This documentation describes the Oracle WebLogic Server Multitenant RESTful server runtime resources that are used to monitor the Administration Server in the specified domain partition.

For a complete listing of the WLS REST reference documents and descriptions of their use, see *Administering Oracle WebLogic Server with RESTful Management Services*. 
This resource is used to access the different versions of the resources in this domain.

The latest version is 12.2.1.3.0. The other versions, which are deprecated, are 12.2.1.0.0, 12.2.1.1.0, 12.2.1.2.0.

For future releases, latest always refers to the most recent release.

All new and non-deprecated MBean features are available in all versions. Any MBean features that were deprecated in a version will not be available in that version or later versions, but will still be available using earlier versions.

To always use the latest resources, use latest in the URLs. Note that this might require updating a client when moving to a newer version of WebLogic Server. To fix the version so that an update is not required, use 12.2.1.3.0 in the URLs.

The resource supports the following methods:

- **GET**
GET

Get this collection of weblogic.management.rest.bean.model.Version instances.

Roles

Admin, Deployer, Monitor, Operator

Response Body

Contains a list of weblogic.management.rest.bean.model.Version entities.

This method can return the following links:

- uri=/management/weblogic rel=canonical
  This resource.
- uri=/management/weblogic/12.2.1.3.0 rel=current
  Access the latest version of the WLS resources in this domain.
- uri=/management/weblogic rel=self
  This resource.

Gracefully, asynchronously shuts down a data source that has a health state of "Running". A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to "Shutdown".

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

Roles

Admin

Request Body

Must contain a JSON object with the following fields:

`operationSecs`

The number of seconds to allow the operation to run before stopping processing. If set to 0, the default is used. The default is to use Inactive Connection Timeout Seconds if set or 60 seconds. If you want a minimal timeout, set the value to 1. If you want no timeout, set it to a large value (not recommended).

Type: integer/int32

Response Body

`weblogic.management.runtime.JDBCDataSourceTaskRuntimeMBean` reference return field.
The resource supports the following methods:

- POST
POST

Asynchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. These connections remain in the pool and are not closed because the pool may be resumed.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended.

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

Gracefully, synchronously shuts down a data source that has a health state of Running. A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

If successful, the health state is set to Shutdown

This is a privileged operation that can only be invoked by an authorized user.

**Response Body**

Contains an empty JSON object.
The resource supports the following methods:

- POST
POST

Synchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. If graceful suspend is done as part of a graceful shutdown operation, connections are immediately closed when no longer reserved or at the end of the timeout period. If not done as part of a shutdown operation, these connections remain in the pool and are not closed because the pool may be resumed.

By default, the timeout period is 60 seconds. You can change the value of this timeout period by configuring or dynamically setting Inactive Connection Timeout Seconds to a non-zero value.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended

This is a privileged operation that can only be invoked by an authorized user.

Pauses the consumption operation on all the destinations hosted by the JMSServer.
When the JMSServer is paused for consumption, all of its destination's state is marked
as "consumption paused" and all the new synchronous receive operations will block
until the destination is resumed and there are messages available for consumption. All
the synchronous receive with blocking timeout will block until the timeout happens
during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages
delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume"
the destination to allow for any further consume operations on that destination.

The resource supports the following methods:

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - UN-BORN MESSAGES
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - UN-COMMITTED MESSAGES
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - QUOTA BLOCKING SEND
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - UN-COMMITTED MESSAGES
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - ROLLED BACK MESSAGES
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCollectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is
not exceeded, then they are delivered (made available for consumption) on
that destination and are counted as "current" messages in the destination
statistics. If the redelivery limit exceeds, then those messages will be moved to
the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is
RedeliveryLimit.

- RECOVERED MESSAGES
  These messages are similar to ROLLED BACK MESSAGES except that these
  messages appear on the queue because of an explicit call to session "recover"
  by the client.

- REDELIVERED MESSAGES
  These are again similar to ROLLED BACK MESSAGES except that these
  messages may re-appear on the destination because of an un-successful
delivery attempt to the client (consumer crash, close etc.).

Pauses the consumption operation on all the destinations hosted by the JMSServer.

When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

**Definition of In-Flight work**

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - UN-BORN MESSAGES
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - UN-COMMITTED MESSAGES
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - QUOTA BLOCKING SEND
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - UN-COMMITTED MESSAGES
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - ROLLED BACK MESSAGES
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCarctionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in...
the destination statistics and after the “delay” period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as “current” messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session “recover” by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

weblogic.management.runtime.JDBCReplayStatisticsRuntimeMBean

This class is used to get replay statics for an Oracle replay datasource aggregated across all connections in the pool.

The properties of the weblogic.management.runtime.JDBCReplayStatisticsRuntimeMBean entity are as follows:

**deploymentState**
The current deployment state of the module.

A module can be in one and only one of the following states. State can be changed via deployment or administrator console.

- UNPREPARED. State indicating at this module is neither prepared or active.
- PREPARED. State indicating at this module of this application is prepared, but not active. The classes have been loaded and the module has been validated.
- ACTIVATED. State indicating at this module is currently active.
- NEW. State indicating this module has just been created and is being initialized.

*Type: integer/int32*
*Constraints: Read Only*

**failedReplayCount**
Obtains the number of replays that failed.

When replay fails, it rethrows the original SQLRecoverableException to the application, with the reason for the failure chained to that original exception. Application can call `getNextException` to retrieve the reason.

*Type: integer/int64*
*Constraints: Read Only*

**moduleId**
Returns the identifier for this Component. The identifier is unique within the application.

Typical modules will use the URI for their id. Web Modules will return their context-root since the web-uri may not be unique within an EAR.

*Type: string*
*Constraints: Read Only*

**name**
The name of this configuration. WebLogic Server uses an MBean to implement and persist the configuration.

*Type: string*
*Constraints: Read Only*

**replayDisablingCount**
Obtains the number of times that replay is disabled. When replay is disabled in the middle of a request, the remaining calls in that request are no longer protected by AC. In case an outage strikes one of those remaining calls, no replay will be attempted, and application simply gets an SQLRecoverableException.

*Type: integer/int64*
Constraints: Read Only

**successfulReplayCount**
Obtains the number of replays that succeeded. Successful replays mask the outages from applications.

*Type: integer/int64*

**totalCalls**
Obtains the total number of JDBC calls executed so far.

*Type: integer/int64*

**totalCallsAffectedByOutages**
Obtains the number of JDBC calls affected by outages. This includes both local calls and calls that involve roundtrip(s) to the database server.

*Type: integer/int64*

**totalCallsAffectedByOutagesDuringReplay**
Obtains the number of JDBC calls affected by outages in the middle of replay. Outages may be cascaded and strike a call multiple times when replay is ongoing. AC automatically reattempts replay when this happens, unless it reaches the maximum retry limit.

*Type: integer/int64*

**totalCallsTriggeringReplay**
Obtains the number of JDBC calls that triggered replay. Not all the calls affected by an outage trigger replay, because replay can be disabled for some requests.

*Type: integer/int64*

**totalCompletedRequests**
Obtains the total number of completed requests so far.

*Type: integer/int64*

**totalProtectedCalls**
Obtains the total number of JDBC calls executed so far that are protected by AC.

*Type: integer/int64*

**totalReplayAttempts**
Obtains the number of replay attempts. AC automatically reattempts when replay fails, so this number may exceed the number of JDBC calls that triggered replay.

*Type: integer/int64*

**weblogic.management.runtime.RecourceActionEventVBean**

The `RecourceActionEventVBean` holds runtime state about an individual recourse action to be executed or withdrawn by the WebLogic Resource Consumption Management feature for a configured Trigger on the current server instance in the current Domain Partition.

The WebLogic Resource Consumption Management feature automatically initiates a configured recourse action of a Trigger when the configured usage limits of the Trigger are exceeded by a Domain Partition.

When the current resource usage by the Domain Partition falls below the configured usage limit, the feature automatically withdraws the recourse action (where possible).

This Bean captures the following runtime state of such an individual recourse action:

- The recourse action of a new execution of a recourse action (because the usage limit has been exceeded) or a the withdrawal of an existing recourse action (the current resource usage has gone below the usage limit).
- Whether the initiated recourse action was successfully executed.

The properties of the `RecourceActionEventVBean` entity are as follows:

**weblogic.management.runtime.TaskRuntimeMBean**
Exposes monitoring information about an ongoing and potentially long-running administrative process. This should be taken to mean, at minimum, any OA&M operation involving I/O. Examples include starting and stopping servers, deploying and undeploying applications, or migrating services.

An MBean operation of this sort should fork a separate thread to perform the actual work and immediately return an instance of TaskRuntimeMBean to the caller. The caller can then use this to track the task’s progress as desired. Users can also query for all instances of TaskRuntimeMBean to get a summary of both currently-running and recently-completed tasks.
Instance of `TaskRuntimeMBean` continue to exist in the MBeanServer after the completion of the work they describe. They will eventually either be explicitly deregistered by the user, or removed by a scavenger process which periodically purges instances of `TaskRuntimeMBean` that have been completed for some time.

**weblogic.management.runtime.TriggerRuntimeMBean**

The `{@code TriggerRuntimeMBean}` holds runtime state (for the current Server instance) for a Trigger that has been configured in the Resource Consumption Management policy of the current Domain Partition.
The WebLogic Resource Consumption Management feature automatically initiates the configured recourse action of a Trigger when the Trigger’s configured usage limits are exceeded by a Domain Partition. When a usage limit is exceeded, and the configured recourse action has been successfully executed, the Trigger is *Activated*.

When the current resource usage by the Domain Partition falls below the Trigger’s configured usage limit, the feature automatically withdraws the recourse action where possible. When the current usage is below the configured usage limit, and the configured recourse action has been successfully withdrawn, the Trigger is said to be *not Activated*.

The MBean captures the following states for a Trigger when the current resource consumption usage by the Domain Partition exceeds or goes below the configured usage limit for the Domain Partition:

- Whether the Trigger is *Activated* (usage has exceeded the limit and the recourse action was successfully executed) or not
- The time when the last recourse action was executed successfully for the Trigger
- Whether a recourse action has been initiated in response to the resource usage by the Domain Partition exceeding the configured usage limits

The properties of the `weblogic.management.runtime.TriggerRuntimeMBean` entity are as follows:

**activated**
Indicates if the Trigger is *Activated*

Type: boolean

Constraints: Read Only

**initiated**
Indicates if a recourse action has been initiated for this Trigger as a result of the current resource usage by a Domain Partition exceeding its usage limit. A new `RecourseActionEventVBean` is added to the array returned by `getRecourseActionEventsHistory()`.

weblogic.management.runtime.WLDFImageCreationTaskRuntimeMBean

Provides aggregated information about all active Harvester configurations, as well as metadata about harvestable and harvested attributes, types, and instances. Harvestable means potentially available for harvesting; harvested means explicitly designated for harvesting. These terms apply to types, instances, and the attributes within those types. In addition, the interface provides access to sampling and snapshot statistics. All statistics are base on data collected during the current server session.

The properties of the weblogic.management.runtime.WLDFHarvesterRuntimeMBean entity are as follows:

knownHarvestableTypes
The set of all known types, regardless of whether the types are currently configured for harvesting. The set includes the WebLogic Server MBeans, which are always present, plus any other types that can be discovered. MBeans that are not WebLogic Server MBeans will require instances to exist in order to discover the type.

weblogic.management.runtime.WLDFImageRuntimeMBean

WLDFImageRuntimeMBean supports operations to request the generation of a diagnostic image for capturing a running server's internal state information. These operations will fork a separate thread to perform the actual work and immediately return an instance of this MBean to the caller. The caller can then use that instance to track the task's progress.

Exposes monitoring information about a potentially long-running request for the generation of a diagnostic image. Remote clients, as well as clients running within a server, can access this information.

**weblogic.management.runtime.WseePolicyRuntimeMBean**

This attribute corresponds to the "name" attribute of the "port" element in the WSDL
that describes the Web service. Programmers specify the name of the port using the
portName attribute of the @WLXXXTransport annotation, where XXX refers to the
type of transport (HTTP, HTTPS, or JMS).
