Cause: An attempt was made to add a new operation to the batch when the batch was full and Block_On_Batch_Full is set to false.

Action: When Block_On_Batch_Full is set to false this exception will be thrown if an attempt is made to add a batch operation to a full batch. When Block_On_Batch_Full is set to true (the default) the caller’s thread will block until the batch full condition is cleared and the operation is successfully added. The batch full condition will clear when pending batches are processed to the Oracle BAM Server freeing up space in the batch.

BEA-001586: EndRequest failed: [0]
Cause: This generally happens because the application failed to complete a local transaction before closing the connection. See the associated message to determine if this is the case.
Action: The error is ignored if the connection can be cleared. This is, however, an application error to not complete the transaction. Fix the software.

BEA-001587: For LLR RAC DataSource [0] Member of MultiDataSource, test-on-reserve is disabled, and the health of the DataSource cannot be verified.
Cause: test-on-reserve is disabled in the data source configuration.
Action: Enable test-on-reserve in the data source configuration. If all member data sources are marked as unhealthy and the WLS Administration Server fails to boot, use WLST to change the configuration.

BEA-001594: Forcibly releasing an already closed connection "{1}" back into the data source connection pool "{0}".
Cause: When isClosed() is called on the connection, either directly by the application or when accessing a connection, the driver indicates that the connection is already closed. The connection is closed in the WLS data source and returned to the pool. The connection will be replaced in the pool with a new connection.

BEA-002002: Failed to parse method name {0}.

Cause: This can happen for a variety of reasons. Normally, it is because the caller made a request for a non-existent method. Alternatively, the IDL mangling of the method name may be ambiguous, so WebLogic Server cannot decide which method to call.

Action: If the IDL mangling is causing a problem, try changing the name of the method. In particular, names such as getSomedata() (where somedata is also the name of an attribute or method) can cause problems. Also, some bugs with name mangling exist in JDK 1.3.1. Try using a JDK 1.4 client.

BEA-003105: The asynchronous replication request timed out while attempting to add object {0} to the replication queue. This session has not been replicated to any backup at this point.

   **Cause:** The asynchronous replication request timed out while attempting to add object {0} to the replication queue. Once full, the queue waits until it has space for the object. This wait took longer than the ClusterMBean specified AsyncSessionQueueTimeout, thus the session object was not put into the queue and will not be replicated at this time.
   **Action:** This could be due to the secondary server or persistent store slowing down the replication process. To better handle this, the SessionFlushInterval and the SessionFlushThreshold can be reduced to replicate less at a time and to replicate more often. Checking the performance of the secondary server or persistent store is advised.

BEA-011083: The EJB specification prohibits stateful session beans from using the TimerService.
Cause: An illegal call was made to the getTimerService() method on the stateful session beans SessionContext.
Action: Correct the stateful session bean code so that it does not call the getTimerService() method from the bean class.

Level: 1
Type: ERROR
Impact: EJB
BEA-011084: This EJB class does not support EJB timers and therefore is prohibited from using the TimerService. To use EJB timers, the bean class must implement javax.ejb.TimedObject or have a method that is annotated with @Timeout.
Cause: An illegal call to the getTimerService() method on the EJBContext.
**Action:** Correct the EJB class so it either implements the `javax.ejb.TimedObject` interface or ensure that it does not call the `getTimerService()` method on the `EJBContext`.

**BEA-011088:** The following error occurred while invoking the `ejbTimeout(javax.ejb.Timer)` method of EJB {0}.  
**Cause:** This could be caused by erroneous code in the `ejbTimeout` method or by the failure of a dependent resource.  
**Action:** All exceptions that occur while invoking or attempting to invoke the `ejbTimeout` method should be investigated and resolved. If the `ejbTimeout` method is non-transactional, that is, has a transaction attribute of `NotSupported`, or if the bean uses bean-managed transactions, the `ejbTimeout` method may not be retried, leading to missed timeout notifications.

**BEA-011098:** No generated primary key was returned from the database insert statement as expected. Verify that the primary key database column for this EJB is an IDENTITY column as declared in the CMP deployment descriptor for this EJB.

**Cause:** This is most likely caused by a database configuration error. It may also be caused by a JDBC driver that does not support the getGeneratedKeys() method on java.sql.Statement.

**Action:** Verify that the primary key column in the database is marked as an IDENTITY column (or a functional equivalent is setup for the column such as a database trigger to insert a value into the primary key column).

**Level:** 1
**Type:** ERROR
**Impact:** EJB

**BEA-011099:** Multiple generated keys were returned from the database insert statement. The EJB container is unable to determine which generated key corresponds to the primary key column. To use the IDENTITY primary key generator, you must only have a single automatically generated database column per EJB.

**Cause:** This is most likely caused by a database configuration error. Each EJB may only have a single automatically generated database column.

**Action:** Verify that the database table corresponding to the EJB only has a single generated column.

BEA-011127: Error deserializing one or more EJB timers from the persistent store for the EJB deployment {0}. An incompatible change to the class of a Serializable object associated with the timer may be the cause. If this is the case, you can either undeploy your application entirely to remove the EJB timers from the persistent store or revert the incompatible changes to the Serializable class so the EJB timer can be deserialized. The error was: {1}

**Cause:** A common cause of this error is an incompatible serializable class change in your application.

**Action:** If the error is due to an incompatible serializable class change in your application, there are two options for dealing with the serialization errors. The first option is to completely undeploy the EJB, which will cause all of the EJB timers in the persistent store to be permanently removed. The second option is to revert changes to the serializable class that is associated with the EJB timer and redeploy the application. This allows the EJB timer to be deserialized.

BEA-014003: EJB {0} uses optimistic concurrency and contains a finder or select method, {1}, for which include-updates is true. This combination of features does not work properly with database {2}.
Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks, unless Oracle is used as the database. Oracle read consistency does not hold read locks, so in this case reads are performed using the current JTA transaction. When reads are performed in a local transaction updates that have been flushed prior to commit of the transaction are not visible.
Action: Set include-updates for the query to false to avoid this warning message, or if you are using Oracle as your database, set the database-type to Oracle in weblogic-cmp-jar.xml.

BEA-014005: The configured dispatch policy {1} for Message-Driven Bean (MDB) {0} will be ignored: the MDB is not running in a WebLogic thread.

**BEA-014006**: The Message-Driven Bean (MDB) named {0} has a dispatch policy {1} that refers to an unknown execute queue thread pool. The default execute thread pool will be used instead.

**Cause:** The specified MDB named has a dispatch policy that refers to an unknown execute queue thread pool.

**Action:** Create an execute thread queue pool for the server named {1}, or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing execute queue thread pool.

BEA-014010: The Message-Driven Bean {0} of application {1} will now be suspended, as it listens to global JMS topic {2} and a new application version {3} is being redeployed. Note also that the current Message-Driven Bean is not a durable subscriber to the topic, and messages published by the topic after the currently active version of the Message-Driven Bean is suspended may not be received by the new application version.

Cause: The specified Message-Driven Bean listens to the specified global JMS topic and a new application version is being redeployed.

Action: To ensure that the new application version will receive all messages published while the Message-Driven Bean was suspended, set the activation config property "subscriptionDurability" to "durable" in the deployment descriptor or annotation.

Type: WARNING
Impact: EJB

BEA-014011: EJB {0} uses optimistic-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. This combination of features is incompatible. The use-select-for-update is turned off by the EJB container in this case.

Cause: Optimistic concurrency is implemented by reading data in a local transaction to avoid holding database locks. The element use-select-for-update in the RDBMS deployment descriptor when set to true, will cause SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the table. This conflicts with the Optimistic Concurrency strategy.

Action: Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014012: EJB {0} uses optimistic-concurrency and disables cluster invalidation, but does not have verify-rows set to Read. This combination will prevent detection of stale data if the bean is never modified in a transaction.

Cause: Optimistic concurrency beans verify consistency of data only if the bean has been modified, unless verify-rows is set to Read. If some other member of a cluster modifies a bean, other members will not be notified of this modification and will continue to store stale data unless the other members also attempt to modify the bean.

Action: Set either of the elements verify-rows to Read or cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

Level: 1
Type: WARNING
Impact: EJB

BEA-014013: EJB {0} does not have a concurrency-strategy of either optimistic or readOnly and disables cluster invalidation. Cluster invalidation is relevant only for these concurrency strategies.
**Cause:** When an EJB is using either optimistic or readOnly concurrency-strategy and is deployed to a cluster, the container invalidates such beans on modification to avoid throwing OptimisticConcurrencyExceptions. This invalidation can be turned off by setting the cluster-invalidation-disabled to true in the RDBMS deployment descriptor.

**Action:** Set cluster-invalidation-disabled to false in the RDBMS deployment descriptor to avoid this warning message.

**BEA-014014:** The Message-Driven Bean (MDB) named [0] has a dispatch policy [1] that refers to an unknown work manager. The default work manager will be used instead.

**Cause:** The specified MDB has a dispatch policy that refers to an unknown work manager.

**Action:** Create a work manager for the server named [1], or modify the dispatch-policy attribute in the MDBs WebLogic descriptor file to the name of an already existing work manager.

**Level:** 1  
**Type:** WARNING

**Impact:** EJB

**BEA-014016:** EJB [0] uses readonly-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is read-only, select-for-update is unnecessary.

**Cause:** Read-only beans cannot be updated. Therefore, use-select-for-update is unnecessary.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

**Level:** 1  
**Type:** WARNING

**Impact:** EJB

**BEA-014017:** EJB [0] uses exclusive-concurrency and has the use-select-for-update element in the RDBMS deployment descriptor set to true. As the bean is locked at the server level during a transaction, select-for-update on the database is unnecessary.

**Cause:** Exclusive concurrency is implemented by locking the bean at the server level when the bean participates in a transaction. Setting the element use-select-for-update in the RDBMS deployment descriptor to true causes SELECT ... FOR UPDATE to be used whenever the bean is loaded from the database, thus locking the row in the database too. This may be unnecessary, as the bean is locked by the container.

**Action:** Set use-select-for-update element in the RDBMS deployment descriptor to false to avoid this warning message.

BEA-040456: An entity of type "[3]" with name "[2]" in JMS module "[0]" is not targeted. There is no subdeployment with name "[1]" in the configuration repository (config.xml). Therefore, this entity will not exist anywhere in the domain.
Cause: The entity of the given name and type in the given JMS module does not have a corresponding subdeployment in the configuration repository (config.xml). In order for this entity to exist in the domain, it must be targeted with a sub-deployment element.
Action: Add a sub-deployment stanza to the appropriate deployment descriptor in config.xml. This will either be a jms-system-resource for a system module, or an app-deployment for a stand-alone JMS deployable module. If the JMS module is inside a Java EE application (an EAR file), then you must add the sub-deployment stanza to the subdeployment that represents this JMS module in the Java EE application. You do not necessarily have to target the subdeployment yet. Simply adding the subdeployment with no targets will remove this warning. However, if you wish for this entity to exist somewhere in your domain you must target the sub-deployment.

Action: Review your application code and configuration. BEA-040505: The JMS module named "[0]" inside application "[1]" does not have a sub-deployment stanza named "[0]". Without such a stanza, no entities inside the module will be deployed, since the subdeployments inside of the sub-deployment stanza named "[0]" control where JMS entities inside this module are targeted.

**Cause:** When a JMS module is inside an EAR file, the targeting information for entities inside that module are nested within a sub-deployment named after the name of the JMS module found in the weblogic-application.xml file of the EAR file. If no sub-deployment exists with the name of the JMS module, then no targeted entities inside the module will become available. This is usually an oversight on the part of the administrator.

**Action:** Add a sub-deployment stanza with the name of the JMS module as specified in the weblogic-application.xml file to the app-deployment stanza. Nested inside that sub-deployment, you can target the entities in the module as you normally would.

**BEA-090902**: The certificate chain received from {0} contained a V1 certificate which cannot be a CA.  
**Cause**: The certificate chain received by the peer contained a V1 certificate which cannot be a CA. This is rejected by the basic constraints checking for strong and strict and not allowing V1 certificates as CAs, which protects against a specific certificate chain attack on SSL.

If the certificate chain really is from a valid peer, you should look at updating the peer certificate chain with valid CA certificates. If this is not possible, you can disable the basic constraints checking to allow the certificate chain to be accepted and allows this vulnerability to be exploited.

BEA-130000: Insertion of \{0\} into XML entity cache rejected. Entity size, \{1\}, exceeded cache size, \{2\}.
Cause: The cache may be too small or a specific item might be very large. The worst case is that this indicates a denial of service attack.
Action: No action is required. However, performance will be best if items are cached.

BEA-130001: Entity cache appears to be broken. This impacts the performance of XML parsing.
Cause: Unknown
Action: No action is required. However, performance will increase if items are cached. Also the cache provides a backup in the case of a network failure. While the cache is not operating, this backup is not in effect.

BEA-130002: The entity that was just put in the cache cannot be retrieved: "\{0\}". Timeout may be too short.
Cause: Usually this indicates that the entity timeout was set to a very small value. Otherwise, there is some unknown problem with the cache module itself.
Action: No action is required, but XML parse performance will be impacted. Also, there is no cached copy to act as a backup in the event of a network failure.

BEA-130003: Could not instantiate the specified factory class. \{0\}.
Cause: The class name of the factory was not correct or it was not in the CLASSPATH.

**BEA-141145:** An attempt was made to connect to the Administration Server without credentials.

**Cause:** The requirement to supply credentials on all requests was added in version 8.1 of the product. It is most likely that an old version of a utility is being used that is not properly supplying these credentials. It is also possible that this represents an attempt to compromise the server.

**Action:** Determine the source of the request. If it is a legitimate request, ensure that updated software is being used which properly supplies the credentials. It is also important to restrict access to the Administration Server. Refer to the WebLogic Server documentation to ensure that all of the proper security precautions have been taken.

BEA-141146: An attempt was made to connect to the Administration Server by the user {0} and a password which does not match.
Cause: The requirement to supply credentials on all requests was added in version 8.1 of the product. In this case, the password is not valid for the specified user. This may be the result of supplying an improper user name and password when using the deployment utilities.
Action: Determine the source of the request. If it is a legitimate request, ensure that updated software which properly supplies the credentials is in use. It is also important to restrict access to the Administration Server. Refer to the WebLogic Server documentation to ensure that all of the proper security precautions have been taken.

BEA-141147: An attempt was made to upload a file to the Administration Server by the unauthorized user {0}.
Cause: The requirement to supply credentials on all requests was added in version 8.1 of the product. In this case, the user specified is not configured with the authorization to upload files.
Action: To enable the user to upload files to the Administration Server, it is necessary that the user be added to the administrator or deployer role. Alternatively, it is possible to authorize a user specifically for "FileUpload". Consult the WebLogic Server documentation for instructions on how to do this.

Impact: Management

BEA-141148: An invalid attempt was made to download a {1} resource from the Administration Server by the unauthorized user {0}.
Cause: The requirement to supply credentials on all requests was added in version 8.1 of the product. In this case, the credentials of the user that is being used to boot the Managed Server are used to authorize the request. That user is not authorized to access files of the type {1}.
Action: Ensure that the proper credentials are being used to initiate the connection. In most cases, this involves ensuring that the credentials being used to boot the Managed Server are properly authorized on the Administration Server.
Level: 1

Type: ERROR
Impact: Management

BEA-141149: An invalid attempt was made to connect to the Administration Server with a salt of {0} and a signature of {1}, likely due to private key mismatch or clock skew between servers.
Cause: The requirement to supply credentials on all requests was added in version 8.1 of the product. In this case, the password is not valid for the specified
user or the nonce has expired. This may be the result of supplying an improper
user name and password when using the deployment utilities.

Action: Determine the source of the request and ensure that the Managed Server
and the Administration Server share the same security credential. That credential
is stored in the domain configuration and distributed at server startup. In this
case, where the Managed Server is booted using a configuration that is different
from that of the Administration Server, perhaps in Managed Server independence

BEA-150000: An error occurred while establishing a connection back to the Administration Server [0] during startup. Since bootstrap succeeded, check that [0] uniquely identifies the Administration Server.
Cause: An improper Administration Server URL has been specified, or the Administration Server is not available at the specified URL. Commonly this is because the Managed Server shares an administration URL with the Administration Server. Another possibility is that the host identified by [0], or the
local host, is not configured properly. For instance, an /etc/hosts or DNS lookup on the hostname results in a loopback address.

**Action:** Verify that the URL specified for the Administration Server is valid, unique and that the Administration Server is available and listening at the specified URL. A common problem is that the administration port is enabled and both the Administration Server and Managed Server are running on the same machine. In this instance a different administration port should be selected for the Managed Server. Another possibility is that the host identified by {0}, or the local host, is not configured properly. BEA-213500: Partition {0} has ResourceDeploymentPlanPath set to {1} but the zip file from which it is being imported does not have an entry for it.  
Cause: While importing the partition, an attempt was made to import a partition without proper configuration. **BEA-213508:** The name of the object \{0\} in partition-config.xml is \{1\} whereas \{2\} has the name changed to something else. Therefore it could not be found. Changing names of attributes in \{2\} is not supported.

Impact: Store

BEA-280102: The persistent file store "[0]" must reinitialize its cache: recovery may take longer than usual. The signature in the cache file "[2]" for the persistent store file "[1]" could not be verified, or the cache file is missing. Ignore this Warning if this is the first time the store has ever booted. Possible causes include: first boot of store (potentially after using a write policy different from Direct-Write-With-Cache), store migration, unclean shutdown, off-line store compression, and manual removal of cache files.

Cause: The cache file is missing, or the signature stored in the cache file does not match the signature of the primary file.

Action: Make sure that the configuration is correct, do not delete cache files, and ensure a clean shutdown.

Level: 1
Type: WARNING
Impact: Store

BEA-280103: The persistent file store "[0]" will cache in [1].
Cause: This is an informational message.
Action: No action is required.

Level: 1
Type: NOTIFICATION
Impact: Store

BEA-280104: The persistent file store "[0]" will use buffered writes instead of direct IO because the configured block size "[2]" is not a multiple of the environment's direct IO alignment "[1]". When there are high request loads, this may reduce file store performance. The store is still operating in a transactionally safe synchronous mode.

Cause: Direct I/O requires the block size to be a multiple of directIO granularity.
Action: Reconfigure the store with a block size that is a multiple of the direct I/O alignment for your environment. If the store is not empty and contains useful data, use the store admin compact utility to change block size, otherwise make sure that all storage areas are removed before starting WebLogic Server again.

Action: Consult your storage vendor and operating system documentation.

BEA-280109: The JVM was unable to load the native wlfileio library for the store "{0}". File and paging stores will continue to function correctly. Specifically, file stores that are configured with a transactionally safe synchronous write policy will continue to operate safely and transactionally but may open with a different write-policy. Other store types may not be able to open.
Cause: See message body.
Action: See file store open log messages for the requested and final file store write policies. See the documentation for file store synchronous write policy configuration.

**BEA-320188:** Long RID value with `{0}` components was created.

**Cause:** RID values grow during DiagnosticContext propagation, which are outbound calls to other JVMs or when Work is scheduled. A corresponding log event is also produced to the FlightRecorder.

**Action:** Enable DiagnosticContext debug and review the FlightRecorder data to look for JFRDebugEvents which indicate extreme RID growth and where it is seen. Pay particular attention to the scheduling of work from daemon threads. These can cause RID growth and may require that the daemon thread call DiagnosticContextHelper.handleLocalContextAsNonInheritable() to prevent propagating the Context.

BEA-2156400: The validation.xml file, located at {0}, does not conform to the JSR 303 specifications.
Cause: The file does not conform to the JSR 303 specification. This maybe because the file is intended to configure another validation framework or because of a typo in the file.
Action: JSR 303 specifies the location of the validator descriptor as either WEB-INF for web application or META-INF for all other cases. A validation.xml file at that location should only be used for the purpose of configuring javax.validation. If the purpose of the file is to configure another validation framework, consider using a different name or placing the file in a different location.
