This documentation describes the Oracle WebLogic Server RESTful server runtime resources that are used to monitor the Administration Server or a Managed Server.

For a complete listing of the WLS REST reference documents and descriptions of their use, see *Administering Oracle WebLogic Server with RESTful Management Services*. 
This resource is used to access the different versions of the resources in this domain.

The latest version is 12.2.1.3.0. The other versions, which are deprecated, are 12.2.1.0.0, 12.2.1.1.0, 12.2.1.2.0.

For future releases, latest always refers to the most recent release.

All new and non-deprecated MBean features are available in all versions. Any MBean features that were deprecated in a version will not be available in that version or later versions, but will still be available using earlier versions.

To always use the latest resources, use latest in the URLs. Note that this might require updating a client when moving to a newer version of WebLogic Server. To fix the version so that an update is not required, use 12.2.1.3.0 in the URLs.

The resource supports the following methods:

- GET
GET

Get this collection of `weblogic.management.rest.bean.model.Version` instances.

Roles

Admin, Deployer, Monitor, Operator

Response Body

Contains a list of `weblogic.management.rest.bean.model.Version` entities. This method can return the following links:

- `uri=/management/weblogic rel=canonical`
  This resource.
- `uri=/management/weblogic/12.2.1.3.0 rel=current`
  Access the latest version of the WLS resources in the this domain.
- `uri=/management/weblogic rel=self`
  This resource.

Example

Response Body

Contains a JSON object with a com.bea.wls.redef.runtime.ClassRedefinitionTaskRuntimeMBean reference return field.

POST

Initiate a class redefinition cycle, to redefine only the specified classes from given module. Class redefinition will be performed asynchronously. The progress of the class redefinition process can be monitored with the returned task. If specified module name is null, any classes within the application (scoped to any modules as well as globally scoped classes) which are included in the list will be redefined.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

/management/weblogic/{version}/serverRuntime/JDBCServiceRuntime/JDBCDataSourceRuntimeMBeans/{name}/asyncShutdown

The resource supports the following methods:

- POST
POST Gracefully, asynchronously shuts down a data source that has a health state of Running. A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Shutdown.

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

Roles
Admin

Request Body
Must contain a JSON object with the following fields:

**operationSecs**
The number of seconds to allow the operation to run before stopping processing. If set to 0, the default is used. The default is to use Inactive Connection Timeout Seconds if set or 60 seconds. If you want a minimal timeout, set the value to 1. If you want no timeout, set it to a large value (not recommended).

**Type**: integer/int32

Response Body
Contains a JSON object with a weblogic.management.runtime.JDBCDataSourceTaskRuntimeMBean reference return field.
/management/weblogic/{version}/serverRuntime/JDBCServiceRuntime/JDBCDataSourceRuntimeMBeans/{name}/asyncSuspend

The resource supports the following methods:

- POST
POST

Asynchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. These connections remain in the pool and are not closed because the pool may be resumed.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended

This is a privileged operation that can only be invoked by an authorized user.

This method supports both asynchronous and best effort synchronous invocations. The behavior is controlled by the 'Prefer' header. See About Synchronous and Asynchronous Operations.

- POST
POST

Resets the connection pool in the data source by shutting down and recreating all available database connections in the pool.

Use when a data source is in the health state of Unhealthy and needs to be reinitialized.

This is a privileged operation that can only be invoked by an authorized user.

The resource supports the following methods:

/management/weblogic/{version}/serverRuntime/JDBCServiceRuntime/JDBCDataSourceRuntimeMBeans/{name}/shutdown

The resource supports the following methods:
- POST
POST

Gracefully, synchronously shuts down a data source that has a health state of `Running`. A graceful (non-forced) datasource shutdown operation involves first gracefully suspending the data source and then releasing the associated resources including the connections. See the description above for details of gracefully suspending the datasource. After the datasource is gracefully suspended, all remaining in-use connections are closed and the datasource is marked as shut down.

If successful, the health state is set to `Shutdown`

This is a privileged operation that can only be invoked by an authorized user.

/management/weblogic/{version}/serverRuntime/JDBCServiceRuntime/JDBCDataSourceRuntimeMBeans/{name}/suspend

The resource supports the following methods:

- POST
POST

Synchronously, gracefully suspends a data source that has the health state of Running and disables existing connections. This operation immediately marks the data source as suspended and no further connections are created. Idle (not reserved) connections are marked as disabled. After a timeout period for the suspend operation, all remaining connections in the pool are marked as suspended and the following exception is thrown for any operations on the connection, indicating that the data source is suspended: java.sql.SQLRecoverableException: Connection has been administratively disabled. Try later. If graceful suspend is done as part of a graceful shutdown operation, connections are immediately closed when no longer reserved or at the end of the timeout period. If not done as part of a shutdown operation, these connections remain in the pool and are not closed because the pool may be resumed.

By default, the timeout period is 60 seconds. You can change the value of this timeout period by configuring or dynamically setting Inactive Connection Timeout Seconds to a non-zero value.

Setting IgnoreInUseConnectionsEnabled to false causes the operation to fail if in-use connections exist.

If successful, the health state is set to Suspended

This is a privileged operation that can only be invoked by an authorized user.

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination

The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - UN-BORN MESSAGES
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - UN-COMMITTED MESSAGES
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - QUOTA BLOCKING SEND
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - UN-COMMITTED MESSAGES
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - ROLLED BACK MESSAGES
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the “delay” period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session “recover” by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination

/management/weblogic/{version}/serverRuntime/JMSRuntime/JMSServers/{name}/sessionPoolRuntimes/{name}/JMSServer/pauseInsertion

The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - UN-BORN MESSAGES
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - UN-COMMITTED MESSAGES
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - QUOTA BLOCKING SEND
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - UN-Acknowledged (Client Ack Pending) MESSAGES
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - UN-COMMITTED MESSAGES
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - ROLLED BACK MESSAGES
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the “delay” period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as “current” messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session “recover” by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JMSServer/JMSServers/{name}/pauseConsumption

The resource supports the following methods:

- **POST**
POST

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

Contains an empty JSON object.
The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- **In-flight messages associated with Producers**
  - **UN-BORN MESSAGES**
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - **QUOTA BLOCKING SEND**
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- **In-flight messages associated with Consumers**
  - **UN-ACKNOWLEDGED (CLIENT ACK PENDING) MESSAGES**
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - **UN-COMMITTED MESSAGES**
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - **ROLLED BACK MESSAGES**
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in
the destination statistics and after the "delay" period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as "current" messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- **RECOVERED MESSAGES**
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session "recover" by the client.

- **REDELIVERED MESSAGES**
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

The resource supports the following methods:

/management/weblogic/{version}/serverRuntime/partitionRuntimes/{name}/JM SRuntime/JMSServers/{name}/sessionPoolRuntimes/{name}/JMSServer/pauseConsumption

The resource supports the following methods:

- POST
POST

Pauses the consumption operation on all the destinations hosted by the JMSServer. When the JMSServer is paused for consumption, all of its destination's state is marked as "consumption paused" and all the new synchronous receive operations will block until the destination is resumed and there are messages available for consumption. All the synchronous receive with blocking timeout will block until the timeout happens during the consumption paused state.

All the asynchronous consumers attached to that destination will not get any messages delivered to them while the destination in "consumption paused" state.

After a successful consumption "pause" operation, the user has to explicitly "resume" the destination to allow for any further consume operations on that destination.

Roles

Admin

Response Body

Contains an empty JSON object.
The resource supports the following methods:

- POST
POST

Pauses the appearance of any messages on all the destinations of the JMSServer, that are result of the in-flight work completion on all the destinations hosted by this JMSServer.

Definition of In-Flight work

The definitions below are based on the current implementation of WebLogic JMS subsystem.

- In-flight messages associated with Producers
  - UN-BORN MESSAGES
    Messages that are produced by the producer, with "birth time" (TimeToDeliver) set in future are called un-born messages and are counted as "pending" messages in the destination statistics and are not available for consumers yet.
  - UN-COMMITTED MESSAGES
    These are the messages that are produced by the producer as part of the transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. These messages are also counted as "pending" messages in the destination statistics and are not available for consumption.
  - QUOTA BLOCKING SEND
    These are the messages that are produced by the producers but are not able reach the destination because of (either message or byte or both) quota limit on the destination and the producers are willing to block for a specific period of time for the quota to be available. These messages are invisible to the system and are not counted against any of the destination statistics.

- In-flight messages associated with Consumers
  - UN-AKNOLEDGED (CLIENT ACK PENDING) MESSAGES
    These are the messages that are successfully consumed by the clients using a "client acknowledge" session, and are awaiting acknowledgements from the clients. These are "pending messages" which will be removed from the destination/system when the acknowledgement is received.
  - UN-COMMITTED MESSAGES
    These are the messages that are consumed (received) by the clients within a transaction (using either user transaction or transacted session) and the transaction is still not committed or rolled back. When the clients successfully commit the transaction the messages get removed from the system.
  - ROLLED BACK MESSAGES
    These are the messages that are put back on the destination because of a successful rollback of transactional receive by the consumers. These messages might or might not be ready for consumption (re-delivered) to the clients immediately, depending on the redelivery parameters, RedeliveryDelay and/or RedeliveryDelayOverride and RedeliveryLimit configured on the associated JMSCConnectionFactory and JMSDestination respectively.

If there is a redelivery delay configured, then for that "delay" duration, the messages are not available for consumption and are counted as "pending" in...
the destination statistics and after the “delay” period, if the redelivery limit is not exceeded, then they are delivered (made available for consumption) on that destination and are counted as “current” messages in the destination statistics. If the redelivery limit exceeds, then those messages will be moved to the ErrorDestination, if one configured.

Another parameter that controls the availability of the rolled back messages is RedeliveryLimit.

- RECOVERED MESSAGES
  These messages are similar to ROLLED BACK MESSAGES except that these messages appear on the queue because of an explicit call to session “recover” by the client.

- REDELIVERED MESSAGES
  These are again similar to ROLLED BACK MESSAGES except that these messages may re-appear on the destination because of an un-successful delivery attempt to the client (consumer crash, close etc.).

The resource supports the following methods:

Response Body

Returns the matching records in the same text format as the corresponding server-side log files. The records are in chronological order, oldest record first.

If there are more matching records than limit specified in the request body, then the oldest limit matching records are returned, and an extra line is added to the response in the form nextRecordId=nnn. Immediately invalidates the cached security keys for the specified WebLogic Server user.

An SNMP security key is an encrypted version of an SNMP agent’s engine ID and an authentication password or privacy password. WebLogic Server generates one security key for each entry that you create in the SNMP credential map. When a WebLogic Server SNMP agent receives an SNMPv3 request, it compares the key that is in the request with its WebLogic Server keys. If it finds a match, it processes the request. The SNMP agent also encodes these keys in its responses and notifications. (You configure which keys are encoded when you create a trap destination.)

Instead of regenerating the keys for each SNMPv3 communication, WebLogic Server caches the keys. To make sure that the cache contains the latest set of SNMP credentials, WebLogic Server periodically invalidates the cache. After the cache is invalidated, the next time an SNMP agent requests credentials, WebLogic Server regenerates the cache.

Note that making a change to the credential map does not automatically update the cache. Instead, the cache is updated only after it has been invalidated.

Instead of waiting for WebLogic Server to invalidate the cached entry for a key, you can invalidate it immediately.

Returns WebLogic Server’s MIB module for custom MBeans as a `java.lang.String`. You can save the `String` to a file and then load the file into a MIB browser.

When you register custom MBeans in the WebLogic Server Runtime MBean Server, WebLogic Server adds entries to a runtime MIB module that it maintains for custom MBeans. For each custom MBean type, WebLogic Server adds a table to the MIB module. For each instance of the custom MBean, it adds a table row. While WebLogic Server does not persist the MIB module as a file or other data structure, the OIDs in the module remain constant across server sessions.

Request Body

Must contain a JSON object with the following fields:

limit
The maximum number of matching records that will be returned.

If there are more available records, then the response will contain the oldest matching records, as well as a nextRecordId that the client can use to continue the search (by setting fromId to its value).

This field must be specified. The value must be greater than zero.

Type: long

query
An optional filter that can be used to restrict which records are returned, for example "SEVERITY = 'Info'". See "WLDF Query Language in Configuring and Using the Diagnostics Framework for Oracle WebLogic Server" for more details.

This field is optional. If not specified, then no filter is applied to the records.

Type: string

lastMinutes
Only return records that have been logged in the last n minutes.

This field is optional. If specified, the value must be greater than zero.

Type: long

since
Only return records that were logged at this time or later.

This field is optional. If specified it must be in one the following formats: "yyyy-MM-dd'T'HH:mm:ss.SSSXXX" (e.g. "2016-05-24T13:44:02.349-04:00"), "yyyy-MM-dd'T'HH:mm:ss.SSSXX" (e.g. "2016-05-24T13:44:02.349-0400") or "yyyy-MM-dd'T'HH:mm:ss.SSSX" (e.g. "2016-05-24T13:44:02.349-04").

Type: string

until

Type: string

fromId
Only return records starting at this record id or later.
This can be used to continue a search that has more matching results than the specified limit field. The previous response will return a nextRecordId. Set fromId to that value and POST again to continue the search.
This field is optional.

Type: long

The following options are available for setting the range of records to search:
- dont specify anything - search all records.
- lastMinutes - search records that were logged in the last n minutes.
- since - search records that were logged since this time up to the end of the log.
- until - search records from the beginning of the log up to, but not including, this time.
- fromId - search records that were logged from this record id up to the end of the log.
- since and until - search records in this time range.
- fromId and until - search records from this record id up to, but not including, this time.

Response Body
Contains a JSON object with the following fields:

records
The matching records. The records are in chronological order, oldest first.
All available fields are returned for each record. The list of available fields depends on the log.
If there are more matching records than limit specified in the request body, then the oldest matches up that that limit will be returned.

Type: array of object

nextRecordId
Identifies the next matching record in the log.
This field is only present if there are more matching records than limit specified in the request body. The client can continue the search by POSTing the same query to this resource again, setting fromId to the value of nextRecordId, instead of specifying lastMinutes or since

Type: long

weblogic.management.runtime.ApplicationRuntimeMBean

An application represents a Java EE enterprise application packaged in an EAR file or EAR exploded directory. The EAR file or directory contains a set of components such as WAR, EJB, and RAR connector components, each of which can be deployed on one or more targets. A target is a server or a cluster. Modules in the application can have one of the following states:
- **UNPREPARED** - Indicates that none of the modules in this application are currently prepared or active.
- **PREPARED** - Indicates that none of the modules in this application are currently prepared or active.
- **ACTIVATED** - Indicates that at least one module in this application is currently active.

ApplicationRuntimeMBean encapsulates runtime information about a deployed enterprise application.

The properties of the `weblogic.management.runtime.ApplicationRuntimeMBean` entity are as follows:

- **activeVersionState**
  Specifies whether this application version is the currently active version.
  
  An application can be the only version currently deployed, or it can have more than one version currently deployed, using the side-by-side deployment feature. If more than one version is deployed, only one version can be active. This attribute specifies the state the current application version is in.

  An application can be in an **INACTIVE** state, which means that it has not been activated yet, or that there is more than one version of the application deployed (using side-by-side deployment) and this version is retiring.

  An application can be in **ACTIVE_ADMIN** state, which means that it is the currently active version for administrative channel requests.

  An application can be in **ACTIVE** state, which means that it is the currently active version for normal (non-administrative) channel requests.

  **Type**: integer/int32  
  **Constraints**: Read Only

- **applicationName**

weblogic.management.runtime.JDBCReplayStatisticsRuntimeMBean

This class is used to get replay statics for an Oracle replay datasource aggregated across all connections in the pool.

The properties of the weblogic.management.runtime.JDBCReplayStatisticsRuntimeMBean entity are as follows:

deploymentState
The current deployment state of the module.

A module can be in one and only one of the following states. State can be changed via deployment or administrator console.

- UNPREPARED. State indicating at this module is neither prepared or active.
- PREPARED. State indicating at this module of this application is prepared, but not active. The classes have been loaded and the module has been validated.
- ACTIVATED. State indicating at this module is currently active.
- NEW. State indicating this module has just been created and is being initialized.

Type: integer/int32
Constraints: Read Only
**failedReplayCount**
Obtains the number of replays that failed.

When replay fails, it rethrows the original SQLException to the application, with the reason for the failure chained to that original exception. Application can call `getNextException` to retrieve the reason.

**Type**: integer/int64

**Constraints**: Read Only

**moduleId**
Returns the identifier for this Component. The identifier is unique within the application.

Typical modules will use the URI for their id. Web Modules will return their context-root since the web-uri may not be unique within an EAR.

**Type**: string

**Constraints**: Read Only

**name**
The name of this configuration. WebLogic Server uses an MBean to implement and persist the configuration.

**Type**: string

**Constraints**: Read Only

**replayDisablingCount**
Obtains the number of times that replay is disabled. When replay is disabled in the middle of a request, the remaining calls in that request are no longer protected by AC. In case an outage strikes one of those remaining calls, no replay will be attempted, and application simply gets an SQLException.

**Type**: integer/int64

**Constraints**: Read Only

**successfulReplayCount**
Obtains the number of replays that succeeded. Successful replays mask the outages from applications.

**Type**: integer/int64

**Constraints**: Read Only

**totalCalls**
Obtains the total number of JDBC calls executed so far.

**Type**: integer/int64

**Constraints**: Read Only

**totalCallsAffectedByOutages**

**Type**: integer/int64

**Constraints**: Read Only
**totalCallsAffectedByOutagesDuringReplay**
Obtains the number of JDBC calls affected by outages in the middle of replay. Outages may be cascaded and strike a call multiple times when replay is ongoing. AC automatically reattempts replay when this happens, unless it reaches the maximum retry limit.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**totalCallsTriggeringReplay**
Obtains the number of JDBC calls that triggered replay. Not all the calls affected by an outage trigger replay, because replay can be disabled for some requests.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**totalCompletedRequests**
Obtains the total number of completed requests so far.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**totalProtectedCalls**
Obtains the total number of JDBC calls executed so far that are protected by AC.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**totalReplayAttempts**
Obtains the number of replay attempts. AC automatically reattempts when replay fails, so this number may exceed the number of JDBC calls that triggered replay.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**totalRequests**
Obtains the total number of successfully submitted requests so far.

**Type:** integer/\text{int64}

**Constraints:** Read Only

**weblogic.management.runtime.QueryCacheRuntimeMBean**

This interface contains accessor methods for all query cache runtime information collected for an EJB. The cache miss counts need some explaining. A query-cache miss can occur due to one of the following reasons:

- The query result was not found in the query-cache
- The query result has timed out
- A bean which satisfies the query was not found in the entity cache
- A query with relationship-caching turned on did not find the related-beans query result
- A query which loads multiple EJBs could not load one or more of them

To better aid tuning, there are separate counters provided for each of the last four of the above causes. The fifth counter is a total cache miss counter. This counter takes into account all five causes of a cache miss.

The properties of the `weblogic.management.runtime.QueryCacheRuntimeMBean` entity are as follows:

weblogic.management.runtime.RecourseActionEventVBean

The RecourseActionEventVBean holds runtime state about an individual recourse action to be executed or withdrawn by the WebLogic Resource Consumption Management feature for a configured Trigger on the current server instance in the current Domain Partition.

When the current resource usage by the Domain Partition falls below the configured usage limit, the feature automatically withdraws the recourse action (where possible).

This Bean captures the following runtime state of such an individual recourse action:

- The recourse action of a new execution of a recourse action (because the usage limit has been exceeded) or a the withdrawal of an existing recourse action (the current resource usage has gone below the usage limit).
- Whether the initiated recourse action was successfully executed.

**weblogic.management.runtime.ServerMigrationRuntimeMBean**

ServerMigrationRuntimeMBean provides runtime monitoring information about the past migrations performed by this server as the cluster master. If this server was never the cluster master then no information would be available. This RuntimeMBean would be hosted on all cluster members and can be queried for the location of the cluster master which is just another peer in the cluster. JMX clients can make another call to the server hosting the cluster master functionality to get the migration history.

Please note that the migration history is not persisted and is lost when a server is shutdown.

The properties of the weblogic.management.runtime.ServerMigrationRuntimeMBean entity are as follows:

**clusterMaster**
Is the current server the cluster master?

Type: boolean
Constraints: Read Only

**clusterMasterName**

The returned URL will be consistent with dynamic channel updates.

*Type: string*

**currentDirectory**
The absolute path of the directory from which the server was started.

This may be used in conjunction with other relative paths in ServerMBean to compute full paths.

*Type: string*

The returned value indicates the default protocol, listen address and listen port:

```
protocol://listen-address:listen-port
```

Note: The default protocol, listen address and listen port are persisted in the domain's `config.xml` file, however when a server instance is started, command-line options can override these persisted values. This `getDefaultURL` method returns the URL values that are currently being used, not necessarily the values that are specified in `config.xml`

The returned URL will be consistent with dynamic channel updates.

**weblogic.management.runtime.TaskRuntimeMBean**

Exposes monitoring information about an ongoing and potentially long-running administrative process. This should be taken to mean, at minimum, any OA&M operation involving I/O. Examples include starting and stopping servers, deploying and undeploying applications, or migrating services.

An MBean operation of this sort should fork a separate thread to perform the actual work and immediately return an instance of TaskRuntimeMBean to the caller. The caller can then use this to track the task's progress as desired. Users can also query for all instances of TaskRuntimeMBean to get a summary of both currently-running and recently-completed tasks.

Instance of TaskRuntimeMBean continue to exist in the MBeanServer after the completion of the work they describe. They will eventually either be explicitly deregistered by the user, or removed by a scavenger process which periodically purges instances of TaskRuntimeMBean that have been completed for some time.

The `weblogic.management.runtime.TriggerRuntimeMBean` holds runtime state (for the current Server instance) for a Trigger that has been configured in the Resource Consumption Management policy of the current Domain Partition.

The WebLogic Resource Consumption Management feature automatically initiates the configured recourse action of a Trigger when the Trigger's configured usage limits are exceeded by a Domain Partition. When a usage limit is exceeded, and the configured recourse action has been successfully executed, the Trigger is *Activated*.

When the current resource usage by the Domain Partition falls below the Trigger's configured usage limit, the feature automatically withdraws the recourse action where possible. When the current usage is below the configured usage limit, and the configured recourse action has been successfully withdrawn, the Trigger is said to be *not Activated*.

The MBean captures the following states for a Trigger when the current resource consumption usage by the Domain Partition exceeds or goes below the configured usage limit for the Domain Partition:

- Whether the Trigger is *Activated* (usage has exceeded the limit and the recourse action was successfully executed) or not
- The time when the last recourse action was executed successfully for the Trigger
- Whether a recourse action has been initiated in response to the resource usage by the Domain Partition exceeding the configured usage limits

weblogic.management.runtime.WLDFImageCreationTaskRuntimeMBean

Exposes monitoring information about a potentially long-running request for the generation of a diagnostic image. Remote clients, as well as clients running within a server, can access this information.

weblogic.management.runtime.WLDFImageRuntimeMBean

WLDFImageRuntimeMBean supports operations to request the generation of a diagnostic image for capturing a running server’s internal state information. These operations will fork a separate thread to perform the actual work and immediately return an instance of this MBean to the caller. The caller can then use that instance to track the task’s progress.

weblogic.management.runtime.WLDFWatchNotificationSourceRuntimeMBean

Attaches an action listener in order to receive action events when a policy evaluates to true. Note that the listener will receive all actions; the caller must filter the output.

Unlike the deprecated WLDFWatchJMXNotificationRuntimeMBean, the action generated by this source is a Java Map object comprised of simple JDK types, and does not require a client dependency on any WLDF code.

Note: As of WebLogic Server 12.2.1, the terms watch and notification are replaced by policy and action, respectively. However, the definition of these terms has not changed.
