle Enterprise Scheduler require an existing Oracle Fusion Middleware Infrastructure installation; when you install Oracle SOA Suite, Oracle Enterprise Scheduler gets installed, too, and Oracle SOA Suite must be installed in the same Oracle Home as Oracle Fusion Middleware Infrastructure.</td>
<td>See About Product Distributions.</td>
<td>You must obtain both Oracle Fusion Middleware Infrastructure and Oracle SOA Suite and Business Process Management distributions.</td>
</tr>
<tr>
<td>Determine your installation directories</td>
<td>Verify that the directories that will need to be created can be created or accessed by the installer, and exist on systems that meet the minimum requirements.</td>
<td>See What Are the Key Oracle Fusion Middleware Directories? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware.</td>
<td>None.</td>
</tr>
<tr>
<td>Install Oracle Fusion Middleware Infrastructure</td>
<td>Install Oracle Fusion Middleware Infrastructure to create the Oracle home directory for Oracle SOA Suite.</td>
<td>See Installing the Infrastructure Software in Oracle Fusion Middleware Installing and Configuring the Oracle Fusion Middleware Infrastructure.</td>
<td>None.</td>
</tr>
<tr>
<td>Install the software</td>
<td>Install the Oracle SOA Suite software into the existing Oracle Fusion Middleware Infrastructure home. When you install Oracle SOA Suite, Oracle Enterprise Scheduler gets installed too.</td>
<td>See Installing the Oracle SOA Suite and Oracle Business Process Management Software.</td>
<td>Select SOA on the Installation Type screen.</td>
</tr>
<tr>
<td>Task</td>
<td>Description</td>
<td>More Information</td>
<td>Special Instructions</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create a WebLogic domain</td>
<td>Use the configuration wizard to create and configure the WebLogic domain.</td>
<td>See Configuring the Oracle SOA Suite Domain.</td>
<td>Follow the instructions provided for specific screens in Configuration Options to Select for Oracle SOA Suite and Oracle Enterprise Scheduler.</td>
</tr>
<tr>
<td></td>
<td>Ensure that you select the appropriate options on the configuration screens.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Start the servers</td>
<td>Once you complete the domain creation, start the administration and managed servers.</td>
<td>See Starting the Servers.</td>
<td>Start the Managed server on which wsm-pm is targeted before you start the Manager Server on which Oracle Enterprise Scheduler is deployed.</td>
</tr>
<tr>
<td>Verify the configuration</td>
<td>Verify to ensure that the domain is configured properly.</td>
<td>See Verifying the Configuration.</td>
<td>None.</td>
</tr>
<tr>
<td>Next steps after installing and configuring Oracle SOA Suite and Oracle Enterprise Scheduler</td>
<td>You can perform administrative as well as management tasks for the domain that you have just configured.</td>
<td>See Next Steps After Configuring the Domain.</td>
<td>None.</td>
</tr>
</tbody>
</table>

**Configuration Options to Select for Oracle SOA Suite and Oracle Enterprise Scheduler**

**A.2.2.1 Configuration Options to Select for Oracle SOA Suite and Oracle Enterprise Scheduler**

Almost all of the screens and options that you must select while configuring Oracle SOA Suite and Enterprise Schedule Services are identical to those provided in Configuring the Oracle SOA Suite Domain. However, there are a couple of screens on which you must select different options. listed in the following table.

**Table A-3  Key Screens and Configuration Options for Oracle SOA Suite and Enterprise Schedule Services Topology**

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Components</td>
<td>This screen appears when you run the RCU to create schemas.</td>
</tr>
<tr>
<td></td>
<td>In addition to the schema list provided in Specifying a Custom Prefix and Selecting Schemas, select Oracle Enterprise Scheduler.</td>
</tr>
</tbody>
</table>
Table A-3  (Cont.) Key Screens and Configuration Options for Oracle SOA Suite and Enterprise Schedule Services Topology

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
</table>
| Templates                    | This screen appears after you start the configuration wizard to create your domains. In addition to the templates listed in Selecting the Configuration Template for Oracle SOA Suite, select the following templates:  
• Oracle Enterprise Scheduler Services Basic - 12.2.1.2.0 [oracle_common]  
• Oracle Enterprise Manager Plugin for ESS - 12.2.1.2.0 [em]  |
| Managed Servers              | On the Managed Servers screen (Configuring Managed Servers for Oracle SOA Suite), two managed servers are created: soa_server1 and ess_server1. Delete ess_server1 and create soa_server2. Ensure that in the Listen Address drop-down list, you select the IP address of the host on which the Managed Server will reside. Do not use All Local Addresses. In the Server Groups drop-down list, ensure that soa_server1 and soa_server2 are targeted to SOA-MGD-SVRS and ESS_MGD_SVRS.  |
| Assign Servers to Clusters   | On this screen (Assigning Oracle SOA Suite Managed Servers to the Cluster), assign both soa_server1 and soa_server2 to soa_cluster1.  |
| Assign Servers to Machine    | On this screen (Assigning Servers to Oracle SOA Suite Machines), assign the AdminServer, soa_server1 and soa_server2 to soa_machine1.  |

You can target the Oracle Business Process Management software to one cluster and the Oracle Application Development Framework software to another cluster, so there is no resource contention between the two products.

About the Oracle Business Process Management and Oracle Application Development Framework Topology

Roadmap for Installing and Configuring the Oracle Business Process Management and Oracle Application Development Framework Topology

A.3.1 About the Oracle Business Process Management and Oracle Application Development Framework Topology

Figure A-3 shows the Oracle Business Process Management (BPM) and Oracle Application Development Framework (ADF) topology.

Use this topology if you are deploying applications that take advantage of both the BPM software and a custom user interface developed using ADF. This topology allows you to target the BPM software to one cluster and the ADF software to another cluster, so there is no resource contention between the two products.
A.3.2 Roadmap for Installing and Configuring the Oracle Business Process Management and Oracle Application Development Framework Topology

Table A-4 describes the roadmap needed to configure this topology on your system.

<table>

Configuration Options to Select for Oracle Business Process Management and Application Development Framework

A.3.2.1 Configuration Options to Select for Oracle Business Process Management and Application Development Framework

Almost all of the screens and options that you must select while configuring Oracle Business Process Management and Application Development Framework are identical to the ones provided in Configuring the Oracle Business Process Management Domain. However, there are a couple of screens on which you must select different options. Ensure that you select the configuration options as provided in Table A-5.

Table A-5  Key Screens and Configuration Options for Oracle Business Process Management and Application Development Framework Topology

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Servers</td>
<td>On the Managed Servers screen (Configuring Managed Servers for Oracle Business Process Management), do the following:</td>
</tr>
<tr>
<td></td>
<td>1. Click <strong>Add</strong> and create the following Managed Servers:</td>
</tr>
<tr>
<td></td>
<td>• Two BPM Managed Servers, bpm_server1 and bpm_server2.</td>
</tr>
<tr>
<td></td>
<td>• Two ADF managed servers, adf_server1 and adf_server2.</td>
</tr>
<tr>
<td></td>
<td>2. Ensure that in the <strong>Listen Address</strong> drop-down list, you select the IP address of the host on which the Managed Server will reside. Do not use <strong>All Local Addresses</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. In the <strong>Server Groups</strong> drop-down list, ensure that bpm_server1 and bpm_server2 are targeted to <strong>SOA-MGD-SVRS</strong>, but do not assign any server groups to adf_server1 and adf_server2. Leave the ADF Managed Servers as <strong>Unspecified</strong>.</td>
</tr>
<tr>
<td>Clusters</td>
<td>On the Clusters screen (Configuring a Cluster for Oracle Business Process Management), create two clusters: bpm_cluster1 and adf_cluster1.</td>
</tr>
</tbody>
</table>
### Table A-5  (Cont.) Key Screens and Configuration Options for Oracle Business Process Management and Application Development Framework Topology

<table>
<thead>
<tr>
<th>Screen</th>
<th>Description</th>
</tr>
</thead>
</table>
| Assign Servers to Clusters | On this screen (Assigning Oracle Business Process Management Managed Servers to the Cluster), assign the servers as given below:  
  • bpm_server1 and bpm_server2 to bpm_cluster1  
  • adf_server1 and adf_server2 to adf_cluster1  |
| Assign Servers to Machine | On this screen (Assigning Servers to Oracle Business Process Management Machines), assign the servers as follows:  
  • AdminServer, bpm_server1 and bpm_server2 to bpm_machine1  
  • adf_server1 and adf_server2 to adf_machine1 |
