Oracle® Fusion Middleware
Upgrading Oracle HTTP Server
12c (12.2.1.2)
E77927-03

January 2017
This guide describes an upgrade of the Oracle HTTP Server to this release of Oracle Fusion Middleware.
## Preface

Audience ............................................................... vii  
Documentation Accessibility ........................................ vii  
Related Documents.................................................. vii  
Conventions............................................................. viii  

## What's New in This Guide

New and Changed Features for 12c ........................................ ix  
Other Significant Changes in this Document for 12c ................. ix  

## 1 Introduction to Upgrading Oracle HTTP Server to 12c (12.2.1.2)

1.1 About the Starting Points for an Oracle HTTP Server Upgrade ........................................ 1-1  
1.2 About the Oracle HTTP Server Standard Topologies.................................................. 1-2  
  1.2.1 Fusion Middleware Infrastructure Upgrade Topology with Oracle HTTP Server ........... 1-2  
1.3 Differences between Oracle HTTP Server 11g and 12c ................................................. 1-6  
1.4 About Upgrade Restrictions ......................................................................................... 1-6  
1.5 How to Use this Guide ................................................................................................. 1-7  
1.6 Determining whether Oracle HTTP Server is Standalone or Managed (Collocated) ......... 1-7  

## 2 Preparing to Upgrade Oracle HTTP Server

2.1 Oracle Fusion Middleware Pre-Upgrade Checklist .................................................. 2-2  
2.2 Creating a Complete Backup ................................................................................ 2-4  
  2.2.1 Backing Up the Schema Version Registry Table ............................................... 2-4  
  2.2.2 Maintaining Custom Domain Environment Settings ........................................ 2-4  
2.3 Cloning Your Production Environment for Testing ................................................ 2-5  
2.4 Verifying Certification and System Requirements ..................................................... 2-6  
  2.4.1 Verify Your Environment Meets Certification Requirements ............................... 2-6  
  2.4.2 Verify System Requirements and Specifications ............................................... 2-7  
  2.4.3 Verify That the Database Hosting Oracle Fusion Middleware Is Supported .......... 2-10  
  2.4.4 Verify That the JDK Is Certified for This Release of Oracle Fusion Middleware ....... 2-10  
2.5 Updating Policy Files when Using Enhanced Encryption (AES 256) .......................... 2-11
2.6 Purging Unused Data ............................................................................................................................ 2-11
2.7 Creating an Edition on the Server for Edition-Based Redefinition .................................................. 2-11
2.8 Creating a Non-SYSDBA User to Run the Upgrade Assistant .......................................................... 2-12
2.9 Identifying Existing Schemas Available for Upgrade ........................................................................... 2-14

Part I Upgrading Oracle HTTP Server from 11g to 12c

3 Upgrading a Standalone Oracle HTTP Server from 11g to 12c

3.1 About the Standalone Oracle HTTP Server Upgrade Process from 11g to 12c .................... 3-1
3.2 Important Pre-Upgrade Considerations.......................................................................................... 3-3
  3.2.1 Oracle Web Cache 11g Users ................................................................................................. 3-4
  3.2.2 WebGate 11g Users ............................................................................................................. 3-4
  3.2.3 Updating the WebGate log file-name ...................................................................................... 3-4
  3.2.4 Application Artifacts from 11g ............................................................................................... 3-5
  3.2.5 Migrating 11g Application Artifacts....................................................................................... 3-5
3.3 Installing the Standalone Oracle HTTP Server .............................................................................. 3-5
3.4 Stopping Servers and Processes ..................................................................................................... 3-7
3.5 Upgrading Domain Component Configurations ............................................................................. 3-9
  3.5.1 Starting the Upgrade Assistant ............................................................................................... 3-9
  3.5.2 Upgrading the 11g Domain Components Using the Upgrade Assistant.......................... 3-11
  3.5.3 Verifying the Domain-specific-Component Configurations Upgrade ............................... 3-14
3.6 Starting Servers and Processes ...................................................................................................... 3-14
  3.6.1 Starting the Standalone Oracle HTTP Server .................................................................... 3-16
3.7 Verifying the Upgrade ...................................................................................................................... 3-16

4 Upgrading a Managed Oracle HTTP Server from 11g to 12c

4.1 About the Managed Oracle HTTP Server Upgrade Process from 11g to 12c ........................... 4-2
4.2 Installing the Product Distributions................................................................................................. 4-3
4.3 Running a Pre-Upgrade Readiness Check ...................................................................................... 4-6
  4.3.1 About Running a Pre-Upgrade Readiness Check ................................................................. 4-6
  4.3.2 Starting the Upgrade Assistant in Readiness Mode ............................................................. 4-7
  4.3.3 Performing a Readiness Check with the Upgrade Assistant ........................................... 4-9
  4.3.4 Understanding the Readiness Report .................................................................................... 4-11
4.4 Stopping Servers and Processes .................................................................................................... 4-15
4.5 Creating the Required 12c Schemas with the RCU...................................................................... 4-16
4.6 Reconfiguring the Domain .............................................................................................................. 4-20
  4.6.1 Backing Up the Domain ........................................................................................................ 4-21
  4.6.2 Starting the Reconfiguration Wizard .................................................................................... 4-21
  4.6.3 Reconfiguring the Domain with the Reconfiguration Wizard ........................................... 4-22
4.7 Upgrading Domain Component Configurations ............................................................................ 4-27
  4.7.1 Starting the Upgrade Assistant ............................................................................................ 4-27
  4.7.2 Upgrading Domain Components Using the Upgrade Assistant ...................................... 4-29
  4.7.3 Verifying the Domain-specific-Component Configurations Upgrade ............................ 4-31
4.8 Starting Servers and Processes .................................................................................................... 4-32
4.8.1 Starting the Oracle HTTP Server........................................................................................ 4-33
4.9 Verifying the Upgrade ................................................................................................................ 4-34
4.10 Importing Wallets to the KSS Database after an Upgrade Using WLST ......................... 4-34

Part II Upgrading Oracle HTTP Server from a Previous 12c Release

5 Upgrading a Standalone Oracle HTTP Server from a Previous 12c Release

5.1 About the Standalone Oracle HTTP Server Upgrade Process from a Previous 12c Release 5-2
5.2 Installing the Standalone Oracle HTTP Server ....................................................................... 5-3
5.3 Stopping Servers and Processes ............................................................................................... 5-5
5.4 Reconfiguring the Domain ......................................................................................................... 5-6
  5.4.1 Backing Up the Domain ...................................................................................................... 5-7
  5.4.2 Starting the Reconfiguration Wizard ................................................................................. 5-8
  5.4.3 Reconfiguring the Existing Domain with the Reconfiguration Wizard ......................... 5-9
5.5 Upgrading Standalone System Component Configurations .................................................... 5-13
  5.5.1 Starting the Upgrade Assistant ........................................................................................ 5-13
  5.5.2 Upgrading Standalone System Component Configurations Using the Upgrade Assistant ................................................................. 5-16
  5.5.3 Verifying the Domain-specific-Component Configurations Upgrade .............................. 5-18
5.6 Verifying the Upgrade ................................................................................................................ 5-18
  5.6.1 Starting the Node Manager ............................................................................................ 5-18
  5.6.2 Starting the Standalone Oracle HTTP Server ................................................................ 5-19
5.7 Starting Servers and Processes ................................................................................................. 5-19

6 Upgrading a Managed Oracle HTTP Server from a Previous 12c Release

6.1 About the Managed Oracle HTTP Server Upgrade Process from a Previous 12c Release ... 6-2
6.2 Installing the Product Distributions ......................................................................................... 6-3
6.3 Running a Pre-Upgrade Readiness Check ................................................................................ 6-6
  6.3.1 About Running a Pre-Upgrade Readiness Check ............................................................ 6-6
  6.3.2 Starting the Upgrade Assistant in Readiness Mode ....................................................... 6-7
  6.3.3 Performing a Readiness Check with the Upgrade Assistant ........................................ 6-9
  6.3.4 Understanding the Readiness Report ............................................................................. 6-11
6.4 Stopping Servers and Processes ............................................................................................... 6-15
6.5 Upgrading Product Schemas ..................................................................................................... 6-16
  6.5.1 Identifying Existing Schemas Available for Upgrade ..................................................... 6-16
  6.5.2 Starting the Upgrade Assistant ....................................................................................... 6-18
  6.5.3 Upgrading the Product Schemas Using the Upgrade Assistant .................................... 6-20
  6.5.4 Verifying the Schema Upgrade ...................................................................................... 6-23
6.6 Reconfiguring the Domain ......................................................................................................... 6-23
  6.6.1 Backing Up the Domain ................................................................................................. 6-24
  6.6.2 Starting the Reconfiguration Wizard ............................................................................. 6-25
  6.6.3 Reconfiguring the Domain with the Reconfiguration Wizard ........................................ 6-26
6.7 Upgrading Domain Component Configurations ................................................................. 6-30
   6.7.1 Starting the Upgrade Assistant .................................................................................. 6-30
   6.7.2 Upgrading Domain Components Using the Upgrade Assistant ............................... 6-32
   6.7.3 Verifying the Domain-specific-Component Configurations Upgrade ......................... 6-34
6.8 Starting Servers and Processes ....................................................................................... 6-35
   6.8.1 Starting the Oracle HTTP Server .............................................................................. 6-36
6.9 Verifying the Upgrade ..................................................................................................... 6-37
6.10 Importing Wallets to the KSS Database after an Upgrade Using WLST ....................... 6-37

A Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm
   A.1 How to Check whether Certificate Signed with MD5 Algorithm is Present in the Wallet? .... A-1
   A.2 Removing Certificate Signed with MD5 Algorithm from the Wallet .............................. A-3
   A.3 Adding Certificate Signed with SHA-2 Algorithm to the Wallet ................................ A-4
   A.4 Enabling Support for Certificate Signed with MD5 Algorithm in your 12.2.1.2 Oracle HTTP Server Deployment ................................................................................................................................. A-4
This preface contains the following sections:

Audience

Documentation Accessibility

Related Documents

Conventions

Audience

This manual is intended for Oracle Fusion Middleware system administrators who are responsible for upgrading Oracle Fusion Middleware. It is assumed that the readers of this manual have knowledge of the following:

• Oracle Fusion Middleware 11g or Oracle Fusion Middleware 12c system administration and configuration information for the existing deployment

• The configuration and expected behavior of the system or systems being upgraded

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Upgrade documentation is organized by tasks in the 12c documentation library. The task-specific pages provide direct links to common upgrade procedures and related documentation.

You can refer the Oracle Fusion Middleware Library for additional information.
• For installation information, see Fusion Middleware Installation Documentation.
• For upgrade information, see Fusion Middleware 12c Upgrade Documentation.
• For administration-related information, see Fusion Middleware 12c Administration Documentation.
• For release-related information, see Fusion Middleware 12c Release Notes.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><code>monospace</code></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
What's New in This Guide

The following topics introduce the new and changed features of the standalone Oracle HTTP Server and provides pointers to additional information.

New and Changed Features for 12c

Other Significant Changes in this Document for 12c

New and Changed Features for 12c

Before you begin the upgrade process, review the following list of changes for standalone Oracle HTTP Servers in 12c:

- The installer will no longer create a separate instance directory for Oracle HTTP Server. Instance information for the standalone OHS will be stored in a new standalone domain home. For more information, see Oracle HTTP Server Standard Upgrade Topology for Standalone Agents not Associated with a WebLogic Domain.

- OPMN agent and opmnctl command line utility are no longer used in Oracle Fusion Middleware. Instead, system components are managed by NodeManager and WLST commands.

Other Significant Changes in this Document for 12c

Support for Certificates signed with MD5 algorithm has been removed. See Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm.
Introduction to Upgrading Oracle HTTP Server to 12c (12.2.1.2)

Before you begin, review all introductory information to understand the standard upgrade topologies and upgrade paths for Oracle HTTP Server 12c (12.2.1.2)

### About the Starting Points for an Oracle HTTP Server Upgrade
You can upgrade to Oracle HTTP Server 12c (12.2.1.2) from supported 11g and 12c releases.

### About the Oracle HTTP Server Standard Topologies
The steps to upgrade Oracle HTTP Server to 12c (12.2.1.2) depend on the existing production topology (either 11g or a previous 12c release).

### Differences between Oracle HTTP Server 11g and 12c
There are a few key differences to be aware of before you upgrade your Oracle HTTP Server to this release of Oracle Fusion Middleware.

### About Upgrade Restrictions
If you are using two or more Oracle Fusion Middleware products of the same or different versions in a single, supported, Oracle Fusion Middleware configuration, you must consider the interoperability and compatibility factors before planning the upgrade.

### How to Use this Guide
Strategy to upgrade Oracle HTTP Server varies depending upon whether it is a standalone deployment or a managed deployment.

### Determining whether Oracle HTTP Server is Standalone or Managed (Collocated)
Oracle HTTP Server is the web server component for Oracle Fusion Middleware. It provides a listener for Oracle WebLogic Server and the framework for hosting static pages, dynamic pages, and applications over the Web. If you configure Oracle HTTP Server in a WebLogic Server domain, it is called as the Managed Oracle HTTP Server because you can manage the Oracle HTTP Server instances like any other elements of the WebLogic Server domain using Enterprise Manager Fusion Middleware Control, or WLST Command line interface, or the Node Manager. If you install the Oracle HTTP software in a separate Oracle home without installing the Oracle Fusion Middleware Infrastructure, it is called as the standalone mode.

1.1 **About the Starting Points for an Oracle HTTP Server Upgrade**
You can upgrade to Oracle HTTP Server 12c (12.2.1.2) from supported 11g and 12c releases.

Supported release starting points are:
About the Oracle HTTP Server Standard Topologies

The steps to upgrade Oracle HTTP Server to 12c (12.2.1.2) depend on the existing production topology (either 11g or a previous 12c release).

As a result, it is difficult to provide exact upgrade instructions for every possible Oracle HTTP Server installation. Therefore, this upgrade documentation provides instructions for upgrading several typical Oracle HTTP Server topologies. These typical topologies are referred to as standard upgrade topologies.

Your actual topology may vary, but the topologies described here provide an example that can be used as a guide to upgrade other similar Oracle HTTP Server topologies.

Note: For additional information about the upgrade process and planning resources to ensure your upgrade is successful, see Preparing to Upgrade in Oracle Fusion Middleware Planning an Upgrade of Oracle Fusion Middleware.

If you are upgrading from a previous 12c release, the standard topology remains unchanged. If you are upgrading from 11g, refer to the following sections to upgrade the following specific topologies:

Fusion Middleware Infrastructure Upgrade Topology with Oracle HTTP Server
This topic contains the Oracle Fusion Middleware 11g Application Developer standard upgrade topology with Oracle HTTP Server and the resulting Oracle Fusion Middleware 12c Infrastructure topology as it appears after you complete the upgrade procedures in this guide.

1.2.1 Fusion Middleware Infrastructure Upgrade Topology with Oracle HTTP Server

This topic contains the Oracle Fusion Middleware 11g Application Developer standard upgrade topology with Oracle HTTP Server and the resulting Oracle Fusion Middleware 12c Infrastructure topology as it appears after you complete the upgrade procedures in this guide.
Most of the elements in Figure 1-1 are described in Table 1-1.

Table 1-1 Description of the Elements in the Infrastructure Standard Upgrade Topology with Oracle HTTP Server

<table>
<thead>
<tr>
<th>Element</th>
<th>Description and Links to Additional Documentation</th>
</tr>
</thead>
</table>
| 11g Application Developer Topology with Oracle HTTP Server | This is the label for the left side of Figure 1-1. It shows a typical single-host topology created using the Oracle Fusion Middleware 11g Application Developer installer.  
It consists of a single domain that contains a cluster of two managed servers and the Administration Server. It also has an optional file-based store or database with schemas.  
Figure 1-1 also shows an Oracle HTTP Server instance as part of the 11g domain.  
This document describes, step-by-step, how to upgrade this topology to an equivalent topology created using the Oracle Fusion Middleware 12c Infrastructure distribution. |
| 12c Infrastructure Standard Installation Topology with Oracle HTTP Server | This is the label for the right side of the figure. It shows a typical single-host topology created using the Oracle Fusion Middleware 12c Infrastructure distribution.  
Like the Application Developer 11g topology, it also consists of a single domain that contains a cluster of two managed servers and the Administration Server.  
Figure 1-1 also shows an Oracle HTTP Server instance as part of the 12c domain. |
Table 1-1 (Cont.) Description of the Elements in the Infrastructure Standard Upgrade Topology with Oracle HTTP Server

<tbody>
<tr>
<td>Oracle HTTP Server &quot;associated with the domain&quot;</td>
<td>An Oracle HTTP Server 11g instance that has been configured to be &quot;associated with&quot; the Oracle WebLogic Server domain. In Oracle Fusion Middleware 11g, system component instance, such as Oracle HTTP Server, are configured with an Oracle Universal Installer-based configuration wizard and are managed using Oracle Process Manager and Notification Server.</td>
</tr>
<tr>
<td>Oracle HTTP Server</td>
<td>Unlike the Oracle HTTP Server 11g instance in the left side of the diagram, the Oracle HTTP Server 12c instance shown in the 12c topology is configured as part of the domain using the Oracle Fusion Middleware Configuration Wizard. It is managed using Oracle Enterprise Manager Fusion Middleware Control, the Oracle WebLogic Scripting Tool (WLST), and the Oracle WebLogic Server Node Manager software.</td>
</tr>
</tbody>
</table>

Oracle HTTP Server Standard Upgrade Topology for Standalone Agents not Associated with a WebLogic Domain

In 12c, a Standalone Oracle HTTP Server is not managed by or associated with an Oracle WebLogic Server domain. A standalone Oracle HTTP Server 12c topology is installed and configured without the Oracle Fusion Middleware Infrastructure. A Managed Oracle HTTP Server, however, is associated with an existing Oracle WebLogic Server domain. For the standalone scenario, you install the Oracle HTTP Server software in its own Oracle home, and you configure the Oracle HTTP Server instance in its own standalone domain.

1.2.1.1 Oracle HTTP Server Standard Upgrade Topology for Standalone Agents not Associated with a WebLogic Domain

In 12c, a Standalone Oracle HTTP Server is not managed by or associated with an Oracle WebLogic Server domain. A standalone Oracle HTTP Server 12c topology is installed and configured without the Oracle Fusion Middleware Infrastructure. A Managed Oracle HTTP Server, however, is associated with an existing Oracle WebLogic Server domain. For the standalone scenario, you install the Oracle HTTP Server software in its own Oracle home, and you configure the Oracle HTTP Server instance in its own standalone domain.
Note:

- For more information on installing and configuring a standalone Oracle HTTP Server, see About Oracle HTTP Server Installation in Oracle Fusion Middleware Installing and Configuring Oracle HTTP Server.

- For more information on the latest 12c standalone domain, see What Is a Standalone Domain? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware.

- For more information on the administration scenarios and key features of the Oracle HTTP Server, see Introduction to Oracle HTTP Server Administrator's Guide for Oracle HTTP Server.

- For more information on upgrading a managed Oracle HTTP Server, see Performing the Infrastructure Upgrade in Upgrading to the Oracle Fusion Middleware Infrastructure.

Figure 1-2 shows a standalone Oracle HTTP Server topology.

**Figure 1-2  Standalone Oracle HTTP Server Upgrade Topology**

**Table 1-2 Description of the Elements in the Oracle Fusion Middleware Standalone Oracle HTTP Server Upgrade Topology**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description and Links to Additional Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>WEBHOST</td>
<td>Standard term used in Oracle documentation referring to the machine that hosts the Web tier.</td>
</tr>
<tr>
<td>Standalone Domain</td>
<td>A standalone domain is only created if you are upgrading from 11g to 12c. If you are upgrading from 12.1.2.0, 12.1.3.0, 12.2.1.0, and 12.2.1.1, then the standalone domain already exists and there is no need to create the standalone domain. The standalone domain has a directory structure similar to an Oracle WebLogic domain, but it does not contain an Administration Server or Managed Servers. The Oracle WebLogic Server Node Manager and other tools allow you to manage the standalone Oracle HTTP Server instance. For more information on standalone domains, see What Is a Standalone Domain? in Oracle Fusion Middleware Understanding Oracle Fusion Middleware.</td>

</table>
1.3 Differences between Oracle HTTP Server 11g and 12c

There are a few key differences to be aware of before you upgrade your Oracle HTTP Server to this release of Oracle Fusion Middleware.

Table 1-3 lists the key differences between Oracle HTTP Server 11g and 12c.

<table>
<thead>
<tr>
<th>In Oracle HTTP Server 11g:</th>
<th>In Oracle HTTP Server 12c:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server instances are typically configured in a separate Oracle instance directory outside the 11g Middleware home.</td>
<td>Oracle HTTP Server instances can be configured a part of an Oracle WebLogic Server domain, using the Oracle Fusion Middleware Configuration Wizard.</td>
</tr>
<tr>
<td>Oracle HTTP Server instances are managed using the Oracle Process Manager and Notification Server (OPMN) management software. Optionally, the Oracle HTTP Server instances can be associated with the WebLogic domain.</td>
<td>When configured as part of an Oracle Application Server Infrastructure domain, Oracle HTTP Server instances can be managed using Oracle Enterprise Manager Fusion Middleware Control and the Oracle WebLogic Scripting Tool (WLST). In Oracle Fusion Middleware 12c, the Node Manager agent is responsible for delegating and executing management requests to Oracle HTTP Server instances.</td>
</tr>
<tr>
<td>mod_osso is supported and included with Oracle HTTP Server 11g. If you use mod_osso in 11g, it will be disabled after upgrade as it is not supported in 12c.</td>
<td>mod_osso is not supported or included with Oracle HTTP Server 12c. Oracle WebGate is the recommended replacement. You can install WebGate with Oracle HTTP Server. For more information on configuring WebGate with Oracle HTTP Server, see Oracle Fusion Middleware Installing and Configuring Oracle HTTP Server.</td>
</tr>
</tbody>
</table>

For more information about the changes to the ways system components, such as Oracle HTTP Server, are configured and managed in Oracle Fusion Middleware 12c, as well as other key changes for Oracle Fusion Middleware 12c, see the following:

- New and Changed Features for 12c
- New and Deprecated Terminology for 12c
- What is the WebLogic Management Framework?

1.4 About Upgrade Restrictions

If you are using two or more Oracle Fusion Middleware products of the same or different versions in a single, supported, Oracle Fusion Middleware configuration, you must consider the interoperability and compatibility factors before planning the upgrade.

**Interoperability**

In the context of Oracle Fusion Middleware products, interoperability is defined as the ability of two Oracle Fusion Middleware products or components of the same version (or release) to work together (interoperate) in a supported Oracle Fusion Middleware configuration. Specifically, interoperability applies when the first 4 digits of the release or version number are the same. For example, Oracle Fusion Middleware 12c (12.2.1.0) components are generally interoperable with other 12c (12.2.1.2) components.
Compatibility
In the context of Oracle Fusion Middleware products, compatibility is defined as the ability of two Oracle Fusion Middleware components of different versions (or releases) to interoperate.

For a list of products and features available in Oracle Fusion Middleware Release 12.2.1.2, see Products and Features Available in Oracle Fusion Middleware in Oracle Fusion Middleware Understanding Interoperability and Compatibility.

When performing the upgrade of your hardware or software, verify that your Oracle Fusion Middleware software is certified to support the new operating system or computer hardware. For more information, refer to the following resources:

- Oracle Fusion Middleware Supported System Configurations
- Oracle® Fusion Middleware System Requirements and Specifications

1.5 How to Use this Guide
Strategy to upgrade Oracle HTTP Server varies depending upon whether it is a standalone deployment or a managed deployment.

Depending upon the starting point and type of your deployment, navigate to one of the following parts in this guide. Further, each part has sub-sections covering the upgrade procedure for each valid starting point.

- Upgrading Oracle HTTP Server from 11g to 12c
  - Upgrading a Standalone Oracle HTTP Server from 11g to 12c
  - Upgrading a Managed Oracle HTTP Server from 11g to 12c
- Upgrading Oracle HTTP Server from a Previous 12c Release
  - Upgrading a Standalone Oracle HTTP Server from a Previous 12c Release
  - Upgrading a Managed Oracle HTTP Server from a Previous 12c Release

**Note:** Before you start your upgrade, make sure that you review the introductory topics and complete the required pre-upgrade tasks.

1.6 Determining whether Oracle HTTP Server is Standalone or Managed (Collocated)
Oracle HTTP Server is the web server component for Oracle Fusion Middleware. It provides a listener for Oracle WebLogic Server and the framework for hosting static pages, dynamic pages, and applications over the Web. If you configure Oracle HTTP Server in a WebLogic Server domain, it is called as the Managed Oracle HTTP Server because you can manage the Oracle HTTP Server instances like any other elements of the WebLogic Server domain using Enterprise Manager Fusion Middleware Control, or WLST Command line interface, or the Node Manager. If you install the Oracle HTTP software in a separate Oracle home without installing the Oracle Fusion Middleware Infrastructure, it is called as the standalone mode.

To determine whether you are upgrading a managed or a standalone Oracle HTTP Server:
If you are an 11g user: Check for the registered property in the file
ORACLE_INSTANCE/config/OPMN/opmn/instance.properties. If it is set to
true, then the instance is registered. A managed Oracle HTTP Server is registered, if it
is not registered then it is Standalone Oracle HTTP Server.

If you are a 12c user: Check the element extention-template-ref and its
attribute name in the file DOMAIN_HOME/init-info/domain-info.xml. If you
find an element with the name Oracle HTTP Server (Standalone), then it is a
standalone Oracle HTTP Server. And if you find an element with name Oracle HTTP
Server (Collocated), then it is collocated.
Preparing to Upgrade Oracle HTTP Server

Upgrade is performed while the servers are down. The pre-upgrade tasks are often time-consuming. Oracle recommends that you plan and prepare your environment for upgrade by completing these pre-upgrade tasks, so that you have a successful upgrade and a limited downtime.

**Note:** If you are installing Oracle HTTP Server on your certified Windows operating system, you should verify that the msvcr90.dll and linkinfo.dll library files exist on your system; these are required by Oracle HTTP Server. For more information, see Missing Libraries Might Cause HTTPD to Exit Without Notice in Oracle Fusion Middleware Release Notes for Oracle HTTP Server Release Notes. If you are unable to obtain the required libraries on your system, contact Microsoft support for further assistance.

Use the following checklist to make sure you complete the pre-upgrade tasks:

- **Oracle Fusion Middleware Pre-Upgrade Checklist**
  Perform the tasks in this checklist before you begin any upgrade to ensure you have a successful upgrade and limited downtime.

- **Creating a Complete Backup**
  Before you start an upgrade, back up all system-critical files, including the databases that host your Oracle Fusion Middleware schemas.

- **Cloning Your Production Environment for Testing**
  Create a copy of your actual production environment, upgrade the cloned environment, verify that the upgraded components work as expected, and then (and only then) upgrade your production environment.

- **Verifying Certification and System Requirements**
  Review the certification matrix and system requirements documents to verify that your environment meets the necessary requirements for installation.

- **Updating Policy Files when Using Enhanced Encryption (AES 256)**
  If you plan to use enhanced encryption, such as Advanced Encryption Standard (AES) 256, in your upgraded environment. Oracle recommends that you apply the latest required policy files to the JDK before you upgrade.

- **Purging Unused Data**
  Purging unused data and maintaining a purging methodology before an upgrade can optimize the upgrade process.
Creating an Edition on the Server for Edition-Based Redefinition
Before upgrading an Edition-Based Redefinition (EBR) enabled schema, you must connect to the database server and create an edition on the database server for 12c.

Creating a Non-SYSDBA User to Run the Upgrade Assistant
Oracle recommends that you create a non-SYSDBA user called FMW to run the Upgrade Assistant. This user has the privileges required to modify schemas, but does not have full administrator privileges.

Identifying Existing Schemas Available for Upgrade
This optional task enables you to review the list of available schemas before you begin the upgrade by querying the schema version registry. The registry contains schema information such as version number, component name and ID, date of creation and modification, and custom prefix.

2.1 Oracle Fusion Middleware Pre-Upgrade Checklist
Perform the tasks in this checklist before you begin any upgrade to ensure you have a successful upgrade and limited downtime.

Upgrades are performed while the servers are down. This checklist identifies important — and often time-consuming — pre-upgrade tasks that you can perform before the upgrade to limit your downtime. The more preparation you can do before you begin the upgrade process, the less time you will spend offline.

**Note:** The pre-upgrade procedures you perform will depend on the configuration of your existing system, the components you are upgrading, and the environment you want to create at the end of the upgrade and configuration process. Complete only those tasks that apply to your configurations or use cases.

<td>• Make sure that your backup includes the schema version registry table. See Backing Up the Schema Version Registry Table.</td>
</tr>
<tr>
<td></td>
<td>• If you modified any of the startup scripts in your existing domain, you will need to copy them to temporary directory location (outside of the existing domain) during the upgrade and redeploy them after the upgrade. See Maintaining Custom Domain Environment Settings.</td>
</tr>
<tr>
<td>Task</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Optional</strong></td>
<td>Clone your production environment to use as an upgrade testing platform.</td>
</tr>
</tbody>
</table>
| **Required** | Verify that you are installing and upgrading your product on a supported hardware and software configuration.  
**CAUTION:** Do not attempt an upgrade if you are unable to use the latest supported operating system. As with all supported configurations, failure to comply with these requirements may cause your upgrade to fail. |
| **Required for 32-bit Operating Systems Only** | Migrate to a 64-bit operating system before you can upgrade.  
This is required only if you are currently running an unsupported 32-bit operating system. |
| **Optional** | Update security policy files if you are using enhanced encryption (AES 256).  
Some of the security algorithms used in Fusion Middleware 12c require additional policy files for the JDK.  
If you plan to use enhanced encryption, such as AES 256, Oracle recommends that you apply the latest required policy files to the JDK before you upgrade. |
| **Optional** | Purge any outdated or unused data before you upgrade.  
To optimize performance, Oracle strongly recommends that you purge data and objects that will not be used in the upgraded environment. |
| **Required for Oracle Database Users Only** | Before upgrading an Edition-Based Redefinition (EBR) enabled schema, you must connect to the database server and create an edition on the database server for 12c (12.2.1.2).  
If you are using an Edition-Based Redefinition (EBR) database, you must create the edition before starting the upgrade. |
| **Optional** | Create a Non-SYSDBA user to run the Upgrade Assistant.  
Oracle recommends that you create the FMW user to run Upgrade Assistant. User FMW can run the Upgrade Assistant without system administration privileges. |
| **Optional** | Identify which schemas are currently in your domain before you begin.  
It is important that you know which schemas are in your pre-upgrade domain before you start the upgrade. You should know the schema owner names and passwords, as well as the versions of each schema. |
2.2 Creating a Complete Backup

Before you start an upgrade, back up all system-critical files, including the databases that host your Oracle Fusion Middleware schemas.

The backup must include the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table so that you can restore the contents back to its pre-upgrade state if the upgrade fails.

The Upgrade Assistant Prerequisites screen prompts you to acknowledge that backups have been performed before you proceed with the actual upgrade. However, note that the Upgrade Assistant does not verify that a backup has been created.

For more information about creating a backup, see:

- Backing Up Your Environment in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*
- Upgrading and Preparing Your Oracle Databases for 12c in *Oracle Fusion Middleware Planning an Upgrade of Oracle Fusion Middleware*

In addition to creating a complete backup of your system, you must also back up your schema version registry and any custom settings that you want to use in your upgraded environment. See:

**Backing Up the Schema Version Registry Table**

Your system backup must include the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table.

**Maintaining Custom Domain Environment Settings**

If you have modified any domain-generated or server startup scripts in your pre-upgrade environment, it is important to note that these changes are overwritten during the installation, domain upgrade, and reconfiguration operations.

2.2.1 Backing Up the Schema Version Registry Table

Your system backup must include the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table. Each Fusion Middleware schema has a row in the `SYSTEM.SCHEMA_VERSION_REGISTRY$` table. If you run the Upgrade Assistant to update an existing schema and it does not succeed, you must restore the original schema before you can try again. Before you run the Upgrade Assistant, make sure you back up your existing database schemas and the schema version registry.

**Note:** Before you upgrade a schema using the Upgrade Assistant, you must perform a complete database backup. During the upgrade, you are required to acknowledge that backups have been performed.

2.2.2 Maintaining Custom Domain Environment Settings

If you have modified any domain-generated or server startup scripts in your pre-upgrade environment, it is important to note that these changes are overwritten during the installation, domain upgrade, and reconfiguration operations.

Every domain installation includes dynamically-generated domain and server startup scripts, such as `setDomainEnv`. These files are replaced by newer versions during the installation and upgrade process. To maintain your custom domain-level environment
settings, Oracle recommends that you create a separate file to store the custom domain information before you upgrade, instead of modifying the scripts directly.

For example, if you want to customize server startup parameters that apply to all servers in a domain, you can create a file called `setUserOverrides.cmd` (Windows) or `setUserOverrides.sh` (UNIX) and configure it to add custom libraries to the WebLogic Server classpath, specify additional command-line options for running the servers, or specify additional environment variables. When using the `pack` and `unpack` commands, any custom settings that you add to this file are preserved during the domain upgrade operation and are carried over to the remote servers.

The following example illustrates startup customizations in a `setUserOverrides` file:

```bash
# add custom libraries to the WebLogic Server system classpath
if [ "${POST_CLASSPATH}" != "" ] ; then
    POST_CLASSPATH="${POST_CLASSPATH}${CLASSPATHSEP}${HOME}/foo/fooBar.jar"
    export POST_CLASSPATH
else
    POST_CLASSPATH="${HOME}/foo/fooBar.jar"
    export POST_CLASSPATH
fi

# specify additional java command-line options for servers
JAVA_OPTIONS="${JAVA_OPTIONS} -Dcustom.property.key=custom.value"
```

If the `setUserOverrides` file exists during a server startup, the file is included in the startup sequence and any overrides contained within this file take effect. You must store the `setUserOverrides` file in the `domain_home/bin` directory.

---

**Note:**

If you are unable to create the `setUserOverrides` script before an upgrade, you need to reapply your settings as described in Re-apply Customizations to Startup Scripts in Oracle Fusion Middleware Upgrading Oracle WebLogic Server.

---

### 2.3 Cloning Your Production Environment for Testing

Create a copy of your actual production environment, upgrade the cloned environment, verify that the upgraded components work as expected, and then (and only then) upgrade your production environment.

Cloning your production environment for testing is recommended, but not required.

Upgrades cannot be reversed. In most cases, if an error occurs, you must stop the upgrade and restore the entire environment from backup and begin the upgrade process from the beginning. Identifying potential upgrade issues in a development environment can eliminate unnecessary downtime.

---

**Note:** It is beyond the scope of this document to describe the cloning procedures for all components and operating systems. Cloning procedures are component and operating system-specific. At a high level, you install the pre-upgrade version of your component domain on a test machine, create the required schemas using the Repository Creation Utility (RCU), and perform the upgrade.
Additional benefits of running an upgrade in a cloned production environment include the following:

- Uncover and correct any upgrade issues.
- Practice completing an end-to-end upgrade.
- Understand the upgrade performance and how purge scripts can help.
- Understand the time required to complete the upgrade.
- Understand the database resource usage (such as temporary tablespace; PGA, and so on).

**Note:** You can run the pre-upgrade Readiness Check on the cloned production environment to help identify potential upgrade issues with your data, but you must perform a complete test upgrade on a cloned environment to ensure a successful upgrade.

### 2.4 Verifying Certification and System Requirements

Review the certification matrix and system requirements documents to verify that your environment meets the necessary requirements for installation.

**Note:** When checking the certification, system requirements, and interoperability information, be sure to check specifically for any 32-bit or 64-bit system requirements. It is important for you to download software specifically designed for the 32-bit or 64-bit environment, explicitly.

**WARNING:** Make sure that your current environment has been patched to the latest patch set before you begin the upgrade. Certifications are based on fully patched environments unless stated otherwise.

**Verify Your Environment Meets Certification Requirements**

Oracle has tested and verified the performance of your product on all certified systems and environments. Make sure that you are installing your product on a supported hardware or software configuration.

**Verify System Requirements and Specifications**

It is important to verify that the system requirements such as disk space, available memory, specific platform packages and patches, and other operating system-specific items are met.

**Verify That the Database Hosting Oracle Fusion Middleware Is Supported**

You must have a supported Oracle database configured with the required schemas before you run Oracle Fusion Middleware 12c.

**Verify That the JDK Is Certified for This Release of Oracle Fusion Middleware**

### 2.4.1 Verify Your Environment Meets Certification Requirements

Oracle has tested and verified the performance of your product on all certified systems and environments. Make sure that you are installing your product on a supported hardware or software configuration.
Whenever new certifications occur, they are added to the appropriate certification document right away. New certifications can occur at any time, and for this reason the certification documents are kept outside of the documentation libraries and are available on Oracle Technology Network. For more information, see the Certification Matrix for 12c (12.2.1.2).

2.4.2 Verify System Requirements and Specifications

It is important to verify that the system requirements such as disk space, available memory, specific platform packages and patches, and other operating system-specific items are met.

Use the Oracle Fusion Middleware System Requirements and Specifications document to verify that the requirements of the certification are met. For example, if the Certification Matrix for 12c (12.2.1.2) indicates that your product is certified for installation on 64-Bit Oracle Linux 7, the System Requirements and Specifications document should be used to verify that your Oracle Linux 7 system has met the required minimum specifications such as disk space, available memory, specific platform packages and patches, and other operating system-specific items. This document is updated as needed and resides outside of the documentation libraries on the Oracle Technology Network (OTN).

---

**Note:** When you install the Oracle Fusion Middleware Release 12c software in preparation for upgrade, you should use the same user account that you used to install and configure the existing, pre-upgrade Oracle Fusion Middleware software. On UNIX operating systems, this ensures that the proper owner and group is applied to new Oracle Fusion Middleware 12c files and directories.

If you are running a 32–bit environment, you will need to perform an additional set of steps:

**Migrating from a 32-Bit to a 64-Bit Operating System**

If you have a 32–bit operating system, then you must migrate your 32-bit environment to a 64-bit software environment before you upgrade.

2.4.2.1 Migrating from a 32-Bit to a 64-Bit Operating System

If you have a 32-bit operating system, then you must migrate your 32-bit environment to a 64-bit software environment before you upgrade.

Make sure to validate the migration to ensure all your Oracle Fusion Middleware 11g software is working properly on the 64-bit machine, and only then perform the upgrade to Oracle Fusion Middleware 12c.

In these tasks, `host` refers to the 32-bit source machine and `target` refers to the new 64-bit target machine.

---

**Note:** These steps assume that your database is located on a separate host and will not be moved.

Upgrading an operating system typically involves the following:
Caution: These steps are provided as an example of the operating system upgrade process and may or may not include all of the procedures you must perform to update your specific operating system. Consult your operating system's upgrade documentation for more information.

Procure the Hardware That Supports the Upgrade's 64-bit Software Requirement
Make sure that you have supported target hardware in place before you begin the upgrade process.

Stop All Processes
Before upgrading, you must stop all processes, including Managed Servers, the Administration Server, and Node Manager, if they are started on the host.

Back Up All Files from the 32-bit Host Machine
Make sure that you have created a complete backup of your entire 11g deployment before you begin the upgrade process. These files can be used if there is an issue during the migration and you have to restart the process.

Set Up the Target 64-bit Machine with the 11g Host Name and IP Address
The host name and IP address of the target machine must be made identical to the host. This require you to change the IP address and name of the source machine or decommission the source machine to avoid conflicts in the network.

Restore the 11g Backup from 32-bit Host to 64-bit Host
Restore the files you backed from the 32-bit host using the same directory structure that was used in 11g. The directory structure on the target machine must be identical to the structure of the host machine.

Install the 12c Product Distributions on the Target Machine
Oracle recommends an Out-of-Place approach for upgrade. Therefore, you must install the 12c product distributions in a new Oracle home on the target machine.

Upgrade the Target 64-bit Environment Using the Standard Upgrade Procedure
After installing the product on the target machine, you must upgrade each product component individually using an upgrade utility specified in the component-specific upgrade guide and complete any post-upgrade tasks.

2.4.2.1 Procure the Hardware That Supports the Upgrade's 64-bit Software Requirement
Make sure that you have supported target hardware in place before you begin the upgrade process.

2.4.2.2 Stop All Processes
Before upgrading, you must stop all processes, including Managed Servers, the Administration Server, and Node Manager, if they are started on the host.

Stop the Managed Servers
To stop a WebLogic Server Managed Server, use the stopManagedWebLogic script:

- (UNIX) \$DOMAIN_HOME/bin/stopManagedWebLogic.sh
  managed_server_name admin_url
• (Windows) \bin\stopManagedWebLogic.cmd

managed_server_name admin_url

When prompted, enter your user name and password.

Stop the Administration Server

When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the stopWebLogic script:

• (UNIX) /bin/stopWebLogic.sh

• (Windows) \bin\stopWebLogic.cmd

When prompted, enter your user name, password, and the URL of the Administration Server.

Stop Node Manager

To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the nodemanager.properties attribute QuitEnabled to true (the default is false), you can use WLST to connect to Node Manager and shut it down. For more information, see stopNodeManager in Oracle Fusion Middleware WLST Command Reference for WebLogic Server.

2.4.2.1.3 Back Up All Files from the 32-bit Host Machine

Make sure that you have created a complete backup of your entire 11g deployment before you begin the upgrade process. These files can be used if there is an issue during the migration and you have to restart the process.

---

Note: If the upgrade from 32-bit to 64-bit takes place on the same machine, there is a risk of corrupting the source environment if the upgrade fails.

---

For more information on backing up your 11g files, see Backing Up Your Environment in Oracle Fusion Middleware Administrator’s Guide.

During the upgrade you must have access to the contents of the following:

• 11g Domain Home

• 11g/nodemanager directory located in $ORACLE_HOME/wlserver/common/

Some of the backup and recovery procedures described in Backing Up Your Environment in Oracle Fusion Middleware Administrator’s Guide are product-specific. Do not proceed with the upgrade until you have a complete backup.

2.4.2.1.4 Set Up the Target 64-bit Machine with the 11g Host Name and IP Address

The host name and IP address of the target machine must be made identical to the host. This require you to change the IP address and name of the source machine or decommission the source machine to avoid conflicts in the network.

The process of changing an IP address and host name vary by operating system. Consult your operating system’s administration documentation for more information.
2.4.2.1.5 Restore the 11g Backup from 32-bit Host to 64-bit Host

Restore the files you backed from the 32-bit host using the same directory structure that was used in 11g. The directory structure on the target machine must be identical to the structure of the host machine.

For detailed information about restoring your 11g files to the 64-bit target machine, see Recovering Your Environment in Oracle Fusion Middleware Administrator’s Guide.

2.4.2.1.6 Install the 12c Product Distributions on the Target Machine

Oracle recommends an Out-of-Place approach for upgrade. Therefore, you must install the 12c product distributions in a new Oracle home on the target machine.

Refer to the component-specific installation guides for the component(s) you are installing.

2.4.2.1.7 Upgrade the Target 64-bit Environment Using the Standard Upgrade Procedure

After installing the product on the target machine, you must upgrade each product component individually using an upgrade utility specified in the component-specific upgrade guide and complete any post-upgrade tasks.

For a complete upgrade procedure, see the component-specific upgrade guide for the component(s) you are upgrading.

Note: The Node Manager upgrade procedure requires access to the original Node Manager files. Use the 11g Node Manager files that you backed up from the 32-bit source machine as part of Back Up All Files from the 32-bit Host Machine.

2.4.3 Verify That the Database Hosting Oracle Fusion Middleware Is Supported

You must have a supported Oracle database configured with the required schemas before you run Oracle Fusion Middleware 12c.

Review the Fusion Middleware database requirements before starting the upgrade to ensure that the database hosting Oracle Fusion Middleware is supported and has sufficient space to perform an upgrade. For more information, see the Certification Matrix for 12c (12.2.1.2).

Note: If your database version is no longer supported, you must upgrade to a supported version before starting an upgrade. See Upgrading and Preparing Your Oracle Databases for 12c in Oracle Fusion Middleware Planning an Upgrade of Oracle Fusion Middleware.

2.4.4 Verify That the JDK Is Certified for This Release of Oracle Fusion Middleware

Refer to the Oracle Fusion Middleware Supported System Configurations information on the Oracle Technology Network (OTN) to verify that the JDK you are using is supported.

At the time this document was published, the certified JDK for 12c (12.2.1.2) was 1.8.0_101.

If your JDK is not supported, or you do not have a JDK installed, you must download the required Java SE JDK, from the following website:
Make sure that the JDK is installed outside of the Oracle home. The Oracle Universal Installer validates that the designated Oracle home directory is empty, and the install does not progress until an empty directory is specified. If you install JDK under Oracle home, you may experience issues in future operations. Therefore, Oracle recommends that you use install the JDK in the following directory: /home/oracle/products/jdk.

For more information on the difference between generic and platform-specific installers, see “Understanding the Difference Between Generic and Platform-Specific Distributions” in the Oracle Fusion Middleware Download, Installation, and Configuration Readme Files.

2.5 Updating Policy Files when Using Enhanced Encryption (AES 256)

If you plan to use enhanced encryption, such as Advanced Encryption Standard (AES) 256, in your upgraded environment. Oracle recommends that you apply the latest required policy files to the JDK before you upgrade.

The Java platform defines a set of APIs spanning major security areas, including cryptography, public key infrastructure, authentication, secure communication, and access control. These APIs allow developers to easily integrate security mechanisms into their application code.

Some of the security algorithms used in Fusion Middleware 12c require additional policy files for the JDK. For more information, see Java Cryptography Architecture Oracle Providers Documentation.

**Note:** If you attempt to use enhanced encryption without applying these policy files to the JDK before you begin the upgrade, the upgrade can fail and you must restore the entire pre-upgrade environment and start the upgrade from the beginning.

2.6 Purging Unused Data

Purging unused data and maintaining a purging methodology before an upgrade can optimize the upgrade process.

Some components have automated purge scripts. If you are using purge scripts, wait until the purge is complete before starting the upgrade process. The upgrade may fail if the purge scripts are running while using the Upgrade Assistant to upgrade your schemas.

2.7 Creating an Edition on the Server for Edition-Based Redefinition

Before upgrading an Edition-Based Redefinition (EBR) enabled schema, you must connect to the database server and create an edition on the database server for 12c.

Edition-based redefinition enables you to upgrade an application's database objects while the application is in use, thus minimizing or eliminating downtime. This is accomplished by changing (redefining) database objects in a private environment known as an edition. Only when all changes have been made and tested do you make the new version of the application available to users.
Before upgrading an Edition-Based Redefinition (EBR) enabled schema, you must connect to the database server and create an edition on the database server for 12c. The new edition for 12c must be a child of your existing 11g or 12c edition.

To create an edition on the database server, log in as an SYS user (or another Oracle user that has DBA privileges) and enter the following command:

```
cREATE EDITION Oracle_FMW_12_2_1_1 AS CHILD OF Oracle_FMW_11_1_1_7_0;
```

where `Oracle_FMW_11_1_1_7_0` is an example of the edition name you specified in RCU 11.1.1.7 when the 11.1.1.7 schemas were created. Be sure to provide the actual name used when creating the edition.

The following message notifies you that the edition is created successfully:

```
Edition created.
```

During the upgrade, you are prompted to launch the Reconfiguration Wizard to reconfigure your existing domain. Before running the Reconfiguration Wizard, you must specify the database default edition. Use the following SQL to manually set up the default edition name for the database, for example:

```
ALTER DATABASE DEFAULT EDITION = Oracle_FMW_12_2_1_1;
```

### 2.8 Creating a Non-SYSDBA User to Run the Upgrade Assistant

Oracle recommends that you create a non-SYSDBA user called `FMW` to run the Upgrade Assistant. This user has the privileges required to modify schemas, but does not have full administrator privileges.

SYSDBA is an administrative privilege that is required to perform high-level administrative operations such as creating, starting up, shutting down, backing up, or recovering the database. The SYSDBA system privilege is for a fully empowered database administrator. When you connect with the SYSDBA privilege, you connect with a default schema and not with the schema that is generally associated with your user name. For SYSDBA, this schema is SYS. Access to a default schema can be a very powerful privilege. For example, when you connect as user SYS, you have unlimited privileges on data dictionary tables. Therefore, Oracle recommends that you create a non-SYSDBA user to upgrade the schemas. The privileges listed below must be granted to user FMW before starting the Upgrade Assistant.
Notes: If you created the non-SYSDBA user FMW in a previous release, you must drop and recreate this user before starting the upgrade. Running the Upgrade Assistant with an older FMW user may lead to a failed upgrade as new privileges may have been added. Oracle recommends that you drop and recreate the user instead of modifying the existing FMW user.

By default, the \texttt{v\textasciix$atrans$} table does not exist. You must run the \texttt{XAVIEW.SQL} script to create this table before creating the user. Moreover, the \texttt{grant select} privilege on the \texttt{v\textasciix$atrans$} table is required only by Oracle Identity Manager. If you do not require Oracle Identity Manager for configuration, or if you do not have the \texttt{v\textasciix$atrans$} table, then remove the following line from the script:

\begin{verbatim}
grant select on v\textasciix$atrans$ to FMW with grant option;
\end{verbatim}

In the example below, \texttt{welcome1} is the password. When granting privileges, make sure that you specify your actual password.

\begin{verbatim}
create user FMW identified by welcome1;
grant dba to FMW;
grant execute on DBMS_LOB to FMW with grant option;
grant execute on DBMS_OUTPUT to FMW with grant option;
grant execute on DBMS_STATS to FMW with grant option;
grant execute on sys.dbms_agadm to FMW with grant option;
grant execute on sys.dbms_agin to FMW with grant option;
grant execute on sys.dbms_agms to FMW with grant option;
grant execute on sys.dbms_ag to FMW with grant option;
grant execute on utl_file to FMW with grant option;
grant execute on dbms_lock to FMW with grant option;
grant select on sys.V\textasciix$_{INSTANCE}$ to FMW with grant option;
grant select on sys.GV\textasciix$_{INSTANCE}$ to FMW with grant option;
grant select on sys.V\textasciix$_{SESSION}$ to FMW with grant option;
grant select on sys.GV\textasciix$_{SESSION}$ to FMW with grant option;
grant select on dba_scheduler_jobs to FMW with grant option;
grant select on dba_scheduler_running_jobs to FMW with grant option;
grant select on dba_aa_agents to FMW with grant option;
grant execute on sys.DBMS_SHARED_POOL to FMW with grant option;
grant select on dba_2pc_pending to FMW with grant option;
grant select on dba_pending_transactions to FMW with grant option;
grant execute on DBMS_FLASHBACK to FMW with grant option;
grant execute on dbms_crypto to FMW with grant option;
grant execute on DBMS_REPUTIL to FMW with grant option;
grant execute on dbms_job to FMW with grant option;
grant select on pending_trans to FMW with grant option;
grant select on dba_scheduler_job_classes to FMW with grant option;
grant select on SYS.DBA_DATA_FILES to FMW with grant option;
grant select on SYS.V\textasciix$_{ASM\_DISKGROUP}$ to FMW with grant option;
grant select on v\textasciix$atrans$ to FMW with grant option;
grant execute on sys.dbms_system to FMW with grant option;
grant execute on DBMS_SCHEDULER to FMW with grant option;
grant select on dba_data_files to FMW with grant option;
grant execute on UTL\_RAW to FMW with grant option;
grant execute on DBMS\_XMLDOM to FMW with grant option;
grant execute on DBMS\_APPLICATION\_INFO to FMW with grant option;
grant execute on DBMS\_UTILITY to FMW with grant option;
grant execute on DBMS\_SESSION to FMW with grant option;
grant execute on DBMS\_METADATA to FMW with grant option;
grant execute on DBMS\_XMLGEN to FMW with grant option;
\end{verbatim}
grant execute on DBMS_DATAPUMP to FMW with grant option;
grant execute on DBMS_MVIEW to FMW with grant option;
grant select on ALL_ENCRYPTED_COLUMNS to FMW with grant option;
grant select on dba_queue_subscribers to FMW with grant option;
grant execute on SYS.DBMS_ASSERT to FMW with grant option;
grant select on dba_subscr_registrations to FMW with grant option;
grant manage scheduler to FMW;

---

Note:

Oracle Database 11.2.0.3 Database Users ONLY: You must apply Oracle Patch 13036331 before you begin the upgrade. Go to My Oracle Support to download the patch.

If you do not apply this patch, you must grant additional privileges for some schemas.

---

2.9 Identifying Existing Schemas Available for Upgrade

This optional task enables you to review the list of available schemas before you begin the upgrade by querying the schema version registry. The registry contains schema information such as version number, component name and ID, date of creation and modification, and custom prefix.

Previewing a list of all the schemas that are available for an upgrade before you run the Upgrade Assistant helps you to decide if you want to select individual schemas to upgrade or allow the Upgrade Assistant to automatically select and upgrade all of the schemas in the domain.

To identify existing schemas in your domain that are available for upgrade:

1. If you are using an Oracle database, connect to the database as a user having Oracle DBA privileges, and run the following from SQL*Plus to get the current version numbers:

   SET LINE 120
   COLUMN MRC_NAME FORMAT A14
   COLUMN COMP_ID FORMAT A20
   COLUMN VERSION FORMAT A12
   COLUMN STATUS FORMAT A9
   COLUMN UPGRADED FORMAT A8
   SELECT MRC_NAME, COMP_ID, OWNER, VERSION, STATUS, UPGRADED FROM
   SCHEMA_VERSION_REGISTRY ORDER BY MRC_NAME, COMP_ID ;

2. Examine the report that is generated. If the value in the VERSION column is at 11.1.1.6.0 or higher, and the STATUS column value is VALID, then the schema is supported for upgrade.
   
   If an upgrade is not needed for a schema, the schema_version_registry table retains the schema at its pre-upgrade version.

3. Note the schema prefix name that was used for your existing schemas. You will use the same prefix when creating new 12c schemas.
Notes:

- If your existing schemas are not at a supported version, then you must upgrade them to a supported version before using the 12c (12.2.1.2) upgrade procedures. Refer to your pre-upgrade version documentation for more information.

- Some components, such as Oracle Enterprise Data Quality, Oracle GoldenGate Monitor and Oracle GoldenGate Veridata, support an upgrade from versions other than the standard Oracle Fusion Middleware supported versions.

- If you used a file-based policy store in 11g, then you must reassociate the file-based policy store with a database-based security store before running the Upgrade Assistant. For more information see Reassociating a File-Based Policy Store Before Upgrade.

- If you used an OID-based policy store in 11g, make sure that you create a new OPSS schema before you perform the upgrade. After the upgrade, the OPSS schema will remain an LDAP-based store.

- If you are upgrading an ORASDPM schema that was created using RCU 11g (11.1.1.4 or earlier), and you subsequently upgraded ORASDPM to 11g (11.1.1.6 or later), the FMW user will need to grant the CREATE TABLE privilege to user prefix_ORASDPM before upgrading to 12c (12.2.1.2).

  ```sql
  grant CREATE TABLE to prefix_ORASDPM;
  ```

  where `prefix` is the name given to the schema when it was created.

- You can only upgrade schemas for products that are available for upgrade in the Oracle Fusion Middleware release 12c (12.2.1.2). Do not attempt to upgrade a domain that includes components that are not yet available for upgrade to 12c (12.2.1.2).
Part I

Upgrading Oracle HTTP Server from 11g to 12c

Part I contains the following chapters:

- Upgrading a Standalone Oracle HTTP Server from 11g to 12c
- Upgrading a Managed Oracle HTTP Server from 11g to 12c
  
  This chapter describes the procedure for upgrading a managed Oracle HTTP Server from 11g to 12c. The valid starting points for this upgrade are 11g releases 11.1.1.7 and above.
This chapter describes the procedures for upgrading an 11g standalone Oracle HTTP Server to 12c; one that is not managed by or associated with an existing Oracle WebLogic Server (WLS) domain.

This chapter contains the following sections:

About the Standalone Oracle HTTP Server Upgrade Process from 11g to 12c
Review the flowchart and roadmap for an overview of the upgrade process for Oracle HTTP Server.

Important Pre-Upgrade Considerations
Before you begin the upgrade, it is important to make sure that your existing setup is not impacted during or after the upgrade. If you are using Oracle Web Cache or WebGate, or if you have Application-specific artifacts in your 11g domain, review the topics under this section carefully to prevent impact to your existing setup.

Installing the Standalone Oracle HTTP Server
Before beginning your upgrade, download the Oracle HTTP Server 12c (12.2.1.2) distribution on the target system and install it using the Oracle Universal Installer.

Stopping Servers and Processes
Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

Upgrading Domain Component Configurations
After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.

Starting Servers and Processes
After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

Verifying the Upgrade
You can verify that the upgrade is successful if you are able to start the Node Manager and the Standalone Oracle HTTP Server properly.

3.1 About the Standalone Oracle HTTP Server Upgrade Process from 11g to 12c
Review the flowchart and roadmap for an overview of the upgrade process for Oracle HTTP Server.
Figure 3-1 shows the high-level procedures associated with a standalone Oracle HTTP Server upgrade when the starting point is 11g. The tools used for each step are also listed.

![Figure 3-1 Upgrade Process Flowchart for Standalone Oracle HTTP Server from 11g to 12c](image)

The following table describes the tasks that must be completed to upgrade a standalone Oracle HTTP Server from 11g to 12c.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>Verify that you are upgrading a standalone Oracle HTTP Server. To determine which Oracle HTTP Server you have in your existing environment, see Determining whether Oracle HTTP Server is Standalone or Managed (Collocated).</td>
</tr>
<tr>
<td>Required</td>
<td>Complete the pre-upgrade tasks. The pre-upgrade tasks include cloning your production environment, verifying system requirements and certifications, purging unused data, and creating non-SYSDBA user. For a complete list of pre-upgrade tasks, see Preparing to Upgrade Oracle HTTP Server. Additionally, also complete the following tasks: Important Pre-Upgrade Considerations.</td>
</tr>
<tr>
<td>Required</td>
<td>Install the Standalone Oracle HTTP Server. Run the installation program to install the software. Select the installation type Standalone Oracle HTTP Server (managed independently of WebLogic server). This transfers the software to your system and creates a new Oracle home directory. See Installing the Standalone Oracle HTTP Server.</td>
</tr>
<tr>
<td>Required</td>
<td>Shut down the 11g environment. See Stopping Servers and Processes.</td>
</tr>
<tr>
<td>Required</td>
<td>Upgrade the 11g standalone system component configurations. See Upgrading Domain Component Configurations.</td>
</tr>
</tbody>
</table>
Table 3-1 (Cont.) Tasks for Upgrading Standalone Oracle HTTP Server from 11g to 12c

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>Restart the servers and processes.</td>
</tr>
<tr>
<td>Required</td>
<td>Verify the upgrade.</td>
</tr>
<tr>
<td></td>
<td>Your Oracle HTTP Server should continue to function as expected.</td>
</tr>
<tr>
<td></td>
<td>If you have post-upgrade issues, you will need to troubleshoot the installation and retry the upgrade.</td>
</tr>
<tr>
<td></td>
<td>See Troubleshooting Oracle HTTP Server in Oracle Fusion Middleware Administering Oracle HTTP Server.</td>
</tr>
</tbody>
</table>

3.2 Important Pre-Upgrade Considerations

Before you begin the upgrade, it is important to make sure that your existing setup is not impacted during or after the upgrade. If you are using Oracle Web Cache or WebGate, or if you have Application-specific artifacts in your 11g domain, review the topics under this section carefully to prevent impact to your existing setup.

Oracle Web Cache 11g Users
Oracle Web Cache is a secure reverse proxy cache and a compression engine deployed between a browser and the HTTP server or a browser and the Content Management server to improve the performance of the websites by caching frequently accessed content. Oracle has released the last version of Web Cache in 11g. Web Cache is not available in 12c.

WebGate 11g Users
A WebGate is a web-server plug-in for Oracle Access Manager (OAM) that intercepts HTTP requests and forwards them to the Access Server for authentication and authorization. WebGate is included as part of Oracle HTTP Server 12c installation and is upgraded as part of the Oracle HTTP Server upgrade process through Upgrade Assistant.

Updating the WebGate log file-name
In Oracle Fusion Middleware 12c, WebGate log file is renamed from oblog.log to webgate.log. After upgrading to the latest release of Oracle HTTP Server, you must manually update the oblog_config_wg.xml file and replace every occurrence of ‘oblog.log’ with ‘webgate.log’.

Application Artifacts from 11g
Application artifacts include all of your web resources: JSP files, images, stylesheets, Javascript, static HTML pages in addition to your Java classes and source files and web application configuration files. The integrated development environment (IDE) uses all of these resources, and refers to them as web application artifacts.

Migrating 11g Application Artifacts
You need to manually migrate any 11g application artifacts that reside within the Oracle instance, including any combination of static files such as HTML or images, CGI or FastCGI scripts or applications, or third-party modules. Application artifacts that were referred to by the 11g configuration, but were stored in directories outside of the Oracle instance, will continue to be referenced by the migrated configuration used by Oracle HTTP Server 12c.
3.2.1 Oracle Web Cache 11g Users

Oracle Web Cache is a secure reverse proxy cache and a compression engine deployed between a browser and the HTTP server or a browser and the Content Management server to improve the performance of the websites by caching frequently accessed content. Oracle has released the last version of Web Cache in 11g. Web Cache is not available in 12c.

Consider the following limitations if you are using Web Cache in your 11g environment:

- Web Cache is not available in Fusion Middleware 12c. Correspondingly, there is no upgrade for Web Cache.
- Web Cache 11g front-ending a 12c Oracle HTTP Server is not a certified combination.
- If you are using both Web Cache and Oracle HTTP Server in your 11g setup, you can only upgrade the Oracle HTTP Server to 12c. In that case, you need to disable the 11g Web Cache and change the configuration settings to divert the traffic to Oracle HTTP Server directly.
- If you are using both Web Cache and Oracle HTTP Server in your 11g setup, and you have associated them with a WebLogic Server (WLS) domain for administering them through the Enterprise Manager Fusion Middleware Control, then you must also upgrade the WLS domain to 12c. In that case, the associated Oracle HTTP Server is also upgraded to 12c. However, the Web Cache is removed from the 12c Fusion Middleware Control.

3.2.2 WebGate 11g Users

A WebGate is a web-server plug-in for Oracle Access Manager (OAM) that intercepts HTTP requests and forwards them to the Access Server for authentication and authorization. WebGate is included as part of Oracle HTTP Server 12c installation and is upgraded as part of the Oracle HTTP Server upgrade process through Upgrade Assistant.

---

**Note:** In Oracle Fusion Middleware 12c (12.2.1.2), WebGate log file is renamed from oblog.log to webgate.log. After upgrading to the latest release of Oracle HTTP Server, you must manually update the oblog_config_wg.xml file and replace every ‘oblog.log’ occurrence with ‘webgate.log’. For a procedure to do this task, see [Updating the WebGate log file-name](#).

3.2.3 Updating the WebGate log file-name

In Oracle Fusion Middleware 12c, WebGate log file is renamed from oblog.log to webgate.log. After upgrading to the latest release of Oracle HTTP Server, you must manually update the oblog_config_wg.xml file and replace every occurrence of ‘oblog.log’ with ‘webgate.log’.

To update the WebGate log file-name:

1. Change directory to the following path:

```plaintext
DOMAIN_HOME/config/fmwconfig/components/OHS/ohs_instance/webgate/config
```
2. Open the oblog_config_wg.xml file in edit mode.

3. Replace every occurrence of ‘oblog.log’ with ‘webgate.log’.

### 3.2.4 Application Artifacts from 11g

Application artifacts include all of your web resources: JSP files, images, stylesheets, Javascript, static HTML pages in addition to your Java classes and source files and web application configuration files. The integrated development environment (IDE) uses all of these resources, and refers to them as web application artifacts.

If you have 11g application artifacts that you want to continue using in 12c, carefully review the following:

- As part of upgrading Oracle HTTP Server from an 11g Oracle instance to a 12c domain, the Oracle HTTP Server configuration directory layout is being migrated from an Oracle instance to a standalone domain.

- Oracle HTTP Server 11g configuration files that reside in the component configuration directory of the Oracle instance are migrated automatically.

- Application artifacts that reside within the Oracle instance, including any combination of static files (such as HTML or images, CGI or FastCGI scripts or applications, or third-party modules), must be migrated manually after the upgrade to 12c.

For more information, see [Migrating 11g Application Artifacts](#).

### 3.2.5 Migrating 11g Application Artifacts

You need to manually migrate any 11g application artifacts that reside within the Oracle instance, including any combination of static files such as HTML or images, CGI or FastCGI scripts or applications, or third-party modules. Application artifacts that were referred to by the 11g configuration, but were stored in directories outside of the Oracle instance, will continue to be referenced by the migrated configuration used by Oracle HTTP Server 12c.

For example, if a third-party plug-in module was installed into the Oracle home with Oracle HTTP Server 11g, and the configuration referenced it by the Oracle home location using the configuration in the example below, the plug-in module must be installed manually into the Oracle home with 12c Oracle HTTP Server or the upgraded configuration must be modified to reference it elsewhere.

```
LoadModule example_module "ORACLE_HOME/ohs/modules/mod_example.so"
```

Similarly, if static files were copied into the `/htdocs` directory within the 11g component configuration directory, then they too must be manually copied into the 12c instance configuration directory or the upgraded configuration must be modified to reference it elsewhere. Other types of application artifacts must be manually migrated in a similar manner.

### 3.3 Installing the Standalone Oracle HTTP Server

Before beginning your upgrade, download the Oracle HTTP Server 12c (12.2.1.2) distribution on the target system and install it using the Oracle Universal Installer.

To install the standalone Oracle HTTP Server:
1. Sign in to the target system where you want to install the 12c (12.2.1.2) product distribution.

2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle HTTP Server (UNIX: `fmw_12.2.1.2.0_ohs_linux64.bin`),
   - (Windows: `setup_fmw_12.2.1.2.0_ohs_win64.exe`)

3. Change to the directory where you downloaded the 12c (12.2.1.2) product distribution.

4. Check that your machines meet the following requirements:
   - Ensure that the system, patch, kernel, and other requirements are met as specified in Roadmap for Verifying Your System Environment.
   - Because Oracle HTTP Server is installed by default on port 7777, you must ensure that port 7777 is not used by any service on the nodes. To check if this port is in use, run the following command before installing Oracle HTTP Server. You must free the port if it is in use.
     ```bash
     netstat -an | grep 7777
     ```

5. Start the installation program by entering the following command:
   - (UNIX) `./fmw_12.2.1.2.0_ohs_linux64.bin`
   - (Windows) `setup_fmw_12.2.1.2.0_ohs_win64.exe`

6. On UNIX operating systems, the Installation Inventory Setup screen appears if this is the first time you are installing an Oracle product on this host.
   Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location and click **Next**.

   **Note:** The Installation Inventory Setup screen does not appear on Windows operating systems.

7. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click **Next**.

8. On the Auto Updates screen, select **Skip Auto Updates**. Options are:
   - **Skip Auto Updates**: If you do not want your system to check for software updates at this time.
   - **Select patches from directory**: To navigate to a local directory if you downloaded patch files.
   - **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click **Search**. To configure a proxy server for the installer to access My Oracle Support, click **Proxy Settings**. Click **Test Connection** to test the connection.

   Click **Next**.
9. On the Installation Location screen, specify the location for the Oracle home
directory and click **Next**.

Since you are installing the standard installation topology for Oracle HTTP Server
in a standalone domain, you can specify an Oracle home directory of your choice.
However, ensure that you install the software in a new Oracle home.

For more information about Oracle Fusion Middleware directory structure, see
Selecting Directories for Installation and Configuration in *Oracle Fusion Middleware*
Planning an Installation of Oracle Fusion Middleware.

10. On the Installation Type screen, select **Standalone HTTP Server (Managed
independently of WebLogic server)** and click **Next**.

11. The Prerequisite Checks screen analyzes the host computer to ensure that the
specific operating system prerequisites have been met.

To view the list of tasks that gets verified, select **View Successful Tasks**. To view
log details, select **View Log**. If any prerequisite check fails, then an error message
appears at the bottom of the screen. Fix the error and click **Rerun** to try again. To
ignore the error or the warning message and continue with the installation, click
**Skip** (not recommended).

12. On the Security Updates screen, indicate how you would like to receive security
updates if you already have an Oracle Support account.

If you do not have an Oracle Support account and you are sure that you want to
skip this step, clear the check box and verify your selection in the follow-up dialog
box.

13. On the Installation Summary screen, verify the installation options you selected.

If you want to save these options to a response file, click **Save Response File** and
enter the response file location and name. The response file collects and stores all
the information that you have entered, and enables you to perform a silent
installation (from the command line) at a later time.

Click **Install** to begin the installation.

14. On the Installation Progress screen, when the progress bar displays 100%, click
**Finish** to dismiss the installer, or click **Next** to see a summary.

15. The Installation Complete screen displays the Installation Location and the Feature
Sets that are installed. Review this information and click **Finish** to close the
installer.

You have installed the Oracle HTTP Server in a standalone mode.

### 3.4 Stopping Servers and Processes

Before you run the Upgrade Assistant to upgrade your schemas and configurations,
you must shut down all processes and servers, including the Administration Server
and any managed servers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server
domain, an Administration Server, multiple managed servers, Java components,
system components such as Identity Management components, and a database used as
a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

**Note:** The procedures in this section describe how to stop servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

To stop your Fusion Middleware environment, follow the steps below.

**Step 1: Stop System Components**
To stop system components, such as Oracle HTTP Server, use the `stopComponent` script:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

You can stop system components in any order.

**Step 2: Stop the Managed Servers**
To stop a WebLogic Server Managed Server, use the `stopManagedWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/stopManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\stopManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

**Step 3: Stop Oracle Identity Management Components**
Stop any Oracle Identity Management components, such as Oracle Internet Directory:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

**Step 4: Stop the Administration Server**
When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/stopWebLogic.sh`
- (Windows) `DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.
Step 5: Stop Node Manager

To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. For more information, see `stopNodeManager` in *Oracle Fusion Middleware WLST Command Reference for WebLogic Server*.

3.5 Upgrading Domain Component Configurations

After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.

Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

Upgrading the 11g Domain Components Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.

Verifying the Domain-specific-Component Configurations Upgrade

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

3.5.1 Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

To start the Upgrade Assistant:

1. Go to the `oracle_common/upgrade/bin` directory:
   • (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   • (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Start the Upgrade Assistant:
   • (UNIX) `./ua`
   • (Windows) `ua.bat`

For information about other parameters that you can specify on the command line, such as logging parameters, see:

Upgrade Assistant Parameters
### 3.5.1.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

#### Table 3-2 Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-readiness</code></td>
<td>Required for readiness checks</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the <code>-examine</code> parameter.</td>
</tr>
</tbody>
</table>

**Note:** Readiness checks cannot be performed on standalone installations (those not managed by the WebLogic Server).

| `-threads`  | Optional | Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4. |

| `-response`| Required for silent upgrades or silent readiness checks | Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in *silent mode* (without displaying Upgrade Assistant screens). |

| `-examine` | Optional | Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the `-readiness` parameter. |
### Table 3-2 (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-logLevel attribute</td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes:&lt;br&gt;• TRACE&lt;br&gt;• NOTIFICATION&lt;br&gt;• WARNING&lt;br&gt;• ERROR&lt;br&gt;• INCIDENT_ERROR&lt;br&gt;The default logging level is NOTIFICATION.&lt;br&gt;Consider setting the -logLevel TRACE attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if -logLevel TRACE is used.</td>
</tr>
<tr>
<td>-logDir location</td>
<td>Optional</td>
<td>Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant will create log files and temporary files. The default locations are:&lt;br&gt;UNIX:&lt;br&gt;ORACLE_HOME/oracle_common/upgrade/logs&lt;br&gt;ORACLE_HOME/oracle_common/upgrade/temp&lt;br&gt;Windows:&lt;br&gt;ORACLE_HOME/oracle_common\upgrade\logs&lt;br&gt;ORACLE_HOME/oracle_common\upgrade\temp</td>
</tr>
<tr>
<td>-help</td>
<td>Optional</td>
<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>

### 3.5.2 Upgrading the 11g Domain Components Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.

To upgrade the 11g domain using Upgrade Assistant:
1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click Next.

   **Note:** For more information about any Upgrade Assistant screen, click Help on the screen.

2. On the Domain Directory screen, select Create a New Domain (choose when upgrading from 11g).

   Select Create a New Domain and click Next.

   **Note:**
   - Create a New Domain option should only be used if you are upgrading from version 11g.
   - If you have already created a new 12c standalone domain for your upgraded 11g system components, you can extend the standalone domain with the standalone Oracle HTTP Server using Update an Existing Domain option.
   - Update an Existing Domain option should only be used if you are upgrading from a previous 12c release (12.1.2.0, 12.1.3.0, 12.2.1.0, and 12.2.1.1) to the latest 12c release (12.2.1.2).

4. On the Component List screen, verify that the list includes all the components for which you want to upgrade configurations and click Next.

   If you do not see the components you want to upgrade, click Back to go to the previous screen and specify a different domain.

5. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click Next.

   **Note:** The Upgrade Assistant does not verify whether the prerequisites have been met.

6. On the Instance Directories screen, select 11g Source and provide the directory location of the 11g instance that you want to upgrade.

   This instance is used as a basis for configuring the 12c Oracle HTTP Server instance. The 11g Oracle HTTP Server installation is not altered.

   Click + to add additional 11g instance directories, if necessary. Click Next.

   **Note:** You cannot use the Upgrade Assistant to upgrade Oracle 10g instances to Oracle 12c. You must first upgrade Oracle 10g instances to 11g. For more information on migrating 10g to 11g, see the 11g upgrade documentation for your components.
7. On the Node Manager screen, specify the following to create a new Node Manager to administer your standalone domain.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>To specify the user name used to access Node Manager.</td>
</tr>
<tr>
<td>Password</td>
<td>To specify the password used to access Node Manager. Re-enter the password for confirmation.</td>
</tr>
<tr>
<td>Listen Address</td>
<td>To enter the DNS name or IP address upon which Node Manager listens.</td>
</tr>
<tr>
<td>Listen Port</td>
<td>To enter the listening port number of Node Manager.</td>
</tr>
</tbody>
</table>

**Note:** The user name and password are only used to authenticate connections between Node Manager and clients. They are independent of the server Administrator credentials.

8. On the Examine screen, review the status of the Upgrade Assistant as it examines each standalone component, verifying that the standalone component configuration is ready for upgrade. If the status is **Examine finished**, click **Next**.

If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking **No** in the Examination Failure dialog. Click **View Log** to see what caused the error and refer to Troubleshooting Your Upgrade in *Oracle Fusion Middleware Upgrading with the Upgrade Assistant Upgrade Guide* for information on resolving common upgrade errors.

**Note:**

- If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking **Yes** in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.

- Canceling the examination process has no effect on the configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

9. On the Upgrade Summary screen, review the summary of the options you have selected for component configuration upgrade.

The response file collects and stores all the information that you have entered, and enables you to perform a silent upgrade at a later time. The silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again. If you want to save these options to a response file, click **Save Response File** and provide the location and name of the response file.

Click **Upgrade** to start the upgrade process.

10. On the Upgrade Progress screen, monitor the status of the upgrade.
Caution: Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

If any components are not upgraded successfully, refer to the Upgrade Assistant log files for more information.

Note: The progress bar on this screen displays the progress of the current upgrade procedure. It does not indicate the time remaining for the upgrade.

Click Next.

11. If the upgrade is successful: On the Upgrade Success screen, click Close to complete the upgrade and close the wizard. The Post-Upgrade Actions window describes the manual tasks you must perform to make components functional in the new installation. This window appears only if a component has post-upgrade steps.

If the upgrade fails: On the Upgrade Failure screen, click View Log to view and troubleshoot the errors. The logs are available at ORACLE_HOME/oracle_common/upgrade/logs. Note: If the upgrade fails you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.

3.5.3 Verifying the Domain-specific-Component Configurations Upgrade

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

To log into the Administration Console, go to: http://administration_server_host:administration_server_port/console
To log into the Fusion Middleware Control, go to: http://administration_server_host:administration_server_port/em

Note:

After upgrade, make sure you run the administration tools from the new 12c Oracle home and not from the previous Oracle home.

During the upgrade process, some OWSM documents, including policy sets and predefined documents such as policies and assertion templates, may need to be upgraded. If a policy set or a predefined document is upgraded, its version number is incremented by 1.

3.6 Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.
To start your Fusion Middleware environment, follow the steps below.

**Step 1: Start the Administration Server**

When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the `startWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/startWebLogic.sh`
- (Windows) `DOMAIN_HOME\bin\startWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

**Step 2: Start Node Manager**

To start Node Manager, use the `startNodeManager` script:

- (UNIX) `DOMAIN_HOME/bin/startNodeManager.sh`
- (Windows) `DOMAIN_HOME\bin\startNodeManager.cmd`

**Step 3: Start Oracle Identity Management Components**

Start any Oracle Identity Management components, such as Oracle Internet Directory, that form part of your environment:

- (UNIX) `DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\startComponent.cmd component_name`

**Step 4: Start the Managed Servers**

To start a WebLogic Server Managed Server, use the `startManagedWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\startManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

**Note:** The startup of a Managed Server will typically start the applications that are deployed to it. Therefore, it should not be necessary to manually start applications after the Managed Server startup.
Step 5: Start System Components

To start system components, such as Oracle HTTP Server, use the `startComponent` script:

- (UNIX) `DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\startComponent.cmd component_name`

You can start system components in any order.

**Starting the Standalone Oracle HTTP Server**

After upgrade, start the standalone Oracle HTTP Server.

3.6.1 Starting the Standalone Oracle HTTP Server

After upgrade, start the standalone Oracle HTTP Server.

To start the standalone Oracle HTTP Server:

1. Go to the `oracle_common/upgrade/bin` directory:
   - (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Enter the command to start the standalone server.

   On UNIX operating systems:
   ```
   ./startComponent.sh ohs_name
   ```

   On Windows operating systems:
   ```
   startComponent.cmd ohs_name
   ```

   For more information, see Starting and Stopping System Components in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

3.7 Verifying the Upgrade

You can verify that the upgrade is successful if you are able to start the Node Manager and the Standalone Oracle HTTP Server properly.

If you experience post-upgrade issues, you need to troubleshoot the installation and retry the upgrade. For more information, see Troubleshooting Oracle HTTP Server in *Administrator’s Guide for Oracle HTTP Server*.

If you are not able to start the newly upgraded environment, a possible cause could be the use of MD5 certificates in your Oracle wallet. See Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm for a procedure to check whether you are using MD5 signatures and a procedure to replace them with SHA-2 certificates.
Upgrading a Managed Oracle HTTP Server from 11g to 12c

This chapter describes the procedure for upgrading a managed Oracle HTTP Server from 11g to 12c. The valid starting points for this upgrade are 11g releases 11.1.1.7 and above.

- **About the Managed Oracle HTTP Server Upgrade Process from 11g to 12c**
  - Review the flowchart and roadmap for an overview of the upgrade process for Managed Oracle HTTP Server.

- **Installing the Product Distributions**
  - Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle HTTP Server 12c (12.2.1.2) distributions on the target system and install them using Oracle Universal Installer.

- **Running a Pre-Upgrade Readiness Check**
  - To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

- **Stopping Servers and Processes**
  - Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

- **Creating the Required 12c Schemas with the RCU**
  - When upgrading from 11g, you must use the Repository Creation Utility (RCU) to create the required 12c schemas before you begin the upgrade.

- **Reconfiguring the Domain**
  - Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

- **Upgrading Domain Component Configurations**
  - After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.

- **Starting Servers and Processes**
  - After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

- **Verifying the Upgrade**
  - If you can log in to the Administration Console and the Enterprise Manager Fusion Middleware Control, your upgrade is successful.
4.1 About the Managed Oracle HTTP Server Upgrade Process from 11g to 12c

Review the flowchart and roadmap for an overview of the upgrade process for Managed Oracle HTTP Server.

Figure 4-1 shows the process flow to upgrade a Managed Oracle HTTP Server to the latest 12c release. The tools used for each step are also listed.

Table 6-1 describes the tasks that must be completed to upgrade a Managed Oracle HTTP Server from a 11g release to 12c (12.2.1.2).

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>To determine which Oracle HTTP Server you have in your existing environment, see Determining whether Oracle HTTP Server is Standalone or Managed (Collocated).</td>
</tr>
<tr>
<td>Verify that you are upgrading a Managed Oracle HTTP Server.</td>
<td></td>
</tr>
<tr>
<td>Required</td>
<td>The pre-upgrade tasks include cloning your production environment, verifying system requirements and certifications, purging unused data, and creating non-SYSDBA user.</td>
</tr>
<tr>
<td>If you have not done so already, review the introductory topics in this guide and complete the required pre-upgrade tasks.</td>
<td>For a complete list of pre-upgrade tasks, see Preparing to Upgrade Oracle HTTP Server.</td>
</tr>
</tbody>
</table>
Table 4-1  (Cont.) Tasks for Upgrading Managed Oracle HTTP Server from 11g to 12c

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required</strong> Download and install the 12.2.1.2 Fusion Middleware Infrastructure and Oracle HTTP Server distributions.</td>
<td>The Infrastructure distribution packs the WebLogic Server and the Java Required Files (JRF) that are required to set up the foundation to install other Fusion Middleware products. As per the upgrade topology defined in this guide, you must install the Infrastructure in a new Oracle home. You must install Oracle HTTP Server in the Oracle home that is created when you installed the 12.2.1.2 Infrastructure. See Installing the Product Distributions.</td>
</tr>
<tr>
<td><strong>Optional</strong> Run the Readiness Check.</td>
<td>See Running a Pre-Upgrade Readiness Check.</td>
</tr>
<tr>
<td><strong>Required</strong> Shut down the 11g instance.</td>
<td>Before starting the upgrade process, shut down the Administration Server, the Managed Servers, and your 11g instance. See Stopping Servers and Processes.</td>
</tr>
<tr>
<td><strong>Required</strong> Create the required 12c schemas.</td>
<td>See Creating the Required 12c Schemas with the RCU.</td>
</tr>
<tr>
<td><strong>Required</strong> Reconfigure your existing 12c domain with the Reconfiguration Wizard.</td>
<td>Run the Reconfiguration Wizard from 12c Oracle HTTP Server installation to reconfigure the existing domain. See Reconfiguring the Domain.</td>
</tr>
<tr>
<td><strong>Required</strong> Upgrade your existing 12c domain configurations with the Upgrade Assistant.</td>
<td>After the installation, you need to use the Upgrade Assistant to upgrade the Oracle HTTP Server and system component infrastructure. See Upgrading Domain Component Configurations.</td>
</tr>
<tr>
<td><strong>Required</strong> Restart the servers and processes.</td>
<td>The upgrade process is complete. You can now restart the Administration Server, the Managed Servers, and your 12.2.1.2 instance. See Starting Servers and Processes.</td>
</tr>
<tr>
<td><strong>Required</strong> Verify the upgrade.</td>
<td>For verifying the upgrade, see Verifying the Upgrade. Complete the following post-upgrade task: Importing Wallets to the KSS Database after an Upgrade Using WLST.</td>
</tr>
</tbody>
</table>

4.2 Installing the Product Distributions

Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle HTTP Server 12c (12.2.1.2) distributions on the target system and install them using Oracle Universal Installer.

**Note:** You must install the Oracle Fusion Middleware Infrastructure distribution first before installing other Fusion Middleware products, when Infrastructure is required for the upgrade.
To install the 12c (12.2.1.2) distributions:

1. Sign in to the target system where you want to install the 12c (12.2.1.2) product distribution.

2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle Fusion Middleware Infrastructure
     (fmw_12.2.1.2.0_infrastructure_generic.jar)
   - Oracle HTTP Server (UNIX: fmw_12.2.1.2.0_ohs_linux64.bin),
     (Windows: setup_fmw_12.2.1.2.0_ohs_win64.exe)

3. Check that your machines meet the following requirements:
   - Ensure that the system, patch, kernel, and other requirements are met as specified in Installing and Configuring Oracle HTTP Server.
   - Because Oracle HTTP Server is installed by default on port 7777, you must ensure that port 7777 is not used by any service on the nodes. To check if this port is in use, run the following command before installing Oracle HTTP Server. You must free the port if it is in use.
     
     ```
     netstat -an | grep 7777
     ```

4. On UNIX platforms, if the /etc/oraInst.loc file exists, check that its contents are correct. Specifically, check that the inventory directory is correct and that you have write permissions for that directory.
   
   If the /etc/oraInst.loc file does not exist, you can skip this step.

5. Change to the directory where you downloaded the 12c (12.2.1.2) product distribution.

6. Start the installation program for Oracle Fusion Middleware Infrastructure:
   - (UNIX) `JDK_HOME/bin/java -jar fmw_12.2.1.2.0_infrastructure_generic.jar`
   - (Windows) `JDK_HOME\bin\java -jar fmw_12.2.1.2.0_infrastructure_generic.jar`

7. On UNIX operating systems, the Installation Inventory Setup screen appears if this is the first time you are installing an Oracle product on this host.

   Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location and click **Next**.

   **Note:** The Installation Inventory Setup screen does not appear on Windows operating systems.

8. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click **Next**.

9. On the Auto Updates screen, select **Skip Auto Updates**. Options are:
- **Skip Auto Updates**: If you do not want your system to check for software updates at this time.

- **Select patches from directory**: To navigate to a local directory if you downloaded patch files.

- **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click **Search**. To configure a proxy server for the installer to access My Oracle Support, click **Proxy Settings**. Click **Test Connection** to test the connection.

Click Next.

10. On the Installation Location screen, specify the location for the Oracle home directory and click **Next**.

Since you are installing the standard installation topology for a collocated Oracle HTTP Server in a WebLogic Server domain, enter the path to an existing Oracle Fusion Middleware Infrastructure Oracle home.

For more information about Oracle Fusion Middleware directory structure, see **Selecting Directories for Installation and Configuration in Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware**.

11. On the Installation Type screen, select the following:

- For Infrastructure, select **Fusion Middleware Infrastructure**

- For Oracle HTTP Server, select **Collocated HTTP Server (Managed through WebLogic Server)**

Click **Next**.

12. The Prerequisite Checks screen analyzes the host computer to ensure that the specific operating system prerequisites have been met.

To view the list of tasks that gets verified, select **View Successful Tasks**. To view log details, select **View Log**. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click **Rerun** to try again. To ignore the error or the warning message and continue with the installation, click **Skip** (not recommended).

13. On the Installation Summary screen, verify the installation options you selected.

If you want to save these options to a response file, click **Save Response File** and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.

Click **Install** to begin the installation.

14. On the Installation Progress screen, when the progress bar displays 100%, click **Finish** to dismiss the installer, or click **Next** to see a summary.

15. The Installation Complete screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer.
16. After you have installed Oracle Fusion Middleware Infrastructure, enter the following command to start the installer for your product distribution and repeat the steps above to navigate through the installer screens:

(UNIX) ./fmw_12.2.1.2.0_ohs_linux64.bin

(Windows) setup_fmw_12.2.1.2.0_ohs_win64.exe

You have installed the Oracle HTTP Server in a collocated mode.

4.3 Running a Pre-Upgrade Readiness Check

To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

About Running a Pre-Upgrade Readiness Check

You can run the Upgrade Assistant in -readiness mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

Starting the Upgrade Assistant in Readiness Mode

Use the -readiness parameter to start the Upgrade Assistant in readiness mode.

Performing a Readiness Check with the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

Understanding the Readiness Report

After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

4.3.1 About Running a Pre-Upgrade Readiness Check

You can run the Upgrade Assistant in -readiness mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

The Upgrade Assistant readiness check performs a read-only, pre-upgrade review of your Fusion Middleware schemas and WebLogic domain configurations that are at a supported starting point. The review is a read-only operation.

The readiness check generates a formatted, time-stamped readiness report so you can address potential issues before you attempt the actual upgrade. If no issues are detected, you can begin the upgrade process. Oracle recommends that you read this report thoroughly before performing an upgrade.

You can run the readiness check while your existing Oracle Fusion Middleware domain is online (while other users are actively using it) or offline.

You can run the readiness check any number of times before performing any actual upgrade. However, do not run the readiness check after an upgrade has been performed, as the report results may differ from the result of pre-upgrade readiness checks.
4.3.2 Starting the Upgrade Assistant in Readiness Mode

Use the -readiness parameter to start the Upgrade Assistant in readiness mode.

To perform a readiness check on your pre-upgrade environment with the Upgrade Assistant:

1. Go to the oracle_common/upgrade/bin directory:
   - (UNIX) ORACLE_HOME/oracle_common/upgrade/bin
   - (Windows) ORACLE_HOME\oracle_common\upgrade\bin

2. Start the Upgrade Assistant.
   - (UNIX) ./ua -readiness
   - (Windows) ua.bat -readiness

Note: If the DISPLAY environment variable is not set up properly to allow for GUI mode, you may encounter the following error:

Xlib: connection to ":1.0" refused by server
Xlib: No protocol specified

To resolve this issue, set the DISPLAY environment variable to the system name or IP address of your local workstation, and rerun Upgrade Assistant.

If you continue to receive these errors after setting DISPLAY, try launching another GUI tool, such as vncconfig. If you see the same errors, your DISPLAY environment variable may still not be set correctly.

For information about other parameters that you can specify on the command line, see:

Upgrade Assistant Parameters

4.3.2.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.
### Table 4-2  Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-readiness</td>
<td>Required for readiness checks</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the -examine parameter.</td>
</tr>
<tr>
<td>-threads</td>
<td>Optional</td>
<td>Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4.</td>
</tr>
<tr>
<td>-response</td>
<td>Required for silent upgrades or silent readiness checks</td>
<td>Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in <em>silent mode</em> (without displaying Upgrade Assistant screens).</td>
</tr>
<tr>
<td>-examine</td>
<td>Optional</td>
<td>Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the -readiness parameter.</td>
</tr>
<tr>
<td>-logLevel attribute</td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes: * TRACE * NOTIFICATION * WARNING * ERROR * INCIDENT_ERROR * The default logging level is NOTIFICATION. Consider setting the -logLevel TRACE attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if -logLevel TRACE is used.</td>
</tr>
</tbody>
</table>

Running a Pre-Upgrade Readiness Check

4-8 Upgrading Oracle HTTP Server
### Table 4-2 (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
</table>
| `-logDir location`      | Optional             | Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant will create log files and temporary files. The default locations are: UNIX: 
`ORACLE_HOME/oracle_common/upgrade/logs`  
`ORACLE_HOME/oracle_common/upgrade/temp`  
Windows:  
`ORACLE_HOME/oracle_common/upgrade/logs`  
`ORACLE_HOME/oracle_common/upgrade/temp` |
| `-help`                 | Optional             | Displays all of the command-line options.                                  |

### 4.3.3 Performing a Readiness Check with the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

Readiness checks are performed only on schemas or component configurations that are at a supported upgrade starting point.

To complete the readiness check:

1. On the Welcome screen, review information about the readiness check. Click Next.
2. On the Readiness Check Type screen, select the readiness check that you want to perform:
   - **Individually Selected Schemas** allows you to select individual schemas for review before upgrade. The readiness check reports whether a schema is supported for an upgrade or where an upgrade is needed.
     When you select this option, the screen name changes to Selected Schemas.
   - **Domain Based** allows the Upgrade Assistant to discover and select all upgrade-eligible schemas or component configurations in the domain specified in the Domain Directory field.
When you select this option, the screen name changes to Schemas and Configuration.

Leave the default selection if you want the Upgrade Assistant to check all schemas and component configurations at the same time, or select a specific option:

- **Include checks for all schemas** to discover and review all components that have a schema available to upgrade.

- **Include checks for all configurations** to review component configurations for a managed WebLogic Server domain.

Click Next.

3. If you selected **Individually Selected Schemas**: On the Available Components screen, select the components that have a schema available to upgrade for which you want to perform a readiness check.

If you select a component that has dependent components, those components are automatically selected. For example, if you select Oracle Platform Security Services, Oracle Audit Services is automatically selected.

Depending on the components you select, additional screens may display. For example, you may need to:

- Specify the domain directory.

- Specify schema credentials to connect to the selected schema: **Database Type**, **DBA User Name**, and **DBA Password**. Then click **Connect**.

  **CAUTION:** Oracle database is the default database type. Make sure that you select the correct database type before you continue. If you discover that you selected the wrong database type, do not go back to this screen to change it to the correct type. Instead, close the Upgrade Assistant and restart the readiness check with the correct database type selected to ensure that the correct database type is applied to all schemas.

- Select the **Schema User Name** and specify the **Schema Password**.

Click Next to start the readiness check.

4. On the Readiness Summary screen, review the summary of the readiness checks that will be performed based on your selections.

If you want to save your selections to a response file to run the Upgrade Assistant again later in response (or silent) mode, click **Save Response File** and provide the location and name of the response file. A silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again.

For a detailed report, click **View Log**.

Click Next.

5. On the Readiness Check screen, review the status of the readiness check. The process can take several minutes.
If you are checking multiple components, the progress of each component displays in its own progress bar in parallel.

When the readiness check is complete, click **Continue**.

6. On the End of Readiness screen, review the results of the readiness check (**Readiness Success** or **Readiness Failure**):

- If the readiness check is successful, click **View Readiness Report** to review the complete report. Oracle recommends that you review the Readiness Report before you perform the actual upgrade even when the readiness check is successful. Use the **Find** option to search for a particular word or phrase within the report. The report also indicates where the completed Readiness Check Report file is located.

- If the readiness check encounters an issue or error, click **View Log** to review the log file, identify and correct the issues, and then restart the readiness check. The log file is managed by the command-line options you set.

### 4.3.4 Understanding the Readiness Report

After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

The format of the readiness report file is:

`readiness_timestamp.txt`

where `timestamp` indicates the date and time of when the readiness check was run.

A readiness report contains the following information:

<table>
<thead>
<tr>
<th>Report Information</th>
<th>Description</th>
<th>Required Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall Readiness Status: SUCCESS or FAILURE</td>
<td>The top of the report indicates whether the readiness check passed or completed with one or more errors.</td>
<td>If the report completed with one or more errors, search for FAIL and correct the failing issues before attempting to upgrade. You can re-run the readiness check as many times as necessary before an upgrade.</td>
</tr>
<tr>
<td>Timestamp</td>
<td>The date and time that the report was generated.</td>
<td>No action required.</td>
</tr>
<tr>
<td>Log file location</td>
<td>The directory location of the generated log file.</td>
<td>No action required.</td>
</tr>
<tr>
<td>Readiness report location</td>
<td>The directory location of the generated readiness report.</td>
<td>No action required.</td>
</tr>
</tbody>
</table>
Table 4-3  (Cont.) Readiness Report Elements

<table>
<thead>
<tr>
<th>Report Information</th>
<th>Description</th>
<th>Required Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Names of components that were check</td>
<td>The names and versions of the components included in the check and status.</td>
<td>If your domain includes components that cannot be upgraded to this release, such as SOA Core Extension, do not attempt an upgrade.</td>
</tr>
<tr>
<td>Names of schemas that were check</td>
<td>The names and current versions of the schemas included in the check and status.</td>
<td>Review the version numbers of your schemas. If your domain includes schemas that cannot be upgraded to this release, do not attempt an upgrade.</td>
</tr>
<tr>
<td>Individual Object Test Status: FAIL</td>
<td>The readiness check test detected an issue with a specific object.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td>Individual Object Test Status: PASS</td>
<td>The readiness check test detected no issues for the specific object.</td>
<td>If your readiness check report shows only the PASS status, you can upgrade your environment. Note, however, that the Readiness Check cannot detect issues with externals such as hardware or connectivity during an upgrade. You should always monitor the progress of your upgrade.</td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: FAILURE</td>
<td>The readiness check detected one or more errors that must be resolved for a particular object such as a schema, an index, or datatype.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: SUCCESS</td>
<td>The readiness check test detected no issues.</td>
<td>No action required.</td>
</tr>
</tbody>
</table>

Here is a sample Readiness Report file. Your report may not include all of these checks.

Upgrade readiness check completed with one or more errors.

This readiness check report was created on Tue May 30 11:15:52 EDT 2016
Log file is located at: ORACLE_HOME/oracle_common/upgrade/logs/ua2016-05-30-11-14-06AM.log

Starting readiness check of components.

Oracle Metadata Services
Starting readiness check of Oracle Metadata Services.
  Schema User Name: DEV11_MDS
  Database Type: Oracle Database
  Database Connect String: machinename@yourcompany.com
  VERSION Schema DEV11_MDS is currently at version 12.1.1.1.0. Readiness checks will now be performed.
  Starting schema test: TEST_REQUIRED_TABLES  Test that the schema contains all the required tables
    Completed schema test: TEST_REQUIRED_TABLES --> Test that the schema contains all
the required tables +++ PASS
Starting schema test: TEST_REQUIRED_PROCEDURES Test that the schema contains all the required stored procedures

**EXCEPTION** Schema is missing a required procedure: GETREPOSITORYFEATURES
Completed schema test: TEST_REQUIRED_PROCEDURES --> Test that the schema contains all the required stored procedures +++ FAIL
Starting schema test: TEST_REQUIRED_VIEWS Test that the schema contains all the required database views
Completed schema test: TEST_REQUIRED_VIEWS --> Test that the schema contains all the required database views +++ PASS
Starting index test for table MDS_ATTRIBUTES: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes
Completed index test for table MDS_ATTRIBUTES: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes +++ PASS
Starting index test for table MDS_COMPONENTS: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes
Completed index test for table MDS_TXN_LOCKS: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes +++ PASS
Starting schema test: TEST_REQUIRED_TRIGGERS Test that the schema has all the required triggers
Completed schema test: TEST_REQUIRED_TRIGGERS --> Test that the schema has all the required triggers +++ PASS
Starting schema test: TEST_MISSING_COLUMNS Test that tables and views are not missing any required columns
Completed schema test: TEST_MISSING_COLUMNS --> Test that tables and views are not missing any required columns +++ PASS
Starting schema test: TEST_UNEXPECTED_TABLES Test that the schema does not contain any unexpected tables
Completed schema test: TEST_UNEXPECTED_TABLES --> Test that the schema does not contain any unexpected tables +++ PASS
Starting schema test: TEST_UNEXPECTED_PROCEDURES Test that the schema does not contain any unexpected stored procedures
Completed schema test: TEST_UNEXPECTED_PROCEDURES --> Test that the schema does not contain any unexpected stored procedures +++ PASS
Starting schema test: TEST_UNEXPECTED_VIEWS Test that the schema does not contain any unexpected views
Completed schema test: TEST_UNEXPECTED_VIEWS --> Test that the schema does not contain any unexpected views +++ PASS
Starting index test for table MDS_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes
Completed index test for table MDS_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes +++ PASS
Completed index test for table MDS_LABELS: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes +++ PASS
Starting index test for table MDS_LARGE_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes
Starting schema test: TEST_UNEXPECTED_TRIGGERS Test that the schema does not contain any unexpected triggers
Completed schema test: TEST_UNEXPECTED_TRIGGERS --> Test that the schema does not contain any unexpected triggers +++ PASS
Starting schema test: TEST_UNEXPECTED_COLUMNS Test that tables and views do not contain any unexpected columns
Completed schema test: TEST_UNEXPECTED_COLUMNS --> Test that tables and views do not contain any unexpected columns +++ PASS
Starting datatype test for table MDS_ATTRIBUTES: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Completed datatype test for table MDS_ATTRIBUTES: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes +++ PASS
Starting datatype test for table MDS_COMPONENTS: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Starting permissions test: TEST_DBA_TABLE_GRANTS Test that DBA user has
privilege to view all user tables

Completed permissions test: TEST_DBA_TABLE_GRANTS --> Test that DBA user has
privilege to view all user tables +++ PASS

Starting schema test: TEST_ENOUGH_TABLESPACE Test that the schema tables automatically extend if full

Completed schema test: TEST_ENOUGH_TABLESPACE --> Test that the schema
tablespaces automatically extend if full +++ PASS

Starting schema test: TEST_USER_TABLESPACE_QUOTA Test that tablespace quota for this user is sufficient to perform the upgrade

Completed schema test: TEST_USER_TABLESPACE_QUOTA --> Test that tablespace quota for this user is sufficient to perform the upgrade +++ PASS

Starting schema test: TEST_ONLINE_TABLESPACE Test that schema tablespaces are online

Completed schema test: TEST_ONLINE_TABLESPACE --> Test that schema tablespaces are online +++ PASS

Starting schema test: TEST_DATABASE_VERSION Test that the database server version number is supported for upgrade

INFO Database product version: Oracle Database 11g Enterprise Edition Release 11.2.0.3.0 - 64bit Production
With the Partitioning, OLAP, Data Mining and Real Application Testing options

Completed schema test: TEST_DATABASE_VERSION --> Test that the database server version number is supported for upgrade +++ PASS

Finished readiness check of Oracle Metadata Services with status: FAILURE.

If you are running the 12.1.3.0 version of Oracle Fusion Middleware IAU Schemas, and those schemas were upgraded from 11g (11.1.1.7 and later) or 12c (12.1.2.0), your readiness check may fail with the following error:

Starting index test for table IAU_COMMON: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes

INFO Audit schema index DYN_EVENT_CATEGORY_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_EVENT_TYPE_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_TENANT_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_USER_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_COMPONENT_TYPE_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_USER_TENANT_INDEX in table IAU_COMMON is missing the required columns or index itself is missing. This maybe caused by a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

Completed index test for table IAU_COMMON: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes +++ FAIL

Note: You can ignore the missing index error in the readiness report. This is a known issue. The corresponding missing index is added during the schema upgrade operation. This error does not occur if the schema to be upgraded was created in 12c using the RCU.
4.4 Stopping Servers and Processes

Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server domain, an Administration Server, multiple managed servers, Java components, system components such as Identity Management components, and a database used as a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

Note: The procedures in this section describe how to stop servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

To stop your Fusion Middleware environment, follow the steps below.

Step 1: Stop System Components

To stop system components, such as Oracle HTTP Server, use the stopComponent script:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

You can stop system components in any order.

Step 2: Stop the Managed Servers

To stop a WebLogic Server Managed Server, use the stopManagedWebLogic script:

- (UNIX) `DOMAIN_HOME/bin/stopManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\stopManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

Step 3: Stop Oracle Identity Management Components

Stop any Oracle Identity Management components, such as Oracle Internet Directory:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

Step 4: Stop the Administration Server

When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.
To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/stopWebLogic.sh`
- (Windows) `DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

**Step 5: Stop Node Manager**

To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. For more information, see `stopNodeManager` in *Oracle Fusion Middleware WLST Command Reference for WebLogic Server*.

### 4.5 Creating the Required 12c Schemas with the RCU

When upgrading from 11g, you must use the Repository Creation Utility (RCU) to create the required 12c schemas before you begin the upgrade.

**Note:** If you are upgrading from a previous 12c release of Oracle Fusion Middleware, you do not need to re-create these schemas if they already exist. Refer to the steps below to identify the existing schemas in your domain.

If you are upgrading from 11g, refer to the Pre-Upgrade Checklist to identify the existing schemas in your domain. The following schemas must exist before you upgrade to 12c:

- **Service Table** schema (`prefix_STB`). This schema is new in 12c and is required for domain-based upgrades. It stores basic schema configuration information (for example, schema prefixes and passwords) that can be accessed and used by other Oracle Fusion Middleware components during the domain creation. This schema is automatically created when you run the Repository Creation Utility (RCU), where you specify the existing schema owner prefix that you used for your other 11g schemas. **Note:** If the Service Table schema does not exist, you may encounter the error message `UPGAST-00328` : The schema version registry table does not exist on this database. If that happens it is necessary to create the service table schema in order to run Upgrade Assistant.

- **Oracle Platform Security Services (OPSS)** schema (`prefix_OPSS`). This schema is required if you are using an OID-based security store in 11g. This schema is automatically created when you run the Repository Creation Utility (RCU). The only supported LDAP-based OPSS security store is Oracle Internet Directory (OID). An LDAP-based policy store is typically used in production environments. You do not need to reassociate an OID-based security store before upgrade. While the Upgrade Assistant is running, you can select the OPSS schema. The Upgrade Assistant upgrades the OID-based security store automatically. **Note:** The 12c OPSS database schema is required so that you can reference the 12c schema during the reconfiguration of the domain. Your domain continues to use the OID-based security store after the upgrade is complete.

To create the 12c schemas with the RCU:
1. (Optional) If you are upgrading from 11g, and you would like to confirm which schemas are in your existing domain, connect to the database as a user with DBA privileges, and run the following code from SQL*Plus:

```
SET LINE 120
COLUMN MRC_NAME FORMAT A14
COLUMN COMP_ID FORMAT A20
COLUMN VERSION FORMAT A12
COLUMN STATUS FORMAT A9
COLUMN UPGRADED FORMAT A8
SELECT MRC_NAME, COMP_ID, OWNER, VERSION, STATUS, UPGRADED FROM
SCHEMA_VERSION_REGISTRY ORDER BY MRC_NAME, COMP_ID ;
```

2. Verify that a certified JDK already exists on your system by running `java -version` from the command line. For 12c (12.2.1.2), the certified JDK is 1.8.0_101 and later.

Ensure that the JAVA_HOME environment variable is set to the location of the certified JDK. For example:

- (UNIX) `setenv JAVA_HOME /home/Oracle/Java/jdk1.8.0_101`
- (Windows) `set JAVA_HOME=C:\home\Oracle\Java\jdk1.8.0_101`

Add `$JAVA_HOME/bin` to `$PATH`.

3. Go to the oracle_common/bin directory:

- (UNIX) `ORACLE_HOME/oracle_common/bin`
- (Windows) `ORACLE_HOME\oracle_common\bin`

4. Start the RCU:

- (UNIX) `./rcu`
- (Windows) `rcu.bat`

5. On the Welcome screen, click **Next**.

6. On the Create Repository screen, select **Create Repository** and then select **System Load and Product Load**.

   If you do not have DBA privileges, select **Prepare Scripts for System Load**. This will generate a SQL script containing all the same SQL statements and blocks that would have been called if the RCU were to execute the actions for the selected components. After the script is generated, a user with the necessary SYS or SYSDBA privileges can execute the script to complete the system load phase.

   Click **Next**.

7. On the Database Connection Details screen, select the **Database Type** and enter the connection information for the database that hosts the 11g schemas. See the pertinent table below.
### Table 4-4  Connection Credentials for Oracle Databases and Oracle Databases with Edition-Based Redefinition

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Specify the name of the server where your database is running in the following format: examplehost.examediann.com For Oracle RAC databases, specify the VIP name or one of the node names in this field.</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number for your database. The default port number for Oracle databases is 1521.</td>
</tr>
<tr>
<td>Service Name</td>
<td>Specify the service name for the database. Typically, the service name is the same as the global database name. For Oracle RAC databases, specify the service name of one of the nodes in this field. For example: examplehost.examediann.com</td>
</tr>
<tr>
<td>Username</td>
<td>Enter the user name for your database. The default user name is SYS.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for your database user.</td>
</tr>
<tr>
<td>Role</td>
<td>Select the database user's role from the drop-down list: Normal or SYSDBA</td>
</tr>
</tbody>
</table>

### Table 4-5  Connection Credentials for MySQL Databases

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Specify the host name, IP address, or complete server name in host\server format of the server where your database is running.</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number for your database.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Specify the name of your database.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify the name of a user with administrator privileges.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for your database user.</td>
</tr>
</tbody>
</table>

### Table 4-6  Connection Credentials for Microsoft SQL Server Databases

<table>
<thead>
<tr>
<th>Option</th>
<th>Description and Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unicode Support</td>
<td>Select Yes or No from the drop-down list.</td>
</tr>
<tr>
<td>Server Name</td>
<td>Specify the host name, IP address, or complete server name in host\server format of the server where your database is running. MSSQL named instances: A named instance is identified by the network name of the computer plus the instance name that you specify during installation. The client must specify both the server name and the instance name when connecting.</td>
</tr>
<tr>
<td>Table 4-6</td>
<td>(Cont.) Connection Credentials for Microsoft SQL Server Databases</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Option</strong></td>
<td><strong>Description and Example</strong></td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number for your database.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Specify the name of your database.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify the name of a user with administrator privileges.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for your database user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 4-7</th>
<th>Connection Credentials for IBM DB2 Databases</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Option</strong></td>
<td><strong>Description and Example</strong></td>
</tr>
<tr>
<td>Server Name</td>
<td>Specify the host name, IP address, or complete server name in host\server format of the server where your database is running.</td>
</tr>
<tr>
<td>Port</td>
<td>Specify the port number for your database.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Specify the name of your database.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify the name of a user with DB Owner privileges. The default user name for IBM DB2 databases is db2admin.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for your database user.</td>
</tr>
</tbody>
</table>

If the prerequisite check is successful, click OK to continue to the next page. If the check fails, review the details you entered and try again.

8. On the Select Components screen, select Select existing prefix and select the prefix that was used to create the existing 11g schemas from the drop-down menu (for example, DEV11G). This prefix is used to logically group schemas together for use in this domain.

Select AS Common Schemas.

**Note:** The Common Infrastructure Services Service Table (prefix_STB) and Oracle Platform Security Services (prefix_OPSS) schemas are selected by default if they have not yet been created.

Make a note of the prefix and schema names for the components you are installing as you will need this information when you configure the installation. Click Next.

9. In the Checking Prerequisites dialog, verify that the prerequisites check is successful, then click OK.

10. On the Schema Passwords screen, specify the passwords for your schema owners. Make a note of the passwords you enter on this screen as you will need this information while configuring your product installation.

11. On the Map Tablespaces screen, configure the desired tablespace mapping for the schemas you want to create.

Click Next, then click OK in the confirmation dialog. When the progress dialog shows the tablespace creation is complete, click OK.
You see the **Encrypt Tablespace** check box only if you have enabled Transparent Data Encryption (TDE) in the database (Oracle or Oracle EBR) when you start the RCU. Select the **Encrypt Tablespace** check box on the Map Tablespaces screen to encrypt all new tablespaces that the RCU creates.

12. Verify the information on the Summary screen and click **Create** to begin schema creation.

   This screen contains information about the log files that were created from this RCU operation. You can click on the name of a particular log file to view the contents of that file.

13. Review the information on the Completion Summary screen to verify that the operation is completed successfully. Click **Close** to complete the schema creation.

### 4.6 Reconfiguring the Domain

Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

When you reconfigure a WebLogic Server domain, the following items are automatically updated, depending on the applications in the domain:

- WebLogic Server core infrastructure
- Domain version

---

**Note:**

Before you begin the domain reconfiguration, note the following limitations:

- The Reconfiguration Wizard does not update any of your own applications that are included in the domain.
- Transforming a non-dynamic cluster domain to a dynamic cluster domain during the upgrade process is not supported.

   The dynamic cluster feature is available when running the Reconfiguration Wizard, but Oracle only supports upgrading a non-dynamic cluster upgrade and then adding dynamic clusters. You cannot add dynamic cluster during the upgrade process.

---

Specifically, when you reconfigure a domain, the following occurs:

- The domain version number in the `config.xml` file for the domain is updated to the Administration Server's installed WebLogic Server version.
- Reconfiguration templates for all installed Oracle products are automatically selected and applied to the domain. These templates define any reconfiguration tasks that are required to make the WebLogic domain compatible with the current WebLogic Server version.
- Start scripts are updated.

   If you want to preserve your modified start scripts, be sure to back them up before starting the Reconfiguration Wizard.
Follow these instructions to reconfigure the existing domain using the Reconfiguration Wizard. For general information about how the domain is reconfigured, see Reconfiguring WebLogic Domains in Oracle Fusion Middleware Upgrading Oracle WebLogic Server.

### 4.6.1 Backing Up the Domain

Before running the Reconfiguration Wizard, create a backup copy of the domain directory.

1. Copy the source domain to a separate location to preserve the contents.
   
   For example, copy `C:\domains\mydomain` to `C:\domains\mydomain_backup`.

2. Before updating the domain on each remote Managed Server, create a backup copy of the domain directory on each remote machine.

3. Verify that the backed up versions of the domain are complete.

If domain reconfiguration fails for any reason, you must copy all files and directories from the backup directory into the original domain directory to ensure that the domain is returned entirely to its original state before reconfiguration.

### 4.6.2 Starting the Reconfiguration Wizard

To start the Reconfiguration Wizard in graphical mode:

1. Sign in to the system on which the domain resides.

2. Open the command shell (on UNIX operating systems) or open a command prompt window (on Windows operating systems).

3. **Edition Based Database Users Only**: If your schemas are configured with EBR database, a default edition name must be manually supplied before you run the Reconfiguration Wizard.

   Run the following SQL command to set the default edition:

   ```sql
   SET DEFAULT_EDITION 'default' 
   ```
ALTER DATABASE DEFAULT EDITION = edition_name;
where edition_name is the child edition name.

4. Go to the oracle_common/common/bin directory:
   - (UNIX) ORACLE_HOME/oracle_common/common/bin
   - (Windows) ORACLE_HOME/oracle_common/common/bin

5. Start the Reconfiguration Wizard with the following logging options:
   - (UNIX) ./reconfig.sh -log=log_file -log_priority=ALL
   - (Windows) reconfig.cmd -log=log_file -log_priority=ALL

where log_file is the absolute path of the log file you’d like to create for the
domain reconfiguration session. This can be helpful if you need to troubleshoot the
reconfiguration process.

The parameter -log_priority=ALL ensures that logs are logged in fine mode.

---

**Note:**
When you run this command, the following error message might appear to
indicate that the default cache directory is not valid:

*sys-package-mgr*: can’t create package cache dir

You can change the cache directory by setting the environment variable
CONFIG_JVM_ARGS. For example:

CONFIG_JVM_ARGS=-Dpython.cachedir=valid_directory

---

### 4.6.3 Reconfiguring the Domain with the Reconfiguration Wizard

Navigate through the screens in the Reconfiguration Wizard to reconfigure your
existing domain.

To reconfigure the domain:

1. On the Select Domain screen, specify the location of the domain you want to
   upgrade or click **Browse** to navigate and select the domain directory. Click **Next**.

2. On the Reconfiguration Setup Progress screen, view the progress of the setup
   process. When complete, click **Next**.

During this process:

- The reconfiguration templates for your installed products, including Fusion
  Middleware products, are automatically applied. This updates various domain
  configuration files such as config.xml, config-groups.xml,
  and security.xml (among others).

- Schemas, scripts, and other such files that support your Fusion Middleware
  products are updated.

- The domain upgrade is validated.
3. On the Domain Mode and JDK screen, select the JDK to use in the domain or click **Browse** to navigate to the JDK you want to use. The supported JDK version for 12c (12.2.1.2) is 1.8.0_101 and later. Click **Next**.

**Note:** You cannot change the **Domain Mode** at this stage.

For a list of JDKs that are supported for a specific platform, see Oracle Fusion Middleware Supported System Configurations.

4. On the JDBC Data Sources screen, configure the JDBC data sources defined in your domain source.

The JDBC data sources associated with the products for which you are creating the domain are listed in the lower half of the screen. A JDBC data source contains a pool of database connections that are created when the data source instance is created, deployed or targeted, or at server startup. Applications look up a data source on the JNDI tree, and then request a connection. When the applications no longer need the connections, they return the connections to the connection pool in the data source.

From the **Data Source Name** drop-down list, select the data source(s) for which you want to specify the settings. The values that you specify are displayed in the appropriate columns in the data source list, for the selected data source.

For Oracle RAC Configuration for data sources, you can select one of the three options:

- Convert to GridLink
- Convert to RAC multi data source
- Don’t convert

For more information about each option, click **Help**.

After specifying the details, click **Next**.

If you do not select any data sources on the JDBC Data Sources screen, the following warning displays:

**Missing Driver**

Click **Ok** to proceed without verification, click **Cancel** to return to the JDBC Data Sources page.

In this case, if you click **Ok**, the data sources are not verified.

5. On the JDBC Data Sources Test screen, select the check box for the data source connection you configured on the JDBC Data Sources screen and click **Test Selected Connections** to test the data source connection.

**Note:** In order to test the database connections, the database to which you are connecting must be running. If you do not want to test the connections at this time, do not select any data sources. Click **Next** to continue.
6. On the Database Configuration Type screen, select RCU Data to connect to the Server Table (_STB) schema.

Enter the database connection details using the RCU service table (_STB) schema credentials and click Get RCU Configuration.

The Reconfiguration Wizard uses this connection to automatically configure the data sources required for components in your domain.

NOTE: For any existing 11g datasource, the reconfiguration will preserve the existing values. For new datasources where the schema was created for 12c by the RCU, the default connection data will be retrieved from the _STB schema. If no connection data for a given schema is found in the _STB schema, then the default connection data is used.

If the check is successful, click Next. If the check fails, reenter the connection details correctly and try again.

7. On the JDBC Component Schema Test screen, select all the component schemas and click Test Selected Connections to test the connection for each schema. The result of the test is indicated in the Status column.

When the check is complete, click Next.

8. The Node Manager screen is only displayed if the domain you are reconfiguring is currently using a per host Node Manager.

On the Node Manager screen, select the Node Manager configuration to use for the reconfigured domain. The resulting configuration depends on the combination of options you select for Node Manager Type and Node Manager Configuration.

Table 4-8  Field Descriptions for Node Manager Screen

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Per Domain Default Location</td>
<td>If you select this option, the Node Manager home is redefined to DOMAIN_NAME/nodemanager and you cannot edit the Node Manager home.</td>
</tr>
<tr>
<td>Per Domain Custom Location</td>
<td>Select this option if you want the per domain Node Manager configuration files to be created in a specific location for this domain. Specify the directory in the Node Manager Home field, or click Browse to use the navigation tree to select the location. The specified directory must be empty. The nodemanager.properties and nodemanager.domains files are created in this directory.</td>
</tr>
<tr>
<td>Node Manager Home</td>
<td>If you selected the Per Domain Custom Location option, click Browse to navigate to the directory location that you want to use to store the per domain Node Manager configuration.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Manual Node Manager Setup</td>
<td>If you select this option, creation of the Node Manager configuration for the domain is skipped (all remaining fields cannot be modified), and if you want to use Node Manager in the domain, you must manually configure Node Manager as described in Completing the Node Manager Configuration. The reconfigured domain will still use a per host Node Manager configuration. You should also select this option if your existing domain is not configured to use Node Manager and you do not want to use Node Manager in the reconfigured domain. For more information about Node Manager configuration, see Administering Node Manager for Oracle WebLogic Server.</td>
</tr>
<tr>
<td>Node Manager Configuration</td>
<td>Select one of the following two options. These fields are not available if you selected Manual Node Manager Setup.</td>
</tr>
<tr>
<td>Create New Configuration</td>
<td>A per domain Node Manager configuration will be automatically created for the reconfigured domain using default settings in nodemanager.properties. If necessary, you can modify nodemanager.properties after the domain has been successfully reconfigured.</td>
</tr>
<tr>
<td>Migrate Existing Configuration</td>
<td>The existing per host Node Manager configuration will be migrated to a per domain configuration for the reconfigured domain. This does not include environment-specific settings for ListenAddress, ListenPort, StartScriptName, JavaHome, and LogFile.</td>
</tr>
<tr>
<td>Node Manager Home</td>
<td>If you selected the Migrate Existing Configuration option, enter or browse to the Node Manager home directory that you want to migrate to the reconfigured domain.</td>
</tr>
</tbody>
</table>
### Table 4-8 (Cont.) Field Descriptions for Node Manager Screen

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Apply Oracle Recommended Defaults</strong></td>
<td>If you selected the <strong>Migrate Existing Configuration</strong> option, select this check box if you want to use Oracle-recommended defaults in the <code>nodemanager.properties</code> file. Deselect this check box if you want to continue using the settings in the <code>nodemanager.properties</code> file being migrated. Oracle-recommended properties with default values are as follows:</td>
</tr>
<tr>
<td><strong>LogLimit</strong>=0</td>
<td><strong>AuthenticationEnabled</strong>=true</td>
</tr>
<tr>
<td><strong>LogLevel</strong>=INFO</td>
<td><strong>DomainsFileEnabled</strong>=true</td>
</tr>
<tr>
<td><strong>NativeVersionEnabled</strong>=true</td>
<td><strong>LogToStderr</strong>=true</td>
</tr>
<tr>
<td><strong>SecureListener</strong>=true</td>
<td><strong>LogCount</strong>=1</td>
</tr>
<tr>
<td><strong>StopScriptEnabled</strong>=false</td>
<td><strong>QuitEnabled</strong>=false</td>
</tr>
<tr>
<td><strong>LogAppend</strong>=true</td>
<td><strong>StateCheckInterval</strong>=500</td>
</tr>
<tr>
<td><strong>CrashRecoveryEnabled</strong>=false</td>
<td><strong>StartScriptEnabled</strong>=true</td>
</tr>
<tr>
<td><strong>LogFormatter</strong>=<code>weblogic.nodemanager.server.LogFormatter</code></td>
<td><strong>ListenBacklog</strong>=50</td>
</tr>
</tbody>
</table>

**Node Manager Credentials: Username, Password**

Specify the username and password that you want to use to start Node Manager in the reconfigured domain.

9. On the Advanced Configuration screen, you can select all categories for which you want to perform advanced configuration. For each category you select, the appropriate configuration screen is displayed to allow you to perform advanced configuration.

**Note:** The categories that are listed on the Advanced Configuration screen depend on the resources defined in the templates you selected for the domain.

For this upgrade, select none of the options and click **Next**.

10. On the Configuration Summary screen, review the detailed configuration settings of the domain before continuing.

You can limit the items that are displayed in the right-most panel by selecting a filter option from the **View** drop-down list.

To change the configuration, click **Back** to return to the appropriate screen. To reconfigure the domain, click **Reconfig**.

**Note:** The location of the domain does not change when you reconfigure it.

11. The Reconfiguration Progress screen displays the progress of the reconfiguration process.
During this process:

- Domain information is extracted, saved, and updated.
- Schemas, scripts, and other such files that support your Fusion Middleware products are updated.

When the progress bar shows 100%, click Next.

12. The End of Configuration screen indicates whether the reconfiguration process completed successfully or failed. It also displays the location of the domain that was reconfigured as well as the Administration Server URL (including the listen port). If the reconfiguration is successful, it displays **Oracle WebLogic Server Reconfiguration Succeeded**.

If the reconfiguration process did not complete successfully, an error message is displayed indicates the reason. Take appropriate action to resolve the issue. If you cannot resolve the issue, contact My Oracle Support.

Note the Domain Location and the Admin Server URL for further operations.

### 4.7 Upgrading Domain Component Configurations

After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.

**Starting the Upgrade Assistant**

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

**Upgrading Domain Components Using the Upgrade Assistant**

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.

**Verifying the Domain-specific-Component Configurations Upgrade**

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

### 4.7.1 Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

To start the Upgrade Assistant:

1. Go to the `oracle_common/upgrade/bin` directory:

   - (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Start the Upgrade Assistant:
For information about other parameters that you can specify on the command line, such as logging parameters, see:

**Upgrade Assistant Parameters**

### 4.7.1.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-readiness</td>
<td>Required for readiness checks</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the -examine parameter. <strong>Note:</strong> Readiness checks cannot be performed on standalone installations (those not managed by the WebLogic Server).</td>
</tr>
<tr>
<td>-threads</td>
<td>Optional</td>
<td>Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4.</td>
</tr>
<tr>
<td>-response</td>
<td>Required for silent upgrades or silent readiness checks</td>
<td>Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in <em>silent mode</em> (without displaying Upgrade Assistant screens).</td>
</tr>
<tr>
<td>-examine</td>
<td>Optional</td>
<td>Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the -readiness parameter.</td>
</tr>
</tbody>
</table>
### Table 4-9 (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-logLevel attribute</td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TRACE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NOTIFICATION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• WARNING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• INCIDENT_ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default logging level is NOTIFICATION.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Consider setting the -logLevel TRACE attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant’s log files can become very large if -logLevel TRACE is used.</td>
</tr>
<tr>
<td>-logDir location</td>
<td>Optional</td>
<td>Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant will create log files and temporary files. The default locations are: UNIX:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-ORACLE_HOME/oracle_common/upgrade/logs</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-ORACLE_HOME/oracle_common/upgrade/temp</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Windows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-ORACLE_HOME/oracle_common\upgrade\logs</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-ORACLE_HOME/oracle_common\upgrade\temp</td>
</tr>
<tr>
<td>-help</td>
<td>Optional</td>
<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>

#### 4.7.2 Upgrading Domain Components Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.
After running the Reconfiguration Wizard to reconfigure the WebLogic domain to 12c (12.2.1.2), you must run the Upgrade Assistant to upgrade the domain component configurations to match the updated domain configuration.

To upgrade domain component configurations with the Upgrade Assistant:

1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click Next.

   **Note:** For more information about any Upgrade Assistant screen, click Help on the screen.

2. On the WebLogic Components screen, select the **WebLogic Component Configurations** option to upgrade component configurations for a managed WebLogic Server domain. Enter the connection details required to connect to the WebLogic Administration Server that is managing the domain and click Next.

3. On the Component List screen, verify that the list includes all the components for which you want to upgrade configurations and click Next.

   If you do not see the components you want to upgrade, click Back to go to the previous screen and specify a different domain.

4. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click Next.

   **Note:** The Upgrade Assistant does not verify whether the prerequisites have been met.

5. On the Examine screen, review the status of the Upgrade Assistant as it examines each component, verifying that the component configuration is ready for upgrade. If the status is Examine finished, click Next.

   If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking No in the Examination Failure dialog. Click View Log to see what caused the error and refer to Troubleshooting Your Upgrade in Oracle Fusion Middleware Upgrading with the Upgrade Assistant Upgrade Guide for information on resolving common upgrade errors.

   **Note:**
   - If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking Yes in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.
   - Canceling the examination process has no effect on the configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

6. On the Upgrade Summary screen, review the summary of the options you have selected for component configuration upgrade.
The response file collects and stores all the information that you have entered, and enables you to perform a silent upgrade at a later time. The silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again. If you want to save these options to a response file, click **Save Response File** and provide the location and name of the response file.

Click **Upgrade** to start the upgrade process.

7. On the Upgrade Progress screen, monitor the status of the upgrade.

   **Caution:** Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

   If any components are not upgraded successfully, refer to the Upgrade Assistant log files for more information.

   **Note:** The progress bar on this screen displays the progress of the current upgrade procedure. It does not indicate the time remaining for the upgrade.

   Click **Next**.

8. If the upgrade is successful: On the Upgrade Success screen, click **Close** to complete the upgrade and close the wizard. The Post-Upgrade Actions window describes the manual tasks you must perform to make components functional in the new installation. This window appears only if a component has post-upgrade steps.

   If the upgrade fails: On the Upgrade Failure screen, click **View Log** to view and troubleshoot the errors. The logs are available at `ORACLE_HOME/oracle_common/upgrade/logs`.

   **Note:** If the upgrade fails you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.

### 4.7.3 Verifying the Domain-specific-Component Configurations Upgrade

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

To log into the Administration Console, go to: `http://administration_server_host:administration_server_port/console`

To log into the Fusion Middleware Control, go to: `http://administration_server_host:administration_server_port/em`
After upgrade, make sure you run the administration tools from the new Oracle home and not from the previous Oracle home.

During the upgrade process, some OWSM documents, including policy sets and predefined documents such as policies and assertion templates, may need to be upgraded. If a policy set or a predefined document is upgraded, its version number is incremented by 1.

Note:

4.8 Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.

Note: The procedures in this section describe how to start servers and processes using the WLST command line or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Administering Oracle Fusion Middleware.

To start your Fusion Middleware environment, follow the steps below.

Step 1: Start the Administration Server
When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the startWebLogic script:

• (UNIX) $DOMAIN_HOME/bin/startWebLogic.sh
• (Windows) $DOMAIN_HOME\bin\startWebLogic.cmd

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 2: Start Node Manager
To start Node Manager, use the startNodeManager script:

• (UNIX) $DOMAIN_HOME/bin/startNodeManager.sh
• (Windows) $DOMAIN_HOME\bin\startNodeManager.cmd

Step 3: Start Oracle Identity Management Components
Start any Oracle Identity Management components, such as Oracle Internet Directory, that form part of your environment:

• (UNIX) $DOMAIN_HOME/bin/startComponent.sh component_name
• (Windows) $DOMAIN_HOME\bin\startComponent.cmd component_name
Step 4: Start the Managed Servers

To start a WebLogic Server Managed Server, use the `startManagedWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\startManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

**Note:** The startup of a Managed Server will typically start the applications that are deployed to it. Therefore, it should not be necessary to manually start applications after the Managed Server startup.

Step 5: Start System Components

To start system components, such as Oracle HTTP Server, use the `startComponent` script:

- (UNIX) `DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\startComponent.cmd component_name`

You can start system components in any order.

**Starting the Oracle HTTP Server**

You can use Enterprise Manager Fusion Middleware Control to start, stop, and restart Oracle HTTP Server.

4.8.1 Starting the Oracle HTTP Server

You can use Enterprise Manager Fusion Middleware Control to start, stop, and restart Oracle HTTP Server.

You can start the Oracle HTTP Server with the Node Manager by following the procedure mentioned in Running Oracle HTTP Server Remotely in Oracle Fusion Middleware Administering Oracle HTTP Server.

To start an Oracle HTTP Server using Enterprise Manager Fusion Middleware Control:

1. Go to the Oracle HTTP Server home page.
2. From the Oracle HTTP Server menu:
   a. Select Control.
   b. Select Start Up from the Control menu.
   Or
3. From the Target Navigation tree:
   a. Right-click the Oracle HTTP Server instance you want to start.
   b. Select Control.
c. Select **Start Up** from the **Control** menu.

### 4.9 Verifying the Upgrade

If you can log in to the Administration Console and the Enterprise Manager Fusion Middleware Control, your upgrade is successful.

To verify the upgrade:

1. Sign in to the following URL:
   
   http://MachineName.us.oracle.com:7777

2. To access Enterprise Manager Fusion Middleware Control:

   http://MachineName.us.oracle.com:7001/em

If you are not able to start the newly upgraded environment, a possible cause could be the use of MD5 certificates in your Oracle wallet. See [Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm](#) for a procedure to check whether you are using MD5 signatures and a procedure to replace them with SHA-2 certificates.

### 4.10 Importing Wallets to the KSS Database after an Upgrade Using WLST

When you use Upgrade Assistant to upgrade from a previous version of Oracle HTTP Server to 12c (12.2.1.2), you must perform an additional wallet management task.

Use the `ohs_postUpgrade` command to import the wallets for Oracle HTTP Server instances to the KSS database.

This command parses across all of the Oracle HTTP Server instances in the domain and imports the wallets to the KSS database if an entry does not already exist in the database against the same keystore name. For more information on this command, see [ohs_postUpgrade](#).

1. Start WLST from the command line.

   (UNIX) `ORACLE_HOME/oracle_common/common/bin/wlst.sh`

   (Windows) `ORACLE_HOME/oracle_common\common\bin\wls\cmd`

2. Connect to the Administration Server instance:

   `connect('<userName>', '<password>', '<host>:<port>')`

3. Enter the `ohs_postUpgrade` WLST custom command, for example:

   `ohs_postUpgrade()`
Part II contains the following chapters:

Upgrading a Standalone Oracle HTTP Server from a Previous 12c Release

Upgrading a Managed Oracle HTTP Server from a Previous 12c Release
This chapter describes the procedure for upgrading a managed Oracle HTTP Server from to a latest 12c release from a previous 12c release. The valid starting point for this upgrade are 12c releases 12.1.2 and above.
Upgrading a Standalone Oracle HTTP Server from a Previous 12c Release

This chapter describes the process of upgrading a Standalone Oracle HTTP Server to the latest 12c from a previous Standalone Oracle HTTP Server 12c release.

Note:
The information in this chapter assumes that you have read and performed any required pre-upgrade tasks listed in Planning an Upgrade to Oracle Fusion Middleware 12c (12.2.1.2) in Oracle Fusion Middleware Planning an Upgrade of Oracle Fusion Middleware.

This chapter contains the following sections:

About the Standalone Oracle HTTP Server Upgrade Process from a Previous 12c Release
Review the flowchart and roadmap for an overview of the upgrade process for Oracle HTTP Server.

Installing the Standalone Oracle HTTP Server
Before beginning your upgrade, download the Oracle HTTP Server 12c (12.2.1.2) distribution on the target system and install it using the Oracle Universal Installer.

Stopping Servers and Processes
Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

Reconfiguring the Domain
Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

Upgrading Standalone System Component Configurations
Use the Upgrade Assistant to upgrade the standalone agent’s component configurations when the agent is managed by OPMN. The standalone component configuration upgrade does not support upgrade of a standalone agent that is not managed by OPMN.

Verifying the Upgrade
You can verify that the upgrade is successful if you are able to start the Node Manager and the Standalone Oracle HTTP Server properly.

Starting Servers and Processes
After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.
5.1 About the Standalone Oracle HTTP Server Upgrade Process from a Previous 12c Release

Review the flowchart and roadmap for an overview of the upgrade process for Oracle HTTP Server.

Figure 5-1 shows the high-level procedures associated with a standalone Oracle HTTP Server upgrade when the starting point is another 12c release. The tools used for each step are also listed.

Figure 5-1 Upgrade Process Flowchart for Standalone Oracle HTTP Server from a Previous 12c release

The following table describes the tasks that must be completed to upgrade a standalone Oracle HTTP Server from a previous release of 12c to the latest version.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>To determine which Oracle HTTP Server you have in your existing environment, see Determining whether Oracle HTTP Server is Standalone or Managed (Collocated).</td>
</tr>
<tr>
<td>Verify that you are upgrading a standalone Oracle HTTP Server.</td>
<td>The pre-upgrade tasks include cloning your production environment, verifying system requirements and certifications, purging unused data, and creating non-SYSDBA user. For a complete list of pre-upgrade tasks, see Preparing to Upgrade Oracle HTTP Server.</td>
</tr>
<tr>
<td>Required</td>
<td>Run the installation program to install the software. Select the installation type Standalone Oracle HTTP Server (managed independently of WebLogic server). This transfers the software to your system and creates a new Oracle home directory. See Installing the Standalone Oracle HTTP Server.</td>
</tr>
<tr>
<td>Complete the pre-upgrade tasks</td>
<td></td>
</tr>
<tr>
<td>Install the 12c Standalone Oracle HTTP Server distribution</td>
<td></td>
</tr>
<tr>
<td>Shut down the existing 12c environment</td>
<td></td>
</tr>
<tr>
<td>Reconfigure your existing 12c domain with the Reconfiguration Wizard</td>
<td></td>
</tr>

5.2 Installing the Standalone Oracle HTTP Server

Before beginning your upgrade, download the Oracle HTTP Server 12c (12.2.1.2) distribution on the target system and install it using the Oracle Universal Installer.

To install the standalone Oracle HTTP Server:

1. Sign in to the target system where you want to install the 12c (12.2.1.2) product distribution.

2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle HTTP Server (UNIX: `fmw_12.2.1.2.0_ohs_linux64.bin`),
   - (Windows: `setup_fmw_12.2.1.2.0_ohs_win64.exe`)

3. Change to the directory where you downloaded the 12c (12.2.1.2) product distribution.

4. Check that your machines meet the following requirements:
   - Ensure that the system, patch, kernel, and other requirements are met as specified in Roadmap for Verifying Your System Environment.
   - Because Oracle HTTP Server is installed by default on port 7777, you must ensure that port 7777 is not used by any service on the nodes. To check if this port is in use, run the following command before installing Oracle HTTP Server. You must free the port if it is in use.
     ```bash
     netstat -an | grep 7777
     ```

5. Start the installation program by entering the following command:
   - (UNIX) `./fmw_12.2.1.2.0_ohs_linux64.bin`
(Windows) setup_fmw_12.2.1.2.0_ohs_win64.exe

6. On UNIX operating systems, the Installation Inventory Setup screen appears if this is the first time you are installing an Oracle product on this host.

Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location and click Next.

**Note:** The Installation Inventory Setup screen does not appear on Windows operating systems.

7. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click Next.

8. On the Auto Updates screen, select **Skip Auto Updates**. Options are:

   - **Skip Auto Updates**: If you do not want your system to check for software updates at this time.
   
   - **Select patches from directory**: To navigate to a local directory if you downloaded patch files.
   
   - **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click **Search**. To configure a proxy server for the installer to access My Oracle Support, click **Proxy Settings**. Click **Test Connection** to test the connection.

   Click Next.

9. On the Installation Location screen, specify the location for the Oracle home directory and click Next.

Since you are installing the standard installation topology for Oracle HTTP Server in a standalone domain, you can specify an Oracle home directory of your choice. However, ensure that you install the software in a new Oracle home.

For more information about Oracle Fusion Middleware directory structure, see Selecting Directories for Installation and Configuration in *Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware*.

10. On the Installation Type screen, select **Standalone HTTP Server (Managed independently of WebLogic server)** and click Next.

11. The Prerequisite Checks screen analyzes the host computer to ensure that the specific operating system prerequisites have been met.

    To view the list of tasks that gets verified, select **View Successful Tasks**. To view log details, select **View Log**. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click **Rerun** to try again. To ignore the error or the warning message and continue with the installation, click **Skip** (not recommended).

12. On the Security Updates screen, indicate how you would like to receive security updates if you already have an Oracle Support account.
If you do not have an Oracle Support account and you are sure that you want to skip this step, clear the check box and verify your selection in the follow-up dialog box.

13. On the Installation Summary screen, verify the installation options you selected.

If you want to save these options to a response file, click **Save Response File** and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.

Click **Install** to begin the installation.

14. On the Installation Progress screen, when the progress bar displays 100%, click **Finish** to dismiss the installer, or click **Next** to see a summary.

15. The Installation Complete screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer.

You have installed the Oracle HTTP Server in a standalone mode.

### 5.3 Stopping Servers and Processes

Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server domain, an Administration Server, multiple managed servers, Java components, system components such as Identity Management components, and a database used as a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

**Note:** The procedures in this section describe how to stop servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in *Oracle Fusion Middleware Administering Oracle Fusion Middleware*.

To stop your Fusion Middleware environment, follow the steps below.

**Step 1: Stop System Components**

To stop system components, such as Oracle HTTP Server, use the `stopComponent` script:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

You can stop system components in any order.

**Step 2: Stop the Managed Servers**

To stop a WebLogic Server Managed Server, use the `stopManagedWebLogic` script:
Step 3: Stop Oracle Identity Management Components
Stop any Oracle Identity Management components, such as Oracle Internet Directory:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

Step 4: Stop the Administration Server
When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/stopWebLogic.sh`
- (Windows) `DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 5: Stop Node Manager
To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. For more information, see `stopNodeManager` in *Oracle Fusion Middleware WLST Command Reference for WebLogic Server*.

5.4 Reconfiguring the Domain
Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

When you reconfigure a WebLogic Server domain, the following items are automatically updated, depending on the applications in the domain:

- WebLogic Server core infrastructure
- Domain version
Note:

Before you begin the domain reconfiguration, note the following limitations:

- The Reconfiguration Wizard does not update any of your own applications that are included in the domain.

- Transforming a non-dynamic cluster domain to a dynamic cluster domain during the upgrade process is not supported.

  The dynamic cluster feature is available when running the Reconfiguration Wizard, but Oracle only supports upgrading a non-dynamic cluster upgrade and then adding dynamic clusters. You cannot add dynamic cluster during the upgrade process.

Specifically, when you reconfigure a domain, the following occurs:

- The domain version number in the config.xml file for the domain is updated to the Administration Server’s installed WebLogic Server version.

- Reconfiguration templates for all installed Oracle products are automatically selected and applied to the domain. These templates define any reconfiguration tasks that are required to make the WebLogic domain compatible with the current WebLogic Server version.

- Start scripts are updated.

  If you want to preserve your modified start scripts, be sure to back them up before starting the Reconfiguration Wizard.

Note: Once the domain reconfiguration process starts, it is irreversible. Before running the Reconfiguration Wizard, ensure that you have backed up the domain as covered in the pre-upgrade checklist. If an error or other interruption occurs while running the Reconfiguration Wizard, you must restore the domain by copying the files and directories from the backup location to the original domain directory. This is the only way to ensure that the domain has been returned to its original state before reconfiguration.

Follow these instructions to reconfigure the existing domain using the Reconfiguration Wizard. For general information about how the domain is reconfigured, see Reconfiguring WebLogic Domains in Oracle Fusion Middleware Upgrading Oracle WebLogic Server.

**5.4.1 Backing Up the Domain**

Before running the Reconfiguration Wizard, create a backup copy of the domain directory.
To create a backup of the domain directory:

1. Copy the source domain to a separate location to preserve the contents.
   
   For example, copy `C:\domains\mydomain` to `C:\domains\mydomain_backup`.

2. Before updating the domain on each remote Managed Server, create a backup copy of the domain directory on each remote machine.

3. Verify that the backed up versions of the domain are complete.

If domain reconfiguration fails for any reason, you must copy all files and directories from the backup directory into the original domain directory to ensure that the domain is returned entirely to its original state before reconfiguration.

### 5.4.2 Starting the Reconfiguration Wizard

To start the Reconfiguration Wizard in graphical mode:

1. Sign in to the system on which the domain resides.

2. Open the command shell (on UNIX operating systems) or open a command prompt window (on Windows operating systems).

3. **Edition Based Database Users Only**: If your schemas are configured with EBR database, a default edition name must be manually supplied before you run the Reconfiguration Wizard.

   Run the following SQL command to set the default edition:
   
   ```sql
   ALTER DATABASE DEFAULT EDITION = edition_name;
   
   where `edition_name` is the child edition name.
   ```

4. Go to the `oracle_common/common/bin` directory:
   
   • (UNIX) `ORACLE_HOME/oracle_common/common/bin`
   
   • (Windows) `ORACLE_HOME/oracle_common\commom\bin`

5. Start the Reconfiguration Wizard with the following logging options:
   
   • (UNIX) `./reconfig.sh -log=log_file -log_priority=ALL`
   
   • (Windows) `reconfig.cmd -log=log_file -log_priority=ALL`

   where `log_file` is the absolute path of the log file you'd like to create for the domain reconfiguration session. This can be helpful if you need to troubleshoot the reconfiguration process.

   The parameter `-log_priority=ALL` ensures that logs are logged in fine mode.
Note:
When you run this command, the following error message might appear to indicate that the default cache directory is not valid:

`*sys-package-mgr*: can’t create package cache dir`

You can change the cache directory by setting the environment variable `CONFIG_JVM_ARGS`. For example:

```
CONFIG_JVM_ARGS=-Dpython.cachedir=valid_directory
```

### 5.4.3 Reconfiguring the Existing Domain with the Reconfiguration Wizard

Navigate through the screens in the Reconfiguration Wizard to reconfigure your existing domain.

To reconfigure the domain with the Reconfiguration Wizard:

1. On the Select Domain screen, specify the location of the domain you want to upgrade or click **Browse** to navigate and select the domain directory. Click **Next**.

2. On the Reconfiguration Setup Progress screen, view the progress of the setup process. When complete, click **Next**.

   During this process:

   - The reconfiguration templates for your installed products, including Fusion Middleware products, are automatically applied. This updates various domain configuration files such as `config.xml`, `config-groups.xml`, and `security.xml` (among others).
   - Schemas, scripts, and other such files that support your Fusion Middleware products are updated.
   - The domain upgrade is validated.

3. On the Domain Mode and JDK screen, select the JDK to use in the domain or click **Browse** to navigate to the JDK you want to use. The supported JDK version for 12c (12.2.1.2) is 1.8.0_101 and later. Click **Next**.

   **Note:** You cannot change the **Domain Mode** at this stage.

   For a list of JDKs that are supported for a specific platform, see Oracle Fusion Middleware Supported System Configurations.

4. On the JDBC Data Sources screen, configure the JDBC data sources defined in your domain source.

   The JDBC data sources associated with the products for which you are creating the domain are listed in the lower half of the screen. A JDBC data source contains a pool of database connections that are created when the data source instance is created, deployed or targeted, or at server startup. Applications look up a data source on the JNDI tree, and then request a connection. When the applications no longer need the connections, they return the connections to the connection pool in the data source.
From the Data Source Name drop-down list, select the data source(s) for which you want to specify the settings. The values that you specify are displayed in the appropriate columns in the data source list, for the selected data source.

For Oracle RAC Configuration for data sources, you can select one of the three options:

- Convert to GridLink
- Convert to RAC multi data source
- Don’t convert

For more information about each option, click Help.

After specifying the details, click Next.

If you do not select any data sources on the JDBC Data Sources screen, the following warning displays:

Missing Driver

Click Ok to proceed without verification, click Cancel to return to the JDBC Data Sources page.

In this case, if you click Ok, the data sources are not verified.

5. On the JDBC Data Sources Test screen, select the check box for the data source connection you configured on the JDBC Data Sources screen and click Test Selected Connections to test the data source connection.

   **Note:** In order to test the database connections, the database to which you are connecting must be running. If you do not want to test the connections at this time, do not select any data sources. Click Next to continue.

6. On the Database Configuration Type screen, select RCU Data to connect to the Server Table (_STB) schema.

   Enter the database connection details using the RCU service table (_STB) schema credentials and click Get RCU Configuration.

   The Reconfiguration Wizard uses this connection to automatically configure the data sources required for components in your domain.

   **NOTE:** For any existing 11g datasource, the reconfiguration will preserve the existing values. For new datasources where the schema was created for 12c by the RCU, the default connection data will be retrieved from the _STB schema. If no connection data for a given schema is found in the _STB schema, then the default connection data is used.

   If the check is successful, click Next. If the check fails, reenter the connection details correctly and try again.

7. On the JDBC Component Schema Test screen, select all the component schemas and click Test Selected Connections to test the connection for each schema. The result of the test is indicated in the Status column.

   When the check is complete, click Next.
8. The Node Manager screen is only displayed if the domain you are reconfiguring is currently using a per host Node Manager.

On the Node Manager screen, select the Node Manager configuration to use for the reconfigured domain. The resulting configuration depends on the combination of options you select for Node Manager Type and Node Manager Configuration.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Per Domain Default Location</td>
<td>If you select this option, the Node Manager home is redefined to <code>DOMAIN_NAME/nodemanager</code> and you cannot edit the Node Manager home.</td>
</tr>
<tr>
<td>Per Domain Custom Location</td>
<td>Select this option if you want the per domain Node Manager configuration files to be created in a specific location for this domain. Specify the directory in the <strong>Node Manager Home</strong> field, or click <strong>Browse</strong> to use the navigation tree to select the location. The specified directory must be empty. The nodemanager.properties and nodemanager.domains files are created in this directory.</td>
</tr>
<tr>
<td>Node Manager Home</td>
<td>If you selected the <strong>Per Domain Custom Location</strong> option, click <strong>Browse</strong> to navigate to the directory location that you want to use to store the per domain Node Manager configuration.</td>
</tr>
<tr>
<td>Manual Node Manager Setup</td>
<td>If you select this option, creation of the Node Manager configuration for the domain is skipped (all remaining fields cannot be modified), and if you want to use Node Manager in the domain, you must manually configure Node Manager as described in Completing the Node Manager Configuration. The reconfigured domain will still use a per host Node Manager configuration. You should also select this option if your existing domain is not configured to use Node Manager and you do not want to use Node Manager in the reconfigured domain. For more information about Node Manager configuration, see Administering Node Manager for Oracle WebLogic Server.</td>
</tr>
<tr>
<td>Node Manager Configuration</td>
<td>Select one of the following two options. These fields are not available if you selected <strong>Manual Node Manager Setup</strong>.</td>
</tr>
<tr>
<td>Create New Configuration</td>
<td>A per domain Node Manager configuration will be automatically created for the reconfigured domain using default settings in nodemanager.properties. If necessary, you can modify nodemanager.properties after the domain has been successfully reconfigured.</td>
</tr>
<tr>
<td>Migrate Existing Configuration</td>
<td>The existing per host Node Manager configuration will be migrated to a per domain configuration for the reconfigured domain. This does not include environment-specific settings for ListenAddress, ListenPort, StartScriptName, JavaHome, and LogFile.</td>
</tr>
</tbody>
</table>
Table 5-2  (Cont.) Field Descriptions for Node Manager Screen

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node Manager Home</td>
<td>If you selected the <strong>Migrate Existing Configuration</strong> option, enter or browse to the Node Manager home directory that you want to migrate to the reconfigured domain.</td>
</tr>
</tbody>
</table>
| Apply Oracle Recommended Defaults           | If you selected the **Migrate Existing Configuration** option, select this check box if you want to use Oracle-recommended defaults in the nodemanager.properties file. Deselect this check box if you want to continue using the settings in the nodemanager.properties file being migrated. Oracle-recommended properties with default values are as follows:  
  LogLimit=0  
  AuthenticationEnabled=true  
  LogLevel=INFO  
  DomainsFileEnabled=true  
  NativeVersionEnabled=true  
  LogToStderr=true  
  SecureListener=true  
  LogCount=1  
  StopScriptEnabled=false  
  QuitEnabled=false  
  LogAppend=true  
  StateCheckInterval=500  
  CrashRecoveryEnabled=false  
  StartScriptEnabled=true  
  LogFormatter=weblogic.nodemanager.server.LogFormatter  
  ListenBacklog=50                                                                                                                                 |
| Node Manager Credentials: Username, Password| Specify the username and password that you want to use to start Node Manager in the reconfigured domain.                                                                                                       |

9. On the Advanced Configuration screen, you can select all categories for which you want to perform advanced configuration. For each category you select, the appropriate configuration screen is displayed to allow you to perform advanced configuration.

**Note:** The categories that are listed on the Advanced Configuration screen depend on the resources defined in the templates you selected for the domain.

For this upgrade, select none of the options and click Next.

10. On the Configuration Summary screen, review the detailed configuration settings of the domain before continuing.

You can limit the items that are displayed in the right-most panel by selecting a filter option from the View drop-down list.

To change the configuration, click Back to return to the appropriate screen. To reconfigure the domain, click Reconfig.
11. The Reconfiguration Progress screen displays the progress of the reconfiguration process.

During this process:

- Domain information is extracted, saved, and updated.
- Schemas, scripts, and other such files that support your Fusion Middleware products are updated.

When the progress bar shows 100%, click **Next**.

12. The End of Configuration screen indicates whether the reconfiguration process completed successfully or failed. It also displays the location of the domain that was reconfigured as well as the Administration Server URL (including the listen port). If the reconfiguration is successful, it displays **Oracle WebLogic Server Reconfiguration Succeeded**.

If the reconfiguration process did not complete successfully, an error message is displayed indicates the reason. Take appropriate action to resolve the issue. If you cannot resolve the issue, contact My Oracle Support.

Note the Domain Location and the Admin Server URL for further operations.

5.5 Upgrading Standalone System Component Configurations

Use the Upgrade Assistant to upgrade the standalone agent’s component configurations when the agent is managed by OPMN. The standalone component configuration upgrade does not support upgrade of a standalone agent that is not managed by OPMN.

**Starting the Upgrade Assistant**

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

**Upgrading Standalone System Component Configurations Using the Upgrade Assistant**

Navigate through the screens in the Upgrade Assistant to upgrade standalone system component configurations.

**Verifying the Domain-specific-Component Configurations Upgrade**

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

5.5.1 Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.
To start the Upgrade Assistant:

1. Go to the oracle_common/upgrade/bin directory:
   - (UNIX) ORACLE_HOME/oracle_common/upgrade/bin
   - (Windows) ORACLE_HOME\oracle_common\upgrade\bin

2. Start the Upgrade Assistant:
   - (UNIX) ./ua
   - (Windows) ua.bat

For information about other parameters that you can specify on the command line, such as logging parameters, see:

Upgrade Assistant Parameters

5.5.1.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-readiness</td>
<td>Required for readiness checks</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the -examine parameter.</td>
</tr>
<tr>
<td>-threads</td>
<td>Optional</td>
<td>Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4.</td>
</tr>
<tr>
<td>-response</td>
<td>Required for silent upgrades or silent readiness checks</td>
<td>Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in silent mode (without displaying Upgrade Assistant screens).</td>
</tr>
</tbody>
</table>
Table 5-3  (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-examine</code></td>
<td>Optional</td>
<td>Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the <code>-readiness</code> parameter.</td>
</tr>
<tr>
<td><code>-logLevel</code></td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TRACE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NOTIFICATION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• WARNING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• INCIDENT_ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default logging level is NOTIFICATION. Consider setting the <code>-logLevel</code> attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if <code>-logLevel</code> TRACE is used.</td>
</tr>
<tr>
<td><code>-logDir</code></td>
<td>Optional</td>
<td>Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant will create log files and temporary files. The default locations are: UNIX: <code>ORACLE_HOME/oracle_common/upgrade/logs</code> <code>ORACLE_HOME/oracle_common/upgrade/temp</code> Windows: <code>ORACLE_HOME/oracle_common/upgrade/logs</code> <code>ORACLE_HOME/oracle_common/upgrade/temp</code></td>
</tr>
<tr>
<td><code>-help</code></td>
<td>Optional</td>
<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>
5.5.2 Upgrading Standalone System Component Configurations Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade standalone system component configurations.

To upgrade the existing 12c domain using Upgrade Assistant:

1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click Next.

   **Note:** For more information about any Upgrade Assistant screen, click Help on the screen.

2. On the Standalone Components screen, select **Standalone System Component Configurations**.

   Select **Update an Existing Domain** and enter the location of the existing 12c domain in the **Domain Directory** field. You can also click **Browse** to select the existing domain directory using the navigation tree. Click Next.

   **Note:**
   - **Create a New Domain** option should only be used if you are upgrading from version 11g.
   - If you have already created a new 12c standalone domain for your upgraded 11g system components, you can extend the standalone domain with the standalone Oracle HTTP Server using **Update an Existing Domain** option.
   - **Update an Existing Domain** option should only be used if you are upgrading from a previous 12c release (12.1.2.0, 12.1.3.0, 12.2.1.0, and 12.2.1.1) to the latest 12c release (12.2.1.2).

3. On the Component List screen, verify that the list includes all the components for which you want to upgrade configurations and click Next.

   If you do not see the components you want to upgrade, click Back to go to the previous screen and specify a different domain.

4. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click Next.

   **Note:** The Upgrade Assistant does not verify whether the prerequisites have been met.

5. On the Instance Directories screen, select **12c Source** and click Next.

   You do not need to enter the Oracle instance directories when upgrading to the latest 12c release from a previous 12c release.
6. On the Examine screen, review the status of the Upgrade Assistant as it examines each standalone component, verifying that the standalone component configuration is ready for upgrade. If the status is **Examine finished**, click Next.

If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking No in the Examination Failure dialog. Click **View Log** to see what caused the error and refer to Troubleshooting Your Upgrade in Oracle Fusion Middleware Upgrading with the Upgrade Assistant Upgrade Guide for information on resolving common upgrade errors.

**Note:**

- If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking Yes in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.

- Canceling the examination process has no effect on the configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

7. On the Upgrade Summary screen, review the summary of the options you have selected for component configuration upgrade.

The response file collects and stores all the information that you have entered, and enables you to perform a silent upgrade at a later time. The silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again. If you want to save these options to a response file, click **Save Response File** and provide the location and name of the response file.

Click **Upgrade** to start the upgrade process.

8. On the Upgrade Progress screen, monitor the status of the upgrade.

**Caution:** Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

If any components are not upgraded successfully, refer to the Upgrade Assistant log files for more information.

**Note:** The progress bar on this screen displays the progress of the current upgrade procedure. It does not indicate the time remaining for the upgrade.

Click Next.

9. If the upgrade is successful: On the Upgrade Success screen, click Close to complete the upgrade and close the wizard. The Post-Upgrade Actions window describes the manual tasks you must perform to make components functional in the new installation. This window appears only if a component has post-upgrade steps.
If the upgrade fails: On the Upgrade Failure screen, click View Log to view and troubleshoot the errors. The logs are available at ORACLE_HOME/oracle_common/upgrade/logs. Note If the upgrade fails you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.

5.5.3 Verifying the Domain-specific-Component Configurations Upgrade

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

To log into the Administration Console, go to: http://administration_server_host:administration_server_port/console

To log into the Fusion Middleware Control, go to: http://administration_server_host:administration_server_port/em

Note:

After upgrade, make sure you run the administration tools from the new 12c Oracle home and not from the previous Oracle home.

During the upgrade process, some OWSM documents, including policy sets and predefined documents such as policies and assertion templates, may need to be upgraded. If a policy set or a predefined document is upgraded, its version number is incremented by 1.

5.6 Verifying the Upgrade

You can verify that the upgrade is successful if you are able to start the Node Manager and the Standalone Oracle HTTP Server properly.

If you experience post-upgrade issues, you need to troubleshoot the installation and retry the upgrade. For more information, see Troubleshooting Oracle HTTP Server in Administrator’s Guide for Oracle HTTP Server.

If you are not able to start the newly upgraded environment, a possible cause could be the use of MD5 certificates in your Oracle wallet. See Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm for a procedure to check whether you are using MD5 signatures and a procedure to replace them with SHA-2 certificates.

Starting the Node Manager

Server instances in a WebLogic Server production environment are often distributed across multiple domains, machines, and geographic locations. Node Manager is a WebLogic Server utility that enables you to manage (start, shut down, and restart) your Oracle HTTP Server instance.

Starting the Standalone Oracle HTTP Server

After upgrade, start the standalone Oracle HTTP Server.

5.6.1 Starting the Node Manager

Server instances in a WebLogic Server production environment are often distributed across multiple domains, machines, and geographic locations. Node Manager is a
WebLogic Server utility that enables you to manage (start, shut down, and restart) your Oracle HTTP Server instance.

On Windows operating systems, Oracle recommends that you configure Node Manager to run as a startup service. This allows Node Manager to start up automatically each time the system is restarted. For more information, see Running Node Manager as a Startup Service in Oracle Fusion Middleware Administering Node Manager for Oracle WebLogic Server.

**Note:** On UNIX platforms, do not run Node Manager as the root user.

### 5.6.2 Starting the Standalone Oracle HTTP Server

After upgrade, start the standalone Oracle HTTP Server.

To start the standalone Oracle HTTP Server:

1. Go to the `oracle_common/upgrade/bin` directory:
   - (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Enter the command to start the standalone server.
   - On UNIX operating systems:
     ```
     ./startComponent.sh ohs_name
     ```
   - On Windows operating systems:
     ```
     startComponent.cmd ohs_name
     ```

   For more information, see Starting and Stopping System Components in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

### 5.7 Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.

**Note:** The procedures in this section describe how to start servers and process using the WLST command line or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Administering Oracle Fusion Middleware.

To start your Fusion Middleware environment, follow the steps below.
**Step 1: Start the Administration Server**

When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the `startWebLogic` script:

- (UNIX) `{DOMAIN_HOME}/bin/startWebLogic.sh`
- (Windows) `{DOMAIN_HOME}\bin\startWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

**Step 2: Start Node Manager**

To start Node Manager, use the `startNodeManager` script:

- (UNIX) `{DOMAIN_HOME}/bin/startNodeManager.sh`
- (Windows) `{DOMAIN_HOME}\bin\startNodeManager.cmd`

**Step 3: Start Oracle Identity Management Components**

Start any Oracle Identity Management components, such as Oracle Internet Directory, that form part of your environment:

- (UNIX) `{DOMAIN_HOME}/bin/startComponent.sh component_name`
- (Windows) `{DOMAIN_HOME}\bin\startComponent.cmd component_name`

**Step 4: Start the Managed Servers**

To start a WebLogic Server Managed Server, use the `startManagedWebLogic` script:

- (UNIX) `{DOMAIN_HOME}/bin/startManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `{DOMAIN_HOME}\bin\startManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

---

**Note:** The startup of a Managed Server will typically start the applications that are deployed to it. Therefore, it should not be necessary to manually start applications after the Managed Server startup.

**Step 5: Start System Components**

To start system components, such as Oracle HTTP Server, use the `startComponent` script:

- (UNIX) `{DOMAIN_HOME}/bin/startComponent.sh component_name`
- (Windows) `{DOMAIN_HOME}\bin\startComponent.cmd component_name`

You can start system components in any order.
Upgrading a Managed Oracle HTTP Server from a Previous 12c Release

This chapter describes the procedure for upgrading a managed Oracle HTTP Server from a previous 12c release to a latest 12c release. The valid starting point for this upgrade are 12c releases 12.1.2 and above.

This procedure assumes that you have an existing 12c Fusion Middleware Infrastructure (JRF plus the WebLogic Server) installed and configured on your system.

About the Managed Oracle HTTP Server Upgrade Process from a Previous 12c Release
Review the flowchart and roadmap for an overview of the upgrade process for Managed Oracle HTTP Server.

Installing the Product Distributions
Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle HTTP Server 12c (12.2.1.2) distributions on the target system and install them using Oracle Universal Installer.

Running a Pre-Upgrade Readiness Check
To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

Stopping Servers and Processes
Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

Upgrading Product Schemas
After stopping servers and processes, use the Upgrade Assistant to upgrade supported product schemas to the current release of Oracle Fusion Middleware.

Reconfiguring the Domain
Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

Upgrading Domain Component Configurations
After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.
Starting Servers and Processes
After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

Verifying the Upgrade
If you can log in to the Administration Console and the Enterprise Manager Fusion Middleware Control, your upgrade is successful.

Importing Wallets to the KSS Database after an Upgrade Using WLST
When you use Upgrade Assistant to upgrade from a previous version of Oracle HTTP Server to 12c (12.2.1.2), you must perform an additional wallet management task.

6.1 About the Managed Oracle HTTP Server Upgrade Process from a Previous 12c Release
Review the flowchart and roadmap for an overview of the upgrade process for Managed Oracle HTTP Server.

Figure 4-1 shows the process flow to upgrade a Managed Oracle HTTP Server to the latest 12c release. The tools used for each step are also listed.

Figure 6-1 Upgrade Process Flowchart for Managed Oracle HTTP Server from 11g to 12c

Table 6-1 describes the tasks that must be completed to upgrade a Managed Oracle HTTP Server from a previous 12c release to 12c (12.2.1.2).

Table 6-1 Tasks for Upgrading Managed Oracle HTTP Server from a Previous 12c Release

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>Verify that you are upgrading a Managed Oracle HTTP Server. To determine which Oracle HTTP Server you have in your existing environment, see Determining whether Oracle HTTP Server is Standalone or Managed (Collocated).</td>
</tr>
<tr>
<td>Required</td>
<td>If you have not done so already, review the introductory topics in this guide and complete the required pre-upgrade tasks. The pre-upgrade tasks include cloning your production environment, verifying system requirements and certifications, purging unused data, and creating non-SYSDBA user. For a complete list of pre-upgrade tasks, see Preparing to Upgrade Oracle HTTP Server.</td>
</tr>
</tbody>
</table>
Table 6-1  (Cont.) Tasks for Upgrading Managed Oracle HTTP Server from a Previous 12c Release

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required</strong></td>
<td>Download and install the 12.2.1.2 Fusion Middleware Infrastructure and Oracle HTTP Server distributions. The Infrastructure distribution packs the WebLogic Server and the Java Required Files (JRF) that are required to set up the foundation to install other Fusion Middleware products. As per the upgrade topology defined in this guide, you must install the Infrastructure in a new Oracle home. You must install Oracle HTTP Server in the Oracle home that is created when you installed the 12.2.1.2 Infrastructure. See Installing the Product Distributions.</td>
</tr>
<tr>
<td><strong>Optional</strong></td>
<td>Run the Readiness Check. Running the Readiness Check helps using the Upgrade Assistant helps you to determine whether your pre-upgrade environment is ready for upgrade. For the complete procedure, see Running a Pre-Upgrade Readiness Check.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Shut down the 12c instance. Before starting the upgrade process, shut down the Administration Server, the Managed Servers, and your 12c instance. See Stopping Servers and Processes.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Upgrade the existing schemas with the Upgrade Assistant. See Upgrading Product Schemas.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Reconfigure your existing domain. Run the Reconfiguration Wizard from 12c Oracle HTTP Server installation to reconfigure the existing domain. See Reconfiguring the Existing Domain with the Reconfiguration Wizard.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Upgrade your existing domain configurations. After the installation, you need to use the Upgrade Assistant to upgrade the Oracle HTTP Server and system component infrastructure. See Upgrading Domain Components Using the Upgrade Assistant.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Restart the servers and processes. The upgrade process is complete. You can now restart the Administration Server, the Managed Servers, and your 12.2.1.2 instance. See Starting Servers and Processes.</td>
</tr>
<tr>
<td><strong>Required</strong></td>
<td>Verify the upgrade. For verifying the upgrade, see Verifying the Upgrade. Complete the following post-upgrade task: Importing Wallets to the KSS Database after an Upgrade Using WLST.</td>
</tr>
</tbody>
</table>

6.2 Installing the Product Distributions

Before beginning your upgrade, download Oracle Fusion Middleware Infrastructure and Oracle HTTP Server 12c (12.2.1.2) distributions on the target system and install them using Oracle Universal Installer.
To install the 12c (12.2.1.2) distributions:

1. Sign in to the target system where you want to install the 12c (12.2.1.2) product distribution.

2. Download the following from Oracle Technology Network or Oracle Software Delivery Cloud to your target system:
   - Oracle Fusion Middleware Infrastructure
     (fmw_12.2.1.2.0_infrastructure_generic.jar)
   - Oracle HTTP Server (UNIX: fmw_12.2.1.2.0_ohs_linux64.bin),
     (Windows: setup_fmw_12.2.1.2.0_ohs_win64.exe)

3. Check that your machines meet the following requirements:
   - Ensure that the system, patch, kernel, and other requirements are met as specified in Installing and Configuring Oracle HTTP Server.
   - Because Oracle HTTP Server is installed by default on port 7777, you must ensure that port 7777 is not used by any service on the nodes. To check if this port is in use, run the following command before installing Oracle HTTP Server. You must free the port if it is in use.
     
        netstat -an | grep 7777

4. On UNIX platforms, if the /etc/oraInst.loc file exists, check that its contents are correct. Specifically, check that the inventory directory is correct and that you have write permissions for that directory.

   If the /etc/oraInst.loc file does not exist, you can skip this step.

5. Change to the directory where you downloaded the 12c (12.2.1.2) product distribution.

6. Start the installation program for Oracle Fusion Middleware Infrastructure:
   - (UNIX) $JDK_HOME/bin/java -jar fmw_12.2.1.2.0_infrastructure_generic.jar
   - (Windows) $JDK_HOME\bin\java -jar fmw_12.1.2.0_infrastructure_generic.jar

7. On UNIX operating systems, the Installation Inventory Setup screen appears if this is the first time you are installing an Oracle product on this host.

   Specify the location where you want to create your central inventory. Make sure that the operating system group name selected on this screen has write permissions to the central inventory location and click Next.

Note: The Installation Inventory Setup screen does not appear on Windows operating systems.
8. On the Welcome screen, review the information to make sure that you have met all the prerequisites. Click Next.

9. On the Auto Updates screen, select Skip Auto Updates. Options are:

- **Skip Auto Updates**: If you do not want your system to check for software updates at this time.

- **Select patches from directory**: To navigate to a local directory if you downloaded patch files.

- **Search My Oracle Support for Updates**: To automatically download software updates if you have a My Oracle Support account. You must enter Oracle Support credentials then click Search. To configure a proxy server for the installer to access My Oracle Support, click Proxy Settings. Click Test Connection to test the connection.

Click Next.

10. On the Installation Location screen, specify the location for the Oracle home directory and click Next.

Since you are installing the standard installation topology for a collocated Oracle HTTP Server in a WebLogic Server domain, enter the path to an existing Oracle Fusion Middleware Infrastructure Oracle home.

For more information about Oracle Fusion Middleware directory structure, see Selecting Directories for Installation and Configuration in Oracle Fusion Middleware Planning an Installation of Oracle Fusion Middleware.

11. On the Installation Type screen, select the following:

- For Infrastructure, select Fusion Middleware Infrastructure

- For Oracle HTTP Server, select Collocated HTTP Server (Managed through WebLogic Server)

Click Next.

12. The Prerequisite Checks screen analyzes the host computer to ensure that the specific operating system prerequisites have been met.

To view the list of tasks that gets verified, select View Successful Tasks. To view log details, select View Log. If any prerequisite check fails, then an error message appears at the bottom of the screen. Fix the error and click Rerun to try again. To ignore the error or the warning message and continue with the installation, click Skip (not recommended).

13. On the Installation Summary screen, verify the installation options you selected.

If you want to save these options to a response file, click Save Response File and enter the response file location and name. The response file collects and stores all the information that you have entered, and enables you to perform a silent installation (from the command line) at a later time.

Click Install to begin the installation.

14. On the Installation Progress screen, when the progress bar displays 100%, click Finish to dismiss the installer, or click Next to see a summary.
15. The Installation Complete screen displays the Installation Location and the Feature Sets that are installed. Review this information and click **Finish** to close the installer.

16. After you have installed Oracle Fusion Middleware Infrastructure, enter the following command to start the installer for your product distribution and repeat the steps above to navigate through the installer screens:

   (UNIX) `./fmw_12.2.1.2.0_ohs_linux64.bin`

   (Windows) `setup_fmw_12.2.1.2.0_ohs_win64.exe`

You have installed the Oracle HTTP Server in a collocated mode.

### 6.3 Running a Pre-Upgrade Readiness Check

To identify potential issues with the upgrade, Oracle recommends that you run a readiness check before you start the upgrade process. Be aware that the readiness check may not be able to discover all potential issues with your upgrade. An upgrade may still fail, even if the readiness check reports success.

**About Running a Pre-Upgrade Readiness Check**

You can run the Upgrade Assistant in `-readiness` mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

**Starting the Upgrade Assistant in Readiness Mode**

Use the `-readiness` parameter to start the Upgrade Assistant in readiness mode.

**Performing a Readiness Check with the Upgrade Assistant**

Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

**Understanding the Readiness Report**

After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

### 6.3.1 About Running a Pre-Upgrade Readiness Check

You can run the Upgrade Assistant in `-readiness` mode to detect issues before you perform the actual upgrade. You can run the readiness check in GUI mode using the Upgrade Assistant or in silent mode using a response file.

The Upgrade Assistant readiness check performs a read-only, pre-upgrade review of your Fusion Middleware schemas and WebLogic domain configurations that are at a supported starting point. The review is a read-only operation.

The readiness check generates a formatted, time-stamped readiness report so you can address potential issues before you attempt the actual upgrade. If no issues are detected, you can begin the upgrade process. Oracle recommends that you read this report thoroughly before performing an upgrade.

You can run the readiness check while your existing Oracle Fusion Middleware domain is online (while other users are actively using it) or offline.

You can run the readiness check any number of times before performing any actual upgrade. However, do not run the readiness check after an upgrade has been
performed, as the report results may differ from the result of pre-upgrade readiness checks.

**Note:**
To prevent performance from being affected, Oracle recommends that you run the readiness checks during off-peak hours.

### 6.3.2 Starting the Upgrade Assistant in Readiness Mode

Use the `-readiness` parameter to start the Upgrade Assistant in readiness mode.

To perform a readiness check on your pre-upgrade environment with the Upgrade Assistant:

1. Go to the `oracle_common/upgrade/bin` directory:
   - (UNIX) `ORACLE_HOME/oracle_common/upgrade/bin`
   - (Windows) `ORACLE_HOME\oracle_common\upgrade\bin`

2. Start the Upgrade Assistant.
   - (UNIX) `./ua -readiness`
   - (Windows) `ua.bat -readiness`

**Note:** If the `DISPLAY` environment variable is not set up properly to allow for GUI mode, you may encounter the following error:

```
Xlib: connection to ":1.0" refused by server
Xlib: No protocol specified
```

To resolve this issue, set the `DISPLAY` environment variable to the system name or IP address of your local workstation, and rerun Upgrade Assistant.

If you continue to receive these errors after setting `DISPLAY`, try launching another GUI tool, such as `vncconfig`. If you see the same errors, your `DISPLAY` environment variable may still not be set correctly.

For information about other parameters that you can specify on the command line, see:

[Upgrade Assistant Parameters](#)

### 6.3.2.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.
### Table 6-2 Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-readiness</code></td>
<td>Required for readiness checks</td>
<td>Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the <code>-examine</code> parameter.</td>
</tr>
<tr>
<td><code>-threads</code></td>
<td>Optional</td>
<td>Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4.</td>
</tr>
<tr>
<td><code>-response</code></td>
<td>Required for silent upgrades or silent readiness checks</td>
<td>Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in silent mode (without displaying Upgrade Assistant screens).</td>
</tr>
<tr>
<td><code>-examine</code></td>
<td>Optional</td>
<td>Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the <code>-readiness</code> parameter.</td>
</tr>
<tr>
<td><code>-logLevel</code></td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes: TRACE, NOTIFICATION, WARNING, ERROR, INCIDENT_ERROR. The default logging level is NOTIFICATION. Consider setting the <code>-logLevel</code> TRACE attribute to so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if <code>-logLevel</code> TRACE is used.</td>

6.3.3 Performing a Readiness Check with the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to complete the pre-upgrade readiness check.

Readiness checks are performed only on schemas or component configurations that are at a supported upgrade starting point.

To complete the readiness check:

1. On the Welcome screen, review information about the readiness check. Click Next.

2. On the Readiness Check Type screen, select the readiness check that you want to perform:

   - **Individually Selected Schemas** allows you to select individual schemas for review before upgrade. The readiness check reports whether a schema is supported for an upgrade or where an upgrade is needed.
     When you select this option, the screen name changes to Selected Schemas.
   
   - **Domain Based** allows the Upgrade Assistant to discover and select all upgrade-eligible schemas or component configurations in the domain specified in the Domain Directory field.
When you select this option, the screen name changes to Schemas and Configuration.

Leave the default selection if you want the Upgrade Assistant to check all schemas and component configurations at the same time, or select a specific option:

- **Include checks for all schemas** to discover and review all components that have a schema available to upgrade.

- **Include checks for all configurations** to review component configurations for a managed WebLogic Server domain.

Click Next.

3. If you selected **Individually Selected Schemas**: On the Available Components screen, select the components that have a schema available to upgrade for which you want to perform a readiness check.

If you select a component that has dependent components, those components are automatically selected. For example, if you select Oracle Platform Security Services, Oracle Audit Services is automatically selected.

Depending on the components you select, additional screens may display. For example, you may need to:

- Specify the domain directory.

- Specify schema credentials to connect to the selected schema: **Database Type**, **DBA User Name**, and **DBA Password**. Then click **Connect**.

**CAUTION:** Oracle database is the default database type. Make sure that you select the correct database type before you continue. If you discover that you selected the wrong database type, do not go back to this screen to change it to the correct type. Instead, close the Upgrade Assistant and restart the readiness check with the correct database type selected to ensure that the correct database type is applied to all schemas.

- Select the **Schema User Name** and specify the **Schema Password**.

Click Next to start the readiness check.

4. On the Readiness Summary screen, review the summary of the readiness checks that will be performed based on your selections.

If you want to save your selections to a response file to run the Upgrade Assistant again later in response (or silent) mode, click **Save Response File** and provide the location and name of the response file. A silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again.

For a detailed report, click **View Log**.

Click Next.

5. On the Readiness Check screen, review the status of the readiness check. The process can take several minutes.
If you are checking multiple components, the progress of each component displays in its own progress bar in parallel.

When the readiness check is complete, click **Continue**.

6. On the End of Readiness screen, review the results of the readiness check (Readiness Success or Readiness Failure):

   - If the readiness check is successful, click **View Readiness Report** to review the complete report. Oracle recommends that you review the Readiness Report before you perform the actual upgrade even when the readiness check is successful. Use the **Find** option to search for a particular word or phrase within the report. The report also indicates where the completed Readiness Check Report file is located.

   - If the readiness check encounters an issue or error, click **View Log** to review the log file, identify and correct the issues, and then restart the readiness check. The log file is managed by the command-line options you set.

### 6.3.4 Understanding the Readiness Report

After performing a readiness check for your domain, review the report to determine whether you need to take any action for a successful upgrade.

The format of the readiness report file is:

```
readiness_timestamp.txt
```

where `timestamp` indicates the date and time of when the readiness check was run.

A readiness report contains the following information:

<table>
<thead>
<tr>
<th>Table 6-3 Readiness Report Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Report Information</strong></td>
</tr>
<tr>
<td>Overall Readiness Status: SUCCESS or FAILURE</td>
</tr>
<tr>
<td>Timestamp</td>
</tr>
<tr>
<td>Log file location</td>
</tr>
<tr>
<td>Readiness report location</td>
</tr>
</tbody>
</table>
### Table 6-3 (Cont.) Readiness Report Elements

<table>
<thead>
<tr>
<th>Report Information</th>
<th>Description</th>
<th>Required Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Names of components that were checked</td>
<td>The names and versions of the components included in the check and status.</td>
<td>If your domain includes components that cannot be upgraded to this release, such as SOA Core Extension, do not attempt an upgrade.</td>
</tr>
<tr>
<td>Names of schemas that were checked</td>
<td>The names and current versions of the schemas included in the check and status.</td>
<td>Review the version numbers of your schemas. If your domain includes schemas that cannot be upgraded to this release, do not attempt an upgrade.</td>
</tr>
<tr>
<td>Individual Object Test Status: FAIL</td>
<td>The readiness check test detected an issue with a specific object.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td>Individual Object Test Status: PASS</td>
<td>The readiness check test detected no issues for the specific object.</td>
<td>If your readiness check report shows only the PASS status, you can upgrade your environment. Note, however, that the Readiness Check cannot detect issues with externals such as hardware or connectivity during an upgrade. You should always monitor the progress of your upgrade.</td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: FAILURE</td>
<td>The readiness check detected one or more errors that must be resolved for a particular object such as a schema, an index, or datatype.</td>
<td>Do not upgrade until all failed issues have been resolved.</td>
</tr>
<tr>
<td>Completed Readiness Check of &lt;Object&gt; Status: SUCCESS</td>
<td>The readiness check test detected no issues.</td>
<td>No action required.</td>
</tr>
</tbody>
</table>

Here is a sample Readiness Report file. Your report may not include all of these checks.

Upgrade readiness check completed with one or more errors.

This readiness check report was created on Tue May 30 11:15:52 EDT 2016
Log file is located at: `ORACLE_HOME/oracle_common/upgrade/logs/ua2016-05-30-11-14-06AM.log`

Starting readiness check of components.

Oracle Metadata Services
  Starting readiness check of Oracle Metadata Services.
  Schema User Name: DEV11_MDS
  Database Type: Oracle Database
  Database Connect String: machinename@yourcompany.com
  VERSION Schema DEV11_MDS is currently at version 12.1.1.1.0. Readiness checks will now be performed.
  Starting schema test: TEST_REQUIRED_TABLES Test that the schema contains all the required tables
  Completed schema test: TEST_REQUIRED_TABLES --> Test that the schema contains all
the required tables +++ PASS
Starting schema test: TEST_REQUIRED_PROCEDURES Test that the schema contains all the required stored procedures
EXCEPTION Schema is missing a required procedure: GETREPOSITORYFEATURES
Completed schema test: TEST_REQUIRED_PROCEDURES --> Test that the schema contains all the required stored procedures +++ FAIL
Starting schema test: TEST_REQUIRED_VIEWS Test that the schema contains all the required database views
Completed schema test: TEST_REQUIRED_VIEWS --> Test that the schema contains all the required database views +++ PASS
Starting index test for table MDS_ATTRIBUTES: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes
Completed index test for table MDS_ATTRIBUTES: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes +++ PASS
Starting index test for table MDS_COMPONENTS: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes
Completed index test for table MDS_TXN_LOCKS: TEST_REQUIRED_INDEXES --> Test that the table contains all the required indexes +++ PASS
Starting schema test: TEST_REQUIRED_TRIGGERS Test that the schema has all the required triggers
Completed schema test: TEST_REQUIRED_TRIGGERS --> Test that the schema has all the required triggers +++ PASS
Starting schema test: TEST_MISSING_COLUMNS Test that tables and views are not missing any required columns
Completed schema test: TEST_MISSING_COLUMNS --> Test that tables and views are not missing any required columns +++ PASS
Starting schema test: TEST_UNEXPECTED_TABLES Test that the schema does not contain any unexpected tables
Completed schema test: TEST_UNEXPECTED_TABLES --> Test that the schema does not contain any unexpected tables +++ PASS
Starting schema test: TEST_UNEXPECTED_PROCEDURES Test that the schema does not contain any unexpected stored procedures
Completed schema test: TEST_UNEXPECTED_PROCEDURES --> Test that the schema does not contain any unexpected stored procedures +++ PASS
Starting schema test: TEST_UNEXPECTED_VIEWS Test that the schema does not contain any unexpected views
Completed schema test: TEST_UNEXPECTED_VIEWS --> Test that the schema does not contain any unexpected views +++ PASS
Starting index test for table MDS_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes
Completed index test for table MDS_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes +++ PASS
Starting index test for table MDS_LABELS: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes +++ PASS
Starting index test for table MDS_LARGE_ATTRIBUTES: TEST_UNEXPECTED_INDEXES --> Test that the table does not contain any unexpected indexes +++ PASS
Starting schema test: TEST_UNEXPECTED_TRIGGERS Test that the schema does not contain any unexpected triggers
Completed schema test: TEST_UNEXPECTED_TRIGGERS --> Test that the schema does not contain any unexpected triggers +++ PASS
Starting schema test: TEST_UNEXPECTED_COLUMNS Test that tables and views do not contain any unexpected columns
Completed schema test: TEST_UNEXPECTED_COLUMNS --> Test that tables and views do not contain any unexpected columns +++ PASS
Starting datatype test for table MDS_ATTRIBUTES: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Completed datatype test for table MDS_ATTRIBUTES: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes +++ PASS
Starting datatype test for table MDS_COMPONENTS: TEST_COLUMN_DATATYPES_V2 --> Test that all table columns have the proper datatypes
Starting permissions test: TEST_DBA_TABLE_GRANTS Test that DBA user has...
privilege to view all user tables

Completed permissions test: TEST_DBA_TABLE_GRANTS --> Test that DBA user has
privilege to view all user tables +++ PASS

Starting schema test: TEST_ENOUGH_TABLESPACE Test that the schema tablespaces
automatically extend if full

Completed schema test: TEST_ENOUGH_TABLESPACE --> Test that the schema
tablespaces automatically extend if full +++ PASS

Starting schema test: TEST_USER_TABLESPACE_QUOTA Test that tablespace quota for
this user is sufficient to perform the upgrade

Completed schema test: TEST_USER_TABLESPACE_QUOTA --> Test that tablespace quota
for this user is sufficient to perform the upgrade +++ PASS

Starting schema test: TEST_ONLINE_TABLESPACE Test that schema tablespaces are
online

Completed schema test: TEST_ONLINE_TABLESPACE --> Test that schema tablespaces
are online +++ PASS

Starting schema test: TEST_DATABASE_VERSION Test that the database server
version number is supported for upgrade

INFO   Database product version: Oracle Database 11g Enterprise Edition Release
11.2.0.3.0 - 64bit Production
With the Partitioning, OLAP, Data Mining and Real Application Testing options

Completed schema test: TEST_DATABASE_VERSION --> Test that the database server
version number is supported for upgrade +++ PASS

Finished readiness check of Oracle Metadata Services with status: FAILURE.

If you are running the 12.1.3.0 version of Oracle Fusion Middleware IAU Schemas, and
those schemas were upgraded from 11g (11.1.1.7 and later) or 12c (12.1.2.0), your
readiness check may fail with the following error:

Starting index test for table IAU_COMMON: TEST_REQUIRED_INDEXES --> Test
that the table contains all the required indexes

INFO Audit schema index DYN_EVENT_CATEGORY_INDEX in table IAU_COMMON is
missing the required columns or index itself is missing. This maybe caused by
a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_EVENT_TYPE_INDEX in table IAU_COMMON is
missing the required columns or index itself is missing. This maybe caused by
a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_TENANT_INDEX in table IAU_COMMON is missing
the required columns or index itself is missing. This maybe caused by a known
issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_USER_INDEX in table IAU_COMMON is missing
the required columns or index itself is missing. This maybe caused by a known
issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_COMPONENT_TYPE_INDEX in table IAU_COMMON is
missing the required columns or index itself is missing. This maybe caused by
a known issue, anyway, this missing index will be added in 12.2.2 upgrade.

INFO Audit schema index DYN_USER_TENANT_INDEX in table IAU_COMMON is
missing the required columns or index itself is missing. This maybe caused by a known
issue, anyway, this missing index will be added in 12.2.2 upgrade.

Completed index test for table IAU_COMMON: TEST_REQUIRED_INDEXES --> Test
that the table contains all the required indexes +++ FAIL

Note: You can ignore the missing index error in the readiness report. This is a
known issue. The corresponding missing index is added during the schema
upgrade operation. This error does not occur if the schema to be upgraded
was created in 12c using the RCU.
6.4 Stopping Servers and Processes

Before you run the Upgrade Assistant to upgrade your schemas and configurations, you must shut down all processes and servers, including the Administration Server and any managed servers.

An Oracle Fusion Middleware environment can consist of an Oracle WebLogic Server domain, an Administration Server, multiple managed servers, Java components, system components such as Identity Management components, and a database used as a repository for metadata. The components may be dependent on each other, so they must be stopped in the correct order.

Note: The procedures in this section describe how to stop servers and processes using the WLST command-line utility or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Oracle Fusion Middleware Administering Oracle Fusion Middleware.

To stop your Fusion Middleware environment, follow the steps below.

Step 1: Stop System Components

To stop system components, such as Oracle HTTP Server, use the stopComponent script:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

You can stop system components in any order.

Step 2: Stop the Managed Servers

To stop a WebLogic Server Managed Server, use the stopManagedWebLogic script:

- (UNIX) `DOMAIN_HOME/bin/stopManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\stopManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

Step 3: Stop Oracle Identity Management Components

Stop any Oracle Identity Management components, such as Oracle Internet Directory:

- (UNIX) `DOMAIN_HOME/bin/stopComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\stopComponent.cmd component_name`

Step 4: Stop the Administration Server

When you stop the Administration Server, you also stop the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.
To stop the Administration Server, use the `stopWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/stopWebLogic.sh`
- (Windows) `DOMAIN_HOME\bin\stopWebLogic.cmd`

When prompted, enter your user name, password, and the URL of the Administration Server.

**Step 5: Stop Node Manager**

To stop Node Manager, close the command shell in which it is running.

Alternatively, after having set the `nodemanager.properties` attribute `QuitEnabled` to `true` (the default is `false`), you can use WLST to connect to Node Manager and shut it down. For more information, see stopNodeManager in *Oracle Fusion Middleware WLST Command Reference for WebLogic Server*.

### 6.5 Upgrading Product Schemas

After stopping servers and processes, use the Upgrade Assistant to upgrade supported product schemas to the current release of Oracle Fusion Middleware.

The Upgrade Assistant allows you to upgrade individually selected schemas or all schemas associated with a domain. The option you select determines which Upgrade Assistant screens you will use.

#### Identifying Existing Schemas Available for Upgrade

This optional task enables you to review the list of available schemas before you begin the upgrade by querying the schema version registry. The registry contains schema information such as version number, component name and ID, date of creation and modification, and custom prefix.

#### Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

#### Upgrading the Product Schemas Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade the product schemas.

#### Verifying the Schema Upgrade

After completing all the upgrade steps, verify that the upgrade was successful by checking that the schema version in `schema_version_registry` has been properly updated.

### 6.5.1 Identifying Existing Schemas Available for Upgrade

This optional task enables you to review the list of available schemas before you begin the upgrade by querying the schema version registry. The registry contains schema information such as version number, component name and ID, date of creation and modification, and custom prefix.

Previewing a list of all the schemas that are available for an upgrade before you run the Upgrade Assistant helps you to decide if you want to select individual schemas to
upgrade or allow the Upgrade Assistant to automatically select and upgrade all of the schemas in the domain.

To identify existing schemas in your domain that are available for upgrade:

1. If you are using an Oracle database, connect to the database as a user having Oracle DBA privileges, and run the following from SQL*Plus to get the current version numbers:

   ```sql
   SET LINE 120
   COLUMN MRC_NAME FORMAT A14
   COLUMN COMP_ID FORMAT A20
   COLUMN VERSION FORMAT A12
   COLUMN STATUS FORMAT A9
   COLUMN UPGRADED FORMAT A8
   SELECT MRC_NAME, COMP_ID, OWNER, VERSION, STATUS, UPGRADED FROM
   SCHEMA_VERSION_REGISTRY ORDER BY MRC_NAME, COMP_ID ;
   ```

2. Examine the report that is generated. If the value in the VERSION column is at 11.1.1.6.0 or higher, and the STATUS column value is VALID, then the schema is supported for upgrade.

   If an upgrade is not needed for a schema, the schema_version_registry table retains the schema at its pre-upgrade version.

3. Note the schema prefix name that was used for your existing schemas. You will use the same prefix when creating new 12c schemas.
Upgrading Product Schemas

Notes:

• If your existing schemas are not at a supported version, then you must upgrade them to a supported version before using the 12c (12.2.1.2) upgrade procedures. Refer to your pre-upgrade version documentation for more information.

• Some components, such as Oracle Enterprise Data Quality, Oracle GoldenGate Monitor and Oracle GoldenGate Veridata, support an upgrade from versions other than the standard Oracle Fusion Middleware supported versions.

• If you used a file-based policy store in 11g, then you must reassociate the file-based policy store with a database-based security store before running the Upgrade Assistant. For more information see Reassociating a File-Based Policy Store Before Upgrade.

• If you used an OID-based policy store in 11g, make sure that you create a new OPSS schema before you perform the upgrade. After the upgrade, the OPSS schema will remain an LDAP-based store.

• If you are upgrading an ORASDPM schema that was created using RCU 11g (11.1.1.4 or earlier), and you subsequently upgraded ORASDPM to 11g (11.1.1.6 or later), the FMW user will need to grant the CREATE TABLE privilege to user prefix_ORASDPM before upgrading to 12c (12.2.1.2).

grant CREATE TABLE to prefix_ORASDPM;

where prefix is the name given to the schema when it was created.

• You can only upgrade schemas for products that are available for upgrade in the Oracle Fusion Middleware release 12c (12.2.1.2). Do not attempt to upgrade a domain that includes components that are not yet available for upgrade to 12c (12.2.1.2).

6.5.2 Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

To start the Upgrade Assistant:

1. Go to the oracle_common/upgrade/bin directory:
   • (UNIX) $ORACLE_HOME/oracle_common/upgrade/bin
   • (Windows) $ORACLE_HOME\oracle_common\upgrade\bin

2. Start the Upgrade Assistant:
   • (UNIX) ./ua
   • (Windows) ua.bat
For information about other parameters that you can specify on the command line, such as logging parameters, see:

**Upgrade Assistant Parameters**

### 6.5.2.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

| Table 6-4 Upgrade Assistant Command-Line Parameters |
|------------------------|-----------------|-----------------|
| **Parameter** | **Required or Optional** | **Description** |
| `-readiness` | Required for readiness checks | Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the `-examine` parameter. |
| `-threads` | Optional | Identifies the number of threads available for concurrent schema upgrades or readiness checks of the schemas. The value must be a positive integer in the range 1 to 8. The default is 4. |
| `-response` | Required for silent upgrades or silent readiness checks | Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in *silent mode* (without displaying Upgrade Assistant screens). |
| `-examine` | Optional | Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the `-readiness` parameter. |
Table 6-4  (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>

6.5.3 Upgrading the Product Schemas Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade the product schemas.

To upgrade the OPSS and IAU schemas:
1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click **Next**.

   **Note:** For more information about any Upgrade Assistant screen, click **Help** on the screen.

2. On the Selected Schemas screen, select the following option:

   - **Individually Selected Schemas** if you want to select individual schemas for upgrade and you do not want to upgrade all of the schemas used by the domain.

   **Caution:** Upgrade only those schemas that are used to support your 12c (12.2.1.2) components. Do not upgrade schemas that are currently being used to support components that are not included in Oracle Fusion Middleware 12c (12.2.1.2).

   Click **Next**.

3. The Available Components screen provides a list of installed Oracle Fusion Middleware components that have schemas that can be upgraded. When you select a component, the schemas and any dependencies are automatically selected.

   Select **Oracle Platform Security Services**. Selecting this automatically selects **Oracle Audit Services**. Click **Next**.

4. On the Domain Directory screen, enter the 12c (12.1.2.0, 12.1.3.0, 12.2.1.0, and 12.2.1.1) WebLogic domain directory. Click **Browse** and use the navigation tree to select the 12c WebLogic domain directory.

   The Upgrade Assistant requires the 12c domain location to access the jps-config.xml file.

5. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click **Next**.

   **Note:** The Upgrade Assistant does not verify whether the prerequisites have been met.

6. On the Examine screen, review the status of the Upgrade Assistant as it examines each schema, verifying that the schema is ready for upgrade. If the status is **Examine finished**, click **Next**.

   If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking **No** in the Examination Failure dialog. Click **View Log** to see what caused the error and refer to Troubleshooting Your Upgrade in *Oracle Fusion Middleware Upgrading with the Upgrade Assistant Upgrade Guide* for information on resolving common upgrade errors.
Note:

- If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking Yes in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.

- Canceling the examination process has no effect on the schemas or configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

7. On the Upgrade Summary screen, review the summary of the options you have selected for schema upgrade.

Verify that the correct Source and Target Versions are listed for each schema you intend to upgrade.

If you want to save these options to a response file to run the Upgrade Assistant again later in response (or silent) mode, click Save Response File and provide the location and name of the response file. A silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again.

Click Upgrade to start the upgrade process.

8. On the Upgrade Progress screen, monitor the status of the upgrade.

Caution: Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

If any schemas are not upgraded successfully, refer to the Upgrade Assistant log files for more information.

Note: The progress bar on this screen displays the progress of the current upgrade procedure. It does not indicate the time remaining for the upgrade.

Click Next.

9. If the upgrade is successful: On the Upgrade Success screen, click Close to complete the upgrade and close the wizard.

If the upgrade fails: On the Upgrade Failure screen, click View Log to view and troubleshoot the errors. The logs are available at ORACLE_HOME/oracle_common/upgrade/logs.

Note: If the upgrade fails, you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.
6.5.4 Verifying the Schema Upgrade

After completing all the upgrade steps, verify that the upgrade was successful by checking that the schema version in `schema_version_registry` has been properly updated.

If you are using an Oracle database, connect to the database as a user having Oracle DBA privileges, and run the following from SQL*Plus to get the current version numbers:

```sql
SET LINE 120
COLUMN MRC_NAME FORMAT A14
COLUMN COMP_ID FORMAT A20
COLUMN VERSION FORMAT A12
COLUMN STATUS FORMAT A9
COLUMN UPGRADED FORMAT A8
SELECT MRC_NAME, COMP_ID, OWNER, VERSION, STATUS, UPGRADED FROM
SCHEMA_VERSION_REGISTRY ORDER BY MRC_NAME, COMP_ID ;
```

In the query result:

- Check that the number in the `VERSION` column matches the latest version number for that schema. For example, verify that the schema version number is 12.2.1.2.0. Note, however, that not all schema versions will be updated. Some schemas do not require an upgrade to this release and will retain their pre-upgrade version number.

- The `STATUS` field will be either `UPGRADING` or `UPGRADED` during the schema patching operation, and will become `VALID` when the operation is completed.

- If the status appears as `INVALID`, the schema update failed. You should examine the logs files to determine the reason for the failure.

- Synonym objects owned by `IAU_APPEND` and `IAU_VIEWER` will appear as `INVALID`, but that does not indicate a failure. They become invalid because the target object changes after the creation of the synonym. The synonyms objects will become valid when they are accessed. You can safely ignore these `INVALID` objects.

6.6 Reconfiguring the Domain

Run the Reconfiguration Wizard to reconfigure your domain component configurations to 12c (12.2.1.2).

When you reconfigure a WebLogic Server domain, the following items are automatically updated, depending on the applications in the domain:

- WebLogic Server core infrastructure
- Domain version
Note:

Before you begin the domain reconfiguration, note the following limitations:

- The Reconfiguration Wizard does not update any of your own applications that are included in the domain.

- Transforming a non-dynamic cluster domain to a dynamic cluster domain during the upgrade process is not supported.

  The dynamic cluster feature is available when running the Reconfiguration Wizard, but Oracle only supports upgrading a non-dynamic cluster upgrade and then adding dynamic clusters. You cannot add dynamic cluster during the upgrade process.

Specifically, when you reconfigure a domain, the following occurs:

- The domain version number in the config.xml file for the domain is updated to the Administration Server's installed WebLogic Server version.

- Reconfiguration templates for all installed Oracle products are automatically selected and applied to the domain. These templates define any reconfiguration tasks that are required to make the WebLogic domain compatible with the current WebLogic Server version.

- Start scripts are updated.

  If you want to preserve your modified start scripts, be sure to back them up before starting the Reconfiguration Wizard.

Note: Once the domain reconfiguration process starts, it is irreversible. Before running the Reconfiguration Wizard, ensure that you have backed up the domain as covered in the pre-upgrade checklist. If an error or other interruption occurs while running the Reconfiguration Wizard, you must restore the domain by copying the files and directories from the backup location to the original domain directory. This is the only way to ensure that the domain has been returned to its original state before reconfiguration.

Follow these instructions to reconfigure the existing domain using the Reconfiguration Wizard. For general information about how the domain is reconfigured, see Reconfiguring WebLogic Domains in Oracle Fusion Middleware Upgrading Oracle WebLogic Server.

Backing Up the Domain

Starting the Reconfiguration Wizard

Reconfiguring the Domain with the Reconfiguration Wizard

Navigate through the screens in the Reconfiguration Wizard to reconfigure your existing domain.

6.6.1 Backing Up the Domain

Before running the Reconfiguration Wizard, create a backup copy of the domain directory.
To create a backup of the domain directory:

1. Copy the source domain to a separate location to preserve the contents.
   
   For example, copy `C:\domains\mydomain` to `C:\domains\mydomain_backup`.

2. Before updating the domain on each remote Managed Server, create a backup copy of the domain directory on each remote machine.

3. Verify that the backed up versions of the domain are complete.

If domain reconfiguration fails for any reason, you must copy all files and directories from the backup directory into the original domain directory to ensure that the domain is returned entirely to its original state before reconfiguration.

### 6.6.2 Starting the Reconfiguration Wizard

To start the Reconfiguration Wizard in graphical mode:

1. Sign in to the system on which the domain resides.

2. Open the command shell (on UNIX operating systems) or open a command prompt window (on Windows operating systems).

3. **Edition Based Database Users Only:** If your schemas are configured with EBR database, a default edition name must be manually supplied before you run the Reconfiguration Wizard.

   Run the following SQL command to set the default edition:
   
   ```sql
   ALTER DATABASE DEFAULT EDITION = edition_name;
   ``
   
   where `edition_name` is the child edition name.

4. Go to the `oracle_common\common\bin` directory:
   
   - (UNIX) `ORACLE_HOME/oracle_common/common/bin`
   
   - (Windows) `ORACLE_HOME\oracle_common\common\bin`

5. Start the Reconfiguration Wizard with the following logging options:
   
   - (UNIX) `./reconfig.sh -log=log_file -log_priority=ALL`
   
   - (Windows) `reconfig.cmd -log=log_file -log_priority=ALL`

   where `log_file` is the absolute path of the log file you'd like to create for the domain reconfiguration session. This can be helpful if you need to troubleshoot the reconfiguration process.

   The parameter `--log_priority=ALL` ensures that logs are logged in fine mode.
Note:
When you run this command, the following error message might appear to indicate that the default cache directory is not valid:

*sys-package-mgr*: can't create package cache dir

You can change the cache directory by setting the environment variable CONFIG_JVM_ARGS. For example:

CONFIG_JVM_ARGS=-Dpython.cachedir=valid_directory

6.6.3 Reconfiguring the Domain with the Reconfiguration Wizard

Navigate through the screens in the Reconfiguration Wizard to reconfigure your existing domain.

To reconfigure the domain:

1. On the Select Domain screen, specify the location of the domain you want to upgrade or click Browse to navigate and select the domain directory. Click Next.

2. On the Reconfiguration Setup Progress screen, view the progress of the setup process. When complete, click Next.

During this process:

- The reconfiguration templates for your installed products, including Fusion Middleware products, are automatically applied. This updates various domain configuration files such as config.xml, config-groups.xml, and security.xml (among others).

- Schemas, scripts, and other such files that support your Fusion Middleware products are updated.

- The domain upgrade is validated.

3. On the Domain Mode and JDK screen, select the JDK to use in the domain or click Browse to navigate to the JDK you want to use. The supported JDK version for 12c (12.2.1.2) is 1.8.0_101 and later. Click Next.

Note: You cannot change the Domain Mode at this stage.

For a list of JDKs that are supported for a specific platform, see Oracle Fusion Middleware Supported System Configurations.

4. On the JDBC Data Sources screen, configure the JDBC data sources defined in your domain source.

The JDBC data sources associated with the products for which you are creating the domain are listed in the lower half of the screen. A JDBC data source contains a pool of database connections that are created when the data source instance is created, deployed or targeted, or at server startup. Applications look up a data source on the JNDI tree, and then request a connection. When the applications no longer need the connections, they return the connections to the connection pool in the data source.
From the **Data Source Name** drop-down list, select the data source(s) for which you want to specify the settings. The values that you specify are displayed in the appropriate columns in the data source list, for the selected data source.

For Oracle RAC Configuration for data sources, you can select one of the three options:

- Convert to GridLink
- Convert to RAC multi data source
- Don’t convert

For more information about each option, click **Help**.

After specifying the details, click **Next**.

If you do not select any data sources on the JDBC Data Sources screen, the following warning displays:

**Missing Driver**

Click **Ok** to proceed without verification, click **Cancel** to return to the JDBC Data Sources page.

In this case, if you click **Ok**, the data sources are not verified.

5. On the JDBC Data Sources Test screen, select the check box for the data source connection you configured on the JDBC Data Sources screen and click **Test Selected Connections** to test the data source connection.

   **Note:** In order to test the database connections, the database to which you are connecting must be running. If you do not want to test the connections at this time, do not select any data sources. Click **Next** to continue.

6. On the Database Configuration Type screen, select **RCU Data** to connect to the Server Table (_STB) schema.

   Enter the database connection details using the RCU service table (_STB) schema credentials and click **Get RCU Configuration**.

   The Reconfiguration Wizard uses this connection to automatically configure the data sources required for components in your domain.

   **NOTE:** For any existing 11g datasource, the reconfiguration will preserve the existing values. For new datasources where the schema was created for 12c by the RCU, the default connection data will be retrieved from the _STB schema. If no connection data for a given schema is found in the _STB schema, then the default connection data is used.

   If the check is successful, click **Next**. If the check fails, reenter the connection details correctly and try again.

7. On the JDBC Component Schema Test screen, select all the component schemas and click **Test Selected Connections** to test the connection for each schema. The result of the test is indicated in the **Status** column.

   When the check is complete, click **Next**.
8. The Node Manager screen is only displayed if the domain you are reconfiguring is currently using a per host Node Manager.

On the Node Manager screen, select the Node Manager configuration to use for the reconfigured domain. The resulting configuration depends on the combination of options you select for Node Manager Type and Node Manager Configuration.

**Table 6-5  Field Descriptions for Node Manager Screen**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Per Domain Default Location</td>
<td>If you select this option, the Node Manager home is redefined to <code>DOMAIN_NAME/nodemanager</code> and you cannot edit the Node Manager home.</td>
</tr>
<tr>
<td>Per Domain Custom Location</td>
<td>Select this option if you want the per domain Node Manager configuration files to be created in a specific location for this domain. Specify the directory in the Node Manager Home field, or click Browse to use the navigation tree to select the location. The specified directory must be empty. The nodemanager.properties and nodemanager.domains files are created in this directory.</td>
</tr>
<tr>
<td>Node Manager Home</td>
<td>If you selected the Per Domain Custom Location option, click Browse to navigate to the directory location that you want to use to store the per domain Node Manager configuration.</td>
</tr>
<tr>
<td>Manual Node Manager Setup</td>
<td>If you select this option, creation of the Node Manager configuration for the domain is skipped (all remaining fields cannot be modified), and if you want to use Node Manager in the domain, you must manually configure Node Manager as described in Completing the Node Manager Configuration. The reconfigured domain will still use a per host Node Manager configuration. You should also select this option if your existing domain is not configured to use Node Manager and you do not want to use Node Manager in the reconfigured domain. For more information about Node Manager configuration, see Administering Node Manager for Oracle WebLogic Server.</td>
</tr>
<tr>
<td>Node Manager Configuration</td>
<td>Select one of the following two options. These fields are not available if you selected Manual Node Manager Setup.</td>
</tr>
<tr>
<td>Create New Configuration</td>
<td>A per domain Node Manager configuration will be automatically created for the reconfigured domain using default settings in nodemanager.properties. If necessary, you can modify nodemanager.properties after the domain has been successfully reconfigured.</td>
</tr>
<tr>
<td>Migrate Existing Configuration</td>
<td>The existing per host Node Manager configuration will be migrated to a per domain configuration for the reconfigured domain. This does not include environment-specific settings for ListenAddress, ListenPort, StartScriptName, JavaHome, and LogFile.</td>
</tr>
</tbody>
</table>
Table 6-5  (Cont.) Field Descriptions for Node Manager Screen

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node Manager Home</td>
<td>If you selected the <strong>Migrate Existing Configuration</strong> option, enter or browse to the Node Manager home directory that you want to migrate to the reconfigured domain.</td>
</tr>
<tr>
<td>Apply Oracle Recommended Defaults</td>
<td>If you selected the <strong>Migrate Existing Configuration</strong> option, select this check box if you want to use Oracle-recommended defaults in the nodemanager.properties file. Deselect this check box if you want to continue using the settings in the nodemanager.properties file being migrated. Oracle-recommended properties with default values are as follows:</td>
</tr>
<tr>
<td></td>
<td>LogLimit=0</td>
</tr>
<tr>
<td></td>
<td>AuthenticationEnabled=true</td>
</tr>
<tr>
<td></td>
<td>LogLevel=INFO</td>
</tr>
<tr>
<td></td>
<td>DomainsFileEnabled=true</td>
</tr>
<tr>
<td></td>
<td>NativeVersionEnabled=true</td>
</tr>
<tr>
<td></td>
<td>LogToStderr=true</td>
</tr>
<tr>
<td></td>
<td>SecureListener=true</td>
</tr>
<tr>
<td></td>
<td>LogCount=1</td>
</tr>
<tr>
<td></td>
<td>StopScriptEnabled=false</td>
</tr>
<tr>
<td></td>
<td>QuitEnabled=false</td>
</tr>
<tr>
<td></td>
<td>LogAppend=true</td>
</tr>
<tr>
<td></td>
<td>StateCheckInterval=500</td>
</tr>
<tr>
<td></td>
<td>CrashRecoveryEnabled=false</td>
</tr>
<tr>
<td></td>
<td>StartScriptEnabled=true</td>
</tr>
<tr>
<td></td>
<td>LogFormatter=weblogic.nodemanager.server.LogFormatter</td>
</tr>
<tr>
<td></td>
<td>ListenBacklog=50</td>
</tr>
<tr>
<td>Node Manager Credentials: Username, Password</td>
<td>Specify the username and password that you want to use to start Node Manager in the reconfigured domain.</td>
</tr>
</tbody>
</table>

**9.** On the Advanced Configuration screen, you can select all categories for which you want to perform advanced configuration. For each category you select, the appropriate configuration screen is displayed to allow you to perform advanced configuration.

**Note:** The categories that are listed on the Advanced Configuration screen depend on the resources defined in the templates you selected for the domain.

For this upgrade, select none of the options and click **Next**.

**10.** On the Configuration Summary screen, review the detailed configuration settings of the domain before continuing.

You can limit the items that are displayed in the right-most panel by selecting a filter option from the **View** drop-down list.

To change the configuration, click **Back** to return to the appropriate screen. To reconfigure the domain, click **Reconfig**.
11. The Reconfiguration Progress screen displays the progress of the reconfiguration process.

During this process:

- Domain information is extracted, saved, and updated.
- Schemas, scripts, and other such files that support your Fusion Middleware products are updated.

When the progress bar shows 100%, click Next.

12. The End of Configuration screen indicates whether the reconfiguration process completed successfully or failed. It also displays the location of the domain that was reconfigured as well as the Administration Server URL (including the listen port). If the reconfiguration is successful, it displays Oracle WebLogic Server Reconfiguration Succeeded.

If the reconfiguration process did not complete successfully, an error message is displayed indicates the reason. Take appropriate action to resolve the issue. If you cannot resolve the issue, contact My Oracle Support.

Note the Domain Location and the Admin Server URL for further operations.

6.7 Upgrading Domain Component Configurations

After reconfiguring the domain, use the Upgrade Assistant to upgrade the domain component configurations inside the domain to match the updated domain configuration.

**Starting the Upgrade Assistant**

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

**Upgrading Domain Components Using the Upgrade Assistant**

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.

**Verifying the Domain-specific-Component Configurations Upgrade**

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

6.7.1 Starting the Upgrade Assistant

Run the Upgrade Assistant to upgrade product schemas, domain component configurations, or standalone system components to 12c (12.2.1.2). Oracle recommends that you run the Upgrade Assistant as a non-SYSDBA user, completing the upgrade for one domain at a time.

To start the Upgrade Assistant:

1. Go to the oracle_common/upgrade/bin directory:
2. Start the Upgrade Assistant:

- (UNIX) ./ua
- (Windows) ua.bat

For information about other parameters that you can specify on the command line, such as logging parameters, see:

Upgrade Assistant Parameters

### 6.7.1.1 Upgrade Assistant Parameters

When you start the Upgrade Assistant from the command line, you can specify additional parameters.

| Table 6-6  Upgrade Assistant Command-Line Parameters |
|-----------|---------------------------------------------|
| Parameter | Required or Optional | Description |
| -readiness | Required for readiness checks | Performs the upgrade readiness check without performing an actual upgrade. Schemas and configurations are checked. Do not use this parameter if you have specified the -examine parameter. |
| -response | Required for silent upgrades or silent readiness checks | Runs the Upgrade Assistant using inputs saved to a response file generated from the data that is entered when the Upgrade Assistant is run in GUI mode. Using this parameter runs the Upgrade Assistant in silent mode (without displaying Upgrade Assistant screens). |
| -examine | Optional | Performs the examine phase but does not perform an actual upgrade. Do not specify this parameter if you have specified the -readiness parameter. |
### Table 6-6  (Cont.) Upgrade Assistant Command-Line Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required or Optional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-logLevel attribute</td>
<td>Optional</td>
<td>Sets the logging level, specifying one of the following attributes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TRACE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NOTIFICATION</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• WARNING</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• INCIDENT_ERROR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default logging level is NOTIFICATION.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Consider setting the -logLevel TRACE attribute so that more information is logged. This is useful when troubleshooting a failed upgrade. The Upgrade Assistant's log files can become very large if -logLevel TRACE is used.</td>
</tr>
<tr>
<td>-logDir location</td>
<td>Optional</td>
<td>Sets the default location of upgrade log files and temporary files. You must specify an existing, writable directory where the Upgrade Assistant will create log files and temporary files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default locations are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>UNIX:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORACLE_HOME/oracle_common/upgrade/logs</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORACLE_HOME/oracle_common/upgrade/temp</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Windows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORACLE_HOME/oracle_common/upgrade/logs</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORACLE_HOME/oracle_common/upgrade/temp</td>
</tr>
<tr>
<td>-help</td>
<td>Optional</td>
<td>Displays all of the command-line options.</td>
</tr>
</tbody>
</table>

### 6.7.2 Upgrading Domain Components Using the Upgrade Assistant

Navigate through the screens in the Upgrade Assistant to upgrade component configurations in the WebLogic domain.
After running the Reconfiguration Wizard to reconfigure the WebLogic domain to 12c (12.2.1.2), you must run the Upgrade Assistant to upgrade the domain component configurations to match the updated domain configuration.

To upgrade domain component configurations with the Upgrade Assistant:

1. On the Welcome screen, review an introduction to the Upgrade Assistant and information about important pre-upgrade tasks. Click Next.

   **Note:** For more information about any Upgrade Assistant screen, click Help on the screen.

2. On the WebLogic Components screen, select the **WebLogic Component Configurations** option to upgrade component configurations for a managed WebLogic Server domain. Enter the connection details required to connect to the WebLogic Administration Server that is managing the domain and click Next.

3. On the Component List screen, verify that the list includes all the components for which you want to upgrade configurations and click Next.

   If you do not see the components you want to upgrade, click Back to go to the previous screen and specify a different domain.

4. On the Prerequisites screen, acknowledge that the prerequisites have been met by selecting all the check boxes. Click Next.

   **Note:** The Upgrade Assistant does not verify whether the prerequisites have been met.

5. On the Examine screen, review the status of the Upgrade Assistant as it examines each component, verifying that the component configuration is ready for upgrade. If the status is Examine finished, click Next.

   If the examine phase fails, Oracle recommends that you cancel the upgrade by clicking No in the Examination Failure dialog. Click View Log to see what caused the error and refer to Troubleshooting Your Upgrade in Oracle Fusion Middleware Upgrading with the Upgrade Assistant Upgrade Guide for information on resolving common upgrade errors.

   **Note:**

   - If you resolve any issues detected during the examine phase without proceeding with the upgrade, you can start the Upgrade Assistant again without restoring from backup. However, if you proceed by clicking Yes in the Examination Failure dialog box, you need to restore your pre-upgrade environment from backup before starting the Upgrade Assistant again.
   - Canceling the examination process has no effect on the configuration data; the only consequence is that the information the Upgrade Assistant has collected must be collected again in a future upgrade session.

6. On the Upgrade Summary screen, review the summary of the options you have selected for component configuration upgrade.
The response file collects and stores all the information that you have entered, and enables you to perform a silent upgrade at a later time. The silent upgrade performs exactly the same function that the Upgrade Assistant performs, but you do not have to manually enter the data again. If you want to save these options to a response file, click **Save Response File** and provide the location and name of the response file.

Click **Upgrade** to start the upgrade process.

7. On the Upgrade Progress screen, monitor the status of the upgrade.

Caution: Allow the Upgrade Assistant enough time to perform the upgrade. Do not cancel the upgrade operation unless absolutely necessary. Doing so may result in an unstable environment.

If any components are not upgraded successfully, refer to the Upgrade Assistant log files for more information.

Note: The progress bar on this screen displays the progress of the current upgrade procedure. It does not indicate the time remaining for the upgrade.

Click **Next**.

8. If the upgrade is successful: On the Upgrade Success screen, click **Close** to complete the upgrade and close the wizard. The Post-Upgrade Actions window describes the manual tasks you must perform to make components functional in the new installation. This window appears only if a component has post-upgrade steps.

If the upgrade fails: On the Upgrade Failure screen, click **View Log** to view and troubleshoot the errors. The logs are available at `ORACLE_HOME/oracle_common/upgrade/logs`.

Note: If the upgrade fails you must restore your pre-upgrade environment from backup, fix the issues, then restart the Upgrade Assistant.

### 6.7.3 Verifying the Domain-specific-Component Configurations Upgrade

To verify that the domain-specific-component configurations upgrade was successful, log in to the Administration console and the Fusion Middleware Control and verify that the version numbers for each component is 12.2.1.2.

To log into the Administration Console, go to: `http://administration_server_host:administration_server_port/console`

To log into the Fusion Middleware Control, go to: `http://administration_server_host:administration_server_port/em`
Note:

After upgrade, make sure you run the administration tools from the new 12c Oracle home and not from the previous Oracle home.

During the upgrade process, some OWSM documents, including policy sets and predefined documents such as policies and assertion templates, may need to be upgraded. If a policy set or a predefined document is upgraded, its version number is incremented by 1.

6.8 Starting Servers and Processes

After a successful upgrade, restart all processes and servers, including the Administration Server and any Managed Servers.

The components may be dependent on each other so they must be started in the correct order.

Note: The procedures in this section describe how to start servers and process using the WLST command line or a script. You can also use the Oracle Fusion Middleware Control and the Oracle WebLogic Server Administration Console. See Starting and Stopping Administration and Managed Servers and Node Manager in Administering Oracle Fusion Middleware.

To start your Fusion Middleware environment, follow the steps below.

Step 1: Start the Administration Server

When you start the Administration Server, you also start the processes running in the Administration Server, including the WebLogic Server Administration Console and Fusion Middleware Control.

To start the Administration Server, use the startWebLogic script:

- (UNIX) $DOMAIN_HOME/bin/startWebLogic.sh
- (Windows) $DOMAIN_HOME\bin\startWebLogic.cmd

When prompted, enter your user name, password, and the URL of the Administration Server.

Step 2: Start Node Manager

To start Node Manager, use the startNodeManager script:

- (UNIX) $DOMAIN_HOME/bin/startNodeManager.sh
- (Windows) $DOMAIN_HOME\bin\startNodeManager.cmd

Step 3: Start Oracle Identity Management Components

Start any Oracle Identity Management components, such as Oracle Internet Directory, that form part of your environment:

- (UNIX) $DOMAIN_HOME/bin/startComponent.sh component_name
- (Windows) $DOMAIN_HOME\bin\startComponent.cmd component_name
Step 4: Start the Managed Servers
To start a WebLogic Server Managed Server, use the `startManagedWebLogic` script:

- (UNIX) `DOMAIN_HOME/bin/startManagedWebLogic.sh managed_server_name admin_url`
- (Windows) `DOMAIN_HOME\bin\startManagedWebLogic.cmd managed_server_name admin_url`

When prompted, enter your user name and password.

---

**Note:** The startup of a Managed Server will typically start the applications that are deployed to it. Therefore, it should not be necessary to manually start applications after the Managed Server startup.

Step 5: Start System Components
To start system components, such as Oracle HTTP Server, use the `startComponent` script:

- (UNIX) `DOMAIN_HOME/bin/startComponent.sh component_name`
- (Windows) `DOMAIN_HOME\bin\startComponent.cmd component_name`

You can start system components in any order.

**Starting the Oracle HTTP Server**
You can use Enterprise Manager Fusion Middleware Control to start, stop, and restart Oracle HTTP Server.

6.8.1 Starting the Oracle HTTP Server

You can use Enterprise Manager Fusion Middleware Control to start, stop, and restart Oracle HTTP Server.

You can start the Oracle HTTP Server with the Node Manager by following the procedure mentioned in Running Oracle HTTP Server Remotely in *Oracle Fusion Middleware Administering Oracle HTTP Server*.

To start an Oracle HTTP Server using Enterprise Manager Fusion Middleware Control:

1. Go to the Oracle HTTP Server home page.
2. From the Oracle HTTP Server menu:
   a. Select Control.
   b. Select Start Up from the Control menu.
   Or
3. From the Target Navigation tree:
   a. Right-click the Oracle HTTP Server instance you want to start.
   b. Select Control.
c. Select **Start Up** from the **Control** menu.

### 6.9 Verifying the Upgrade

If you can log in to the Administration Console and the Enterprise Manager Fusion Middleware Control, your upgrade is successful.

To verify the upgrade:

1. Sign in to the following URL:
   
   http://`MachineName`.us.oracle.com:7777

2. To access Enterprise Manager Fusion Middleware Control:
   
   http://`MachineName`.us.oracle.com:7001/em

If you are not able to start the newly upgraded environment, a possible cause could be the use of MD5 certificates in your Oracle wallet. See **Replacing Certificate Signed Using MD5 Algorithm with Certificate Signed Using SHA-2 Algorithm** for a procedure to check whether you are using MD5 signatures and a procedure to replace them with SHA-2 certificates.

### 6.10 Importing Wallets to the KSS Database after an Upgrade Using WLST

When you use Upgrade Assistant to upgrade from a previous version of Oracle HTTP Server to 12c (12.2.1.2), you must perform an additional wallet management task.

Use the `ohs_postUpgrade` command to import the wallets for Oracle HTTP Server instances to the KSS database.

This command parses across all of the Oracle HTTP Server instances in the domain and imports the wallets to the KSS database if an entry does not already exist in the database against the same keystore name. For more information on this command, see `ohs_postUpgrade`.

1. Start WLST from the command line.
   
   (UNIX) `ORACLE_HOME/oracle_common/common/bin/wlst.sh`

   (Windows) `ORACLE_HOME/oracle_common/common/bin/wlst.cmd`

2. Connect to the Administration Server instance:
   
   `connect('<userName>', '<password>', '<host>:<port>')`

3. Enter the `ohs_postUpgrade` WLST custom command, for example:
   
   `ohs_postUpgrade()`
Oracle strongly recommends that you refrain from using a certificate signed with Message Digest 5 Algorithm (MD5), because the security of MD5 algorithm has been compromised. Therefore, you must replace the certificate signed using MD5 algorithm with a certificate signed with Secure Hashing Algorithm 2 (SHA-2). By default, certificates signed using MD5 algorithm are no longer supported in Oracle HTTP Server.

**How to Check whether Certificate Signed with MD5 Algorithm is Present in the Wallet?**

You can use the orapki utility to display whether your wallet contains a certificate signed with MD5 algorithm.

**Removing Certificate Signed with MD5 Algorithm from the Wallet**

If the Signature algorithm name is displayed equal to "MD5withRSA", it means that a certificate signed with MD5 algorithm is present in your wallet. You must replace this certificate with certificate signed using SHA2 algorithm.

**Adding Certificate Signed with SHA-2 Algorithm to the Wallet**

If you are using CA-signed user certificate that is signed with MD5 algorithm, contact your certificate authority to get a new user certificate signed with SHA-2 algorithm and import it into the wallet.

**Enabling Support for Certificate Signed with MD5 Algorithm in your 12.2.1.2 Oracle HTTP Server Deployment**

By default, support of certificate signed with MD5 algorithm has been removed because the security of MD5 algorithm is severely compromised. If you still want to use certificate signed using MD5 algorithm, you can enable the support for a certificate signed with MD5 algorithm by following the procedure in this section. However, enabling support for certificates signed using MD5 algorithm is not recommended.

**A.1 How to Check whether Certificate Signed with MD5 Algorithm is Present in the Wallet?**

You can use the orapki utility to display whether your wallet contains a certificate signed with MD5 algorithm.

To check whether MD5 certificate is present in your wallet:

1. Locate orapki and keytool path:
(orapki) ORACLE_HOME/oracle_common/bin/orapki
(Keytool) ORACLE_HOME/oracle_common/jdk/jre/bin

2. Set the JAVA_HOME environment variable as follows:
   export JAVA_HOME=ORACLE_HOME/oracle_common/jdk/jre/

3. Display the wallet contents by entering the following command:
   orapki wallet display -wallet wallet_location

   Sample command:
   ORACLE_HOME/oracle_common/bin/orapki wallet display -wallet /scratch/ohs12.2.1.x_install/walletohs2/

   Output:
   Oracle PKI Tool : Version 12.2.0.1.0
   Copyright (c) 2004, 2016, Oracle and/or its affiliates. All rights reserved.
   Requested Certificates:
   User Certificates:
      Subject: CN=www.xyx.com,C=IN
   Trusted Certificates:
      Subject: CN=www.xyx.com,C=IN

4. Identify the domain name (DN) of the certificate present in the wallet. In this example, Subject of User Certificates is the DN of the certificate present in the wallet; which is "CN=www.xyx.com,C=IN".

5. Export the certificate present in the wallet as shown in the following example:
   orapki wallet export -wallet wallet_Location -dn 'DN_string' -cert certificate_file

   Sample command:
   ORACLE_HOME/oracle_common/bin/orapki wallet export -wallet /scratch/ohs12.2.1.x_install/walletohs2/ -dn 'CN=www.xyx.com,C=IN' -cert wallet.cert

6. Use the keytool to check the signature algorithm used to sign the certificate_file that you exported in the previous step by entering the following command:
   ORACLE_HOME/oracle_common/jdk/jre/bin/keytool -printcert -file certificate_file

   Sample command:
   /scratch/ohs12.2.1.x_install/oracle_common/jdk/jre/bin/keytool -printcert -file wallet.cert

   Output:
   Owner: CN="Self-Signed Certificate for ohs3 ", OU=OAS, O=ORACLE, L=REDWOODSHORES, ST=CA, C=US
   Issuer: CN="Self-Signed Certificate for ohs3 ", OU=OAS, O=ORACLE, L=REDWOODSHORES, ST=CA, C=US
   Serial number: cd7081c47adb99f867da01e3fe383e0f
   Valid from: Fri Jul 01 04:21:40 PDT 2016 until: Sat Jun 19 04:21:40 PDT 2066
Certificate fingerprints:
Signature algorithm name: MD5withRSA
Version: 1

"Signature algorithm name: MD5withRSA" implies that MD5 algorithm is being used to sign the certificate present in the wallet.

A.2 Removing Certificate Signed with MD5 Algorithm from the Wallet

If the Signature algorithm name is displayed equal to "MD5withRSA", it means that a certificate signed with MD5 algorithm is present in your wallet. You must replace this certificate with certificate signed using SHA2 algorithm.

To remove certificates signed with MD5 algorithm from your wallet:

1. Enter the following command to remove a user certificate signed using MD5 algorithm:

   ```
   orapki wallet remove -wallet wallet_location -dn 'DN_string'
   -user_cert -auto_login_only
   ```

   Sample command:

   ```
   /scratch/ohs12.2.1.x_install/oracle_common/bin/orapki wallet remove -wallet /scratch/ohs12.2.1.x_install/walletohs2/ -dn 'CN=www.xyx.com,C=IN' -user_cert -auto_login_only
   ```

   Output:

   Oracle PKI Tool : Version 12.2.0.1.0
   Copyright (c) 2004, 2016, Oracle and/or its affiliates. All rights reserved.

2. If the user certificate is a self-signed certificate, you need to remove it from the "trusted certificate" and the "requested certificate" list by entering the following commands:

   ```
   orapki wallet remove -wallet wallet_location -dn 'DN_string' -trusted_cert -auto_login_only
   ```

   ```
   orapki wallet remove -wallet wallet_location -dn 'DN_string' -cert_req -auto_login_only
   ```

   Sample command:

   ```
   /scratch/ohs12.2.1.x_install/oracle_common/bin/orapki wallet remove -wallet /scratch/ohs12.2.1.x_install/walletohs2/ -dn 'CN=www.xyx.com,C=IN' -trusted_cert -auto_login_only
   ```

   Output:

   Oracle PKI Tool : Version 12.2.0.1.0
   Copyright (c) 2004, 2016, Oracle and/or its affiliates. All rights reserved.

3. If a wallet has trusted certificate or a certificate request which is signed using MD5 algorithm, remove that certificate by entering the following commands:

   ```
   orapki wallet remove -wallet wallet_location -dn 'DN_string'
   -trusted_cert -auto_login_only remove cert request
   ```
A.3 Adding Certificate Signed with SHA-2 Algorithm to the Wallet

If you are using CA-signed user certificate that is signed with MD5 algorithm, contact your certificate authority to get a new user certificate signed with SHA-2 algorithm and import it into the wallet.

To add self-signed certificate, signed using SHA-2 algorithm:

1. If certificate is self-signed, enter the following command to add self-signed certificate signed using SHA-2 algorithm:

   ```
   orapki wallet add -wallet wallet_location -dn 'DN_string' -keysize 2048 -sign_alg sha256 -self_signed -validity 9125 -auto_login_only
   ```

   Sample command:

   ```
   /scratch/ohs12.2.1.x_install/oracle_common/bin/orapki wallet add -wallet /scratch/ohs12.2.1.x_install/walletohs2/ -dn 'CN=www.xyx.com,C=IN' -keysize 2048 -sign_alg sha256 -self_signed -validity 9125 -auto_login_only
   ```

2. Add trusted certificate signed using SHA-2 algorithm to wallet by entering the following command:

   ```
   orapki -wallet add -wallet wallet_location -trusted_cert -cert certificate_file -auto_login_only
   ```

3. Add user certificate signed using SHA-2 algorithm to wallet by entering the following command:

   ```
   orapki -wallet add -wallet wallet_location -user_cert -cert certificate_file -auto_login_only
   ```

The operation is successful if you see Signature algorithm name equal to "SHA256withRSA" when you print your certificate file. Following is a sample output:

```
Owner: CN=www.xyx.com, C=IN
Issuer: CN=www.xyx.com, C=IN
Serial number: f689ec6986c70f973138962eb2f0e5f9
Valid from: Wed May 11 04:01:24 PDT 2016 until: Sat Oct 27 04:01:24 PDT 2018
Certificate fingerprints:
   3B:01:2D:AE:9B:BD:3E:13:BE:AF:A0:76
Signature algorithm name: SHA256withRSA
Version: 1
```
Enabling Support for Certificate Signed with MD5 Algorithm in your 12.2.1.2 Oracle HTTP Server Deployment

signed with MD5 algorithm by following the procedure in this section. However, enabling support for certificates signed using MD5 algorithm is not recommended.

To enable support for a certificate signed with MD5 algorithm:

1. For Standalone Oracle HTTP Server deployment:
   a. Stop the Oracle HTTP Server instance and the Node Manager.
   b. Change to the following staging directory:
      
      (UNIX) `ORACLE_HOME/user_projects/domains/base_domain/config/fmwconfig/components/OHS/ohs1`
      
      (Windows) `ORACLE_HOME\user_projects\domains\base_domain\config\fmwconfig\components\OHS\ohs1`
   c. Open the ohs.plugins.nodemanager.properties file in edit mode and add the following line:
      
      `environment.ORACLE_SSL_ALLOW_MD5_CERT_SIGNATURES = 1`
   d. Restart the Node Manager and the Oracle HTTP Server instance.

2. For Managed Oracle HTTP Server deployment:
   a. Stop the Oracle HTTP Server instance, Node Manager, and the WebLogic Server.
   b. Change to the following staging directory:
      
      (UNIX) `ORACLE_HOME/user_projects/domains/base_domain/config/fmwconfig/components/OHS/ohs1`
      
      (Windows) `ORACLE_HOME\user_projects\domains\base_domain\config\fmwconfig\components\OHS\ohs1`
   c. Open the ohs.plugins.nodemanager.properties file in edit mode and add the following line:
      
      `environment.ORACLE_SSL_ALLOW_MD5_CERT_SIGNATURES = 1`
   d. Restart the WebLogic Server, Node Manager, and the Oracle HTTP Server instance.

You must perform this procedure on each Oracle HTTP Server instance.
