Oracle® Enterprise Manager
Cloud Control Advanced Installation and Configuration Guide
12c Release 1 (12.1.0.1)
E24089-15

June 2012
### Preface
- Intended Audience
- Purpose of the Document
- Documentation Accessibility
- Related Documents
- Conventions

### Part I Getting Started

#### 1 Procuring Software
1.1 Procuring Enterprise Manager Cloud Control Software
1.1.1 How Do You Access the Software from DVD?
1.1.1.1 Accessing Software from DVD
1.1.1.2 Setting Mount Point for DVD
1.1.2 How Do You Procure the Software from Oracle Technology Network?
1.1.2.1 Downloading Software
1.1.2.2 Verifying File Size
1.1.2.3 Extracting Contents
1.1.2.4 Verifying Platform Information
1.2 Procuring Oracle Management Agent Software

#### 2 Understanding the Basics
2.1 Understanding Installation Basics
2.1.1 What Different Installation Modes Can You Use?
2.1.2 What Is Enterprise Manager Cloud Control Installation Wizard?
2.1.3 What Installation Types Are Offered by the Installation Wizard?
2.1.3.1 Create a New Enterprise Manager System
2.1.3.2 Upgrade an Existing Enterprise Manager System
2.1.3.3 Install Software Only
2.1.4 What Is Add Host Target Wizard?
2.1.5 What Is Add Management Service Deployment Procedure?
2.1.6 What Ports Are Used for Installation?
2.1.6.1 What Default Ports Are Used?
2.1.6.2 How Can You Customize Ports?
2.1.6.3 What Precautions You Must Take While Customizing Port Numbers?
Part II Installing Enterprise Manager System

3 Installing Enterprise Manager System in Silent Mode

3.1 Overview
Part III Installing Oracle Management Agent

5 Installing Oracle Management Agent in Silent Mode

5.1 Overview ................................................................. 5-1
5.2 Before You Begin ....................................................... 5-2
5.3 Prerequisites ............................................................ 5-3
5.4 Installation Procedure .............................................. 5-6
5.4.1 Creating a Response File ........................................ 5-9
5.4.2 Understanding the Options Supported by agentDeploy.sh (agentDeploy.bat) .... 5-10
5.4.3 Understanding the Contents of the Downloaded Management Agent Software... 5-11
5.5 After You Install ....................................................... 5-12

6 Installing Oracle Management Agent Using RPM File

6.1 Overview ................................................................. 6-1
6.2 Before You Begin ....................................................... 6-2
6.3 Prerequisites ............................................................ 6-2
6.4 Installation Procedure .............................................. 6-5
Performing Additional Configuration Tasks

11.1 Understanding Default and Custom Data Collections.......................................................... 11-1
11.1.1 How Enterprise Manager Stores Default Collection Information........................................ 11-1
11.2 Enabling Multi-Inventory Support for Configuration Management........................................ 11-2
11.2.1 Agent HOME Versus Agent STATE Directories............................................................... 11-3
11.3 Manually Configuring a Database Target for Complete Monitoring................................. 11-4
11.4 Modifying the Default Login Timeout Value.......................................................................... 11-6
11.5 Configuring Clusters and Cluster Databases in Cloud Control............................................. 11-7
11.5.1 Configuring Cluster Databases.......................................................................................... 11-7
11.5.2 Discovering Instances Added to the Cluster Database..................................................... 11-8
11.5.2.1 Troubleshooting........................................................................................................... 11-8
11.6 Collecting Client Configurations.......................................................................................... 11-9
11.6.1 Configuring the Client System Analyzer........................................................................... 11-10
11.6.1.1 Client System Analyzer in Oracle Cloud Control....................................................... 11-10
11.6.1.2 Deploying Client System Analyzer Independently....................................................... 11-10
11.6.2 Configuration Parameters.................................................................................................. 11-11
11.6.2.1 Associating the Parameters with an Application......................................................... 11-14
11.6.3 Rules.................................................................................................................................. 11-15
11.6.4 Customization................................................................................................................... 11-17
11.6.5 CSA Deployment Examples............................................................................................... 11-17
11.6.5.1 Using Multiple Collection Tags.................................................................................. 11-17
11.6.5.2 Privilege Model for Viewing Client Configurations.................................................... 11-18
11.6.5.3 Using the Customization API Example......................................................................... 11-19
11.6.5.4 Using the CSA Servlet Filter Example....................................................................... 11-20
11.6.5.5 Sample Deployments.................................................................................................... 11-21
11.6.5.5.1 Example 1: Helpdesk............................................................................................... 11-21
11.6.5.5.2 Example 2: Inventory............................................................................................... 11-22
11.6.5.5.3 Example 3: Problem Detection................................................................................ 11-23
11.7 Configuring Privilege Delegation Providers......................................................................... 11-23
11.7.1 Creating a Privilege Delegation Setting............................................................................. 11-24
11.7.1.1 Creating a Sudo Setting Using EM CLI....................................................................... 11-25
11.7.1.2 Creating a PowerBroker Setting Using EM CLI.......................................................... 11-25
11.7.2 Applying Privilege Delegation Settings............................................................................. 11-26
11.7.2.1 Applying Settings to Host Targets Using EM CLI....................................................... 11-26
11.7.2.2 Applying Settings to a Composite Target .............................................................. 11-26
11.7.3 Disabling Host Privilege Delegation Provider Settings Using EM CLI ................. 11-27
11.7.4 Sudo Configuration: Sudoers File ........................................................................... 11-27
11.7.5 Configuring Privilege Delegation Providers Using Cloud Control Console ......... 11-27
11.7.5.1 Configuring Sudo Settings For a Host Using Enterprise Manager Cloud Control Console 11-28
11.7.5.2 Configuring PowerBroker Settings For a Host Using the Cloud Control Console .... 11-28
11.7.5.3 Applying Settings to Multiple Host Targets Using the Cloud Control Console ........ 11-28
11.7.5.4 Disabling Host Privilege Delegation Provider Settings For One or More Hosts Using Cloud Control Console 11-29

12 Configuring Enterprise Manager for Firewalls

12.1 Firewall Configuration Considerations ....................................................................... 12-1
12.1.1 Enabling ICMP Echo Requests on Firewalls ........................................................ 12-2
12.2 Overview of Enterprise Manager Components and Ports ...................................... 12-2
12.2.1 Viewing a Summary of the Ports Assigned During Installation ....................... 12-2
12.2.2 Default Port Assignments for Enterprise Manager Components ...................... 12-2
12.3 Firewall Configurations for Enterprise Management Components ...................... 12-3
12.3.1 Firewalls Between Your Browser and the Cloud Control Console ..................... 12-4
12.3.2 Configuring the Management Agent on a Host Protected by a Firewall .............. 12-5
12.3.2.1 Configuring the Management Agent to Use a Proxy Server ........................... 12-5
12.3.2.2 Configuring the Firewall to Allow Incoming Communication From the Oracle Management Service 12-5
12.3.3 Configuring the Oracle Management Service on a Host Protected by a Firewall .. 12-6
12.3.3.1 Configuring the Oracle Management Service to Use a Proxy Server to Communicate with Management Agents 12-6
12.3.3.2 Configuring the Firewall to Allow Incoming Management Data From the Management Agents 12-6
12.3.3.3 Enabling Oracle Management Service to Access My Oracle Support .......... 12-7
12.3.3.4 About the dontProxyfor Property .................................................................. 12-7
12.3.4 Firewalls Between the Oracle Management Service and the Management Repository .... 12-7
12.3.5 Firewalls Between Cloud Control and a Managed Database Target .................... 12-8
12.3.6 Firewalls Used with Multiple Oracle Management Services ............................ 12-8
12.3.7 Configuring Firewalls to Allow ICMP and UDP Traffic for Beacons .................. 12-8

13 Sizing Your Enterprise Manager Deployment

13.1 Overview of Oracle Enterprise Manager Cloud Control Architecture .................... 13-1
13.2 Enterprise Manager Cloud Control Sizing ............................................................... 13-2
13.2.1 Overview of Sizing Guidelines ............................................................................ 13-2
13.2.1.1 Hardware Information .................................................................................. 13-2
13.2.1.2 Sizing Specifications .................................................................................... 13-3
13.2.1.3 Sizing for Upgraded Installs ....................................................................... 13-3
13.2.1.4 Minimum Hardware Requirements ............................................................ 13-3
13.2.1.5 Network Topology Considerations .............................................................. 13-3
13.2.2 Software Configurations .................................................................................... 13-4
15.4.1.1 Deploying JVMD Manager on an OMS Host ........................................................ 15-3
15.4.1.2 Deploying JVMD Manager on a Separate Host from OMS (Remote Deployment) ... 15-4
15.4.1.3 Deploying JVMD Manager Manually ............................................................... 15-8
15.4.1.4 Redeploying JVMD Manager ........................................................................... 15-10
15.4.2 Deploying JVMD Agents ...................................................................................... 15-11
15.4.2.1 Deploying JVMD Agents Using Enterprise Manager Cloud Control ............ 15-11
15.4.2.2 Downloading and Deploying JVMD Agents .................................................... 15-14
15.4.2.3 Redeploying JVMD Agents on WebLogic Servers ........................................ 15-17
15.4.2.4 Deploying JVMD Database Agent ................................................................. 15-17
15.4.2.5 Connecting JVMD Agent to the JVMD Manager Secure Port ....................... 15-18
15.5 After You Install ..................................................................................................... 15-19

16 Integrating BI Publisher with Enterprise Manager
16.1 Overview .................................................................................................................. 16-1
16.1.1 Limitations ........................................................................................................... 16-2
16.1.2 Downloading Oracle BI Publisher ....................................................................... 16-2
16.2 BI Publisher Installation and Integration with Enterprise Manager 12c .............. 16-2
16.2.1 Enterprise Manager and BI Publisher Inventory ............................................... 16-3
16.2.2 Installing Enterprise Manager and Required Infrastructure ............................ 16-3
16.2.2.1 Installing BI EE Using Software-only Install ................................................ 16-3
16.2.2.2 Integrating BI Publisher with Enterprise Manager Using the configureBIP Script... 16-3
16.3 Verifying Integration of BI Publisher with Enterprise Manager .......................... 16-4
16.4 Allowing Access to BI Publisher for Enterprise Manager Administrators ........... 16-5
16.4.1 Permissions ......................................................................................................... 16-5
16.4.2 Roles (groups in the LDAP case) ....................................................................... 16-5
16.4.3 BI Publisher Security Model .............................................................................. 16-6
16.5 Granting the EMBIP* roles to Enterprise Manager/BI Publisher Administrators .... 16-6
16.5.1 Granting BI Publisher roles to Enterprise Manager Administrators (non-LDAP) Using wlst.sh (wlst.bat on Microsoft Windows) 16-7
16.5.2 Propagation Time for Changes to OPSS ............................................................ 16-7
16.6 Allowing Access to BI Publisher for Enterprise Manager Administrators in a LDAP environment 16-7
16.7 Configuring BI Publisher with a Custom Trust Store ........................................... 16-8
16.8 BI Publisher Administration .................................................................................... 16-8
16.9 EMBIP* Roles: Granting Access to Folders and Catalog Objects ...................... 16-8
16.10 Access to Enterprise Manager Repository .......................................................... 16-9
16.11 Troubleshooting .................................................................................................... 16-9
16.12 Managing Enterprise Manager - BI Publisher Connection Credentials .......... 16-10
16.13 Managing the BI Publisher Server ....................................................................... 16-11

Part V Deinstallation

17 Deinstalling Enterprise Manager Cloud Control
17.1 Prerequisites ............................................................................................................. 17-1
17.2 Deinstallation Procedure ......................................................................................... 17-2
C Collecting OCM Data Using Oracle Harvester

C.1 Oracle Harvester ................................................................................................................ C-1
C.1.1 Supported Targets in Oracle Harvester ........................................................................ C-3
C.1.2 Configuration Data Not Available in My Oracle Support .......................................... C-4
C.2 Oracle Configuration Manager .......................................................................................... C-4
C.3 Additional Information .................................................................................................... C-4
C.4 Troubleshooting Configuration Data Collection Tools .................................................... C-4
C.4.1 Oracle Harvester Collection Fails If the state/upload/external Directory Is Missing...... C-5
C.4.2 Oracle Configuration Manager Is Not Running ............................................................. C-5
C.4.3 Configuration Data Not Available in My Oracle Support ............................................ C-6
C.4.4 Only a Subset of the Targets Is Collected by the Oracle Harvester ............................. C-6

D Installing Additional Oracle Management Service in Silent Mode

E Troubleshooting

E.1 Troubleshooting Configuration Assistant Failures .............................................................. E-1
E.1.1 Plugins Prerequisites Check Configuration Assistant .................................................. E-1
E.1.2 Repository Configuration Assistant ............................................................................. E-2
E.1.3 MDS Schema Configuration Assistant ......................................................................... E-3
E.1.4 OMS Configuration Assistant ..................................................................................... E-4
E.1.5 Plugins Deployment and Configuration Configuration Assistant ............................. E-5
E.1.6 Start Oracle Management Service Configuration Assistant .................................... E-5
E.1.7 Plugins Inventory Migration Configuration Assistant ................................................ E-5
E.1.8 Oracle Configuration Manager Repeater Configuration Assistant ........................ E-6

E.2 Troubleshooting ADP and JVMD Failures ......................................................................... E-9
E.2.1 ADP Manager Name Conflict ...................................................................................... E-9
E.2.2 Failure to Deploy ADP Agent On a Target ................................................................. E-10
E.2.3 SSL Handshake Failure Agent Deployment Errors .................................................... E-10
E.2.4 Copying ADP Agent Zip or Javadiagnosticagent Ear Step Failure ............................ E-11
E.3 Troubleshooting Deinstallation Failures ............................................................................ E-11

Index
Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide is an extension to Oracle Enterprise Manager Cloud Control Basic Installation Guide.

While the Oracle Enterprise Manager Cloud Control Basic Installation Guide covers basic installation procedures that help you get started with Enterprise Manager Cloud Control, the Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide covers advanced installation procedures that help you install and configure the Enterprise Manager Cloud Control components in more complex environments.

This preface contains the following topics:

- Intended Audience
- Purpose of the Document
- Documentation Accessibility
- Related Documents
- Conventions

Intended Audience

Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide is meant for system administrators who want to install Enterprise Manager Cloud Control components in complex environments.

Purpose of the Document

Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide covers the following:

- Installing the following in graphical mode:
  - Enterprise Manager Cloud Control software only so that you can configure it later
  - Oracle Management Agent using a shared Oracle home
- Installing the following in silent mode:
  - Enterprise Manager Cloud Control
  - Enterprise Manager Cloud Control software only so that you can configure it later
  - Oracle Management Agent
  - Oracle Management Agent software only so that you can configure it later
  - Oracle Management Agent using a shared Oracle home
- Cloning Oracle Management Agent in graphical and silent mode
- Deinstalling Enterprise Manager Cloud Control and Oracle Management Agent in graphical and silent mode
Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide does NOT cover the following procedures. These procedures are documented in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

- Installing Enterprise Manager Cloud Control in graphical mode
- Installing an additional Oracle Management Service in graphical mode
- Installing Oracle Management Agent in graphical mode
- Installing JVM Diagnostics and Application Dependency and Performance

Also, Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide does NOT cover the procedure for upgrading your existing Enterprise Manager system. The upgrade procedure is documented in the Oracle Enterprise Manager Cloud Control Upgrade Guide.

Documentation Accessibility

For information about Oracle’s commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following books in the Enterprise Manager Cloud Control documentation library:

- Oracle Enterprise Manager Cloud Control Basic Installation Guide
- Oracle Enterprise Manager Cloud Control Upgrade Guide
- Oracle Enterprise Manager Cloud Control Administrator’s Guide

For the latest releases of these and other Oracle documentation, check the Oracle Technology Network at the following URL:

Enterprise Manager also provides extensive online Help. Click Help at the top-right corner of any Cloud Control page to display the online help window.

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>Convention</td>
<td>Meaning</td>
</tr>
<tr>
<td>------------</td>
<td>---------</td>
</tr>
<tr>
<td><em>italic</em></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
This part describes how you can procure the Enterprise Manager Cloud Control software and the Oracle Management Agent software, and explains some key concepts you must know before you start using Enterprise Manager Cloud Control. In particular, this part contains the following chapters:

- Chapter 1, "Procuring Software"
- Chapter 2, "Understanding the Basics"
This chapter describes how you can procure the Enterprise Manager Cloud Control software and the Oracle Management Agent software. In particular, this chapter covers the following:

- Procuring Enterprise Manager Cloud Control Software
- Procuring Oracle Management Agent Software

### 1.1 Procuring Enterprise Manager Cloud Control Software

You can procure the Enterprise Manager Cloud Control software from either the product DVD or the Oracle Technology Network (OTN) Web site. This section describes these sources and covers the following:

- How Do You Access the Software from DVD?
- How Do You Procure the Software from Oracle Technology Network?

#### 1.1.1 How Do You Access the Software from DVD?

You can obtain the Enterprise Manager Cloud Control software from the product DVD that is available through Oracle Service Delivery Managers or Oracle Sales Representatives. The software may be available either on a single DVD or on multiple DVDs depending on the operating system.

This section covers the following:

- Accessing Software from DVD
- Setting Mount Point for DVD

##### 1.1.1.1 Accessing Software from DVD

If the software is available on a single DVD, then insert the DVD into the DVD drive, and manually run the Enterprise Manager Cloud Control Installation Wizard.

If the software is available on multiple DVDs, then copy the archived software from each of the DVDs to a location on your local disk. Extract the contents of each of the archived files to the same location. Then, invoke the Enterprise Manager Cloud Control Installation Wizard.

For example, Oracle delivers two DVDs for Linux x86 (32-bit), mainly these:

- DVD1, containing a ZIP file with the name `em12_linux_disk1of2.zip`
- DVD2, containing a ZIP file with the name `em12_linux_disk2of2.zip`
In this case, copy both the ZIP files to a location on your disk, for example, /temp, and then extract their contents in the same location.

$ cp -r em12_linux_disk1of2.zip /temp
$ cp -r em12_linux_disk2of2.zip /temp
$ unzip em12_linux_disk1of2.zip
$ unzip em12_linux_disk2of2.zip

Once the contents are extracted, you can invoke the Enterprise Manager Cloud Control Installation Wizard. To do so, on UNIX platforms, invoke runInstaller, and on Microsoft Windows platforms, invoke setup.exe.

---

**Note:** For information about the Enterprise Manager Cloud Control Installation Wizard, see Section 2.1.2.

---

### 1.1.1.2 Setting Mount Point for DVD

If you want to access the DVD from a shared DVD drive, then set a mount point for the DVD drive.

On most Linux operating systems, the disk mounts automatically when you insert the DVD into the DVD drive. However, for some Linux operating systems, you might have to manually mount the disk. To verify whether the disk mounts automatically and to manually mount the disk if it does not mount itself automatically, follow these steps:

1. Insert the DVD into the disk drive.
2. To verify if the disk is automatically mounted, run the following command:
   - On Red Hat Enterprise Linux:
     ```bash
     # ls /mnt/cdrom
     ```
   - On SUSE Linux Enterprise Server:
     ```bash
     # ls /media/cdrom
     ```
3. If the command in Step (2) fails to display the contents of the disk, then run the following command:
   - On Red Hat Enterprise Linux:
     ```bash
     # mount -t nfs <host name>:/mnt/<full path to the dvdrom>
     ```
   - On SUSE Linux Enterprise Server:
     ```bash
     # mount -t nfs <host name>:/media/<full path to the dvdrom>
     ```

On most AIX operating systems, the disk mounts automatically when you insert the DVD into the DVD drive. However, for some AIX operating systems, you might have to manually mount the disk. To manually mount the disk if it does not mount itself automatically, follow these steps:

1. Switch the user to `root` user by running the following command:
   ```bash
   $ su -root
   ```
2. Insert the disk into the drive.
3. Enter the following command:

```
# /usr/sbin/mount -rv cdrfs /dev/cd0 /SD_DVD
```

In this example command, /SD_DVD is the disk mount point directory and /dev/cd0 is the device name for the disk device.

4. If you are prompted to specify the disk location, then specify the disk mount point directory path. For example, /SD_DVD

### 1.1.2 How Do You Procure the Software from Oracle Technology Network?

You can procure the Enterprise Manager Cloud Control software from OTN. The software available on OTN is archived using Info-ZIP's highly portable ZIP utility. The software is available in multiple ZIP files. After downloading the software, you will need the UNZIP utility to extract the files.

This section covers the following:

- **Download Software**
- **Verifying File Size**
- **Extracting Contents**
- **Verifying Platform Information**

#### 1.1.2.1 Downloading Software

To download the Enterprise Manager Cloud Control software from OTN, access the following URL:

The software is available in multiple ZIP files. Download the ZIP files to a common location on your local disk.

#### 1.1.2.2 Verifying File Size

After downloading the ZIP files, run the `cksum` command against the files and check if the file checksum of the downloaded software is the same as the file checksum displayed on OTN.

The following is the format of the ZIP files:

```
em12_<platform>_diskNofM.zip (<value> bytes) (cksum - <value>)
```

Here, `<platform>` refers to the operating system, `N` refers to the ZIP file number, and `M` refers to the total number of ZIP files available for download. For example, `em12-linux_disk1of2.zip`, `em12-linux_disk2of2.zip`, `em12-linux64_disk1of2.zip`, or `em12-linux64_disk2of2.zip`.

The value (cksum - <value>) is the file checksum that you need to check. To check the file checksum of the first ZIP file, run the following command:

```
$ cksum em12_<platform>_diskNofM.zip
```

For example,
$ cksum em12_linux_disk1of2.zip

1.1.2.3 Extracting Contents
You must unzip the archive on the platform for which it was intended. For example, if you download the software for the Linux x86 operating system, then you must unzip the file on a Linux x86 operating system only. If you unzip the file on a Microsoft Windows computer and then move the stage area to a Linux computer, then the staged area files will get corrupted. This is because Microsoft Windows does not preserve the case sensitivity or the permission bits of Linux file names.

If you have downloaded a single ZIP file, then extract the contents of it and manually run the Enterprise Manager Cloud Control Installation Wizard.

Note: For information about the Enterprise Manager Cloud Control Installation Wizard, see Section 2.1.2.

If you have downloaded multiple ZIP files to a common location, then extract the contents of all the ZIP files in the same location, and then manually run the Enterprise Manager Cloud Control Installation Wizard.

Tip: If you plan to store the files on a DVD, then first extract the contents of the ZIP file, and then copy those extracted files to the DVD. Do NOT copy the ZIP file itself; you need the unzipped contents of the ZIP file to install the product.

1.1.2.4 Verifying Platform Information
After extracting the contents of the ZIP file, access the following file to verify the platform information. Here, <Software_Location> can be either the DVD mount point or the location on your local disk where you have extracted the contents of the ZIP files.

<Software_Location>/stage/shiphomeproperties.xml

Note that a 32-bit Enterprise Manager Cloud Control software (both Enterprise Manager Cloud Control and Oracle Management Agent) can be installed only on a 32-bit operating system that is running on a 32-bit hardware. Similarly, a 64-bit Enterprise Manager software can be installed only on a 64-bit operating system that is running on a 64-bit hardware.

Do NOT try to install a 32-bit software on a 64-bit platform or vice versa; the installation may proceed, but will fail eventually. Therefore, ensure that you use the right software download for the right platform.

The shiphomeproperties.xml file provides the platform information as shown here:

```xml
<?xml version="1.0" standalone="yes" ?>
<ORACLEHOME_INFO>
<ARU_PLATFORM_INFO>
<ARU_ID>46</ARU_ID>
<ARU_ID_DESCRIPTION>Linux x86</ARU_ID_DESCRIPTION>
</ARU_PLATFORM_INFO>
</ORACLEHOME_INFO>
```

You can see the platform information in the <ARU_ID_DESCRIPTION> syntax. Table 1–1 lists the platform names that may be enclosed in this syntax, and describes whether the names represent a 32-bit or 64-bit software.
1.2 Procuring Oracle Management Agent Software

Oracle Management Agent (Management Agent) is one of the core components of Enterprise Manager Cloud Control, and therefore, its software is part of the Enterprise Manager Cloud Control software. When you install Enterprise Manager Cloud Control, the installation wizard automatically installs a Management Agent.

You can install additional Management Agents using the Add Host Targets Wizard built into the Enterprise Manager Cloud Control console (Cloud Control console). The wizard uses the Management Agent software that is already present in the OMS home. However, note that the Management Agent software present in the OMS home is always for the version and platform on which that OMS is running. For example, if the OMS is Oracle Management Service 12c and it is running on Linux platform, then the Management Agent software available there is also for Linux platform.

If you want to install a Management Agent for a platform that is different from the one on which the OMS is running, then ensure that you download that software using the Self Update console, which is built into the Cloud Control console.

For information on Self Update and how you can use it to download the software, see the chapter on Self Update in the *Oracle Enterprise Manager Cloud Control Administrator’s Guide*.

This chapter introduces you to some key concepts of Enterprise Manager Cloud Control, and describes some important aspects of installation that you must know before you proceed any further.

In particular, this chapter covers the following:

- Understanding Installation Basics
- Understanding Oracle WebLogic Server Requirement
- Understanding Installation Directories
- Understanding Additional Components Installed
- Understanding Configuration Assistants
- Understanding Prerequisite Checks
- Understanding Limitations of Enterprise Manager Cloud Control
- Understanding Other Miscellaneous Concepts

2.1 Understanding Installation Basics

This section describes the fundamental aspects of the installation process. In particular, this section covers the following:

- What Different Installation Modes Can You Use?
- What Is Enterprise Manager Cloud Control Installation Wizard?
- What Installation Types Are Offered by the Installation Wizard?
- What Is Add Host Target Wizard?
- What Is Add Management Service Deployment Procedure?
- What Ports Are Used for Installation?
- What Data Files Are Created While Configuring Oracle Management Repository?
- How Do You Delete Data Files?

2.1.1 What Different Installation Modes Can You Use?

You can install Enterprise Manager Cloud Control or any of its core components either in an interactive, graphical mode or in a silent mode.
In both these modes, you can perform a software-only installation. A Software-Only installation is an approach that enables you to install only the software binaries of Enterprise Manager Cloud Control or a Management Agent, that is, without any configuration to the installation. This is best suited when you want to install the software at one point and configure it later.

### 2.1.2 What Is Enterprise Manager Cloud Control Installation Wizard?

Enterprise Manager Cloud Control Installation Wizard is a Java-based wizard that helps you install or upgrade to Enterprise Manager Cloud Control in graphical mode. If you are installing Enterprise Manager Cloud Control or any of its core components for the first time, then Oracle strongly recommends you to use this installation wizard.

**Note:** To invoke the installation wizard on UNIX platforms, run `runInstaller`. To invoke on Microsoft Windows platforms, run `setup.exe`.

Figure 2–1 describes the key elements of the installation wizard.
2.1.3 What Installation Types Are Offered by the Installation Wizard?

The Enterprise Manager Cloud Control Installation Wizard offers the following installation types:

- Create a New Enterprise Manager System
- Upgrade an Existing Enterprise Manager System
- Install Software Only

When you invoke `runInstaller` or `setup.exe`, if the Enterprise Manager Cloud Control Installation Wizard does not appear, then it is possible that you do not access to the `/stage` directory.

There is a classpath variable that the installation wizard computes for OPatch as `../stage/Components/`, and when the TEMP variable is set to `/tmp`, the installation wizard tries to look for the opatch JAR file in the `/tmp/..../stage` directory, which is equivalent to `/stage`. However, if you do not have the permission on `/stage`, then the installation wizard can hang. Under such circumstances, verify if you have access to the `/stage` directory. If you do not have access to it, then set the TEMP variable to a location where the install user has access to, and then relaunch the installation wizard.
2.1.3.1 Create a New Enterprise Manager System

This installation type enables you to install a new Enterprise Manager Cloud Control system in one of the following ways:

- **Simple**, installs a new Enterprise Manager Cloud Control system quickly with default configuration settings, using an existing, certified Oracle Database to house the Management Repository.

- **Advanced**, installs a new Enterprise Manager Cloud Control system with custom configuration settings, using an existing, certified Oracle Database to house the Management Repository.

For both simple and advanced installation types, the installation wizard does the following:

- Installs Java Development Kit (JDK) 1.6 v24, Oracle WebLogic Server 11g Release 1 (10.3.5) if they do not already exist

- Installs Oracle JRF 11g Release (11.1.1.4.0), which includes oracle_common directory

- Installs Oracle Web Tier 11g Release (11.1.1.4.0), which includes Oracle_WT directory

- Installs Oracle Management Service 12c and Oracle Management Agent 12c

- Installs Oracle Management Plug-Ins such as Oracle Database Management Plug-In, Oracle Fusion Middleware Management Plug-In, Oracle My Oracle Support Management Plug-In, and Oracle Exadata Management Plug-In

- Creates an Oracle WebLogic domain called GCDomain, and a Node Manager user account called nodemanager

- Configures an Oracle Management Service Instance Base directory for storing all configuration details related to the OMS

- Configures the Management Repository (in the existing Oracle Database), the OMS, and the Management Agent

2.1.3.2 Upgrade an Existing Enterprise Manager System

This installation type enables you to upgrade an existing Enterprise Manager 10g Grid Control Release 5 (10.2.0.5.0) or Enterprise Manager 11g Grid Control Release 1 (11.1.0.1.0) to Enterprise Manager Cloud Control.

This installation type offers the following approaches:

- **One System Upgrade**, enables you to upgrade to Enterprise Manager Cloud Control on the same host where your earlier release of Enterprise Manager is running. This approach also upgrades the Management Repository in the existing Oracle Database itself. Since the upgrade happens on the same host, there is a reasonable downtime involved.

- **Two System Upgrade**, enables you to install Enterprise Manager Cloud Control on a host that is different from the host where your existing Enterprise Manager system is running. This approach does not upgrade the Management Repository in the existing Oracle Database, but upgrades the one in the backed up database, thus offering the scope for two Enterprise Manager systems to exist. Since a new Enterprise Manager system coexists with the old one, there is no or near zero downtime involved.
2.1.3.3 Install Software Only

This installation type enables you to install only the software binaries of Enterprise Manager Cloud Control at one point, and configure it at a later point.

This approach helps you divide the installation process into two phases, mainly the installation phase and the configuration phase. Understandably, the installation phase takes less time compared to the configuration phase because the installation phase involves only copying of binaries.

During the installation phase, the installation wizard does the following:

- Installs Java Development Kit (JDK) 1.6 v24, Oracle WebLogic Server 11g Release 1 (10.3.5) if they do not already exist.
- Installs Oracle JRF 11g Release (11.1.1.4.0), which includes oracle_common directory.
- Installs Oracle Web Tier 11g Release (11.1.1.4.0), which includes Oracle_WT directory.
- Installs Oracle Management Service 12c and Oracle Management Agent 12c.
- Installs Oracle Management Plug-Ins such as Oracle Database Management Plug-In, Oracle Fusion Middleware Management Plug-In, Oracle My Oracle Support Management Plug-In, and Oracle Exadata Management Plug-In.

During the configuration phase, the installation wizard does the following:

- Creates an Oracle WebLogic domain called GCDomain, and a Node Manager user account called nodemanager.
- Configures an Oracle Management Service Instance Base directory for storing all configuration details related to the OMS.
- Configures the Management Repository (in the existing Oracle Database), the OMS, and the Management Agent.

2.1.4 What Is Add Host Target Wizard?

The Add Host Targets Wizard (Figure 2–2) is a GUI-rich application accessible from within the Cloud Control console, and used for installing Management Agents on unmanaged hosts and converting them to managed hosts in the Enterprise Manager system.

Using the Add Host Targets Wizard, you can do the following:

- Install a fresh Management Agent
- Clone an existing well-tested, pre-patched, and running Management Agent
- Install a Management Agent from an existing, centrally shared Management Agent
Although the Add Host Targets Wizard can be used for remotely installing one Management Agent, the wizard is best suited for mass-deployment of Management Agents, particularly while mass-deploying Management Agents of different releases on hosts of different platforms. The wizard gives you the flexibility to select multiple hosts on which you want to install a Management Agent. This helps you when you want to install the Management Agent on several hosts, in one attempt.

### 2.1.5 What Is Add Management Service Deployment Procedure?

A deployment procedure is a procedure that contains a hierarchical sequence of provisioning or patching steps, where each step may contain a sequence of other steps. In other words, the workflow of all tasks that need to be performed for a particular life cycle management activity is encapsulated in a deployment procedure.

Enterprise Manager Cloud Control offers multiple deployment procedures, and all of these can be accessed from within the Cloud Control console. One of the deployment procedures that falls within the context of Enterprise Manager Cloud Control installation is the Add Management Service deployment procedure.

The Add Management Service deployment procedure (Figure 2–3) helps you meet high-availability requirements by enabling you to install an additional OMS using an existing OMS that is running on an AdminServer host.
In simple words, the Add Management Service deployment procedure enables you to install additional OMSes in your environment. The deployment procedure clones an existing OMS and replicates its configuration to the destination host.

The earlier releases of Enterprise Manager offered this installation type from the Enterprise Manager Installation Wizard. However, for the Enterprise Manager Cloud Control release, this installation type is offered as a deployment procedure.

For more information about the deployment procedure, see the chapter on adding additional management service in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

2.1.6 What Ports Are Used for Installation?

This section describes the default ports that are honored while installing Enterprise Manager Cloud Control. In particular, this section covers the following:

- What Default Ports Are Used?
- How Can You Customize Ports?
- What Precautions You Must Take While Customizing Port Numbers?

2.1.6.1 What Default Ports Are Used?

The following are the default ports used for installation:

- Enterprise Manager Cloud Control

<table>
<thead>
<tr>
<th>Upload Port</th>
<th>Console Port</th>
</tr>
</thead>
</table>

Figure 2–3  Add Management Service Deployment Procedure
Oracle Management Agent
The default upload port for Management Agent is 3872. The same port is used for both HTTP and HTTPS. If 3872 is not available, then the first available free port from the range 1830 to 1849 is selected.

Admin Server
The default HTTPS port for Admin Server is 7101. If 7101 is not available, then the first available free port from the range 7101 to 7200 is selected.

Node Manager
The default HTTPS port for Node Manager is 7401. If 7401 is not available, then the first available free port from the range 4899 to 4908 is selected.

Managed Server
The default HTTP port for Managed Server is 7201. If 7201 is not available, then the first available free port from the range 7201 to 7300 is selected.

The default HTTPS port for Managed Server is 7301. If 7310 is not available, then the first available free port from the range 7301 to 7400 is selected.

2.1.6.2 How Can You Customize Ports?
Enterprise Manager Cloud Control offers you the flexibility to use custom ports instead of default ports.

Customizing Ports While Installing Enterprise Manager Cloud Control
- If you are installing Enterprise Manager Cloud Control in graphical mode, that is, using the Enterprise Manager Cloud Control Installation Wizard, then you can use the Port Configuration Details screen to enter custom ports. You can also import a staticports.ini file that already captures the custom ports.
- If you are installing Enterprise Manager Cloud Control in silent mode, that is, using the installation procedures described in Part II, then update the staticports.ini file with suitable custom ports.

The staticports.ini file is available at the following location of the software kit (DVD, downloaded software, and so on):
<software_kit>/response/staticports.ini

Customizing HTTP/HTTPS Console and Upload Ports After Installing Enterprise Manager Cloud Control
If you want to change the HTTP/HTTPS console ports and upload ports after installing Enterprise Manager Cloud Control, then follow these steps:

1. Stop the OMS:

<table>
<thead>
<tr>
<th>HTTP Port</th>
<th>HTTPS Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>4889</td>
<td>1159</td>
</tr>
</tbody>
</table>

If 4889 is not available, then the first available free port from the range 4889 to 4898 is selected.

If 1159 is not available, then the first available free port from the range 4899 to 4908 is selected.

The first available free port from the range 7788 - 7798 is selected.

The first available free port from the range 7799 - 7809 is selected.
2. Update the emoms properties with HTTP and HTTPS ports as described in Table 2–1. Specify the values for parameters <http_upload_new>, <https_upload_new>, <http_console_new>, and <https_console_new>):

<table>
<thead>
<tr>
<th>Port/Property Type</th>
<th>Command to Run</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Upload Port</td>
<td><code>&lt;OMS_HOME&gt;/bin/emctl set property -name oracle.sysman.emSDK.svlt.ConsoleServerPort -value &lt;http_upload_new&gt;</code></td>
</tr>
<tr>
<td>HTTPS Upload Port</td>
<td><code>&lt;OMS_HOME&gt;/bin/emctl set property -name oracle.sysman.emSDK.svlt.ConsoleServerHTTPSPort -value &lt;https_upload_new&gt;</code></td>
</tr>
<tr>
<td>HTTP Console Port</td>
<td><code>&lt;OMS_HOME&gt;/bin/emctl set property -name oracle.sysman.emSDK.svlt.EMConsoleServerPort -value &lt;http_console_new&gt;</code></td>
</tr>
<tr>
<td>HTTPS Console Port</td>
<td><code>&lt;OMS_HOME&gt;/bin/emctl set property -name oracle.sysman.emSDK.svlt.EMConsoleServerHTTPSPort -value &lt;https_console_new&gt;</code></td>
</tr>
</tbody>
</table>

3. Back up the following file:

   `$<OMS_INSTANCE_HOME>/emgc.properties`  

   After backing up the file, open the original emgc.properties file, and specify the new port numbers for the following parameters:

   - EM_UPLOAD_HTTP_PORT=<http_upload_new>
   - EM_UPLOAD_HTTPS_PORT=<https_upload_new>
   - EM_CONSOLE_HTTP_PORT=<http_console_new>
   - EM_CONSOLE_HTTPS_PORT=<https_console_new>

4. Back up the files httpd.conf, ssl.conf, and httpd_em.conf from the following location:

   `$<WEBTIER_INSTANCE_HOME>/config/OHS/ohs#/`  

   After backing up the files, open the original files, and specify the new port numbers:

   - In httpd.conf file, in the Listen directive, replace <http_console_orig> with <http_console_new>.
   - In ssl.conf file, in the Listen directive, replace <https_console_orig> with <https_console_new>.
   - In httpd_em.conf file, in the Listen and VirtualHost directive, replace <http_upload_orig> with <http_upload_new>, and <https_upload_orig> with <https_upload_new>, respectively.

5. Start the OMS, and verify its status:

   `$<OMS_HOME>/bin/emctl start oms`

   `$<OMS_HOME>/bin/emctl status oms -details`

6. If the OMS is configured with any Server Load Balance (SLB), then update the ports in the SLB pools, monitors, and so on.
7. If the OMS is configured for SSO or OAM, then re-run the SSO or OAM configuration.

8. Back up the following file:

   \$<AGENT_INSTANCE_HOME>/sysman/config/emd.properties

   After backing up the file, open the original emd.properties file, and verify the URL mentioned in REPOSITORY_URL. If the URL is an HTTPS URL, then change the port number to <https_upload_new>. If the URL is an HTTP URL, then change the port number to <http_upload_new>.

9. If there are any EM CLI instances set up on the ports you have changed, then set up those instances again. To do so, from each EM CLI instance, run the command emcli setup or emcli status, and note the EM URL that appears.

   If you have changed that port number, run the following command:

   emcli setup -url=http(s)://<host>:<new_port#/>/em
   -dir=<dir>....

2.1.6.3 What Precautions You Must Take While Customizing Port Numbers?

While updating the staticports.ini file, you must be extremely careful because an error in the file can cause the installation wizard to use default ports without displaying any warning. Therefore, before updating the staticports.ini file, check for these points:

- Always enter port numbers that are greater than 1024 and less than 65536.
- If a port is already being used by a component or any other application, do not enter that port (used port) in the staticports.ini file. If you do, then the related configuration assistant also fails.
- If you have entered the same port for more than one component, then the installation displays an error after the prerequisite checks phase. You must rectify this error before proceeding with the installation.
- If you have syntax errors in the staticports.ini file (for example, if you omitted the equal (=) character for a line), then the installation wizard ignores the line. For the components specified on such lines, the installation wizard assigns the default ports. The installation wizard does not display a warning for lines with syntax errors.
- If you misspell a component name, then the installation wizard assigns the default port for the component. Names of components in the file are case-sensitive. The installation wizard does not display a warning for lines with unrecognized names.
- If you enter a nonnumeric value for the port number, then the installation wizard ignores the line and assigns the default port number for the component. It does this without displaying any warning.
- If you misspell the parameter on the command line, then the installation wizard does not display a warning. It continues and assigns default ports to all components.
- If you enter a relative path to the staticports.ini file (for example, ./staticports.ini) in the command line, then the installation wizard does not find the file. It continues without displaying a warning and it assigns default ports to all components. You must enter a full path to the staticports.ini file.
2.1.7 What Data Files Are Created While Configuring Oracle Management Repository?

The following are the data files created while configuring Oracle Management Repository:

<table>
<thead>
<tr>
<th>Data File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgmt.dbf</td>
<td>Stores information about the monitored targets, their metrics, and so on.</td>
</tr>
<tr>
<td>mgmt_ecm_depot1.dbf</td>
<td>Stores configuration information collected from the monitored targets.</td>
</tr>
<tr>
<td>mgmt_ad4j.dbf</td>
<td>Stores monitoring data related to JVM Diagnostics and Application Dependency Performance (ADP).</td>
</tr>
</tbody>
</table>

2.1.8 How Do You Delete Data Files?

To delete the data files, you must drop the SYSMAN/MDS schema. To do so, run the following command from the OMS home.

```
$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -action dropall -dbUser <repository_database_user> -dbPassword <repository_database_password> -dbRole <repository_database_user_role> -mwHome <middleware_home> -mwOraHome <oms_home> -oracleHome <oms_home>
```

**Note:**
- For Microsoft Windows, invoke RepManager.bat.
- If you are dropping the schemas that belong to a 10g Release 2 (10.2.x.x) Management Repository, then run previous command without these arguments:
  ```
  -mwHome <middleware_home> -mwOraHome <middleware_ora_home> -oracleHome <OMS_HOME>
  ```
- The action `dropall` might not drop all the repository objects. For learn more about this issue and the workaround to be used, see *My Oracle Support* note 1365820.1.

After dropping the schema, manually delete the database files `mgmt.dbf` and `mgmt_ecm_depot1.dbf`. You can find these files by running the following command as SYS:

```
SELECT FILE_NAME FROM DBA_DATA_FILES WHERE UPPER (TABLESPACE_NAME) LIKE 'MGMT%';
```

*Table 2–2* describes the `action` options that are supported by the different versions of RepManager.
2.2 Understanding Oracle WebLogic Server Requirement

Enterprise Manager Cloud Control requires Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24+.

If Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24+ are NOT already installed in your environment, then the installation wizard automatically installs them for you while installing a new Enterprise Manager Cloud Control.

This section describes some important aspects related to Oracle WebLogic Server that you must know before you install Enterprise Manager Cloud Control.

In particular, this section covers the following:
- How Do I Verify Whether Oracle WebLogic Server Is Installed?
- Is Oracle WebLogic Server Cluster Supported?
- If Oracle WebLogic Server Already Exists, Is the Existing Domain Used?
- When and Why Do You Need Oracle WebLogic Server Credentials?
- When and Why Do You Need Node Manager Credentials?
- How Do You Find Admin Server Port After Installing Enterprise Manager?
- How Do You Verify Whether Admin Server Is Running?
- How Do You Start Admin Server?

### 2.2.1 How Do I Verify Whether Oracle WebLogic Server Is Installed?

To verify whether Oracle WebLogic Server is installed, check the following file in the Oracle WebLogic Server home:

---

### Table 2–2 RepManager Support for -action dropall Command

<table>
<thead>
<tr>
<th>RepManager Version</th>
<th>Command Supported</th>
</tr>
</thead>
</table>
| RepManager 12.1   | -action dropall
|                   | Drops SYSMAN, SYSMAN_MDS, APM, OPSS, EMRUNTIME, and SYSMAN_RO. |
|                   | Note: The action dropall might not drop all the repository objects. For learn more about this issue and the workaround to be used, see My Oracle Support note 1365820.1. |
|                   | -action drop
|                   | Drops only SYSMAN. |
| RepManager 11.1   | -action dropall
|                   | Drops only SYSMAN and SYSMAN_MDS. |
|                   | Note: The action dropall might not drop all the repository objects. For learn more about this issue and the workaround to be used, see My Oracle Support note 1365820.1. |
|                   | -action drop
|                   | Drops only SYSMAN. |
| RepManager 10.2.0.5 | -action drop
|                   | Drops only SYSMAN. |
Understanding Oracle WebLogic Server Requirement

The following is the sample output of the log.txt file:

```
release 10.3.5.0 [Added]
   |_____Common Infrastructure Engineering 7.1.0.0 [Added]
   |_____Uninstall [Added]
   |_____Patch Client [Added]
   |_____Patch Attachment Facility [Added]
   |_____Clone Facility [Added]
   |_____WebLogic Server 10.3.5.0 [Added]
   |   |_____Core Application Server [Added]
   |   |_____Administration Console [Added]
   |   |_____Configuration Wizard and Upgrade Framework [Added]
   |   |_____Web 2.0 HTTP Pub-Sub Server [Added]
   |   |_____WebLogic SCA [Added]
   |   |_____WebLogic JDBC Drivers [Added]
   |   |_____Third Party JDBC Drivers [Added]
   |   |_____WebLogic Server Clients [Added]
   |   |_____WebLogic Web Server Plugins [Added]
   |   |_____UDDI and Xquery Support [Added]
   |   |_____Server Examples [Added]
   |   |_____Evaluation Database [Added]
   |   |_____Workshop Code Completion Support [Added]
   |_____Oracle Configuration Manager 10.3.3.1 [Added]
   |   |_____Data Collector [Added]
   |_____Oracle Coherence 3.6.0.3 [Not Installed]
   |   |_____Coherence Product Files [Not Installed]
   |   |_____Coherence Examples [Not Installed]
```

2.2.2 Is Oracle WebLogic Server Cluster Supported?

Oracle WebLogic Server cluster consists of multiple Oracle WebLogic Servers running simultaneously and working together to provide increased scalability and reliability. A cluster appears to be a single Oracle WebLogic Server instance. The server instances that constitute a cluster can run on the same host, or be located on different hosts.

You can install Enterprise Manager Cloud Control on an Oracle WebLogic Server Cluster, however, you cannot take advantage of the cluster configurations.

2.2.3 If Oracle WebLogic Server Already Exists, Is the Existing Domain Used?

If Oracle WebLogic Server already exists, then the existing domain is NOT used. Instead, the Enterprise Manager Cloud Control Installation Wizard creates a new domain and deploys the Enterprise Manager Cloud Control software to it.

2.2.4 When and Why Do You Need Oracle WebLogic Server Credentials?

While installing or upgrading to Enterprise Manager Cloud Control, you are prompted to enter the Oracle WebLogic Server credentials (user name and password). The credentials are used for creating the WebLogic domain and other associated components such as the Admin Server, the managed server, and the node manager.

The WebLogic user name is the default user name that will be used as the administrative user for the WebLogic Domain. By default, the user name is **weblogic**. And the WebLogic password is the password for this default administrative user account.
2.2.5 When and Why Do You Need Node Manager Credentials?

While installing or upgrading to Enterprise Manager Cloud Control, you are prompted to enter the Node Manager password for the default Node Manager user account, which is `nodemanager`. The password is used for configuring the Node Manager. A Node Manager enables you to start, shut down, or restart an Oracle WebLogic Server instance remotely, and is recommended for applications with high availability requirements.

2.2.6 How Do You Find Admin Server Port After Installing Enterprise Manager?

To find the Admin Server port, view the value set for the `AS_HTTPS_PORT` parameter in the `emgc.properties` file. This file is available in the Oracle Management Service Instance Base location.

For example,

/DATA/oracle/Middleware/gc_inst/em/EMGC_OMS1/emgc.properties

2.2.7 How Do You Verify Whether Admin Server Is Running?

To install an additional OMS, the Admin Server that is used by the first OMS must be up and running. To verify whether the Admin Server is running, access the Admin Server console using the following URL:

https://host:port/console

Here, host and port are values specified in the `EM_INSTANCE_HOST` and `AS_HTTPS_PORT` parameters, respectively, in the `emgc.properties` file. This properties file is available in the following location, that is, in the OMS home (first OMS) that was initially installed:

$<MIDDLEWARE_HOME>/gc_inst/em/EMGC_OMS1/emgc.properties

2.2.8 How Do You Start Admin Server?

You can start the Admin Server by running the following command. Although the command is used essentially to start the OMS, the command in turn starts the Admin Server on which that OMS is running. So run this command even if you know that the OMS is already running.

```bash
emctl start oms
```

2.3 Understanding Installation Directories

This section describes the installation directories that need to be entered while installing Enterprise Manager Cloud Control or any of its core components. In particular, this section covers the following:

- **What Is Oracle Inventory Directory?**
- **What Is Oracle Middleware Home?**
- **What Is Oracle Management Service Instance Base Location?**
- **What Is Oracle Home?**
- **What Is Agent Base Directory?**
- **What is Agent Instance Directory?**
- **What Is /TMP C:\Temp Directory Used For?**
2.3.1 What Is Oracle Inventory Directory?

If Enterprise Manager Cloud Control is the first Oracle product that you are installing, then the Enterprise Manager Cloud Control Installation Wizard prompts you to enter an inventory directory (also called the `oraInventory` directory).

This inventory directory is used by the installation wizard to place all the installer files and directories on the host. The installation wizard automatically sets up subdirectories for each Oracle product to contain the inventory data.

You can enter the `oraInventory` directory in two ways:

- While installing Enterprise Manager Cloud Control using the installation wizard, you can enter the `oraInventory` directory in the Oracle Inventory screen. When you enter it in this screen, you must also select the appropriate operating system group name that will own the `oraInventory` directories. The group you select must have write permission on the `oraInventory` directories.

- While installing Enterprise Manager Cloud Control in silent mode, that is, without using the installation wizard, you can enter the `oraInventory` directory using the `-invPtrLoc` parameter. This parameter considers the path to a location where the inventory pointer file (`oraInst.loc`) is available. However, this parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

For example,

```
./runInstaller -invPtrLoc /scratch/OracleHomes/oraInst.loc
```

**Note:** Ensure that the `oraInventory` directory is not in a shared location. If it is, change it to a non-shared location.

If you already have an Oracle product installed on the host, then the installation wizard uses the existing `oraInventory` directory that was created while installing that Oracle product. Ensure that you have `write` permission on that directory. To do so, run the installer as the same operating system user as the one who installed the other Oracle product.

**Note:** The `oraInventory` directory is different from `Installation Directory`. For information about `Installation Directory`, see Section 2.3.2.

2.3.2 What Is Oracle Middleware Home?

While installing or upgrading to Enterprise Manager Cloud Control, you are required to enter the Oracle Middleware Home.

`Oracle Middleware Home` (middleware home) is the parent directory that has the Oracle WebLogic Server home, the Java Development Kit, the Web tier instance files, one or more Oracle homes, the OMS instance base directory, and other relevant files. This is where the OMS and the plug-ins are deployed.

For example,

```
/u01/app/Oracle/Middleware
```

If you are installing or upgrading to Enterprise Manager Cloud Control, then:

- If Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24+ are already installed in your environment, then the installation wizard
automatically detects them and displays the absolute path to the middleware home where they are installed.

In this case, validate the middleware home that is detected and displayed by default. If the location is incorrect, then enter the path to the correct location. Ensure that the middleware home you select or enter is a middleware home that does not have any Oracle homes for the OMS and the Management Agent.

- If Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24+ are NOT already installed in your environment, then the installation wizard automatically installs them for you while installing Enterprise Manager Cloud Control.

In this case, enter the absolute path to a directory where you want to have them installed. Ensure that the directory you enter does not contain any files or subdirectories.

For example,

/u01/app/Oracle/Middleware/

---

**Note:** Oracle Middleware Home is different from Oracle Home of OMS or Management Agent. For information about Oracle Home, see Section 2.3.4, "What Is Oracle Home?".

---

### 2.3.3 What Is Oracle Management Service Instance Base Location?

While installing Enterprise Manager Cloud Control, you are required to enter the Oracle Management Service Instance Base Location.

*Oracle Management Service Instance Base Location* is a directory (gc_inst) inside the middleware home where the configuration files of the OMS are stored.

The installation wizard uses its built-in algorithm to identify this location, and displays it for you to validate. If the middleware home is /u01/app/Oracle/Middleware/, then by default, the following is the Oracle Management Service Instance Base Location:

/u01/app/Oracle/Middleware/gc_inst

You can either accept the default location or specify another location that has *write* permission.

---

**Note:** For information about Oracle Middleware Home, see Section 2.3.2.

---

### 2.3.4 What Is Oracle Home?

*Oracle Home* or Oracle home is the directory where the OMS, the Management Agent, and the Oracle Management Plug-ins (plug-ins) are installed. Table 2–3 lists the default Oracle homes are created.

**Table 2–3  Oracle Homes of OMS, Management Agent, Management Plug-Ins**

<table>
<thead>
<tr>
<th>Component</th>
<th>Default Oracle Home</th>
<th>Sample Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Management</td>
<td>$&lt;MIDDLEWARE_HOME&gt;/oms</td>
<td>/u01/app/Oracle/Middleware/cms</td>
</tr>
<tr>
<td>Service</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Understanding Installation Directories

### 2.3.5 What Is Agent Base Directory?

While installing a standalone Management Agent using the Add Host Targets Wizard, you are required to enter an installation base directory, which is essentially the agent base directory.

Agent Base Directory is a directory where the Management Agent home is created.

For example, if the agent base directory is `/u01/app/Oracle`, then the Management Agent home is created as `/u01/app/Oracle/core/12.1.0.1.0`.

### 2.3.6 What is Agent Instance Directory?

*Agent Instance Directory* is a directory (`agent_inst`) created for storing all Management Agent-related configuration files.

Agent Instance Directory is created inside the agent base directory.

For example, if the agent base directory is `/u01/app/Oracle/`, then by default, the following is the agent instance directory:

`/u01/app/Oracle/agent_inst`

### 2.3.7 What Is /TMP C:\Temp Directory Used For?

When you invoke the Enterprise Manager Cloud Control Installation Wizard, it automatically copies some executable files and link files to a temporary directory on the host.
For example, the default /tmp directory on UNIX hosts, and C:\Temp on Microsoft Windows hosts.

If the host is set to run cron jobs along with many other processes that may be running periodically, then these jobs attempt to clean up the default temporary directory, thereby deleting some files and causing the installation wizard to fail.

If there are any cron jobs or processes that are automatically run on the hosts to clean up the temporary directories, then ensure that you set the TMP or TEMP environment variable to a location that is different from the default location. Ensure that the non-default location you set is secure on the hard drive, that is, the non-default location is a location where cleanup jobs are not run. Also ensure that you have write permissions on this alternative directory.

This must be done before you run the installer to invoke the Enterprise Manager Cloud Control Installation Wizard. (For UNIX operating systems, you invoke runInstaller, and for Microsoft Windows, you invoke setup.exe).

---

**Note:** Specifying an alternative temporary directory location is not mandatory, and is required only if any cron jobs are set on the computers to clean up the /tmp directory.

---

### 2.4 Understanding Additional Components Installed

This section describes the additional components that are installed along with the core components of Enterprise Manager Cloud Control. In particular, this section covers the following:

- **What Is Oracle Configuration Manager?**
- **What Are Software Updates?**

#### 2.4.1 What Is Oracle Configuration Manager?

With Enterprise Manager Cloud Control, you can choose to enable Oracle Configuration Manager. Alternatively, you can enable it after installing Enterprise Manager Cloud Control.

Oracle Configuration Manager automatically collects configuration information from your environment at regular intervals and uploads it to Oracle repository. This helps Oracle maintain up-to-date information about your environment, identify security vulnerabilities, quickly diagnose support issues, and offer better solutions consistently.

However, no business or personal information is collected and uploaded, except for local contact name in the event of transmission problems. Oracle guarantees that all the information collected will be kept strictly confidential and under no circumstances will this information be shared with any other party.

Oracle recommends that the host from where you are running the installation wizard have a connection to the Internet so that the configuration information can be automatically collected and uploaded to My Oracle Support.

If the host from where you are running the installation wizard has a connection to the Internet, then on the Oracle Configuration Manager screen of the installation wizard, enter the My Oracle Support user name (or e-mail address) and password.

Otherwise, enter only the e-mail address and leave the other fields blank. After you complete the installation, manually collect the configuration information and upload it...
to My Oracle Support. To understand how the configuration information can be manually collected and uploaded, see the steps outlined in Section 2.4.1.1.

If you want to enable it after installing Enterprise Manager Cloud Control, then see Section 2.4.1.2.

### 2.4.1 Manually Collecting and Uploading Configuration Information

To manually collect the configuration information, follow these steps:

1. Navigate to the OMS home and run the following command:
   
   ```bash
   $<OMS_HOME>/ccr/bin/emCCR collect
   ```
   
   For Oracle Configuration Manager 10.2.7 and higher, the collected configuration information is stored in the `/ccr/hosts/state/upload/ocmconfig.jar` file. For lower versions of Oracle Configuration Manager, the collected configuration information is stored in the `/ccr/state/upload/ocmconfig.jar` file. When you run the same command next time, the ocmconfig.jar file gets overwritten with fresh data. Therefore, at any point, you will see only one ocmconfig.jar file.

2. Upload the `ocmconfig.jar` file to a Service Request on My Oracle Support.

3. Repeat Step (1) and Step (2) from the Management Agent home.

### 2.4.1.2 Enabling Oracle Configuration Manager After Installing Enterprise Manager Cloud Control

To enable Oracle Configuration Manager at a later point, do the following:

1. Set the environment variable `ORACLE_CONFIG_HOME` to the Oracle Management Service Instance Base. Oracle Management Service Instance Base is the directory where the configuration files of the OMS are created.
   
   - In bash terminal, run the following command:
     
     ```bash
     export ORACLE_CONFIG_HOME=<absolute_path_to_gc_inst>
     ```
   
   - In other terminals, run the following command:
     
     ```bash
     setenv ORACLE_CONFIG_HOME <absolute_path_to_gc_inst>
     ```

2. From the OMS home, run the following command:

   ```bash
   $<OMS_HOME>/ccr/bin/setupCCR
   ```

3. From the Management Agent home, run the following command:

   ```bash
   $<AGENT_HOME>/ccr/bin/setupCCR
   ```

### 2.4.2 What Are Software Updates?

While installing or upgrading Enterprise Manager Cloud Control, you can choose to install software updates.

Software updates include interim patches, critical patch updates, prerequisite updates, install updates, and so on released by Oracle periodically.

### 2.4.2.1 How Can You Download the Software Updates?

You can either manually download the software updates or have the Enterprise Manager Cloud Control Installation Wizard automatically download them for you.
Manual Download by User: If you choose to manually download the software updates yourself, then run the following utility and provide the required information:

```
<DVD>/install/utility/downloadSWUpdates -u <My_Oracle_Support_Username>
```

**Note:** If you want to know about the different arguments that can be passed with the utility, then run the following command:

```
<DVD>/install/utility/downloadSWUpdates -h
```

Manual download option is best suited when you are installing Enterprise Manager Cloud Control in silent mode. Oracle recommends you to use this option even while installing in graphical mode.

For information on where the software updates get downloaded by default, and for information on how to download to a custom location, see Section 2.4.2.3.

Automatic Download by Installation Wizard: If you choose to have the Enterprise Manager Cloud Control Installation Wizard automatically download the software updates, then on the Software Updates screen of the installation wizard, enter the My Oracle Support account user name and password. The installation wizard will connect to My Oracle Support and automatically download the updates from there.

### 2.4.2.2 When Can You Apply the Software Updates?

You can apply the software updates in one of the following ways depending on the download mechanism:

- **Manual Download by User:** If you have manually downloaded the software updates, then:
  - **In Graphical Mode:** On the Software Updates screen of the installation wizard, select Search for Updates, and then, select Local Directory. Enter the location where the updates are available, and click Search for Updates. To search the computer and select the location, click Browse.
  - **In Silent Mode:** Before you invoke the installer using the response file, edit the response file to set the INSTALL_UPDATES_SELECTION parameter to "staged". Then, for the STAGE_LOCATION parameter, enter the absolute path to the location where the updates are available.

- **Automatic Download by Installation Wizard:** If you want to automatically download and apply the software updates from My Oracle Support, then:
  - **In Graphical Mode:** On the Software Updates screen of the installation wizard, select Search for Updates, and then, select My Oracle Support. Enter the My Oracle Support account user name and password, and click Search for Updates. Once the search results appear with patch numbers and their details, click the patch number to view the ReadMe associated with that patch.
  - **In Silent Mode:** Before you invoke the installer using the response file, edit the response file to set the INSTALL_UPDATES_SELECTION parameter to "download". Then, enter your My Oracle Support credentials in the MYORACLESUPPORT_USERNAME_FOR_SOFTWAREUPDATES and the MYORACLESUPPORT_PASSWORD_FOR_SOFTWAREUPDATES parameters.
Oracle strongly recommends you to apply them while the installation is in progress for the following reasons:

- Keeping track of the availability of software updates at the time of installation is difficult
- Keeping track of the patch numbers, and manually downloading them and applying them after installation is a cumbersome process

Automatically downloading and applying the software updates during installation saves time and effort, and ensures that you do not miss out on important software updates.

### 2.4.2.3 Where Are the Software Updates Downloaded?

By default, the software updates are downloaded and stored in a subdirectory titled `Updates` in the temporary directory. For example, `/tmp/Updates`.

If you do not want the software updates to be downloaded in the temporary directory location, then run the following command and enter a download location of your choice:

```
<DVD>/install/utility/downloadSWUpdates -u <My Oracle Support Username> -s <Custom Download Location>
```

The following options can be passed with this script:

- `-u <My Oracle Support Username>`
- `-p <My oracle Support Password>`
- `-ph <Proxy Host> [Optional Parameter]`
- `-po <Proxy Port> [Optional Parameter]`
- `-pu <Proxy Username> [Optional Parameter]`
- `-pp <Proxy Password> [Optional Parameter]`
- `-s <Download Location> [Optional Parameter]`

### 2.5 Understanding Configuration Assistants

This section describes the postinstallation activities that are performed by the installation wizard. In particular, this section covers the following:

- **What Are Configuration Assistants?**
- **What Configuration Assistants Are Run by the Installation Wizard?**
- **What Do You Do When Configuration Assistants Fail?**

#### 2.5.1 What Are Configuration Assistants?

While installing or upgrading to Enterprise Manager Cloud Control in either GUI mode (using the installation wizard) or silent mode (using a response file), a set of configuration assistants are run at the end of the installation process to configure the installed or upgraded components. Your installation or upgrade process is complete only after all the components are configured using these configuration assistants.
2.5.2 What Configuration Assistants Are Run by the Installation Wizard?

Table 2–4 lists the configuration assistants run by the installation wizard for the different installation types.

Table 2–4  Configuration Assistants Run for Different Installation Types

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Configuration Assistant</th>
</tr>
</thead>
</table>
| Create a new Enterprise Manager System (Install type offered by the Enterprise Manager Cloud Control installation Wizard) | ■ Plugins Prerequisites Check  
■ Repository Configuration  
■ MDS Schema Configuration  
■ OMS Configuration  
■ Plugins Deployment and Configuration  
■ Plugins Inventory Migration  
■ Oracle Configuration Manager Repeater Configuration  
■ Agent Configuration Assistant |
If an optional configuration assistant fails, then the installation wizard ignores the failure and runs to the next configuration assistant automatically. However, if a mandatory configuration assistant fails, then the installation wizard stops the installation process. In this case, you are expected to resolve the issue and rerun the configuration assistant.

Note: For more information on these upgrade options, see the Oracle Enterprise Manager Cloud Control Upgrade Guide.
For information about the log files to review when a configuration assistant fails, and the actions to be taken to resolve the issue, see Appendix E.

2.6 Understanding Prerequisite Checks

Every time you install Enterprise Manager Cloud Control using the installation wizard, a set of prerequisite checks are run to verify if the environment meets the minimum requirements for a successful installation. The installation wizard checks for a variety of things including required operating system patches, operating system packages, kernel parameters, and so on.

The following sections describe these prerequisite checks. In particular, this section covers the following:

- What Prerequisite Checks Are Run by Default?
- How Can You Run Prerequisite Checks in Standalone Mode?

2.6.1 What Prerequisite Checks Are Run by Default?

The following are the default prerequisite checks that are run for different installation types — Creating a New Enterprise Manager System and Upgrading an Existing Enterprise Manager System:

- Prerequisite check for verifying whether the installation is being done on a certified operating system.
- Prerequisite check for verifying whether all the certified packages and libraries have been installed.
- Prerequisite check for verifying whether the glibc package has been installed. *(Not applicable for Management Agent installation)*
- Prerequisite check for verifying whether there is sufficient disk space in the \texttt{tmp} directory. *(Not applicable for Management Agent installation)*
- Prerequisite check for verifying whether there is sufficient disk space in the inventory directory.
- Prerequisite check for verifying whether there is write permission in the inventory directory. *(Not applicable for OMS installation)*
- Prerequisite check for verifying whether the software is compatible with the current operating system.
- Prerequisite check for verifying whether there is sufficient physical memory.
- Prerequisite check for verifying the required \texttt{ulimit} value. *(Not applicable for Management Agent installation)*
- Prerequisite check for verifying the host name.
- Prerequisite check for verifying whether the \texttt{LD_ASSUME_KERNEL} environment variable is set. *(Not applicable for Management Agent installation)*
- Prerequisite check for verifying whether proper timezone is set.
- Prerequisite check for verifying whether there is 4 GB of swap space. *(Not applicable for Management Agent installation)*
2.6.2 How Can You Run Prerequisite Checks in Standalone Mode?

You can run the prerequisite checks in standalone mode before invoking the installation wizard. This helps you identify and resolve issues that might otherwise cause the installation to fail.

Table 2–5 shows the commands you need to run to run the prerequisite checks in standalone mode:

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>■ Create a New Enterprise Manager System</td>
<td><code>&lt;Software_Location&gt;/install/runInstaller -prereqchecker PREREQ_CONFIG_LOCATION=&lt;Software_Location&gt;/stage/prereq -entryPoint &quot;oracle.sysman.top.oms_Core&quot; -prereqLogLoc &lt;absolute_path_to_log_location&gt; -silent -waitForCompletion</code></td>
</tr>
<tr>
<td>■ Upgrade an Existing Enterprise Manager System</td>
<td></td>
</tr>
<tr>
<td>■ Install Software Only</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** On Microsoft Windows, replace `/runInstaller` with `setup.exe`. Also, `<Software_Location>` mentioned in the commands in Table 2–5 refer to the location where the Enterprise Manager software is available. For example, DVD. If you have downloaded the software from Oracle Technology Network (OTN), then enter the absolute path to that downloaded location.

2.7 Understanding Limitations of Enterprise Manager Cloud Control

This section describes the limitations you might face while using Enterprise Manager Cloud Control. In particular, this section covers the following:

- Can You Access Unlicensed Components?
- What Are the Limitations with DHCP-Enabled Machines?

2.7.1 Can You Access Unlicensed Components?

Although the installation media in your media pack contain many Oracle components, you are permitted to use only those components for which you have purchased licenses. Oracle Support Service does not provide support for components for which licenses have not been purchased.

For more information, access the Enterprise Manager documentation library at the following URL and view the Oracle Enterprise Manager Licensing Information Guide:

2.7.2 What Are the Limitations with DHCP-Enabled Machines?

Do NOT run the OMS on a computer that is DHCP enabled. Oracle strongly suggests that you use a static host name or IP address assigned on the network for Enterprise Manager Cloud Control components to function properly.

For more information, refer to My Oracle Support Note 428665.1 at:

https://support.oracle.com/
2.8 Understanding Other Miscellaneous Concepts

This section covers miscellaneous concepts related to the installation of Enterprise Manager Cloud Control. In particular, this section covers the following:

- What Is a Host List File?
- What Scripts Are Run During the Installation Process?

2.8.1 What Is a Host List File?

While using the Add Host Targets Wizard, you can enter the hosts on which you want to install Oracle Management Agent, in two ways — you can either enter the host name or the IP address, or select an external file that contains a list of hosts mentioned.

If you choose to select an external file, then ensure that the file contains only the host name (Example 2–1), or the host name followed by the platform name (Example 2–2).

**Example 2–1  External File with Only the Host Names**

host1.example.com
host2.example.com

**Example 2–2  External File with the Host Names and Platform Names**

host1.example.com linux
host2.example.com aix

2.8.2 What Scripts Are Run During the Installation Process?

At least once during or after the installation of Enterprise Manager Cloud Control or Management Agent, you are prompted to log in as a root user and run oraInstRoot.sh, allroot.sh, or root.sh. (Note that on Microsoft Windows, these will be .bat scripts.) You must log in as a root user because the scripts edit files in the /etc directory and create files in the local bin directory (/usr/local/bin, by default).

After every installation, a check is performed to identify the Central Inventory (oraInventory) directory. The Central Inventory directory is a directory that is automatically created by the installation wizard when an Oracle product is installed on a host for the very first time.

---

**Note:** Ensure that the central inventory location you specify must NOT be on a shared file system. If it is already on a shared file system, then switch over to a non-shared file system.

---

- If you have NOT installed an Oracle product before on the host, then run the oraInstRoot.sh (or oraInstRoot.bat on Microsoft Windows) script from the Central Inventory:

  $Home/oraInventory/oraInstRoot.sh

  The oraInstRoot.sh script is run to create the oraInst.loc file. The oraInst.loc file contains the Central Inventory location.

- However, if you already have an Oracle product on the host, then run allroot.sh (or allroot.bat on Microsoft Windows) script from the OMS home:
<OMS_HOME>/allroot.sh
Part II

Installing Enterprise Manager System

This part describes the different ways of silently installing Enterprise Manager Cloud Control. In particular, this part contains the following chapters:

- Chapter 3, "Installing Enterprise Manager System in Silent Mode"
- Chapter 4, "Installing Enterprise Manager Software Now and Configuring Later"
3

# Installing Enterprise Manager System in Silent Mode

This chapter describes how you can install Enterprise Manager Cloud Control while utilizing an existing, certified Oracle Database, in silent mode. In particular, this section covers the following:

- Overview
- Before You Begin
- Prerequisites
- Installation Procedure
- After You Install

---

**Note:** Do NOT install the Enterprise Manager system on an OCFS file system. This file system is not supported.

## 3.1 Overview

If you are familiar with the way Enterprise Manager is installed, and if you want to install it without facing any interview screens of the installation wizard, then the best option is to install it in silent mode.

In silent mode, you use a response file that captures all the information you need to successfully complete an installation. This saves time and effort in one way because the installation details are captured just once, and in a single file that can be circulated and reused for installation on multiple other hosts.

However, whether you install Enterprise Manager in graphical mode or silent mode, the installation process, the installed components, and the configuration process remain the same. Therefore, silent mode of installing Enterprise Manager is only an option offered to you.

To understand what components are installed, what configuration assistants are run, and how the directory structure will look after installation, see the chapter on installing Enterprise Manager system in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.

## 3.2 Before You Begin

Before you begin, keep these points in mind:
You must ensure that you have the latest Enterprise Manager Cloud Control software:

- Ensure that you have the Enterprise Manager Cloud Control software released in February 2012 - Enterprise Manager Cloud Control 12c Release 1 (12.1.0.1) (With Bundle Patch 1). You can download it from the following URL:
  

- If you had downloaded and installed the Enterprise Manager Cloud Control software released in October 2011, then apply the following patches, which are part of the Bundle Patch 1 released in February 2012, on the OMS and the Management Agent. In this case, you do not have to download the one released in February 2012.

  * On OMS, apply the patch 13242773.
  * On Management Agent, apply the patches 13242776, 13491785, 13550565, and 13550561.

  To apply these patches, you can either read the My Oracle Support note 1395505.1 or the ReadMes packaged with the patches.

- If you had downloaded the Enterprise Manager Cloud Control software released in October 2011, but not installed it yet, then discard that software and download the one released in February 2012 - Enterprise Manager Cloud Control 12c Release 1 (12.1.0.1) (With Bundle Patch 1). You can download it from the following URL:

Ensure that there are no white spaces in the name of the directory where you download and run the Enterprise Manager Cloud Control software from. For example, do not download and run the software from a directory titled Program Files because there is a white space between the two words of the directory name.

You can install Enterprise Manager Cloud Control only on a single host—locally on the server where you invoke the installation wizard with a response file. You cannot install on multiple or remote hosts.

To invoke the installation wizard on UNIX platforms, run runInstaller. To invoke on Microsoft Windows platforms, run setup.exe.

Enterprise Manager Cloud Control 12c can communicate only with Oracle Management Agent 12c, and not with any earlier release of the Management Agent.

You must not set the ORACLE_HOME and ORACLE_SID environment variables. You must ensure that the Oracle directories do NOT appear in the PATH.

The Enterprise Manager Cloud Control Installation Wizard installs Java Development Kit (JDK) 1.6 v24 and Oracle WebLogic Server 11g Release 1 (10.3.5), but only if they do not exist in your environment.

If Oracle WebLogic Server 11g Release 1 (10.3.5) does not exist and if you choose to manually install it, then ensure that you install it using JDK 1.6 v24+ (64-bit version for 64-bit platforms and 32-bit version for 32-bit platforms).

- Download JDK 1.6 v24+ for your platform from the platform vendor’s Web site. For example, download SUN JDK 1.6 v24+ for Linux platforms from
Oracle Web site. Similarly, download the JDK for other platforms from other vendors’ trusted Web sites.

- If you already have JDK, then verify its version by navigating to the `<JDK_Location>/bin` directory and running the following command:
  
  `./java -fullversion`

  To verify whether it is a 32-bit or a 64-bit JDK, run the following command:
  
  `file *`

- JROCKIT is not supported.

- If you want to manually install Oracle WebLogic Server 11g Release 1 (10.3.5) on Linux 64-bit platforms, first install the 64-bit JDK for your platform, and then download and use the `wls1035_generic.jar` file to install Oracle WebLogic Server.
  
  For example,
  
  `<JDK home>/bin/java -d64 -jar <absolute_path_to_wls1035_generic.jar>`

- If you want to manually install Oracle WebLogic Server 11g Release 1 (10.3.5) on Linux 32-bit platforms, then download and use either the `wls1035_linux32.bin` file or the `wls1035_generic.jar` file.
  
  For example,
  
  `<JDK home>/bin/java -jar <absolute_path_to_wls1035_generic.jar>`

- You must follow the instructions outlined in the Oracle® Fusion Middleware Installation Guide for Oracle WebLogic Server to install Oracle WebLogic Server. The guide is available in the Fusion Middleware documentation library available at:
  

- You must ensure that the Oracle WebLogic Server installation is a typical installation, and even if you choose to perform a custom installation, ensure that components chosen for custom installation are the same as the ones associated with a typical installation.

- You must ensure that the user installing the WebLogic Server is the same as the one installing Enterprise Manager Cloud Control.

If you are installing Enterprise Manager Cloud Control in a middleware home that is on an NFS-mounted drive, then ensure that you maintain the lock file in a local file system and not in that NFS-mounted location. To do so, modify the lock file location in the `httpd.conf` file to map to a location on a local file system.

1. Stop the OMS:
   
   `<OMS_HOME>/bin/emctl stop oms -all`

2. Open the following file:
   
   `<WEBTIER_INSTANCE_HOME>/config/OHS/ohs1/httpd.conf`

**Note:** Oracle recommends you to take a backup of this file before editing it.
3. Search for sections related to the modules mpm_prefork_module and mpm_worker_module. In both these sections, modify the value for the LockFile parameter so that the path leads to a location on the local file system.

   <IfModule mpm_prefork_module>
   StartServers 5
   MinSpareServers 5
   MaxSpareServers 10
   MaxClients 150
   MaxRequestsPerChild 0
   AcceptMutex fcntl
   LockFile "${ORACLE_INSTANCE}/diagnostics/logs/${COMPONENT_TYPE}/${COMPONENT_NAME}/http_lock"
   </IfModule>
   ....
   <IfModule mpm_worker_module>
   StartServers 2
   MaxClients 150
   MinSpareThreads 25
   MaxSpareThreads 75
   ThreadsPerChild 25
   MaxRequestsPerChild 0
   AcceptMutex fcntl
   LockFile "${ORACLE_INSTANCE}/diagnostics/logs/${COMPONENT_TYPE}/${COMPONENT_NAME}/http_lock"
   </IfModule>

4. Save the changes.

5. Restart the OMS:

   <OMS_HOME>/bin/emctl start oms

   - You must ensure that the Oracle WebLogic Server 11g Release 1 (10.3.5) installed by the Enterprise Manager Cloud Control Installation Wizard or by you is dedicated for Enterprise Manager Cloud Control. You must not have any other Oracle Fusion Middleware product installed in that middleware home.

   Enterprise Manager Cloud Control cannot coexist with any Oracle Fusion Middleware product in the same middleware home because the ORACLE_COMMON property is used by both the products.

   - Do not install on a symlink. If you do, then you will not be able to clone this OMS later.

   - By default, the software updates cannot be applied during installation because the INSTALL_UPDATES_SELECTION variable in the response file is set to "skip". However, if you want to apply them during installation, then you can modify this variable as described in Table 3–2.

   - Oracle offers bug fixes for a product based on the Oracle Lifetime Support Policy. When the license period expires for a particular product, the support for bug fixes offered by Oracle also ends. For more information, see the Oracle Lifetime Support Policy available at:

     When determining supportability and certification combinations for an Enterprise Manager Cloud Control installation, you must consider Enterprise Manager Cloud Control’s framework components as well as the targets monitored by Enterprise Manager Cloud Control. Oracle recommends keeping your Cloud Control
components and targets updated to the latest certified versions in order to receive code fixes without having to purchase an Extended Support license.

- You must upgrade all existing EMCLI clients of the earlier release to 12c Release 1 so that they can work with Enterprise Manager Cloud Control. This means, you must discard the old one and set up a new one.

For information about setting up a new EMCLI client, see the Enterprise Manager Command Line Interface Download page within the Cloud Control console. To access that page, in Cloud Control, from the Setup menu, select My Preferences, and then, click Command Line Interface.

- You can find the OMS and Management Agent entries in the /etc/oragchomelist file for all UNIX platforms except HPUNIX, HPia64, Solaris Sparc.

On HPUNIX, HPia64, Solaris Sparc platforms, the entries are present in /var/opt/oracle/oragchomelist.

- As a prerequisite, you must have an existing Oracle Database to configure the Management Repository. This database can also have the Automatic Memory Management (AMM) feature enabled.

### 3.3 Prerequisites

Meet the prerequisites described in the chapter on installing Enterprise Manager system that is available in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

### 3.4 Installation Procedure

This section covers the following:

- Installing Enterprise Manager
- Using Advanced Installer Options
- Understanding the Limitations
- Editing Response File for Installing Software

#### 3.4.1 Installing Enterprise Manager

To install a complete Enterprise Manager system in silent mode, follow these steps:

---

**Note:** Oracle recommends you to run the EM Prerequisite Kit before invoking the installer to ensure that you meet all the repository requirements beforehand. This helps you set up your Management Repository beforehand without starting the installation or upgrade process. For information on the kit, to understand how to run it, and to know about the prerequisite checks it runs, see Oracle Enterprise Manager Basic Installation Guide.

---

1. Copy the following response file to an accessible location on your local host:

```plaintext
<Software_Location>/response/new_install.rsp
```

In this command, `<Software_Location>` is either the DVD location or the location where you have downloaded the software kit.
2. Edit the response file and enter appropriate values for the variables described in Table 3–2.

3. Invoke the installer as a user who belongs to the oinstall group you created. For information about creating operating system groups and users, see the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

   - If this is the first Oracle product you are installing on the host, then run the following command:

     ```
     ./runInstaller -silent -responseFile <absolute_path>/new_install.rsp [-invPtrLoc <absolute_path_to_oraInst.loc>]
     ```

     **Note:** The central inventory location you enter must NOT be on a shared file system. The -invPtrLoc parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

   - Otherwise, run the following command:

     ```
     ./runInstaller -silent -responseFile <absolute_path>/new_install.rsp
     ```

     **Note:** To invoke the installation wizard on UNIX platforms, run `runInstaller`. To invoke on Microsoft Windows platforms, run `setup.exe`.

     **Note:** For information about the additional, advanced options you can pass while invoking the installer, refer to Section 3.4.2.

     **Note:** When you invoke `runInstaller` or `setup.exe`, if the Enterprise Manager Cloud Control Installation Wizard does not appear, then it is possible that you do not access to the `/stage` directory.

     There is a classpath variable that the installation wizard computes for OPatch as `../stage/Components/`, and when the TEMP variable is set to `/tmp`, the installation wizard tries to look for the opatch JAR file in the `/tmp/..stage` directory, which is equivalent to `/stage`. However, if you do not have the permission on `/stage`, then the installation wizard can hang. Under such circumstances, verify if you have access to the `/stage` directory. If you do not have access to it, then set the TEMP variable to a location where the install user has access to, and then relaunch the installation wizard.
3.4.2 Using Advanced Installer Options

The following are some additional, advanced options you can pass while invoking the installer:

- If you want to install on a host that has multiple host names (for example, virtual hosts), then pass the fully qualified host name using the `ORACLE_HOSTNAME` argument while invoking the installer. Ensure that the host name you enter does not have underscores.

  For example:

  ```
  ./runInstaller ORACLE_HOSTNAME=example.com -silent -responseFile <absolute_path>/new_install.rsp
  ```

  **Note:** Ensure that the host name you enter does not have underscores.

- By default, a Provisioning Advisor Framework (PAF) staging directory is created for copying the Software Library entities related to the deployment procedures. By default, this location is the scratch path location (`/tmp`). The location is used only for provisioning activities—entities are copied for a deployment procedure, and then, deleted once the deployment procedure ends.

  If you want to override this location with a custom location, then invoke the installer with the `EM_STAGE_DIR` option, and enter a unique custom location.

  For example,

  ```
  ./runInstaller EM_STAGE_DIR=/home/john/software/oracle/pafdir -silent -responseFile <absolute_path>/new_install.rsp
  ```

- After the installation ends successfully, the OMS and the Management Agent start automatically. If you do not want them to start automatically, then invoke the installer with `START_OMS` and `b_startAgent` options, and set them to `TRUE` or `FALSE` depending on what you want to control.

  For example, if you do not want the Management Agent to start automatically, then run the following command:

  ```
  ./runInstaller START_OMS=TRUE b_startAgent=FALSE -silent -responseFile <absolute_path>/new_install.rsp
  ```

  To understand the limitations involved with this advanced option, see Section 3.4.3.
3.4.3 Understanding the Limitations

When you use `START_OMS` and `b_startAgent` as advanced options to control the way the OMS and the Management Agent start up automatically, sometimes the Management Agent and the host on which it was installed do not appear as targets in the Cloud Control console.

Table 3–1 lists the different combinations of these advanced options, and describes the workaround to be followed for each combination:

**Table 3–1  Advanced Options and Workarounds**

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Workaround</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>START_OMS=FALSE</code></td>
<td></td>
</tr>
</tbody>
</table>
| `b_startAgent=FALSE`  | 1. Start the OMS:  
|  | `$<OMS_HOME>/bin/emctl start oms`  
| 2. Secure the Management Agent:  
|  | `$<AGENT_HOME>/bin/emctl secure agent`  
| 3. Start the Management Agent:  
|  | `$<AGENT_HOME>/bin/emctl start agent`  
| 4. Add the targets:  
|  | `$<AGENT_HOME>/bin/emctl config agent`  
|  | `addinternaltargets`  
| 5. Upload the targets:  
|  | `$<AGENT_HOME>/bin/emctl upload agent`  |
| `START_OMS=TRUE`  |
| `b_startAgent=FALSE`  | 1. Secure the Management Agent:  
|  | `$<AGENT_HOME>/bin/emctl secure agent`  
| 2. Start the Management Agent:  
|  | `$<AGENT_HOME>/bin/emctl start agent`  
| 3. Add the targets:  
|  | `$<AGENT_HOME>/bin/emctl config agent`  
|  | `addinternaltargets`  
| 4. Upload the targets:  
|  | `$<AGENT_HOME>/bin/emctl upload agent`  |
| `START_OMS=FALSE`  |
| `b_startAgent=TRUE`  | 1. Start the OMS:  
|  | `$<OMS_HOME>/bin/emctl start oms`  
| 2. Secure the Management Agent:  
|  | `$<AGENT_HOME>/bin/emctl secure agent`  
| 3. Add the targets:  
|  | `$<AGENT_HOME>/bin/emctl config agent`  
|  | `addinternaltargets`  
| 4. Upload the targets:  
|  | `$<AGENT_HOME>/bin/emctl upload agent`  |

3.4.4 Editing Response File for Installing Software

Table 3–2 describes what variables you must edit and how you must edit them in the `new_install.rsp` response file for installing Enterprise Manager Cloud Control in silent mode.
Table 3–2    Editing Response File for Installing Enterprise Manager System

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| UNIX_GROUP_NAME                  | Enter the name of the UNIX group you belong to. For example, “dba”  
Note: This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.                                            |
| INVENTORY_LOCATION               | Enter the absolute path to the Central Inventory. For example, /scratch/oracle/oraInventory  
Note: This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.                                           |
| SECURITY_UPDATES_VIA_MYORACLESUPPORT | Enter TRUE if you want to download and install security updates. Then, enter the credentials for the following variables:  
MYORACLESUPPORT_USERNAME  
MYORACLESUPPORT_PASSWORD  
Enter FALSE if you do not want to download and install security updates: |
| DECLINE_SECURITY_UPDATES        | Enter TRUE if you want to decline the security updates. In this case, you should have entered False for SECURITY_UPDATES_VIA_MYORACLESUPPORT.  
Enter FALSE if you do not want to decline the security updates. In this case, you should have entered TRUE for SECURITY_UPDATES_VIA_MYORACLESUPPORT. |
| INSTALL_UPDATES_SELECTION       | By default, this variable is set to "skip" indicating that the software updates will not be installed during installation.  
If you want to install the software updates from My Oracle Support, then set this variable to "download". Then, enter the credentials for the following parameters:  
MYORACLESUPPORT_USERNAME_FOR_SOFTWAREUPDATES  
MYORACLESUPPORT_PASSWORD_FOR_SOFTWAREUPDATES  
If you want to install the software updates from a staged location, then set this variable to "staged". Then, for the STAGE_LOCATION parameter, enter the absolute path, which leads to the Updates directory, where the software updates are available. |
| PROXY_USER                       | Enter the user name that can be used to access the proxy server.  
Note: Applies only if you have set the SECURITY_UPDATES_VIA_MYORACLESUPPORT variable to TRUE and/or the INSTALL_UPDATES_SELECTION variable to "download", and only if your connection to the Internet requires you to connect through a proxy. |
### Table 3–2 (Cont.) Editing Response File for Installing Enterprise Manager System

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROXY_PWD</td>
<td>Enter the password that can be used to access the proxy server. <strong>Note:</strong> Applies only if you have set the <code>SECURITY_UPDATES_VIA_MYORACLESUPPORT</code> variable to <code>TRUE</code> and/or the <code>INSTALL_UPDATES_SELECTION</code> parameter to &quot;download&quot;, and only if your connection to the Internet requires you to connect through a proxy.</td>
</tr>
<tr>
<td>PROXY_HOST</td>
<td>Enter the name of the proxy host. <strong>Note:</strong> Applies only if you have set the <code>SECURITY_UPDATES_VIA_MYORACLESUPPORT</code> variable to <code>TRUE</code> and/or the <code>INSTALL_UPDATES_SELECTION</code> parameter to &quot;download&quot;, and only if your connection to the Internet requires you to connect through a proxy.</td>
</tr>
<tr>
<td>PROXY_PORT</td>
<td>Enter the port used by the proxy server. <strong>Note:</strong> Applies only if you have set the <code>SECURITY_UPDATES_VIA_MYORACLESUPPORT</code> variable to <code>TRUE</code> and/or the <code>INSTALL_UPDATES_SELECTION</code> parameter to &quot;download&quot;, and only if your connection to the Internet requires you to connect through a proxy.</td>
</tr>
<tr>
<td>ORACLE_MIDDLEWARE_HOME_LOCATION</td>
<td>Enter the location where you want the installer to install Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24. For example, <code>/u01/app/Oracle/Middleware</code>. Ensure that the middleware location has <code>write</code> permission. And that this is not an NFS-mounted location. If you have already installed them manually, then enter the location where you have installed them. For more information about this location, see Section 2.3.2. <strong>Note:</strong> Ensure that the middleware home you enter here is used only for Enterprise Manager Cloud Control. Ensure that no other Oracle Fusion Middleware products or components are installed in the same middleware home.</td>
</tr>
<tr>
<td>WLS_ADMIN_SERVER_USERNAME</td>
<td>By default, <code>weblogic</code> is the name assigned to the default user account that is created for the Oracle WebLogic Domain. If you want to accept the default name, then skip this variable. However, if you want to have a custom name, then enter the name of your choice.</td>
</tr>
<tr>
<td>WLS_ADMIN_SERVER_PASSWORD</td>
<td>Enter a password for the WebLogic user account. Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.</td>
</tr>
<tr>
<td>WLS_ADMIN_SERVER_CONFIRM_PASSWORD</td>
<td>Confirm the password for the WebLogic user account.</td>
</tr>
<tr>
<td>NODE_MANAGER_PASSWORD</td>
<td>By default, <code>nodemanager</code> is the name assigned to the default user account that is created for the node manager. Enter a password for this node manager user account. Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.</td>
</tr>
<tr>
<td>NODE_MANAGER_CONFIRM_PASSWORD</td>
<td>Confirm the password for the node manager user account.</td>
</tr>
</tbody>
</table>
### Table 3–2  (Cont.) Editing Response File for Installing Enterprise Manager System

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ORACLE_INSTANCE_HOME_LOCATION | By default, gc_inst is considered as the OMS Instance Base directory for storing all OMS-related configuration files, and it is created in the middleware home. If you want to accept the default location and the directory name, then skip this variable. However, if you want to have a custom location and a custom directory name, then enter the absolute path to the custom location leading up to the custom directory name.  
For more information about this location, see Section 2.3.3.
Note: If you have entered an NFS-mounted drive for the ORACLE_MIDDLEWARE_HOME_LOCATION parameter, then ensure that the location you enter for this parameter is a non-NFS-mounted location. |
| DATABASE_HOSTNAME | Enter the fully qualified name of the host where the existing database resides. Ensure that the host name does not have underscores.  
For example, example.com  
If you are connecting to an Oracle RAC Database, and if the nodes have virtual host names, then enter the virtual host name of one of its nodes.  
The connection to the database is established with a connect string that is formed using only this virtual host name, and the installation ends successfully.  
However, if you want to update the connect string with other nodes of the cluster, then after the installation, run the following command:

```bash
$<OMS_HOME>/bin/emctl config oms -store_repos_details -repos_conndesc "(DESCRIPTION= (ADDRESS_LIST=(FAILOVER=ON) (ADDRESS=(PROTOCOL=TCP)(HOST=node1-vip.example.com)(PORT=1521)) (ADDRESS=(PROTOCOL=TCP)(HOST=node2-vip.example.com)(PORT=1521))) (CONNECT_DATA=(SERVICE_NAME=EMREP)))" -repos_user sysman
```
If your Oracle RAC database is configured with Single Client Access Name (SCAN) listener, then you can enter a connection string using the SCAN listener. |
| LISTENER_PORT | Enter the listener port to connect to the existing database.
For example, 1532 |
| SERVICENAME_OR_SID | Enter the service name or the system ID (SID) of the existing database.
For example, orcl |
| SYS_PASSWORD | Enter the SYS user account’s password. |
| SYSMAN_PASSWORD | Enter a password for creating a SYSMAN user account. This password is used to create the SYSMAN user, which is the primary owner of the Management Repository schema.  
Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value. |
SYSMAN_CONFIRM_PASSWORD
Confirm the SYSMAN user account’s password.

MANAGEMENT_TABLESPACE_LOCATION
Enter the absolute path to the location where the data file (mgmt.dbf) for management tablespace can be stored. Ensure that the specified path leads up to the file name.
For example:
- If the database is on a file system, then the path must look like /u01/oracle/prod/oradata/mgmt.dbf
- If the database is on Automatic Storage Management (ASM), then the path must look like +<disk_group>/prod/oradata/mgmt.dbf, where disk_group is a diskgroup created on ASM and prod is the Service ID (SID).
- If the database is on a raw device, then the path must look like </dev/raw1>/prod/oradata/mgmt.dbf, where /dev/raw1 is the raw device and prod is the SID.

Enterprise Manager Cloud Control requires this data file to store information about the monitored targets, their metrics, and so on. Essentially, everything else other than configuration data, software library data, and audit data.

CONFIGURATION_DATA_TABLESPACE_LOCATION
Enter the absolute path to the location where the data file (mgmt_ecm_depot1.dbf) for configuration data tablespace can be stored. Ensure that the specified path leads up to the file name.
For example, /home/john/oradata/mgmt_ecm_depot1.dbf

Enterprise Manager Cloud Control requires this data file to store configuration information collected from the monitored targets.

JVM_DIAGNOSTICS_TABLESPACE_LOCATION
Enter the absolute path to a location where the data file (mgmt_ad4j.dbf) for JVM Diagnostics data tablespace can be stored. Ensure that the specified path leads up to the file name.
For example, /home/john/oradata/mgmt_ad4j.dbf

Enterprise Manager Cloud Control requires this data file to store monitoring data related to JVM Diagnostics and Application Dependency Performance (ADP).

AGENT_REGISTRATION_PASSWORD
Enter a password to secure the communication between the OMS and the Management Agents. Note that you have to provide the same registration password for securing your Management Agents.

AGENT_REGISTRATION_CONFIRM_PASSWORD
Confirm the agent registration password.

STATIC_PORTS_FILE
By default, ports described in Section 2.1.6 are honored. If you want to accept the default ports, then leave this field blank.
If you want to use custom ports, then enter the absolute path to the staticports.ini file that lists the custom ports to be used for the installation.
3.5 After You Install

Perform the post-install steps as described in the chapter on installing Enterprise Manager system that is available in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*. 

---

**Table 3–2 (Cont.) Editing Response File for Installing Enterprise Manager System**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PLUGIN_SELECTION   | By default, mandatory plug-ins such as Oracle Database Management Plug-In, Oracle Fusion Middleware Management Plug-In, Oracle My Oracle Support Management Plug-In, and Oracle Exadata Management Plug-In get automatically installed with the Enterprise Manager system. However, if you want to install any of the other optional plug-ins that are available in the software kit (DVD or downloaded software), then enter the names of those plug-ins for this variable. For example, PLUGIN_SELECTION={"oracle.sysman.empa","oracle.sysman.vt"} If you want to install any plug-in that is not available in the software kit, then do the following:  
1. Manually download the plug-ins from the Enterprise Manager download page on OTN, and store them in an accessible location:  
2. Update this variable (PLUGIN_SELECTION) to the names of those plug-ins you downloaded.  
3. Invoke the installer with the following option, and pass the location where you downloaded the plug-ins:  
   ./runInstaller -pluginLocation <absolute_path_to_plugin_software_location>
This chapter explains how you can install only the software binaries of Enterprise Manager Cloud Control at one point, and configure the installation at a later point. In particular, this chapter covers the following:

- **Overview**
- **Before You Begin**
- **Prerequisites**
- **Installing Software**

**Note:** Do NOT install the Enterprise Manager system on an OCFS file system. This file system is not supported.

### 4.1 Overview

You can choose to install only the software binaries of Enterprise Manager Cloud Control at one point and configure it at a later point in time to work with an existing, certified Oracle Database. This approach enables you to divide the installation process into two phases, mainly the installation phase and the configuration phase. Understandably, the installation phase takes less time compared to the configuration phase because the installation phase involves only copying of binaries. This approach helps you plan your installation according to the time and priorities you have.

During the installation phase, you invoke the installer to create Oracle homes and install the following components in the middleware home:

- Java Development Kit (JDK) 1.6 v24
- Oracle WebLogic Server 11g Release 1 (10.3.5)
- Oracle Management Service 12c
- Oracle Management Agent 12c
- Oracle JRF 11g Release (11.1.1.4.0), which includes `oracle_common` directory
- Oracle Web Tier 11g Release (11.1.1.4.0), which includes `Oracle_WT` directory
- Oracle Management Plug-Ins
  - Oracle Database Management Plug-In
  - Oracle Fusion Middleware Management Plug-In
During the configuration phase, you invoke a configuration script to do the following:

- Create an Oracle WebLogic domain called \texttt{GCDomain}. For this WebLogic Domain, a default user account, \texttt{weblogic}, is used as the administrative user. You can choose to change this, if you want, in the installer.

- Create a Node Manager user account called \texttt{nodemanager}. A Node Manager enables you to start, shut down, or restart an Oracle WebLogic Server instance remotely, and is recommended for applications with high availability requirements.

- Configure an Oracle Management Service Instance Base location (\texttt{gc\_inst}) in the middleware home, for storing all configuration details related to Oracle Management Service 12c.
  
  For example, if the middleware home is /\texttt{u01/app/Oracle/Middleware/}, then the instance base location is /\texttt{u01/app/Oracle/Middleware/gc\_inst}.

- Configures Oracle Management Repository in the existing, certified Oracle Database.

- Runs the following configuration assistants to configure the installed or upgraded components:
  - Plugins Prerequisites Check
  - Repository Configuration
  - MDS Schema Configuration
  - OMS Configuration
  - Plugins Deployment and Configuration
  - Plugins Inventory Migration
  - Oracle Configuration Manager Repeater Configuration
  - Agent Configuration Assistant

**Note:**

- Java Development Kit (JDK) 1.6 v24 and Oracle WebLogic Server 11g Release 1 (10.3.5) are installed only if they do not exist in your environment.

- If you want to manually install Oracle WebLogic Server 11g Release 1 (10.3.5), then follow the guidelines outlined in Section 4.2.

- In addition to the mandatory plug-ins listed above, you can optionally install other plug-ins available in the software kit. The installer offers a screen where you can select the optional plug-ins and install them. However, if you want to install some plug-ins that are not available in the software kit, then refer to the point about installing additional plug-ins in Section 4.4.1.3.1.
4.2 Before You Begin

Before you begin, keep these points in mind:

- You must ensure that you have the latest Enterprise Manager Cloud Control software:
  
  - Ensure that you have the Enterprise Manager Cloud Control software released in February 2012 - *Enterprise Manager Cloud Control 12c Release 1 (12.1.0.1) (With Bundle Patch 1)*. You can download it from the following URL:
    
  
  - If you had downloaded and installed the Enterprise Manager Cloud Control software released in October 2011, then apply the following patches, which are part of the Bundle Patch 1 released in February 2012, on the OMS and the Management Agent. In this case, you do not have to download the one released in February 2012.
    
    * On OMS, apply the patch 13242773.
    
    * On Management Agent, apply the patches 13242776, 13491785, 13550565, and 13550561.

    To apply these patches, you can either read the *My Oracle Support* note 1395505.1 or the ReadMes packaged with the patches.
  
  - If you had downloaded the Enterprise Manager Cloud Control software released in October 2011, but not installed it yet, then discard that software and download the one released in February 2012 - *Enterprise Manager Cloud Control 12c Release 1 (12.1.0.1) (With Bundle Patch 1)*. You can download it from the following URL:
    

- Ensure that there are no white spaces in the name of the directory where you download and run the Enterprise Manager Cloud Control software from. For example, do not download and run the software from a directory titled Program Files because there is a white space between the two words of the directory name.

- You can install Enterprise Manager Cloud Control using the installation wizard only on a single host, that is, locally on the server where the wizard is invoked. You cannot install on multiple or remote hosts.

- To invoke the installation wizard on UNIX platforms, run `runInstaller`. To invoke on Microsoft Windows platforms, run `setup.exe`.

- Enterprise Manager Cloud Control 12c can communicate only with Oracle Management Agent 12c, and not with any earlier release of the Management Agent.

- You must not set the `ORACLE_HOME` and `ORACLE_SID` environment variables. You must ensure that the Oracle directories do NOT appear in the PATH.

- Do not install on a symlink. If you do, then you will not be able to clone this OMS later.

- The Enterprise Manager Cloud Control Installation Wizard installs Java Development Kit (JDK) 1.6 v24 and Oracle WebLogic Server 11g Release 1 (10.3.5), but only if they do not exist in your environment.
(Only for Graphical Mode) You must set the DISPLAY environment variable.

- In bash terminal, run the following command:
  
  ```
  export DISPLAY=<hostname>:<vnc port>.0
  ```
  For example, `export DISPLAY=example.com:1.0`

- In other terminals, run the following command:
  
  ```
  setenv DISPLAY <hostname>:1.0
  ```
  For example, `setenv DISPLAY example.com:1.0`

- If Oracle WebLogic Server 11g Release 1 (10.3.5) does not exist and if you choose to manually install it, then ensure that you install it using JDK 1.6 v24+ (64-bit version for 64-bit platforms and 32-bit version for 32-bit platforms).

  - Download JDK 1.6 v24+ for your platform from the platform vendor’s Web site. For example, download SUN JDK 1.6 v24+ for Linux platforms from Oracle Web site. Similarly, download the JDK for other platforms from other vendors’ trusted Web sites.

  - If you already have JDK, then verify its version by navigating to the `<JDK_Location>/bin` directory and running the following command:
    
    ```
    ./java -fullversion
    ```
    
    To verify whether it is a 32-bit or a 64-bit JDK, run the following command:
    
    ```
    file *
    ```

  - JROCKIT is not supported.

  - If you want to manually install Oracle WebLogic Server 11g Release 1 (10.3.5) on Linux 64-bit platforms, first install the 64-bit JDK for your platform, and then download and use the `wls1035_generic.jar` file to install Oracle WebLogic Server.

    For example,
    
    ```
    <JDK home>/bin/java -d64 -jar <absolute_path_to_wls1035_generic.jar>
    ```

  - If you want to manually install Oracle WebLogic Server 11g Release 1 (10.3.5) on Linux 32-bit platforms, then download and use either the `wls1035_linux32.bin` file or the `wls1035_generic.jar` file.

    For example,
    
    ```
    <JDK home>/bin/java -jar <absolute_path_to_wls1035_generic.jar>
    ```

  - You must follow the instructions outlined in the Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server to install Oracle WebLogic Server. The guide is available in the Fusion Middleware documentation library available at:

    ```
    ```

  - You must ensure that the Oracle WebLogic Server installation is a typical installation, and even if you choose to perform a custom installation, ensure that components chosen for custom installation are the same as the ones associated with a typical installation.
Before You Begin

- You must ensure that the user installing the WebLogic Server is the same as the one installing Enterprise Manager Cloud Control.

- If you are installing Enterprise Manager Cloud Control in a middleware home that is on an NFS-mounted drive, then ensure that you maintain the lock file in a local file system and not in that NFS-mounted location. To do so, modify the lock file location in the `httpd.conf` file to map to a location on a local file system.

1. Stop the OMS:
   
   `<OMS_HOME>/bin/emctl stop oms -all`

2. Open the following file:

   `<WEBTIER_INSTANCE_HOME>/config/OHS/ohs1/httpd.conf`

3. Search for sections related to the modules `mpm_prefork_module` and `mpm_worker_module`. In both these sections, modify the value for the `LockFile` parameter so that the path leads to a location on the local file system.

   ```
   <IfModule mpm_prefork_module>
   StartServers 5
   MinSpareServers 5
   MaxSpareServers 10
   MaxClients 150
   MaxRequestsPerChild 0
   AcceptMutex fcntl
   LockFile "${ORACLE_INSTANCE}/diagnostics/logs/${COMPONENT_TYPE}/${COMPONENT_NAME}/http_lock"
   </IfModule>
   ...
   <IfModule mpm_worker_module>
   StartServers 2
   MaxClients 150
   MinSpareThreads 25
   MaxSpareThreads 75
   ThreadsPerChild 25
   MaxRequestsPerChild 0
   AcceptMutex fcntl
   LockFile "${ORACLE_INSTANCE}/diagnostics/logs/${COMPONENT_TYPE}/${COMPONENT_NAME}/http_lock"
   </IfModule>
   ```

4. Save the changes.

5. Restart the OMS:

   `<OMS_HOME>/bin/emctl start oms`

- You must ensure that the Oracle WebLogic Server 11g Release 1 (10.3.5) installed by the Enterprise Manager Cloud Control Installation Wizard or by you is dedicated for Enterprise Manager Cloud Control. You must not have any other Oracle Fusion Middleware product installed in that middleware home.

   Enterprise Manager Cloud Control cannot coexist with any Oracle Fusion Middleware product in the same middleware home because the `ORACLE_COMMON` property is used by both the products.
(Only for Silent Mode) By default, the software updates cannot be applied during installation because the INSTALL_UPDATES_SELECTION variable in the response file is set to "skip". However, if you want to apply them during installation, then you can modify this variable as described in Section 4.4.2.1.1.

By default, the upload ports and console ports as described in Section 2.1.6 are used.

Oracle offers bug fixes for a product based on the Oracle Lifetime Support Policy. When the license period expires for a particular product, the support for bug fixes offered by Oracle also ends. For more information, see the Oracle Lifetime Support Policy available at:

When determining supportability and certification combinations for an Enterprise Manager Cloud Control installation, you must consider Enterprise Manager Cloud Control's framework components as well as the targets monitored by Enterprise Manager Cloud Control. Oracle recommends keeping your Cloud Control components and targets updated to the latest certified versions in order to receive code fixes without having to purchase an Extended Support license.

You must upgrade all existing EMCLI clients of the earlier release to 12c Release 1 so that they can work with Enterprise Manager Cloud Control. This means, you must discard the old one and set up a new one.

For information about setting up a new EMCLI client, see the Enterprise Manager Command Line Interface Download page within the Cloud Control console. To access that page, in Cloud Control, from the Setup menu, select My Preferences, and then, click Command Line Interface.

You can find the OMS and Management Agent entries in the /etc/oragchomelist file for all UNIX platforms except HPUNIX, HPia64, Solaris Sparc.

On HPUNIX, HPia64, Solaris Sparc platforms, the entries are present in /var/opt/oracle/oragchomelist.

As a prerequisite, you must have an existing Oracle Database to configure the Management Repository. This database can also have the Automatic Memory Management (AMM) feature enabled.

### 4.3 Prerequisites

Meet the prerequisites described in the chapter on installing Enterprise Manager system that is available in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

### 4.4 Installation Procedure

This section describes the following:

- Installing in Graphical Mode
- Installing in Silent Mode
4.4.1 Installing in Graphical Mode

This section explains how you can install only the software binaries of Enterprise Manager Cloud Control at one point in graphical mode, and configure the installation at a later point. In particular, this section covers the following:

- Installing Software
- Running Root Script
- Configure Software
- Performing Post-Configuration Tasks

4.4.1.1 Installing Software

To install only the software binaries of Enterprise Manager Cloud Control in graphical mode, follow these steps:

---

**Note:** Oracle recommends you to run the EM Prerequisite Kit before invoking the installer to ensure that you meet all the repository requirements beforehand. This helps you set up your Management Repository beforehand without starting the installation or upgrade process. For information on the kit, to understand how to run it, and to know about the prerequisite checks it runs, see *Oracle Enterprise Manager Basic Installation Guide*.

---

1. **Invoke the Enterprise Manager Cloud Control Installation Wizard**

Invoke the installer as a user who belongs to the oinstall group you created. For information about creating operating system groups and users, see the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.

```
<Software_Location>/runInstaller [-invPtrLoc <absolute_path_to_oraInst.loc>]
```

---

**Note:**
- In this command, `<Software_Location>` refers to either the DVD or the location where you have downloaded software kit.
- To invoke the installation wizard on UNIX platforms, run `runInstaller`. To invoke on Microsoft Windows platforms, run `setup.exe`.
- For information about the additional, advanced options you can pass while invoking the installer, refer to Section 4.4.1.1.1.
- The central inventory location you enter must NOT be on a shared file system.
- The `-invPtrLoc` parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.
Note: When you invoke `runInstaller` or `setup.exe`, if the Enterprise Manager Cloud Control Installation Wizard does not appear, then it is possible that you do not access to the `/stage` directory.

There is a classpath variable that the installation wizard computes for OPatch as `/stage/Components/`, and when the TEMP variable is set to `/tmp`, the installation wizard tries to look for the opatch JAR file in the `/tmp/.../stage` directory, which is equivalent to `/stage`. However, if you do not have the permission on `/stage`, then the installation wizard can hang. Under such circumstances, verify if you have access to the `/stage` directory. If you do not have access to it, then set the TEMP variable to a location where the install user has access to, and then relaunch the installation wizard.

2. Enter My Oracle Support Details

(Optional) On the My Oracle Support Details screen, enter your My Oracle Support credentials to enable Oracle Configuration Manager. If you do not want to enable Oracle Configuration Manager now, go to Step (3).

If the host from where you are running the installation wizard does not have a connection to the Internet, then enter only the e-mail address and leave the other fields blank. After you complete the installation, manually collect the configuration information and upload it to My Oracle Support.

Note: For information about manually collecting the configuration information and uploading it to My Oracle Support, see Section 2.4.1.1.

3. Click Next.
4. **Install Software Updates**

On the Software Updates screen, select one of the following sources from where the software updates can be installed while the installation of the Enterprise Manager system is in progress. If you do not want to apply them now, then select *Skip*.

- (Recommended) Select **Search for Updates**, and then, select **Local Directory** if you have already manually downloaded the software updates to an accessible local or remote location.

Enter the location where the updates are available, and click **Search for Updates**. To search the computer and select the location, click **Browse**. Once the search results appear with patch numbers and their details, click the patch number to view the ReadMe associated with that patch.

- If the updates have been downloaded to the default location, then select or enter the full path to the scratch path location. For example, if the scratch path location is `/scratch/OracleHomes` and if the software updates are available in `/scratch/OracleHomes/Updates`, then enter `/scratch/OracleHomes/Updates`.

- If the software updates have been downloaded to a custom location, then select or enter the full path to the custom location. For example, if the custom location is `/scratch/john` and if the software updates are available in `/scratch/john/Updates`, then enter `/scratch/john/Updates`.

**Note:** For more information about software updates, and how you can manually download them, see Section 2.4.2.
- Select **Search for Updates**, and then, select **My Oracle Support** if you want the installer to connect to **My Oracle Support** and automatically download the updates from there.

Enter the My Oracle Support account user name and password, and click **Search for Updates**. Once the search results appear with patch numbers and their details, click the patch number to view the ReadMe associated with that patch.

**Note:** If you choose to skip installing the software updates during installation by not providing the My Oracle Support credentials, you can always register the credentials later using the Enterprise Manager Cloud Control console and view the recommended security patches. To do so, in Cloud Control, from the **Setup** menu, select **Security**, and then, click **Preferred Credentials**. On the Preferred Credentials page, click **Set MOS Credentials** and register the credentials.

5. Click **Next**.

If Enterprise Manager Cloud Control is the first Oracle product you are installing on the host that is running on UNIX operating system, then the Oracle Inventory screen appears. For details, see step (6). Otherwise, the Check Prerequisites screen appears. For details, see step (8).

If Enterprise Manager Cloud Control is the first Oracle product you are installing on the host that is running on Microsoft Windows operating system, then the Oracle Inventory screen does not appear. On Microsoft Windows, the following is the default inventory directory:

<system drive>\Program Files\Oracle\Inventory

6. **Enter Oracle Inventory Details**

On the Oracle Inventory screen, do the following. You will see this screen only if this turns out to be your first ever installation of an Oracle product on the host.

a. Enter the full path to a directory where the inventory files and directories can be placed.

**Note:**

- The central inventory location you enter must NOT be on a shared file system. If it is already on a shared file system, then switch over to a non-shared file system by following the instructions outlined in **My Oracle Support** note 1092645.1

- If this is the first Oracle product on the host, then the default central inventory location is /home/<user_name>/oraInventory. However, if you already have some Oracle products on the host, then the central inventory location can be found in the oraInst.loc file. The oraInst.loc file is located in the /etc directory for Linux and AIX, and in the /var/opt/oracle directory for Solaris, HP-UX, and Tru64.

b. Select the appropriate operating system group name that will own the Oracle inventory directories. The group that you select must have write permissions on the Oracle Inventory directories.
7. Click Next.

8. Check Prerequisites

On the Prerequisite Checks screen, check the status of the prerequisite checks run by the installation wizard, and verify whether your environment meets all the minimum requirements for a successful installation.

The installation wizard runs the prerequisite checks automatically when you come to this screen. It checks for the required operating system patches, operating system packages, and so on.

The status of the prerequisite check can be either Warning, Failed, or Succeeded.

- If some checks result in Warning or Failed status, then investigate and correct the problems before you proceed with the installation. The screen provides details on why the prerequisites failed and how you can resolve them. After you correct the problems, return to this screen and click Rerun to check the prerequisites again.

- Although Oracle recommends you to investigate and correct the problems, if you are compelled to proceed without resolving them, then select Ignore to ignore the warnings and failures.

   However, all package requirements must be met or fixed before proceeding any further. Otherwise, the installation might fail.

9. Click Next.

10. Select Installation Type
On the Install Types screen, do the following:

1. Select **Install software only**.
2. Validate or enter the middleware home where you want to install the OMS and other core components.

**Note:**
- If Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 are already installed in your environment, then the installer automatically detects them and displays the absolute path to the middleware home where they are installed. In this case, validate the middleware home location that is detected and displayed by default. If the location is incorrect, then enter the path to the correct location. Ensure that the middleware home location you select or enter is a middleware home location that does not have any Oracle homes for Oracle Management Service and Oracle Management Agent.

- If Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 are NOT already installed in your environment, then the installer automatically installs them for you while installing the Enterprise Manager system. In this case, enter the absolute path to a directory where you want to have them installed. For example, `/oracle/software/`. Ensure that the directory you enter does not contain any files or subdirectories.

11. Click **Next**.
12. Select **Plug-Ins**
4.13. Click Next.

4.14. Review and Install

On the Review screen, review the details you provided for the selected installation type.

- If you want to change the details, click Back repeatedly until you reach the screen where you want to make the changes.
- After you verify the details, if you are satisfied, click Install to begin the installation process.

4.15. On the Install Progress screen, view the overall progress (in percentage) of the installation.

4.16. On the Finish screen, you should see information pertaining to the installation of Enterprise Manager. Review the information and click Close to exit the installation wizard.

4.4.1.1 Using Advanced Installer Options The following are some additional, advanced options you can pass while invoking the installer:

Note: During installation, if you want to install a plug-in that is not available in the software kit, then refer to the point about installing additional plug-ins in Section 4.4.1.1.1.
If you want to install on a host that has multiple host names (for example, virtual hosts), then pass the ORACLE_HOSTNAME argument while invoking the installer. Ensure that the host name you enter does not have underscores.

For example,

```bash
./runInstaller ORACLE_HOSTNAME=example.com
```

If you want to set the Central Inventory, then pass the -invPtrLoc parameter. This parameter considers the path to a location where the inventory pointer file (oraInst.loc) is available. However, this parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

For example,

```bash
./runInstaller -invPtrLoc /scratch/OracleHomes/oraInst.loc
```

If you want to install some plug-ins that are not in the software kit, then follow these steps:

1. Manually download the plug-ins from the Enterprise Manager Download page on OTN, and store them in an accessible location.

2. Invoke the installer with the following option, and pass the location where the plug-ins you want to install are available:

   ```bash
   ./runInstaller -pluginLocation <absolute_path_to_plugin_software_location>
   ```

   The Select Plug-In screen of the installation wizard displays a list of plug-ins available in the software kit as well as the plug-ins available in this custom location. You can choose the ones you want to install.

### 4.4.1.2 Running Root Script

(For UNIX Only) After you install the software binaries of Enterprise Manager Cloud Control, log in as a root user in a new terminal and run the allroot.sh (or allroot.bat on Microsoft Windows) script from the OMS home:

```bash
$<OMS_HOME>/allroot.sh
```

### 4.4.1.3 Configure Software

To configure Enterprise Manager Cloud Control, follow these steps:

1. **Invoke the Enterprise Manager Cloud Control Installation Wizard**

   Invoke the installation wizard as a user who belongs to the oinstall group you created. For information about creating operating system groups and users, see the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

   ```bash
   $<MIDDLEWARE_HOME>/oms/sysman/install/ConfigureGC.sh
   ```

   [-invPtrLoc <absolute_path_to_oraInst.loc>]
Note:

- While installing the software binaries as described in Section 4.4.1.1, if you had passed the argument \texttt{-invPtrLoc}, then pass the same argument here as well.
- The \texttt{-invPtrLoc} parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.
- For information about the additional, advanced options you can pass while invoking the script, refer to Section 4.4.1.3.1.
- The only way to configure a software-only installation is to run the \texttt{ConfigureGC.sh} (or \texttt{ConfigureGC.bat} on Microsoft Windows) script. DO NOT run the individual configuration assistants to configure a software-only installation. If you want to run the individual configuration assistants to configure the installation for some reason, then contact Oracle Support.
- If you have already configured a software-only installation (the Oracle home) using the \texttt{ConfigureGC.sh} script (or \texttt{ConfigureGC.bat} on Microsoft Windows), then DO NOT try to reconfigure it—either using the script or using the individual configuration assistants.
- Ensure that there are no white spaces in the name of the directory where you download and run the Enterprise Manager Cloud Control software from. For example, do not download and run the software from a directory titled \texttt{Program Files} because there is a white space between the two words of the directory name.

2. Select Installation Type
In the installation wizard, on the Install Types screen, select **Create a New Enterprise Manager System**.

3. Click Next.

4. **Enter WebLogic Server Configuration Details**
On the WebLogic Server Configuration Details screen, enter the credentials for the WebLogic Server user account and the Node Manager user account, and validate the path to the Oracle Management Service instance base location.

**Note:** Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.

By default, the WebLogic Domain name is `GCDomain`, and the Node Manager name is `nodemanager`. These are non-editable fields. The installer uses this information for creating Oracle WebLogic Domain and other associated components such as the admin server, the managed server, and the node manager.

A Node Manager enables you to start, shut down, or restart an Oracle WebLogic Server instance remotely, and is recommended for applications with high availability requirements.

By default, the Oracle Management Service instance base location is `gc_inst`, which is created in the middleware home for storing all configuration details related to the OMS.

5. **Click Next.**

6. **Enter Database Connection Details**
On the Database Connection Details screen, enter the fully qualified name of the host where the existing database resides, the database’s listener port and its service name or system ID (SID), and the SYS user account’s password.

The installer uses this information to connect to the existing, certified Oracle Database for creating the SYSMAN schema. SYSMAN schema holds most of the relational data used in managing Enterprise Manager Cloud Control.

**Note:** If any repository-related prerequisite check fails, then run the check manually. For instructions, see the appendix on EM Prerequisite Kit in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

7. Click Next.
8. Enter Repository Configuration Details

On the Repository Configuration Details screen, do the following:

a. For **SYSMAN Password**, enter a password for creating the SYSMAN user account. The SYSMAN user account is used for creating the SYSMAN schema, which holds most of the relational data used in managing Enterprise Manager Cloud Control. SYSMAN is also the super administrator for Enterprise Manager Cloud Control.

**Note:** If you are connecting to an Oracle RAC database, and if you have entered the virtual host name of one of its nodes, then the installation wizard prompts you with a Connection String dialog and requests you to update the connect string with information about the other nodes that are part of the cluster. Update the connect string and click **OK**. If you want to test the connection, click **Test Connection**.

If your Oracle RAC database is configured with Single Client Access Name (SCAN) listener, then you can enter a connection string using the SCAN listener.

Oracle Real Application Cluster (Oracle RAC) nodes are referred to by their virtual IP (vip) names. The service_name parameter is used instead of the system identifier (SID) in connect_data mode, and failover is turned on. For more information, refer to *Oracle Database Net Services Administrator’s Guide*. 
b. For **Registration Password**, enter a password for registering the new Management Agents that join the Enterprise Manager system.

**Note:** Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.

c. For **Management Tablespace**, enter the absolute path to the location where the data file for management tablespace (mgmt.dbf) can be stored. The installer uses this information for storing data about the monitored targets, their metrics, and so on. Ensure that the specified path leads up to the file name.

For example, /u01/oracle/prod/oradata/mgmt.dbf

d. For **Configuration Data Tablespace**, enter the absolute path to the location where the data file for configuration data tablespace (mgmt_ecm_depot1.dbf) can be stored. This is required for storing configuration information collected from the monitored targets. Ensure that the specified path leads up to the file name.

For example, /u01/oracle/prod/oradata/mgmt_ecm_depot1.dbf

e. For **JVM Diagnostics Data Tablespace**, enter the absolute path to a location where the data file for JVM Diagnostics data tablespace (mgmt_ad4j.dbf) can be stored. Ensure that the specified path leads up to the file name. Enterprise Manager Cloud Control requires this data file to store monitoring data related to JVM Diagnostics and Application Dependency Performance (ADP).

For example, /u01/oracle/prod/oradata/mgmt_ad4j.dbf

**Note:** If you are configuring the Management Repository on a database that uses Oracle Automatic Storage Management (Oracle ASM) for storage, then when you enter the data file location, only the disk group is used for creating the tablespaces. For example, if you specify +DATA/a.dbf, then only +DATA is used for creating the tablespaces on Oracle ASM, and the exact location of the data file on the disk group is decided by Oracle Managed Files.

9. Click Next.

10. **Customize Ports**
On the Port Configuration Details screen, customize the ports to be used for various components.

You can enter a free custom port that is either within or outside the port range recommended by Oracle.

To verify if a port is free, run the following command:

- On Unix:
  
  ```bash
  netstat -anp | grep <port_no>
  ```

- On Microsoft Windows:

  ```plaintext
  netstat -an | findstr <port_no>
  ```

However, the custom port must be greater than 1024 and lesser than 65535. Alternatively, if you already have the ports predefined in a `staticports.ini` file and if you want to use those ports, then click **Import staticports.ini file** and select the file.

**Note:** If the `staticports.ini` file is passed during installation, then by default, the ports defined in the `staticports.ini` file are displayed. Otherwise, the first available port from the recommended range is displayed.

11. Click **Next**.
12. **Review and Install**

On the Review screen, review the details you provided for the selected installation type.
If you want to change the details, click Back repeatedly until you reach the screen where you want to make the changes.

After you verify the details, if you are satisfied, click Configure to begin the installation process.

13. Track the Progress

On the Install Progress screen, view the overall progress (in percentage) of the installation.

---

**Note:**

- If a configuration assistant fails, the installer stops and none of the subsequent configuration assistants are run. Resolve the issue and rerun the configuration assistant. For more information, see Appendix E.

- If you accidently exit the installer before clicking Retry, then do NOT restart the installer to reach the same screen; instead, invoke the runConfig.sh script from the OMS home to rerun the configuration assistant in silent mode. On Microsoft Windows hosts, invoke runConfig.bat script.

```
$<MIDDLEWARE_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<absolute_path_to_OMS_home> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

---

14. End the Installation

On the Finish screen, you should see information pertaining to the installation of Enterprise Manager. Review the information and click Close to exit the installation wizard.

4.4.1.3.1 Using Advanced Script Options

The following are some additional, advanced options you can pass while invoking the configureGC.sh script (or configureGC.bat on Microsoft Windows):

- By default, GCDomain is the default name used for creating the WebLogic Domain. To override this and use a custom WebLogic Domain name, invoke the script with the WLS_DOMAIN_NAME option, and enter a unique custom name.

For example, if you want to use the custom name EMDomain, then run the following command:

```
$<MIDDLEWARE_HOME>/oms/sysman/install/ConfigureGC.sh WLS_DOMAIN_NAME=EMDomain
```

- After the configuration ends successfully, the OMS and the Management Agent start automatically. If you do not want them to start automatically, then invoke the script with START_OMS and b_startAgent options, and set them to TRUE or FALSE depending on what you want to control.

For example, if you do not want the Management Agent to start automatically, then run the following command:

```
$<MIDDLEWARE_HOME>/oms/sysman/install/ConfigureGC.sh START_OMS=TRUE b_startAgent=FALSE
```
To understand the limitations involved with this advanced option, see Section 3.4.3.

4.4.1.4 Performing Post-Configuration Tasks
Perform the post-install steps as described in the chapter on installing Enterprise Manager system that is available in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

4.4.2 Installing in Silent Mode
This section explains how you can install only the software binaries of Enterprise Manager Cloud Control at one point in silent mode, and configure the installation at a later point. In particular, this section covers the following:

- Installing Software
- Running Root Script
- Configuring Software
- Performing Post-Configuration Tasks

4.4.2.1 Installing Software
To install only the software binaries of Enterprise Manager Cloud Control in silent mode, follow these steps:

---

**Note:** Oracle recommends you to run the EM Prerequisite Kit before invoking the installer to ensure that you meet all the repository requirements beforehand. This helps you set up your Management Repository beforehand without starting the installation or upgrade process. For information on the kit, to understand how to run it, and to know about the prerequisite checks it runs, see Oracle Enterprise Manager Basic Installation Guide.

---

1. Copy the following response file to an accessible location on your local host:
   
   `<Software_Location>/response/software_only.rsp`

   In this command, `<Software_Location>` refers to either the DVD or the location where you have downloaded software kit.

2. Edit the response file and enter appropriate values for the variables described in Table 4–1.

3. Invoke the installer as a user who belongs to the `oinstall` group you created.

   For information about creating operating system groups and users, see the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

   - If this is the first Oracle product you are installing on the host, then run the following command:
     
     ```
     ./<runInstaller> -silent -responseFile <absolute_path>/software_only.rsp [-invPtrLoc <absolute_path_to_oraInst.loc]`
     ```

   - Otherwise, run the following command:
     
     ```
     ./<runInstaller> -silent -responseFile <absolute_path>/software_only.rsp`
     ```
**4.2.4.2.1 Editing Response File for Installing Software**

Table 4–1 describes what variables you must edit and how you must edit them in the new_install.rsp response file for installing the software binaries.

### Table 4–1 Editing Response File for Installing Enterprise Manager Software

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNIX_GROUP_NAME</td>
<td>Enter the name of the UNIX group you belong to. For example, &quot;dba&quot;. <strong>Note:</strong> This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td>INVENTORY_LOCATION</td>
<td>Enter the absolute path to the Central Inventory. For example, /scratch/oracle/oraInventory. <strong>Note:</strong> This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td>SECURITY_UPDATES_VIA_MYORACLESUPPORT</td>
<td>Enter <strong>TRUE</strong> if you want to download and install security updates. Then, enter the credentials for the following variables: MYORACLESUPPORT_USERNAME, MYORACLESUPPORT_PASSWORD. Enter <strong>FALSE</strong> if you do not want to download and install security updates.</td>
</tr>
</tbody>
</table>
Table 4–1   (Cont.) Editing Response File for Installing Enterprise Manager Software

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECLINE_SECURITY_UPDATES</td>
<td>■ Enter TRUE if you want to decline the security updates. In this case, you should have entered False for SECURITY_UPDATES_VIA_MYORACLESUPPORT.</td>
</tr>
<tr>
<td></td>
<td>■ Enter FALSE if you do not want to decline the security updates. In this case, you should have entered TRUE for SECURITY_UPDATES_VIA_MYORACLESUPPORT.</td>
</tr>
<tr>
<td>INSTALL_UPDATES_SELECTION</td>
<td>By default, this variable is set to <em>skip</em> indicating that the software updates will not be installed during installation.</td>
</tr>
<tr>
<td></td>
<td>■ If you want to install the software updates from My Oracle Support, then set this variable to <em>download</em>. Then, enter the credentials for the following parameters:</td>
</tr>
<tr>
<td></td>
<td>MYORACLESUPPORT_USERNAME_FOR_SOFTWAREUPDATES</td>
</tr>
<tr>
<td></td>
<td>MYORACLESUPPORT_PASSWORD_FOR_SOFTWAREUPDATES</td>
</tr>
<tr>
<td></td>
<td>■ If you want to install the software updates from a staged location, then set this variable to <em>staged</em>. Then, for the STAGE_LOCATION parameter, enter the absolute path, which leads to the Updates directory, where the software updates are available.</td>
</tr>
<tr>
<td>ORACLE_MIDDLEWARE_HOME_LOCATION</td>
<td>Enter the location where you want the installer to install Oracle WebLogic Server 11g Release 1 (10.3.5) and Java Development Kit 1.6 v24. For example, /u01/app/Oracle/Middleware.</td>
</tr>
<tr>
<td></td>
<td>Ensure that the middleware location has write permission to create the Oracle homes for OMS and Management Agent.</td>

<tr>
<td></td>
<td>If you have already installed them manually, then enter the location where you have installed them.</td>
</tr>
<tr>
<td></td>
<td>For more information about this location, see Section 2.3.2.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the middleware home you enter here is used only for Enterprise Manager Cloud Control. Ensure that no other Oracle Fusion Middleware products or components are installed in the same middleware home.</td>
</tr>
</tbody>
</table>
Installation Procedure

4.4.2.2 Running Root Script
(For UNIX Only) After you install the software binaries of Enterprise Manager Cloud Control, log in as a root user in a new terminal and run the allroot.sh script (or allroot.bat on Microsoft Windows) from the OMS home:

$<OMS_HOME>/allroot.sh

4.4.2.3 Configuring Software
To configure the software binaries of Enterprise Manager Cloud Control, follow these steps:

1. Copy the following response file to an accessible location on the host where you copied the software binaries of Enterprise Manager Cloud Control:

   <Software_Location>/response/new_install.rsp

   In this command, <Software_Location> refers to either the DVD or the location where you have downloaded software kit.

2. Edit the response file and enter appropriate values for the variables described in Table 4–2.

Table 4–1 (Cont.) Editing Response File for Installing Enterprise Manager Software

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PLUGIN_SELECTION     | By default, mandatory plug-ins such as Oracle Database Management Plug-In, Oracle Fusion Middleware Management Plug-In, Oracle My Oracle Support Management Plug-In, and Oracle Exadata Management Plug-In get automatically installed with the Enterprise Manager system. However, if you want to install any of the other optional plug-ins that are available in the software kit (DVD or downloaded software), then enter the names of those plug-ins for this variable. For example, PLUGIN_SELECTION="oracle.sysman.empa","oracle.sysman.vt"
|                      | If you want to install any plug-in that is not available in the software kit, then do the following:
|                      | 1. Manually download the plug-ins from the Enterprise Manager download page on OTN, and store them in an accessible location:
|                      | 2. Update this variable (PLUGIN_SELECTION) to the names of those plug-ins you downloaded.
|                      | 3. Invoke the installer with the following option, and pass the location where you downloaded the plug-ins:
|                      | ./runInstaller -pluginLocation <absolute_path_to_plugin_software_location>
3. Configure the software binaries by invoking the `ConfigureGC.sh` script (or `ConfigureGC.bat` on Microsoft Windows) passing the response you edited in the previous step:

```
$<MIDDLEWARE_HOME>/oms/sysman/install/ConfigureGC.sh -silent
-responseFile <absolute_path>/new_install.rsp [-invPtrLoc
<absolute_path_to_inventory_directory>]
```

Note:

- While installing the software binaries as described in Section 4.4.2.1, if you had passed the argument `-invPtrLoc`, then pass the same argument here as well.
- The `-invPtrLoc` parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.
- For information about the additional, advanced options you can pass while invoking the script, refer to Section 4.4.1.3.1.
- The only way to configure a software-only installation is to run the `ConfigureGC.sh` script (or `ConfigureGC.bat` on Microsoft Windows). DO NOT run the individual configuration assistants to configure a software-only installation. If you want to run the individual configuration assistants to configure the installation for some reason, then contact Oracle Support.
- If you have already configured a software-only installation (the Oracle home) using the `ConfigureGC.sh` script (or `ConfigureGC.bat` on Microsoft Windows), then DO NOT try to reconfigure it—either using the script or using the individual configuration assistants.

Note:

- If any repository-related prerequisite check fails, then run the check manually. For instructions, see the appendix on EM Prerequisite Kit in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.
- If a configuration assistant fails, the installer stops and none of the subsequent configuration assistants are run. Resolve the issue and rerun the configuration assistant. For more information, see Appendix E.

### 4.4.2.3.1 Editing Response File for Configuring Software

Table 4–2 describes what variables you must edit and how you must edit them in the `new_install.rsp` file for configuring the software binaries.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WLS_ADMIN_SERVER_USERNAME</td>
<td>By default, <code>weblogic</code> is the name assigned to the default user account that is created for the Oracle WebLogic Domain. If you want to accept the default name, then blank. However, if you want to have a custom name, then enter the name of your choice.</td>
</tr>
</tbody>
</table>
### Table 4–2  (Cont.) Editing Response File for Configuring Enterprise Manager Software

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WLS_ADMIN_SERVER_PASSWORD</strong></td>
<td>Enter a password for the WebLogic user account. Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.</td>
</tr>
<tr>
<td><strong>WLS_ADMIN_SERVER_CONFIRM_PASSWORD</strong></td>
<td>Confirm the password for the WebLogic user account.</td>
</tr>
<tr>
<td><strong>NODE_MANAGER_PASSWORD</strong></td>
<td>By default, nodemanager is the name assigned to the default user account that is created for the node manager. Enter a password for this node manager user account. Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.</td>
</tr>
<tr>
<td><strong>NODE_MANAGER_CONFIRM_PASSWORD</strong></td>
<td>Confirm the password for the node manager user account.</td>
</tr>
<tr>
<td><strong>ORACLE_INSTANCE_HOME_LOCATION</strong></td>
<td>By default, gc_inst is considered as the OMS Instance Base directory for storing all OMS-related configuration files. If you want to accept the default directory, then blank. However, if you want to have a custom directory, then enter the name of the custom directory. Whether you accept the default directory or enter a custom one, by default, the directory is created under the parent directory of the middleware home. For example, if the middleware home is /u01/app/Oracle/Middleware, then the directory is /u01/app/Oracle/gc_inst. For more information about this location, see Section 2.3.3.</td>
</tr>
</tbody>
</table>
| **DATABASE_HOSTNAME**            | Enter the fully qualified name of the host where the existing database resides. Ensure that the host name does not have underscores. For example, example.com If you are connecting to an Oracle RAC Database, and if the nodes have virtual host names, then enter the virtual host name of one of its nodes. The connection to the database is established with a connect string that is formed using only this virtual host name, and the installation ends successfully. However, if you want to update the connect string with other nodes of the cluster, then after the installation, run the following command:  

```bash
$<OMS_HOME>/bin/emctl config oms -store_repos_details -repos_conndesc "(DESCRIPTION= (ADDRESS_LIST=(FAILOVER=ON) (ADDRESS=(PROTOCOL=TCP)(HOST=node1-vip.example.com)(PORT=1521)) (ADDRESS=(PROTOCOL=TCP)(HOST=node2-vip.example.com)(PORT=1521))) (CONNECT_DATA=(SERVICE_NAME=EMREP)))" -repos_user sysman
```

If your Oracle RAC database is configured with Single Client Access Name (SCAN) listener, then you can enter a connection string using the SCAN listener. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LISTENER_PORT</td>
<td>Enter the listener port to connect to the existing database. For example, 1532</td>
</tr>
<tr>
<td>SERVICENAME_OR_SID</td>
<td>Enter the service name or the system ID (SID) of the existing database. For example, orcl</td>
</tr>
<tr>
<td>SYS_PASSWORD</td>
<td>Enter the SYS user account’s password.</td>
</tr>
<tr>
<td>SYSMAN_PASSWORD</td>
<td>Enter a password for creating a SYSMAN user account. This password is used to create the SYSMAN user, which is the primary owner of the Management Repository schema. Ensure that your password contains at least 8 characters without any spaces, begins with a letter, and includes at least one numeric value.</td>
</tr>
<tr>
<td>SYSMAN_CONFIRM_PASSWORD</td>
<td>Confirm the SYSMAN user account’s password.</td>
</tr>
<tr>
<td>MANAGEMENT_TABLESPACE_LOCATION</td>
<td>Enter the absolute path to the location where the data file for management tablespace (mgmt.dbf) can be stored. Ensure that the specified path leads up to the file name. For example:</td>
</tr>
<tr>
<td></td>
<td>- If the database is on a file system, then the path must look like /u01/oracle/prod/oradata/mgmt.dbf</td>
</tr>
<tr>
<td></td>
<td>- If the database is on Automatic Storage Management (ASM), then the path must look like +&lt;disk_group1&gt;/prod/oradata/mgmt.dbf, where disk_group1 is a diskgroup created on ASM and prod is the Service ID (SID).</td>
</tr>
<tr>
<td></td>
<td>- If the database is on a raw device, then the path must look like &lt;/dev/raw1&gt;/prod/oradata/mgmt.dbf, where /dev/raw1 is the raw device and prod is the SID.</td>
</tr>
<tr>
<td></td>
<td>Enterprise Manager Cloud Control requires this data file to store information about the monitored targets, their metrics, and so on. Essentially, everything else other than configuration data, software library data, and audit data.</td>
</tr>
<tr>
<td>CONFIGURATION_DATA_TABLESPACE_LOCATION</td>
<td>Enter the absolute path to the location where the data file for configuration data tablespace (mgmt_ecm Depot1.dbf) can be stored. Ensure that the specified path leads up to the file name. For example, /home/john/oradata/mgmt_ecm Depot1.dbf</td>
</tr>
<tr>
<td></td>
<td>Enterprise Manager Cloud Control requires this data file to store configuration information collected from the monitored targets.</td>
</tr>
<tr>
<td>JVM_DIAGNOSTICS_TABLESPACE_LOCATION</td>
<td>Enter the absolute path to a location where the data file for JVM Diagnostics data tablespace (mgmt_ad4j.dbf) can be stored. Ensure that the specified path leads up to the file name. For example, /home/john/oradata/mgmt_ad4j.dbf</td>
</tr>
<tr>
<td></td>
<td>Enterprise Manager Cloud Control requires this data file to store monitoring data related to JVM Diagnostics and Application Dependency Performance (ADP).</td>
</tr>

### 4.4.2.4 Performing Post-Configuration Tasks

Perform the post-install steps as described in the chapter on installing Enterprise Manager system that is available in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGENT_REGISTRATION_PASSWORD</td>
<td>Enter a password to secure the communication between the OMS and the Management Agents. Note that you have to provide the same registration password for securing your Management Agents.</td>
</tr>
<tr>
<td>AGENT_REGISTRATION_CONFIRM_PASSWORD</td>
<td>Confirm the agent registration password.</td>
</tr>
<tr>
<td>STATIC_PORTS_FILE</td>
<td>By default, ports described in Section 2.1.6 are honored. If you want to accept the default ports, then leave this field blank. If you want to use custom ports, then enter the absolute path to the <code>staticports.ini</code> file that lists the custom ports to be used for the installation.</td>
</tr>
</tbody>
</table>
Part III

Installing Oracle Management Agent

This part describes the different ways of installing Oracle Management Agent. In particular, this part contains the following chapters:

- Chapter 5, "Installing Oracle Management Agent in Silent Mode"
- Chapter 6, "Installing Oracle Management Agent Using RPM File"
- Chapter 7, "Cloning Oracle Management Agent"
- Chapter 8, "Installing Shared Agent"
- Chapter 9, "Installing Oracle Management Agent Software Now and Configuring Later"
This chapter describes how you can install Oracle Management Agent (Management Agent) in silent mode. In particular, this section covers the following:

- **Overview**
- **Before You Begin**
- **Prerequisites**
- **Installation Procedure**
- **After You Install**

### 5.1 Overview

Installing a Management Agent in silent mode is only an alternative to installing it using the Add Host Target Wizard. While the Add Host Target Wizard requires you to use its GUI-rich interview screens for providing all the installation details, the silent mode requires you to use a response file for providing the installation details and a deployment script (`agentDeploy.sh` or `agentDeploy.bat` on Windows) for silently installing the Management Agent using the information supplied in the response file.

The response file and the deployment script are available as part of the Management Agent software. Instead of creating a response file, you can also choose to pass the values as separate arguments while invoking the deployment script.

Installing in silent mode is best suited when you want to install an additional Management Agent on a destination host, from the destination host itself, and without using the Add Host Target Wizard in the Enterprise Manager Cloud Control console.

Once the installation is complete, you will see the following default contents in the agent base directory:

```
<agent_base_directory>
  |___core
  |   |___12.1.0.1.0
  |___plugins
  |___plugins.txt
  |___plugins.txt.status
  |___agent_inst
  |___sbin
  |___agentimage.properties
```
5.2 Before You Begin

Before you begin installing a Management Agent, keep these points in mind:

- Before installing the Management Agent, you must procure the Management Agent software from the OMS host and transfer it to the destination host for installation. The Management Agent software you procure contains the core binaries required for installation, the response file to be edited and passed, and the `agentDeploy.sh` script (`agentDeploy.bat` on Windows).

  By default, the OMS host contains the Management Agent software for the platform on which the OMS is running. For example, if the OMS host is Linux x86, then the Management Agent software available by default is only for Linux x86.

  If you want to install the Management Agent on a platform that is different from the one on which the OMS is running, then download the software for the desired platform using the Self Update console.

  For information on Self Update and how you can use it to download the software, see the chapter on Self Update in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.

- You can run the `agentDeploy.sh` script (`agentDeploy.bat` on Windows) only from the destination host.

- You can install only on one host at a time using the `agentDeploy.sh` script, therefore use this approach when you want to install only on a few hosts.

- You can provide the installation details either in a response file or as values for individual arguments that can be passed while invoking the `agentDeploy.sh` script. However, Oracle recommends that you create a response file and capture the information there.

- You can install even if the OMS is unreachable. In this case, you must pass the special option `-forceConfigure` while invoking the `agentDeploy.sh` script (`agentDeploy.bat` on Windows). For more information, see Table 5–3.

  Typically, you will use this option only when you are installing the Management Agent before installing the OMS, and you know for sure that you will install the OMS later on the host and port mentioned in the response file.

  However, do not pass the option `-forceConfigure` when installing the Management Agent using software-only method as described in Chapter 9.

- You cannot run any preinstallation or postinstallation scripts as part of the installation process. Of course, you can run them manually after the installation ends.

- By default, the `agentDeploy.sh` script (`agentDeploy.bat` on Windows) configures only the following types of plug-ins:

---

**Note:** If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Oracle Management Service. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
5.3 Prerequisites

Before installing the Management Agent, ensure that you meet the following prerequisites.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware Requirements</td>
<td>Ensure that you meet the hard disk space and physical memory requirements. For more information, see the chapter on hardware requirements in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td>Software Requirements (For Microsoft Windows)</td>
<td>Ensure that you have installed Cygwin on the destination host. For more information, see the chapter on installing Cygwin in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td>Operating System Requirements</td>
<td>Ensure that you install the Management Agent only on certified operating systems as mentioned in the Enterprise Manager Certification Matrix available on My Oracle Support. To access this matrix, follow these steps:</td>
</tr>
<tr>
<td></td>
<td>1. Log in to My Oracle Support, and click the Certifications tab.</td>
</tr>
<tr>
<td></td>
<td>2. On the Certifications page, in the Certification Search region, from the Product list, select Enterprise Manager Cloud Control.</td>
</tr>
<tr>
<td></td>
<td>3. From the Release list, select 12.1.0.1.0, and click Search.</td>
</tr>
<tr>
<td></td>
<td>Note: If you use Oracle Solaris 10, then ensure that you have update 9 or higher installed. To verify whether it is installed, run the following command:</td>
</tr>
<tr>
<td></td>
<td>cat /etc/release</td>
</tr>
<tr>
<td></td>
<td>You should see the output similar to the following. Here, s10s_u6 indicates that update 6 is already installed.</td>
</tr>
<tr>
<td></td>
<td>Solaris 10 10/08 s10s_u6wos_07b SPARC</td>
</tr>
<tr>
<td>Package Requirements</td>
<td>Ensure that you install all the operating system-specific packages. For more information, see the chapter on package requirements in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td>User and Operating System Group Requirement</td>
<td>Ensure that the destination host where you want to install the Management Agent has the appropriate users and operating system groups created.</td>
</tr>
<tr>
<td></td>
<td>For more information, see the chapter on creating operating system groups and users in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td>/etc/hosts File Requirements</td>
<td>Ensure that the /etc/hosts file on the host has the IP address, the fully qualified name, and the short name in the following format:</td>
</tr>
<tr>
<td></td>
<td>172.16.0.0 example.com mypc</td>
</tr>
</tbody>
</table>
Table 5–1 (Cont.) Prerequisites for Installing Oracle Management Agent in Silent Mode

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time ZoneRequirements</td>
<td>Ensure that the host time zone has been set correctly. To verify the host time zone, run the following command:</td>
</tr>
<tr>
<td></td>
<td>echo $TZ</td>
</tr>
<tr>
<td></td>
<td>If the time zone displayed is incorrect, run the following commands, before running the agentDeploy.sh or agentDeploy.bat scripts, to set the correct time zone:</td>
</tr>
<tr>
<td></td>
<td>■ For Korn shell:</td>
</tr>
<tr>
<td></td>
<td>TZ=&lt;value&gt;</td>
</tr>
<tr>
<td></td>
<td>export TZ</td>
</tr>
<tr>
<td></td>
<td>■ For Bourne shell or Bash shell:</td>
</tr>
<tr>
<td></td>
<td>export TZ=&lt;value&gt;</td>
</tr>
<tr>
<td></td>
<td>■ For C shell:</td>
</tr>
<tr>
<td></td>
<td>setenv TZ &lt;value&gt;</td>
</tr>
<tr>
<td></td>
<td>For example, in the Bash shell, run the following command to set the time zone to America/New_York:</td>
</tr>
<tr>
<td></td>
<td>export TZ='America/New_York'</td>
</tr>
<tr>
<td></td>
<td>The time zones you can use are listed in &lt;AGENT_HOME&gt;/sysman/admin/supportedtzs.lst.</td>
</tr>
<tr>
<td></td>
<td>Note: If you had ignored a prerequisite check warning about wrong time zone settings during the Management Agent install, you must</td>
</tr>
<tr>
<td></td>
<td>set the correct time zone on the host after installing the Management Agent. For information on setting time zones post install, refer</td>
</tr>
<tr>
<td></td>
<td>Section 5.5.</td>
</tr>
<tr>
<td></td>
<td><strong>SUDO Requirements</strong> <em>(Only for UNIX)</em> Ensure that you have SUDO privileges to invoke /bin/sh as root.</td>
</tr>
<tr>
<td><strong>PATH Environment Variable Requirements</strong></td>
<td><em>(For Microsoft Windows)</em> On the destination host, ensure that the cygwin software location appears before other software locations in</td>
</tr>
<tr>
<td></td>
<td>the PATH environment variable. After making it the first entry, restart the SSH daemon (sshd) on both the hosts.</td>
</tr>
<tr>
<td><strong>Path Validation Requirements</strong></td>
<td>Validate the path to all command locations. For more information, see the appendix on validating command locations in the Oracle</td>
</tr>
<tr>
<td></td>
<td>Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td><strong>CLASSPATH Environment Variable Requirements</strong></td>
<td>Unset the CLASSPATH environment variable. You can always reset the variable to the original value after the installation is complete.</td>
</tr>
<tr>
<td><strong>Port Requirements</strong></td>
<td>Ensure that the default ports described in Section 2.1.6.1 are free.</td>
</tr>
<tr>
<td><strong>Temporary Directory Space Requirements</strong></td>
<td>Ensure that you allocate 400 MB of space for a temporary directory where the executables can be copied.</td>
</tr>
<tr>
<td></td>
<td>By default, the temporary directory location set to the environment variable TMP or TEMP is honored. If both are set, then TEMP is</td>
</tr>
<tr>
<td></td>
<td>honored. If none of them are set, then the following default values are honored: /tmp on UNIX hosts and c:\Temp on Microsoft</td>
</tr>
<tr>
<td></td>
<td>Windows hosts.</td>
</tr>
</tbody>
</table>
### Prerequisites

#### Installing Oracle Management Agent in Silent Mode

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Agent Base Directory</strong></td>
<td>Ensure that the agent base directory is empty. Ensure that the directory name does not contain any spaces. Ensure that the installing user owns the installation base directory. Ensure that the installer user or the root user owns all the parent directories. Ensure that the root user owns the root directory. For example, if the installation base directory is <code>/scratch/OracleHomes/agent</code>, and oracle is the installing user, then the <code>/scratch/OracleHomes/agent</code> directory must be owned by oracle, directories <code>scratch</code> and <code>OracleHomes</code> must be owned by either oracle or root user, and the root directory (<code>/</code>) must be owned by root user. If the agent base directory is mounted, then ensure that it is mounted with the <code>setuid</code> turned on.</td>
</tr>
<tr>
<td><strong>Agent Instance Home</strong></td>
<td>Ensure that the agent instance home location you specify in the response file is empty.</td>
</tr>
<tr>
<td><strong>Permission</strong></td>
<td>- Ensure that the agent base directory is empty, and ensure that you (in fact, all users accessing the agent base directory) have <code>read</code> and <code>execute</code> permission on all the directories that lead up to the agent base directory. For example, if the agent base directory is <code>/home/john/oracle/software/agent/</code>, then you must have <code>read</code> and <code>execute</code> permissions on all the directories, mainly home, john, oracle, software, and agent. - Ensure that you have <code>write</code> permission in the agent instance home. - Ensure that you have <code>write</code> permission in the temporary directory.</td>
</tr>
<tr>
<td><strong>Installing User</strong></td>
<td>If the central inventory owner and the user installing the Management Agent are different, then ensure that they are part of the same group. Also ensure that the inventory owner and the group to which the owner belongs have <code>read</code> and <code>write</code> permissions on the inventory directory. For example, if the inventory owner is <em>abc</em> and the user installing the Management Agent is <em>xyz</em>, then ensure that <em>abc</em> and <em>xyz</em> belong to the same group, and they have read and write access to the inventory.</td>
</tr>
<tr>
<td><strong>Central Inventory</strong></td>
<td>- Ensure that you allocate 100 MB of space for the Central Inventory. - Ensure that the Oracle Inventory (oraInventory) is not in a shared location. When you use the <code>/etc/oraInst.loc</code> file, ensure that the inventory location specified there is not pointing to a shared location. If it is, change it to a non-shared location by following the instructions outlined in My Oracle Support note 1092645.1. - Ensure that you have <code>read</code>, <code>write</code>, and <code>execute</code> permissions on oraInventory on all remote hosts. If you do not have these permissions on the default inventory (typically in the location mentioned in the <code>/etc/oraInst.loc</code> file) on any remote host, then ensure that you enter the path to an alternative inventory location using the <code>INVENTORY_LOCATION</code> or <code>-invPtrLoc</code> arguments as described in Table 5-3. Note that these parameters are supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
</tbody>
</table>

---

**Table 5-1 (Cont.) Prerequisites for Installing Oracle Management Agent in Silent Mode**
5.4 Installation Procedure

To install a Management Agent in silent mode, follow these steps:

1. On the OMS host, from the OMS home, log in to the EMCLI client. EMCLI Client is available by default with every OMS installation, so you need not install the client separately.

   \$<OMS_HOME>/bin/emcli login -username=sysman -password=<password>

   For example,

   \$<OMS_HOME>/bin/emcli login -username=sysman -password=2benot2be

   **Note:** The user name must always be sysman. Do not enter any other user name.

2. Synchronize EMCLI:

   \$<OMS_HOME>/bin/emcli sync

3. Identify the platforms for which the Management Agent software is available on the OMS host:

   \$<OMS_HOME>/bin/emcli get_supported_platforms

---

**Table 5–1 (Cont.) Prerequisites for Installing Oracle Management Agent in Silent Mode**

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent User Account Permissions and Rights (For Microsoft Windows)</td>
<td>(For Microsoft Windows) If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that the agent user account has permissions and rights to perform the following:</td>
</tr>
<tr>
<td></td>
<td>■ Act as part of the operating system.</td>
</tr>
<tr>
<td></td>
<td>■ Increase quotas.</td>
</tr>
<tr>
<td></td>
<td>■ Replace process level token.</td>
</tr>
<tr>
<td></td>
<td>■ Log in as a batch job.</td>
</tr>
<tr>
<td></td>
<td>To verify whether the agent user has these rights, follow these steps:</td>
</tr>
<tr>
<td></td>
<td>1. Launch the Local Security Settings.</td>
</tr>
<tr>
<td></td>
<td>From the Start menu, click Settings and then select Control Panel. From the Control Panel window, select Administrative Tools, and from the Administrative Tools window, select Local Security Settings.</td>
</tr>
<tr>
<td></td>
<td>2. In the Local Security Settings window, from the tree structure, expand Local Policies, and then expand User Rights Assignment.</td>
</tr>
<tr>
<td>Permissions for cmd.exe (For Microsoft Windows)</td>
<td>(For Microsoft Windows) If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that you grant the Cmd.exe program Read and Execute permissions for the user account that the batch job runs under. This is a restriction from Microsoft.</td>
</tr>
<tr>
<td></td>
<td>For more information on this restriction and to understand how you can grant these permissions, access the following URL to Microsoft Web site:</td>
</tr>
<tr>
<td></td>
<td><a href="http://support.microsoft.com/kb/867466/en-us">http://support.microsoft.com/kb/867466/en-us</a></td>
</tr>
</tbody>
</table>

---

5-6 Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide
This command lists all the platforms for which the Management Agent software is available on the OMS host. Example 5–1 shows a sample output of the command.

**Example 5–1  Output Showing Software Availability for Different Platforms**

```
---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = Linux x86
---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = Oracle Solaris on x86-64 (64-bit)
---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = HP-UX PA-RISC (64-bit)
```

If the output lists the platform on which you want to install the Management Agent, then proceed to the next step. Otherwise, download the software for the required platform using the Self Update console.

For information on Self Update and how you can use it to download the software, see the chapter on Self Update in the *Oracle Enterprise Manager Cloud Control Administrator’s Guide*.

4. Download the Management Agent software from Oracle Software Library to a temporary directory on the OMS host:

   `$<OMS_HOME>/bin/emcli get_agentimage -destination=<download_directory> -platform="<platform>" -version=<version>`

   For example,

   `./emcli get_agentimage -destination=/tmp -platform="Linux x86" -version=12.1.0.1.0`

   **Note:** In the command, note the following:

   - `-destination` is a directory on the OMS host where you want the Management Agent software to be downloaded. Ensure that you have write permission on this location.
     
     If the destination directory is titled with two or more words separated by a space, then enclose the directory name with double quotes.
     
     For example, if the destination directory is titled `/tmp/linux agentimage`, then enter the value as
     
     `-destination="/tmp/linux agentimage"`
   
   - `-platform` is the platform for which you want to download the software; this must match one of the platforms listed in the previous step for which the software is available on the OMS host.
   
   - `-version` is the version of the Management Agent software that you want to download; this is an optional argument. If you do not pass this argument, then the version is defaulted to the OMS version.

The command downloads the core Management Agent software to the destination directory you entered. For example, for Linux x86, you will see the file
12.1.0.1.0_AgentCore_46.zip. For information on the contents of this core software, see Section 5.4.3.

5. Transfer the downloaded ZIP file to a temporary directory (/tmp) on the destination host where you want to install the Management Agent. You can use any FTP software to transfer the file. For example, FileZilla.

6. On the destination host, extract the contents of the ZIP file using the `unzip` utility:
   ```
   unzip /tmp/<software_zip_file> -d <software_extract_location>
   
   For example,
   ```
   ```
   unzip /tmp/12.1.0.1.0_AgentCore_46.zip -d /tmp/agtImg
   ```

7. Edit the response file `agent.rsp` as described in Table 5–2.
   ```
   <software_extract_location>/agent.rsp
   ```

8. Invoke the deployment script and pass the response file:
   ```
   <software_extract_location>/agentDeploy.sh AGENT_BASE_DIR=<absolute_path_to_agentbasedir> RESPONSE_FILE=<absolute_path_to_responsefile>
   ```

---

**Note:**

- Instead of creating a response file, if you choose to pass all the arguments explicitly while invoking the deployment script.
  However, the mandatory ones are `OMS_HOST`, `EM_UPLOAD_PORT`, and `AGENT_REGISTRATION_PASSWORD`.
  ```
  For example,
  ```
  ```
  /tmp/agtImg/agentDeploy.sh AGENT_BASE_DIR=/scratch/agent12c OMS_HOST=example.com EM_UPLOAD_PORT=14511 AGENT_REGISTRATION_PASSWORD=2bornot2b
  ```

- When you pass the arguments while invoking the deployment script, these values need not be given with double quotes. However, when you provide them in a response file, the values need to be in double quotes (except for the argument `b_startAgent`).

- In addition to passing the agent base directory and a response file (or individual mandatory arguments with installation details), you can also pass other options that are supported by the deployment script. For more information, see Section 5.4.2.

---

9. Run the root scripts when you are prompted. For more information, see Section 5.5.

---

**Note:** Despite a successful installation, if you see some exceptions in the prerequisite error file, you can ignore the exception trace. This issue might happen when an operation attempts to retrieve an element from a collection using a key that does not exist in that collection. You can ignore this exception.
### 5.4.1 Creating a Response File

Table 5–2 describes the various parameters you must include in the response file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMS_HOST</td>
<td>Enter the OMS host name. For example, <code>OMS_HOST=“example.com”</code></td>
</tr>
<tr>
<td>EM_UPLOAD_PORT</td>
<td>Enter the upload port (HTTP or HTTPS) for communicating with the OMS. For example, <code>EM_UPLOAD_PORT=“14511”</code></td>
</tr>
<tr>
<td>AGENT_REGISTRATION_PASSWORD</td>
<td>Enter a password for registering new Management Agents that join the Enterprise Manager system. By default, the communication between the OMS and the Management Agents is secured, and any new Management Agents that join the Enterprise Manager system must be authenticated before they become part of the system. The password you enter here will be used for authenticating those new Management Agents. For example, <code>AGENT_REGISTRATION_PASSWORD=“Wel456come”</code></td>
</tr>
</tbody>
</table>
| AGENT_INSTANCE_HOME                | Enter a directory location on the destination host where all Management Agent-related configuration files can be stored. For this parameter, you can do one of the following:  
  - Leave it blank. In this case, by default, an instance directory titled `agent_inst` is created in the agent installation base directory.  
    For example, if the installation base directory is `/john/oracle/`, then the instance directory is defaulted to `/john/oracle/agent_inst`  
  - Enter the absolute path to a custom directory. Although you can enter any location as a custom location, Oracle recommends you to maintain the instance directory inside the installation base directory.  
    For example, `AGENT_INSTANCE_HOME=“/john/oracle/instance_dir/inst_mydir”` |
| AGENT_PORT                         | Enter a free port on which the Management Agent process should be started. The same port is used for both HTTP and HTTPS. For example, `AGENT_PORT=“1832”` If you do not enter any value, then either 3872 or any free port between 1830 and 1849 is honored. |
| b_startAgent                       | Enter `TRUE` if you want the Management Agent to start automatically once it is installed and configured. Otherwise, enter `FALSE`. For example, `b_startAgent=TRUE` |
Table 5–3 lists the options supported by the `agentDeploy.sh` script. On Microsoft Windows, these options apply to the `agentDeploy.bat` file.

### Table 5–3 Understanding the Options Supported by `agentDeploy.sh`/`agentDeploy.bat`

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-prereqOnly</code></td>
<td>Runs only the prerequisite checks. Does NOT actually install the Management Agent.</td>
</tr>
<tr>
<td></td>
<td>This option is useful when you want to verify whether your environment meets all the prerequisites for a successful Management Agent installation.</td>
</tr>
<tr>
<td><code>-ignorePrereqs</code></td>
<td>Skips running the prerequisite checks. Use this when you have already used the <code>-prereqOnly</code> option and verified the prerequisites, and only want to install the software binaries.</td>
</tr>
<tr>
<td><code>-invPtrLoc</code></td>
<td>Considers the Oracle Inventory directory for storing inventory details. Enter the absolute path to the <code>oraInst.loc</code> file that contains the location of the OraInventory directory.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong> If you enter a value for this option, do NOT use the <code>INVENTORY_LOCATION</code> option. Also note that this parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td><code>INVENTORY_LOCATION</code></td>
<td>Considers the Oracle Inventory directory for storing inventory details. Enter the absolute path to the OraInventory directory.</td>
</tr>
<tr>
<td></td>
<td><strong>Important:</strong></td>
</tr>
<tr>
<td></td>
<td>■ If you enter a value for this option, do NOT use the <code>-invPtrLoc</code> option.</td>
</tr>
<tr>
<td></td>
<td>■ Do NOT use this option if you already have the <code>/var/opt/oracle/oraInst.loc</code> on HP and Solaris platforms, and <code>/etc/oraInst.loc</code> file on all other UNIX platforms.</td>
</tr>
<tr>
<td></td>
<td>■ This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td><code>-help</code></td>
<td>Displays command line help and describes the usage of the deployment script.</td>
</tr>
</tbody>
</table>
5.4.3 Understanding the Contents of the Downloaded Management Agent Software

Table 5-4 describes the contents of the core Management Agent software you download before installing the Management Agent.

<table>
<thead>
<tr>
<th>Files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1.0.1.0_PluginsOneoffs_&lt;platform id&gt;.zip</td>
<td>Plug-in ZIP file containing all the discovering plug-ins, which were installed with the OMS, Oracle Home discovery plug-in, and Oracle Home monitoring plug-in.</td>
</tr>
<tr>
<td>agentcoreimage.zip</td>
<td>Archived ZIP file containing the core agent bits and agent set-uid binaries.</td>
</tr>
<tr>
<td>agentDeploy.sh/agentDeploy.bat</td>
<td>Script used for deploying the Management Agent.</td>
</tr>
<tr>
<td>unzip</td>
<td>Utility used for unarchiving the ZIP files.</td>
</tr>
</tbody>
</table>

Note: When you pass this option, the Management Agent is configured to use HTTP (non-secure) communication. To establish a secure HTTPS communication between the Management Agent and the OMS, you must manually secure the Management Agent after the OMS is available.
After you install the Management Agent, follow these steps:

1. (Only for UNIX Operating Systems) When prompted, manually run the following scripts as a root user. If you do not have SUDO privileges, then request your Administrator who has the privileges to run these scripts.
   - If this is the first Oracle product you just installed on the host, then run the `oraInstroot.sh` script (oraInstroot.bat on Windows) from the inventory location specified in the `oraInst.loc` file that is available in the Management Agent home.
     
     For example, if the inventory location specified in the `oraInst.loc` file is `$HOME/oraInventory`, then run the following command:
     
     ```bash
     $HOME/oraInventory/oraInstRoot.sh
     ```
     
     **Note:** If you are not a root user, then use SUDO to change to a root user. For example, run the following command:
     
     ```bash
     /usr/local/bin/sudo
     $HOME/oraInventory/oraInstRoot.sh
     ```
   
   **Note:** If the status of the Management Agent is down for some reason, then manually start the Management Agent by running the following command from its Oracle home:
   
   ```bash
   $<INSTANCE_HOME>/bin/emctl start agent
   ```

2. Verify the installation:
   
   a. Navigate to the Management Agent home and run the following command to see a message that confirms that the Management Agent is up and running:
      
      ```bash
      $<INSTANCE_HOME>/bin/emctl status agent
      ```
      
      **Note:** If you are not a root user, then use SUDO to change to a root user. For example, run the following command:
      
      ```bash
      /usr/local/bin/sudo $<AGENT_HOME>/root.sh
      ```

     **Note:** If the status of the Management Agent is down for some reason, then manually start the Management Agent by running the following command from its Oracle home:
     
     ```bash
     $<INSTANCE_HOME>/bin/emctl start agent
     ```

---

### Table 5–4 (Cont.) Contents of the Downloaded Management Agent Software

<table>
<thead>
<tr>
<th>Files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agentimage.properties</td>
<td>Properties file used for getting the version, platform ID, and so on.</td>
</tr>
<tr>
<td>agent.rsp</td>
<td>Response file to be edited and passed for installing the Management Agent.</td>
</tr>
</tbody>
</table>
b. Navigate to the Management Agent home and run the following command to see a message that confirms that EMD upload completed successfully:

```bash
$<INSTANCE_HOME>/bin/emctl upload agent
```

3. Verify if all the plug-ins were installed successfully. To do so, access the following log file from the Management Agent home, and search for the sentence `WARN:Plugin configuration has failed`.

```bash
$<AGENT_HOME>/cfgtoollogs/cfgfw/CfmLogger-<timestamp>.log
```

For example,

```bash
/u01/app/Oracle/core/12.1.0.1.0/cfgtoollogs/cfgfw/CfmLogger-<timestamp>.log
```

If you find the sentence, resolve the issue by running the `AgentPluginDeploy.pl` script from the Management Agent home. In this command, all `<AGENT_HOME>` references refer to the Management Agent home.

```bash
$<AGENT_HOME>/perl/bin/perl <AGENT_HOME>/bin/AgentPluginDeploy.pl -oracleHome <AGENT_HOME> -agentDir <AGENT_BASE_DIR> -pluginIdsInfoFile <AGENT_BASE_DIR>/plugins.txt -action configure -emStateDir <AGENT_INSTANCE_HOME>
```

For example,

```bash
/u01/app/Oracle/core/12.1.0.1.0/perl/bin/perl
```

/`u01/app/Oracle/core/12.1.0.1.0/bin/AgentPluginDeploy.pl
```

-`oracleHome` /`u01/app/Oracle/core/12.1.0.1.0/`

-`agentDir` /`u01/app/Oracle/`

-`pluginIdsInfoFile` /`u01/app/Oracle/plugins.txt`

-`action` `configure`

-`emStateDir` /`u01/app/Oracle/agent_inst`

4. If you had ignored a prerequisite check warning about wrong time zone settings, follow these steps:

1. Set the correct time zone on the required host.
   
   For information on how to set the time zone on a host, refer Time Zone Requirements in Table 5–1.

2. Deinstall the Management Agent present on the host.
   
   For information on how to deinstall a Management Agent, refer Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide.

3. Install a Management Agent on the host.

5. By default, the host and the Management Agent get automatically added to the Enterprise Manager Cloud Control console for monitoring. None of the targets running on that host get automatically discovered and monitored.

   To monitor the other targets, you need to add them to Enterprise Manager Cloud Control either using the Auto Discovery Results page, the Add Targets Manually page, or the discovery wizards offered for the targets you want to monitor.

   For information about discovering targets in Enterprise Manager Cloud Control, refer to the chapter on adding targets in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.
**Note:** If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Oracle Management Service. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
This chapter describes how you can install Oracle Management Agent (Management Agent) using its .rpm file. In particular, this section covers the following:

- Overview
- Before You Begin
- Prerequisites
- Installation Procedure
- After You Install

### 6.1 Overview

Installing a Management Agent using its .rpm file is primarily a silent way of installing a Management Agent. In this method, you download the .rpm file to a temporary directory on the destination host, and install it directly on the destination host without using any response file. Since you install it directly on the destination host, it is best suited for installing a few Management Agents, one at a time.

Once the installation is complete, you will see the following default contents in the agent base directory:

```
<agent_base_directory>
  |___core
  |   |___12.1.0.1.0
  |___plugins
  |___agent_inst
  |___sbin
  |___plugins.txt
  |___agentimage.properties
```

**Note:** Using the .rpm file, you can also choose to install a Management Agent while provisioning an operating system on a bare metal host. For more information, see the Oracle Enterprise Manager Administrator’s Guide for Software and Server Provisioning and Patching. This guide is available in the Enterprise Manager documentation library at:

6.2 Before You Begin

Before you begin installing a Management Agent, keep these points in mind:

- Agent RPM is available only for Linux 32-bit and Linux 64-bit platforms.
- You procure the Management Agent software from the OMS host and transfer it to the destination host for installation. The Management Agent software contains the core binaries required for installation, the response file to be edited and passed, and the configure.pl script.

By default, the OMS host contains the Management Agent software for the platform on which the OMS is running. For example, if the OMS host is Linux x86, then the Management Agent software available by default is only for Linux x86.

If you want to install the Management Agent on a platform that is different from the one on which the OMS is running, then download the software for the desired platform using the Self Update console.

For information on Self Update and how you can use it to download the software, see the chapter on Self Update in the Oracle Enterprise Manager Cloud Control Administrator's Guide.

- You can install only on one host at a time, therefore use this approach when you want to install only on a few hosts.
- You cannot run any preinstallation or postinstallation scripts as part of the installation process. Of course, you can run them manually after the installation ends.
- By default, the .rpm file configures only the following types of plug-ins:
  - All discovery plug-ins that were configured with the OMS from where the Management Agent software is being deployed.
  - Oracle Home discovery plug-in
  - Oracle Home monitoring plug-in
- You must not install two Management Agents on the same host. This disrupts the communication with the OMS.

6.3 Prerequisites

Before installing the Management Agent, ensure that you meet the following prerequisites.
Table 6-1  Prerequisites for Installing Oracle Management Agent Using RPM File

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hardware Requirements</strong></td>
<td>Ensure that you meet the hard disk space and physical memory requirements. For more information, see the chapter on hardware requirements in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td><strong>Operating System Requirements</strong></td>
<td>Ensure that you install the Management Agent only on certified operating systems as mentioned in the Enterprise Manager Certification Matrix available on My Oracle Support.</td>
</tr>
<tr>
<td></td>
<td>To access this matrix, follow these steps:</td>
</tr>
<tr>
<td></td>
<td>1. Log in to My Oracle Support, and click the Certifications tab.</td>
</tr>
<tr>
<td></td>
<td>2. On the Certifications page, in the Certification Search region, from the Product list, select Enterprise Manager Cloud Control.</td>
</tr>
<tr>
<td></td>
<td>3. From the Release list, select 12.1.0.1.0, and click Search.</td>
</tr>
<tr>
<td></td>
<td>Note: If you use Oracle Solaris 10, then ensure that you have update 9 or higher installed. To verify whether it is installed, run the following command:</td>
</tr>
<tr>
<td></td>
<td>cat /etc/release</td>
</tr>
<tr>
<td></td>
<td>You should see the output similar to the following. Here, s10s_u6 indicates that update 6 is already installed.</td>
</tr>
<tr>
<td></td>
<td>Solaris 10 10/08 s10s_u6wos_07b SPARC</td>
</tr>
<tr>
<td><strong>Package Requirements</strong></td>
<td>Ensure that you install all the operating system-specific packages. For more information, see the chapter on package requirements in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td><strong>User and Operating System Group</strong></td>
<td>Ensure that the destination host where you want to install the Management Agent has the appropriate users and operating system groups created.</td>
</tr>
<tr>
<td>Requirement</td>
<td>For more information, see the chapter on creating operating system groups and users in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
</tbody>
</table>
Ensure that the host time zone has been set correctly. To verify the host time zone, run the following command:

```
echo $TZ
```

If the time zone displayed is incorrect, run the following commands, before running the `agentDeploy.sh` or `agentDeploy.bat` scripts, to set the correct time zone:

- For Korn shell:
  ```
  TZ=<value>
  export TZ
  ```
- For Bourne shell or Bash shell:
  ```
  export TZ=<value>
  ```
- For C shell:
  ```
  setenv TZ <value>
  ```

For example, in the Bash shell, run the following command to set the time zone to America/New_York:

```
export TZ='America/New_York'
```

The time zones you can use are listed in `AGENT_HOME/sysman/admin/supportedtzs.lst`.

**Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the Management Agent install, you must set the correct time zone on the host after installing the Management Agent. For information on setting time zones post install, refer Section 6.5.

### Path Validation Requirements

Validate the path to all command locations. For more information, see the appendix on validating command locations in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.

### CLASSPATH Environment Variable Requirements

Unset the `CLASSPATH` environment variable. You can always reset the variable to the original value after the installation is complete.

### Temporary Directory Space Requirements

Ensure that you allocate 400 MB of space for a temporary directory where the executables can be copied.

By default, the temporary directory location set to the environment variable `TMP` or `TEMP` is honored. If both are set, then `TEMP` is honored. If none of them are set, then the following default values are honored: `/tmp` on UNIX hosts and `c:\Temp` on Microsoft Windows hosts.

### Agent Base Directory Requirements

Ensure that the installing user owns the agent base directory.

Ensure that the directory name does not contain any spaces.

Ensure that the installer user or the root user owns all the parent directories. Ensure that the root user owns the root directory.

For example, if the agent base directory is `/scratch/OracleHomes/agent`, and `oracle` is the installing user, then the `/scratch/OracleHomes/agent` directory must be owned by `oracle`, directories `scratch` and `OracleHomes` must be owned by either `oracle` or `root` user, and the root directory (`/`) must be owned by `root` user.

If the agent base directory is mounted, then ensure that it is mounted with the `setuid` turned on.

If the agent base directory is mounted, then ensure that it is mounted with the <code>setuid</code> turned on.</td>
</tr>
</tbody>
</table>
### 6.4 Installation Procedure

To install a Management Agent using its .rpm file, follow these steps:

1. On the OMS host, from the OMS home, log in to the EMCLI client. EMCLI Client is available by default with every OMS installation, so you need not install the client separately.
   
   ```bash
   <$OMS_HOME>/bin/emcli login -username=<username> -password=<password>
   
   For example,
   
   ```bash
   <$OMS_HOME>/bin/emcli login -username=sysman -password=2benot2be
   
   2. Synchronize EMCLI:
      
      ```bash
      <$OMS_HOME>/bin/emcli sync
      
      3. Identify the platforms for which the Management Agent software is available on the OMS host:
      
      ```bash
      <$OMS_HOME>/bin/emcli get_supported_platforms
      
      This command lists all the platforms for which the Management Agent software is available on the OMS host. Example 6–1 shows a sample output of the command.
Example 6–1  Output Showing Software Availability for Different Platforms

---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = Linux x86
---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = Oracle Solaris on x86-64 (64-bit)
---------------------------------------------------
Version = 12.1.0.1.0
Platform Name = HP-UX PA-RISC (64-bit)
---------------------------------------------------

If the output lists the platform on which you want to install the Management Agent, then proceed to the next step. Otherwise, download the software for the required platform using the Self Update console.

For information on Self Update and how you can use it to download the software, see the chapter on Self Update in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.

4. Download the .rpm file of the Management Agent from Oracle Software Library to a temporary directory on the OMS host

$<OMS_HOME>/bin/emcli get_agentimage_rpm
-destination=<download_directory> -platform="<platform>" -version=<version>

For example,

./emcli get_agentimage_rpm -destination=/tmp -platform="Linux x86" -version=12.1.0.1.0

Note:  In the command, note the following:

- **destination** is a directory on the OMS host where you want the .rpm file to be downloaded. Ensure that you have write permission on this location.

  If the destination directory is titled with two or more words separated by a space, then enclose the directory name with double quotes.

  For example, if the destination directory is titled /tmp/linux agentimage, then enter the value as
  
  -destination="/tmp/linux agentimage"

- **platform** is the platform for which you want to download the .rpm file; this must match one of the platforms listed in the previous step for which the software is available on the OMS host.

- **version** is the version of the Management Agent for which you want to download the .rpm file; this is an optional argument. If you do not pass this argument, then the version is defaulted to the OMS version.

The command downloads the .rpm file of the core Management Agent to the destination directory you entered. For example,

oracle-agt-12.1.0.1.0-1.0.i386.rpm
5. Transfer the downloaded .rpm file to a temporary directory (/tmp) on the destination host where you want to install the Management Agent. You can use any FTP software to transfer the file. For example, FileZilla.

6. On the destination host, run the .rpm file as a root user to install the Management Agent:

   rpm -ivh <download_directory>/<rpm_file>

   For example,

   rpm -ivh /tmp/oracle-agt-12.1.0.1.0-1.0.i386.rpm

   ____________________________________________________________________________

   Note: The following is the output of the command:

   Preparing... #                     [100%]
   Running the prereq
   l:oracle-agt #                     [100%]
   Follow the below steps to complete the agent rpm installation:
   1. Edit the properties file: /usr/lib/oracle/agent/agent.properties with the correct values
   2. Execute the command /etc/init.d/config.pl

   ____________________________________________________________________________

7. Edit the agent.properties file as described in Table 6–2. The file is available in the following location:

   /usr/lib/oracle/agent/agent.properties

8. Run the following command to complete the installation:

   /etc/init.d/config.pl

   ____________________________________________________________________________

   Note: Despite a successful installation, if you see some exceptions in the prerequisite error file, you can ignore the exception trace. This issue might happen when an operation attempts to retrieve an element from a collection using a key that does not exist in that collection. You can ignore this exception.

   ____________________________________________________________________________

6.4.1 Editing agent.properties File

Table 6–2 describes the various parameters you must include in the response file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s_OMSHost</td>
<td>(Mandatory) Enter the host name of the OMS to which you want to connect.</td>
</tr>
<tr>
<td>s_OMSPort</td>
<td>(Mandatory) Enter the upload port (HTTP or HTTPS) to communicate with the OMS.</td>
</tr>
</tbody>
</table>
After You Install

6.5 After You Install

After you install the Management Agent, follow these steps:

1. Verify the installation:
   a. Navigate to the Management Agent instance home and run the following command to see a message that confirms that the Management Agent is up and running:

   ```
   $<INSTANCE_HOME>/bin/emctl status agent
   ```

   **Note:** If the status of the Management Agent is down for some reason, then manually start the Management Agent by running the following command from the Management Agent instance home:

   ```
   $<INSTANCE_HOME>/bin/emctl start agent
   ```

### Table 6–2 (Cont.) Creating a Response File for Installing Oracle Management Agent Using an RPM File

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGENT_REGISTRATION_PASSWORD</td>
<td><em>(Mandatory)</em> Enter a password for registering new Management Agents that join the Enterprise Manager system. By default, the communication between the OMS and the Management Agents is secured, and any new Management Agents that join the Enterprise Manager system must be authenticated before they become part of the system. The password you enter here will be used for authenticating those new Management Agents.</td>
</tr>
<tr>
<td>agentUserName</td>
<td><em>(Mandatory)</em> Enter the user name with which you want to install the Management Agent.</td>
</tr>
<tr>
<td>agentUserGroup</td>
<td><em>(Mandatory)</em> Enter the group to which the Management Agent user should belong.</td>
</tr>
<tr>
<td>OraInvLoc</td>
<td><em>(Optional)</em> Enter the absolute path to the Central Inventory where the Management Agent user has write permission. For example, OraInvLoc =/usr/lib/oraInventory. <strong>Note:</strong> This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td>BASEDIR</td>
<td><em>(Optional)</em> Enter the absolute path to the agent base directory where you want to install the Management Agent. For example, /home/john/oracle/. If you do not enter the path to the agent base directory, then by default, the Management Agent is installed in the following location: /usr/lib/oracle/core/12.1.0.1.0</td>
</tr>
<tr>
<td>ORACLE_HOSTNAME</td>
<td><em>(Only for Virtual Hosts)</em> Enter the virtual host name where you want to install the Management Agent.</td>
</tr>
</tbody>
</table>
b. Navigate to the Management Agent and run the following command to see a message that confirms that EMD upload completed successfully:

```
$<INSTANCE_HOME>/bin/emctl upload agent
```

2. Verify if all the plug-ins were installed successfully. To do so, access the following log file from the Management Agent home, and search for the sentence `WARN:Plugin configuration has failed`.

```
$<AGENT_HOME>/cfgtoollogs/cfgfw/CfmLogger-<timestamp>.log
```

For example,
```
/u01/app/Oracle/core/12.1.0.1.0/cfgtoollogs/cfgfw/CfmLogger-<timestamp>.log
```

If you find the sentence, resolve the issue by running the `AgentPluginDeploy.pl` script from the Management Agent home.

```
$<AGENT_HOME>/perl/bin/perl <AGENT_HOME>/bin/AgentPluginDeploy.pl -oracleHome <AGENT_HOME> -agentDir <AGENT_BASE_DIR> -pluginIdsInfoFile <AGENT_BASE_DIR>/plugins.txt -action configure -emStateDir <AGENT_INSTANCE_HOME>
```

For example,
```
/u01/app/Oracle/core/12.1.0.1.0/perl/bin/perl /u01/app/Oracle/core/12.1.0.1.0/bin/AgentPluginDeploy.pl -oracleHome /u01/app/Oracle/core/12.1.0.1.0/ -agentDir /u01/app/Oracle/ -pluginIdsInfoFile /u01/app/Oracle/plugins.txt -action configure -emStateDir /u01/app/Oracle/agent_inst
```

3. If you had ignored a prerequisite check warning about wrong time zone settings, follow these steps:

1. Set the correct time zone on the required host.

   For information on how to set the time zone on a host, refer Time Zone Requirements in Table 6–1.

2. Deinstall the Management Agent present on the host.

   For information on how to deinstall a Management Agent, refer Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide.

3. Install a Management Agent on the host.

4. By default, the host and the Management Agent get automatically added to the Enterprise Manager Cloud Control console for monitoring. None of the targets running on that host get automatically discovered and monitored.

   To monitor the other targets, you need to add them to Enterprise Manager Cloud Control either using the Auto Discovery Results page, the Add Targets Manually page, or the discovery wizards offered for the targets you want to monitor.

   For information about discovering targets in Enterprise Manager Cloud Control, refer to the chapter on adding targets in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.
Note: If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Oracle Management Service. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
This chapter explains how you can clone an existing Oracle Management Agent (Management Agent). In particular, this section covers the following:

- **Overview**
- **Before You Begin**
- **Prerequisites**
- **Cloning Procedure**
- **After You Clone**

### 7.1 Overview

Oracle Management Agent (Management Agent) is one of the core components of Enterprise Manager Cloud Control that enables you to convert an unmanaged host to a managed host in the Enterprise Manager system. The Management Agent works in conjunction with the plug-ins to monitor the targets running on that managed host.

Therefore, if you want to monitor a target running on a host, you must first convert that unmanaged host to a managed host by installing an Oracle Management Agent, and then manually discover the targets running on it to start monitoring them.

However, the Management Agent you install using other installation types is always a fresh installation without any customized configuration that you had done or interim one-off patches that you had applied to other running Management Agents.

If you want to install an additional Management Agent that is identical to the existing well-tested, pre-patched, and running Management Agent, then the best option is to clone the existing instance. This saves time and effort in patching a fresh installation all over again and bringing it to the current state.

You can clone an existing Management Agent in graphical or silent mode.

- In graphical mode, you use the Add Host Targets Wizard that is accessible from within the Enterprise Manager Cloud Control console. The wizard enables you to select a source Management Agent, which you want to clone, and identify one or more remote hosts on which you want to clone it.

  The wizard first copies the source Management Agent image to the host on which Oracle Management Service (OMS) is running, and then, it transfers that copied image to the destination hosts. Although the wizard can be used for remotely cloning one, single Management Agent, it is best suited for mass-deployment of Management Agents, particularly while mass-deploying Management Agents of different releases on hosts of different platforms.
In silent mode, you use a compressed file (ZIP), which you transfer. Understandably, this is a much easier method because you compress the Oracle home of an existing Management Agent and transfer it to the destination host without having to specify any parameters or values in an interview screen, but still retaining all its configuration settings and applied one-off patches.

However, in silent mode, you can install only on one destination host at any given time. Once you are done with cloning of a Management Agent on a host, you must redo the procedure to clone on another host. Therefore, you cannot clone on multiple hosts simultaneously, and as a result, this approach is best suited when you want to clone only on a few hosts, one host after the other.

Understandably, as a prerequisite, you need to have at least one Management Agent in your environment, and its software binaries must be accessible from all the hosts where you want to clone an additional Management Agent. Therefore, note that this installation type must be used for installing only additional Management Agents in your environment.

After installing a Management Agent, to monitor a target, add the target to Enterprise Manager Cloud Control either using the Auto Discovery Results page, the Add Targets Manually page, or the discovery wizards offered for the targets you want to monitor.

For information about discovering targets in Enterprise Manager Cloud Control, refer to the chapter on adding targets in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.

Once the installation is complete, you will see the following default contents in the agent base directory:

```
<agent_base_directory>
    |_____ core
    |       |_____ 12.1.0.1.0
    |_____ plugins
    |_____ plugins.txt
    |_____ agent_inst
    |_____ sbin
    |_____ agentimage.properties
```

**Note:** If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Enterprise Manager Cloud Control. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.

### 7.2 Before You Begin

Before you begin installing an Oracle Management Agent, keep these points in mind:

- **(Only for Graphical Mode)** The Add Host Targets Wizard converts an unmanaged host to a managed host in the Enterprise Manager system by cloning an existing Oracle Management Agent.

- Oracle Management Agent 12c communicates only with Oracle Management Service 12c and not with any earlier release of Enterprise Manager.
(Only for Graphical Mode) Using the Add Host Targets Wizard, you can clone only when the source host (from where you are cloning the Management Agent) and the destination host are running on the same operating system. Therefore, if you have hosts running on different platforms, then you must have one deployment session per platform.

While cloning, the source Management Agent is not shut down.

(Only for Graphical Mode) If you have multiple hosts, sharing a common mounted drive, then install the Management Agents in two different phases:

1. First, clone the Management Agent to the host where the drive is shared by selecting the deployment type **Clone Existing Agent** in the Add Host Targets Wizard. Follow the instructions outlined in this chapter.

2. Then, install a Management Agent on all other hosts that access the shared, mounted drive by selecting the deployment type **Add Host to Shared Agent** in the Add Host Targets Wizard. (Here, you will select the Management Agent you installed in the previous step.) For more information, follow the instructions outlined in Chapter 8.

Cloning on shared clusters is NOT supported. If you have an Oracle RAC Cluster with multiple nodes, then you must clone the Management Agent on each of the nodes separately. In other words, in the Add Host Targets Wizard, you must add each node explicitly as a destination host.

(Only for Graphical Mode) The Add Host Targets Wizard uses SSH to establish connectivity between Oracle Management Service (OMS) and the remote hosts where you want to install the Management Agents.

(Only for Graphical Mode) Only SSH1 (SSH version 1) and SSH2 (SSH version 2) protocols offered by OpenSSH are supported for deploying a Management Agent.

(Only for Graphical Mode) SSH public key authentication and password-based authentication are supported. So you can use an existing SSH public key authentication without exposing your passwords. You can provide a dummy password in the wizard, and the wizard will internally use the underlying public key infrastructure to perform the installation.

(Only for Graphical Mode) The Add Host Targets Wizard supports Named Credentials that enable you to use a set of credentials registered with a particular name specifically for this operation, by your administrator. This ensures an additional layer of security for your passwords because as an operator, you can only select the named credential, which is saved and stored by an administrator, and not know the actual user name and password associated with it.

In case the named credential you select does not have the root privileges to clone, then you can set the named credential to run as another user (locked user account). In this case, the wizard logs in to the hosts using the named credential you select, but clones using the locked user account you set.

For example, you can create a named credential titled User_A, and set it to run as User_X that has the root privileges. In this case, the wizard logs in to the hosts as User_A, but clones as User_X.

By default, the Add Host Targets Wizard configures only the following types of plug-ins:

- All plug-ins that were configured with the Management Agent you are cloning.
- Oracle Home discovery plug-in
- Oracle Home monitoring plug-in

- You must have read privileges on the Oracle WebLogic Server’s alert log directories for the Support Workbench (Incident) metrics to work properly. You must also ensure that the Management Agent that is monitoring this Oracle WebLogic Server target is running on the same host as the Oracle WebLogic Server.

- You must not install two Management Agents on the same host. This disrupts the communication with the OMS.

### 7.3 Prerequisites

Before cloning the Management Agent, ensure that you meet the following prerequisites.

<table>
<thead>
<tr>
<th>Table 7–1</th>
<th>Prerequisites for Cloning Oracle Management Agent</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Requirement</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Hardware Requirements</td>
<td>Ensure that you meet the hard disk space and physical memory requirements. For more information, see the chapter on hardware requirements in the <em>Oracle Enterprise Manager Cloud Control Basic Installation Guide</em>.</td>
</tr>
<tr>
<td>Software Requirements <em>(Only for Graphical Mode)</em></td>
<td><em>(For Microsoft Windows)</em> Ensure that you have installed Cygwin on the destination host. For more information, see the chapter on installing Cygwin in the <em>Oracle Enterprise Manager Cloud Control Basic Installation Guide</em>.</td>
</tr>
</tbody>
</table>
| Operating System Requirements | Ensure that you install the Management Agent only on certified operating systems as mentioned in the Enterprise Manager Certification Matrix available on *My Oracle Support*. To access this matrix, follow these steps:  
  1. Log in to *My Oracle Support*, and click the **Certifications** tab.  
  2. On the Certifications page, in the **Certification Search** region, from the **Product** list, select **Enterprise Manager Cloud Control**.  
  3. From the **Release** list, select **12.1.0.1.0**, and click **Search**.  
    *Note:* If you use Oracle Solaris 10, then ensure that you have update 9 or higher installed. To verify whether it is installed, run the following command:  
    ```
    cat /etc/release
    ```
    You should see the output similar to the following. Here, `s10s_u6` indicates that update 6 is already installed.  
    ```
    Solaris 10 10/08 s10s_u6wos_07b SPARC
    ```
| Package Requirements | Ensure that you install all the operating system-specific packages. For more information, see the chapter on package requirements in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*. |
| User and Operating System Group Requirement | Ensure that the destination host where you want to install the Management Agent has the appropriate users and operating system groups created. For more information, see the chapter on creating operating system groups and users in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*. |
| /etc/hosts File Requirements *(Only for Silent Mode)* | Ensure that the `/etc/hosts` file on the host has the IP address, the fully qualified name, and the short name in the following format:  
  ```
  172.16.0.0 example.com mypc
  ```
Table 7–1  (Cont.) Prerequisites for Cloning Oracle Management Agent

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Host Requirements</td>
<td>Ensure that the destination hosts are accessible from the host where the OMS is running.</td>
</tr>
<tr>
<td></td>
<td>If the destination host and the host on which OMS is running belong to different network domains, then ensure that you update the /etc/hosts file on the destination host to add a line with the IP address of that host, the fully qualified name of that host, and the short name of the host.</td>
</tr>
<tr>
<td></td>
<td>For example, if the fully-qualified host name is example.com and the short name is mypc, then add the following line in the /etc/hosts file: 172.16.0.0 example.com mypc</td>
</tr>
<tr>
<td>Destination Host Credential</td>
<td>Ensure that all the destination hosts running on the same operating system have the same set of credentials.</td>
</tr>
<tr>
<td>Requirements (Only for Graphical Mode)</td>
<td>For example, all the destination hosts running on Linux operating system must have the same set of credentials.</td>
</tr>
<tr>
<td></td>
<td>The wizard installs the Management Agent using the same user account. If you have hosts running on the same operating system but with different credentials, then have two different deployment sessions.</td>
</tr>
</tbody>
</table>
Ensure that the time zones of the destination hosts have been set correctly. To verify the time zone of a destination host, log in to the OMS host, and run the following command:

```
ssh -l <install_user> <destination_host_name> /bin/sh -c 'echo $TZ'
```

If the time zone displayed is incorrect, log in to the destination host, and follow these steps:

1. Run the following commands to set the time zone on the destination host:
   - For Korn shell:
     ```
     TZ=<value>
     export TZ
     ```
   - For Bourne shell or Bash shell:
     ```
     export TZ=<value>
     ```
   - For C shell:
     ```
     setenv TZ <value>
     ```

   For example, in the Bash shell, run the following command to set the time zone to America/New_York:
   ```
   export TZ='America/New_York'
   ```

   The time zones you can use are listed in `<AGENT_HOME>/sysman/admin/supportdtzslst`.

2. Restart the SSH daemon.
   - If the destination host runs on a UNIX based operating system, run the following command:
     ```
     sudo /etc/init.d/sshd restart
     ```
   - If the destination host runs on a Microsoft Windows operating system, run the following commands:
     ```
     cygrunsrv -E sshd
     cygrunsrv -S sshd
     ```

3. Verify whether the SSH server can access the TZ environment variable by logging in to the OMS host, and running the following command:

   ```
   ssh -l <install_user> <destination_host_name> /bin/sh -c 'echo $TZ'
   ```

**Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the cloning procedure, you must set the correct time zone on the destination hosts after cloning the Management Agent. For information on setting time zones post cloning, refer Section 7.5.
**Table 7-1 (Cont.) Prerequisites for Cloning Oracle Management Agent**

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Time Zone Requirements** (Only for Silent Mode) | Ensure that the host time zone has been set correctly. To verify the host time zone, run the following command:  
  \[ \text{echo $TZ} \]  
  If the time zone displayed is incorrect, run the following commands, before running the `agentDeploy.sh` or `agentDeploy.bat` scripts, to set the correct time zone:  
  - For Korn shell:  
    \[ \text{TZ=<value> export TZ} \]  
  - For Bourne shell or Bash shell:  
    \[ \text{export TZ=<value>} \]  
  - For C shell:  
    \[ \text{setenv TZ <value>} \]  
  For example, in the Bash shell, run the following command to set the time zone to America/New_York:  
  \[ \text{export TZ='America/New_York'} \]  
  The time zones you can use are listed in `<AGENT_HOME>/sysman/admin/supportedtzs.lst`.  
  **Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the cloning procedure, you must set the correct time zone on the host after cloning the Management Agent. For information on setting time zones post cloning, refer Section 7.5. |
| **Permission Requirements**           | - Ensure that the agent base directory you specify is empty and has write permission.  
  - Ensure that the instance directory is empty and has write permission.                                                                                                               |
| **SUDO Requirements** (Only for UNIX) | - Ensure that the installing user has SUDO privileges to invoke `/bin/sh` as root.  
  - Ensure that you have the following line in the `/etc/sudoers` file:  
    \[ \text{Defaults visiblepw} \]  
  - Ensure that you comment out the following line in the `/etc/sudoers` file:  
    \[ \text{Defaults requiretty} \] |
| **PATH Environment Variable Requirements** | On the destination host, ensure the following:  
  - *(For Microsoft Windows)* Ensure that the cygwin software location appears before other software locations in the PATH environment variable. After making it the first entry, restart the SSH daemon (`sshd`).  
  - *(For UNIX)* On the destination host, ensure that the SCP binaries (for example, `/usr/local/bin/scp`) are in the PATH environment variable: |
| **Path Validation Requirements**      | Validate the path to all command locations. For more information, see the appendix on validating command locations in the Oracle Enterprise Manager Cloud Control Basic Installation Guide. |
| **CLASSPATH Environment Variable Requirements** | Unset the CLASSPATH environment variable. You can always reset the variable to the original value after the installation is complete. |
### Table 7–1 (Cont.) Prerequisites for Cloning Oracle Management Agent
<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IPV 6 Requirements</strong> <em>(Only for Graphical Mode)</em></td>
<td>If you are installing from an ipv6 OMS to a non-ipv6 host, then follow these step:</td>
</tr>
<tr>
<td>1.</td>
<td>Navigate to the following location on the OMS home:</td>
</tr>
<tr>
<td>2.</td>
<td>$&lt;OMS_HOME&gt;/oui/prov/resources/</td>
</tr>
<tr>
<td>3.</td>
<td>Change the property value of PING_PATH from /bin/ping to /bin/ping6</td>
</tr>
<tr>
<td><strong>Temporary Directory Space Requirements</strong></td>
<td>Ensure that you allocate 400 MB of space for a temporary directory where the executables can be copied.</td>
</tr>
<tr>
<td></td>
<td>By default, the temporary directory location set to the environment variable <code>TMP</code> or <code>TEMP</code> is honored. If both are set, then <code>TEMP</code> is honored.</td>
</tr>
<tr>
<td></td>
<td>If none of them are set, then the following default values are honored: <code>/tmp</code> on UNIX hosts and <code>c:\Temp</code> on Microsoft Windows hosts.</td>
</tr>
<tr>
<td><strong>Agent Base Directory Requirements</strong></td>
<td>Ensure that the installing user owns the agent base directory.</td>
</tr>
<tr>
<td></td>
<td>Ensure that the directory name does not contain any spaces.</td>
</tr>
<tr>
<td></td>
<td>Ensure that the installer user or the root user owns all the parent directories. Ensure that the root user owns the root directory.</td>
</tr>
<tr>
<td></td>
<td>For example, if the agent base directory is <code>/scratch/OracleHomes/agent</code>, and <code>oracle</code> is the installing user,</td>
</tr>
<tr>
<td></td>
<td>then the <code>/scratch/OracleHomes/agent directory must be owned by </code>oracle<code>, directories </code>scratch<code>and</code>OracleHomes<code>must be owned by either</code>oracle<code>or</code>root<code> user, and the root directory (</code>/<code>) must be owned by </code>root` user.</td>
</tr>
<tr>
<td></td>
<td>If the agent base directory is mounted, then ensure that it is mounted with the setuid turned on.</td>
</tr>
<tr>
<td><strong>Read and Execute Permission Requirements</strong></td>
<td>Ensure that you (in fact, all users accessing the Installation Base Directory) have <em>read</em> and <em>execute</em> permission on all the directories that lead up to the Installation Base Directory.</td>
</tr>
<tr>
<td></td>
<td>For example, if the Installation Base Directory is <code>/home/john/oracle/software/agent/</code>, then you must have <em>read</em> and <em>execute</em> permissions on all the directories, mainly <code>/home</code>, <code>/oracle</code>, <code>/software</code>, and <code>/agent</code>.</td>
</tr>
<tr>
<td><strong>Default SSH Port Requirements</strong> <em>(Only for Graphical Mode)</em></td>
<td>Ensure that the SSH daemon is running on the default port (that is, 22) on all the destination hosts. To verify the port, run the following command:</td>
</tr>
<tr>
<td></td>
<td>`netstat -anp</td>
</tr>
<tr>
<td></td>
<td>If the port is a non-default port, that is, any port other than 22, then update the <code>SSH_PORT</code> property in the following file that is present in the OMS home:</td>
</tr>
<tr>
<td></td>
<td><code>$&lt;OMS_HOME&gt;/oui/prov/resources/Paths.properties</code></td>
</tr>
<tr>
<td>Requirement</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Ping Requirements** *(Only for Graphical Mode)* | If a firewall configured in your environment does not allow any ping traffic, then ensure that you do the following:  
1. Take a backup of the following file from the OMS home:  
   For Linux Platforms:  
   `$<OMS_HOME>/oui/prov/resources/sPaths.properties`  
   For Other Platforms:  
   `$<OMS_HOME>/oui/prov/resources/ssPaths_<platform>.properties`  
   For example, `ssPaths_aix.properties` if the OMS is on AIX platform.  
2. Edit the original properties file and change `PING_PATH=/bin/ping` to `PING_PATH=/bin/true`. |
| **Software Availability Requirements** *(Only for Graphical Mode)* | **For Cloning an Existing Management Agent**  
Ensure that you already have Oracle Management Agent 12c running in your environment. Ensure that the platform on which it is running is the same as the platform of the destination hosts on which you want to clone.  
**For Installing a Management Agent Using Shared Oracle Home**  
Ensure that you already have Oracle Management Agent 12c installed as a *Master Agent* in a shared, mounted location |
| **Installation Base Directory Requirements** *(Only for Graphical Mode)* | Ensure that the agent base directory you specify in the Installation Base Directory field is empty and has *write* permission. |
| **plugins.txt File Update Requirements** *(Only for Silent Mode)* | *(Only if you installed additional plug-ins to the Management Agent later)*  
By default, when you install a Management Agent, it is automatically configured with the Oracle Home discovery plug-in, the Oracle Home monitoring plug-in, and all the discovery plug-ins that were configured with the OMS from where the Management Agent is being deployed. However, if you install any additional plug-ins later, then follow these steps:  
1. Edit the `plugins.txt` file from the installation base directory.  
2. Add entries in the following format for every additional plug-in you installed:  
   `<plug-in_name>|<plug-in_version>|<plug-in_type>`  
   For example,  
   `oracle.sysman.oh|12.1.0.1.0|discovery`  
   **Note:** To find the plug-in name, plug-in version, and plug-in type, see the `plugins` directory in the installation base directory. For each plug-in, you should see a subdirectory titled based on the plug-in name, type, and version.  
   For example, `oracle.sysman.db.discovery.plugin_12.1.0.1.0`  
   Here, `oracle.sysman.db` is the plug-in name, `discovery` is the plug-in type, and `12.1.0.1.0` is the plug-in version.  
3. Save the `plugins.txt` file. |
### Table 7–1 (Cont.) Prerequisites for Cloning Oracle Management Agent

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job System Requirements</td>
<td>Ensure that the job system is enabled on the source Management Agent you want to clone.</td>
</tr>
<tr>
<td>Installing User Requirements</td>
<td>If the central inventory owner and the user installing the Management Agent are different, then ensure that they are part of the same group. Also ensure that the inventory owner and the group to which the owner belongs have read and write permissions on the inventory directory. For example, if the inventory owner is <em>abc</em> and the user installing the Management Agent is <em>xyz</em>, then ensure that <em>abc</em> and <em>xyz</em> belong to the same group, and they have read and write access to the inventory.</td>
</tr>
</tbody>
</table>
| Central Inventory (oraInventory) Requirements | ■ Ensure that you allocate 100 MB of space for the Central Inventory.  
■ Ensure that the Oracle Inventory (oraInventory) is not in a shared location. When you use the `/etc/oraInst.loc` file, ensure that the inventory location specified there is not pointing to a shared location. If it is, change it to a non-shared location by following the instructions outlined in My Oracle Support note 1092645.1.  
■ Ensure that you have read, write, and execute permissions on `oraInventory` on all remote hosts. If you do not have these permissions on the default inventory (typically at `/etc/oraInst.loc`) on any remote host, then ensure that you specify the path to an alternative inventory location by using one of the following options in the Additional Parameters field of the Add Host Targets Wizard. However, these parameters are supported only on UNIX platforms, and not on Microsoft Windows platforms.  
```
INVENTORY_LOCATION=<absolute_path_to_inventory_directory>
-invPtrLoc <absolute_path_to_oraInst.loc>
``` |
| Port Requirements | Ensure that the default ports described in Section 2.1.6.1 are free. |
| Agent User Account Permissions and Rights | (For Microsoft Windows) If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that the agent user account has permissions and rights to perform the following:  
■ Act as part of the operating system.  
■ Increase quotas.  
■ Replace process level token.  
■ Log in as a batch job.  
To verify whether the agent user has these rights, follow these steps:  
1. Launch the Local Security Settings.  
   From the Start menu, click Settings and then select Control Panel. From the Control Panel window, select Administrative Tools, and from the Administrative Tools window, select Local Security Settings.  
2. In the Local Security Settings window, from the tree structure, expand Local Policies, and then expand User Rights Assignment. |
Cloning Procedure

This section describes the following:

- Cloning in Graphical Mode
- Cloning in Silent Mode

### Permissions for cmd.exe (For Microsoft Windows)
If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that you grant the `cmd.exe` program Read and Execute permissions for the user account that the batch job runs under. This is a restriction from Microsoft.

For more information on this restriction and to understand how you can grant these permissions, access the following URL to Microsoft Web site:

http://support.microsoft.com/kb/867466/en-us

### Preinstallation/Postinstallation Scripts Requirements
(Only for Graphical Mode)
Ensure that the preinstallation and postinstallation scripts that you want to run along with the installation are available either on the OMS host, destination hosts, or on a shared location accessible to the destination hosts.

### Browser Requirements
(Only for Graphical Mode)

- Ensure that you use a certified browser as mentioned in the Enterprise Manager Certification Matrix available on My Oracle Support.

  To access this matrix, follow these steps:

  1. Log in to My Oracle Support, and click the Certifications tab.
  2. On the Certifications page, in the Certification Search region, from the Product list, select Enterprise Manager Cloud Control.
  3. From the Release list, select 12.1.0.1.0, and click Search.

- If you use Microsoft Internet Explorer 8 or 9, do the following:
  - Turn off the compatibility view mode. To do so, in Microsoft Internet Explorer, from the Tools menu, click Compatibility View to disable it if it is enabled. Also, click Compatibility View Settings and deregister the Enterprise Manager Cloud Control console URL.
  - Enable XMLHTTP. To do so, from the Tools menu, click Internet Options. Click the Advanced tab, and under the Security heading, select Enable native XMLHTTP support to enable it.

</tbody>
</table>
7.4.1 Cloning in Graphical Mode

To clone a Management Agent in graphical mode, follow these steps:

1. In Cloud Control, do one of the following:
   - From the Setup menu, select Add Target, and then, click Auto Discovery Results. On the Auto Discovery Results page, select a host you want to monitor in Enterprise Manager Cloud Control, and click Promote.
     Enterprise Manager Cloud Control displays the Add Host Wizard, where you can select the option to clone an existing Management Agent.
   - From the Setup menu, select Add Target, and then, click Add Targets Manually. On the Add Targets Manually page, select Add Host Targets and click Add Host.
     Enterprise Manager Cloud Control displays the Add Host Wizard, where you can select the option to clone an existing Management Agent.

2. On the Host and Platform page, do the following:
   a. Accept the default name assigned for this session or enter a unique name of your choice. The custom name you enter can be any intuitive name, and need not necessarily be in the same format as the default name. For example, add_host_operation_1
      A unique deployment activity name enables you to save the cloning details specified in this deployment session and reuse them in the future without having to enter all the details all over again in the new session.
   b. Click Add to enter the fully qualified name and select the platform of the host on which you want to clone the Management Agent.

---

**Note:**
- Oracle recommends you to enter the fully qualified domain name of the host. For monitoring purpose, Enterprise Manager Cloud Control adds that host and the Management Agent with the exact name you enter here.
- You must enter only one host name per row. Entering multiple host names separated by a comma is not supported.
- You must ensure that the host name you enter does not have underscores.

Alternatively, you can click either Load from File to add host names stored in a file, or Add Discovered Hosts to add host names from a list of hosts discovered by Enterprise Manager. For information on how the host name entries must appear in the host file, see Section 7.4.1.2.

---

**Note:** When you click Add Discovered Hosts and add hosts from a list of discovered hosts, the host's platform is automatically detected and displayed. The platform name is detected using a combination of factors, including hints received from automated discovery and the platform of the OMS host. This default platform name is a suggestion, so Oracle strongly recommends you to verify the platform details before proceeding to the next step.
As you can clone only if the source host and destination host are running on the same platform, set the platform for the first host in the first row of the table and from the **Platform** list, select **Same for All Hosts**. This will ensure that the platform name you selected for the first host is also set for the rest of the hosts in the table.

**Note:** If you are cloning a Management Agent on a platform that is different from the platform on which the OMS is running, then ensure that you have the software for that platform. If you do not have that software, then go to the Self-Update page within Enterprise Manager Cloud Control, and download the software.

c. Click **Next**.

3. On the Installation Details page, do the following:

   a. In the Deployment Type section, select **Clone Existing Agent**. Then, for **Select Target**, click the torch icon and select the Management Agent you want to clone.

   **Note:** If you have multiple hosts sharing a common mounted drive, then install the Management Agents in two different phases:

   1. In the Add Host Targets Wizard, select the deployment type **Clone Existing Agent**, and clone the Management Agent to the host where the drive is shared.
   2. In the Add Host Targets Wizard, select the deployment type **Add Host to Shared Agent**, and install a Management Agent on all other hosts that access the shared, mounted drive. (Here, you will select the Management Agent you cloned in the previous step as the master agent or shared agent.)

   b. From the table, select the first row that indicates the hosts grouped by their common platform name.

   c. In the Installation Details section, provide the installation details common to the hosts selected in Step 3 (b). For **Installation Base Directory**, enter the absolute path to the agent base directory where you want the software binaries, security files, and inventory files of Management Agent to be copied. For example, `/usr/home/software/oracle/agentHome`.

   **Note:** The Installation Base Directory is essentially the agent base directory. Ensure that the directory you provide is empty. If a previously run deployment session had failed for some reason, then you might see an ADATMP_<timestamp> subdirectory in the installation base directory. In this case, either delete the subdirectory and start a new deployment session, or retry the failed session from the Add Host Status page.

   d. For **Instance Directory**, accept the default instance directory location or enter the absolute path to a directory of your choice where all Management Agent-related configuration files can be stored. For example, `/usr/home/software/oracle/agentHome/agent_inst`
If you are entering a custom location, then ensure that the directory has write permission. Oracle recommends you to maintain the instance directory inside the installation base directory.

e. From Named Credential list, select an appropriate profile whose credentials can be used for setting up the SSH connectivity between the OMS and the remote hosts, and for installing a Management Agent on each of the remote hosts.

**Note:**

- If you do not have a credential profile, or if you have one but do not see it in the Named Credential list, then click the plus icon against this list. In the Create New Named Credential window, enter the credentials and store them with an appropriate profile name so that it can be selected and used for installing the Management Agents. Also set the run privilege if you want to switch over from the Named Credential you are creating, to another user who has the privileges to perform the installation.

- If the plus icon is disabled against this list, then you do not have the privileges to create a profile with credentials. In this case, contact your administrator and either request him/her to grant you the privileges to create a new profile or request him/her to create a profile and grant you the access to view it in the Named Credential list.

- If you have manually set up the SSH connectivity between the OMS and the remote hosts, then you may not have a password for your user account. In this case, create a named credential with a dummy password. Do NOT leave the password field blank.

f. For Privileged Delegation Setting, validate the Privilege Delegation setting to be used for running the root scripts. By default, it is set to the Privilege Delegation setting configured in Enterprise Manager Cloud Control.

If you leave this field blank, the root scripts will not be run by the wizard; you will have to run them manually after the installation. For information about running them manually, see Section 7.5.

This setting will also be used for performing the installation as the user set in the Run As attribute of the selected Named Credential if you had set the user while creating that Named Credential.

**Note:** In the Privilege Delegation setting, the %RUNAS% is honored as the root user for running the root scripts and as the user set in the Run As attribute of the Named Credential for performing the installation.

g. For Port, accept the default port (3872) that is assigned for the Management Agent to communicate, or enter a port of your choice.

The custom port you enter must not be busy. If you are not sure, you can leave this field blank. Enterprise Manager Cloud Control automatically assigns the first available free port within the range of 1830 - 1849.

h. (Optional) In the Optional Details section, enter the absolute path to an accessible location where the preinstallation and postinstallation scripts you
want to run are available. Note that only one preinstallation or one postinstallation script can be specified.

If you want to run the script as root, then select Run as Root. If the script is on the host where OMS is running and is not on the host where you want to install the Management Agent, then select Script on OMS. In this case, the script will be copied from the OMS host to the destination hosts, and then run on the destination hosts.

i. (Optional) For Additional Parameters, enter a whitespace-separate list of additional parameters that you want to pass during the installation. For a complete list of supported additional parameters, see Table 7–2.

For example, if you want to provide the inventory pointer location file, then enter -invPtrLoc followed by the absolute path to the file location. Note that this parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

j. Repeat Step 3 (b) to Step 3 (i) for every other row you have in the table.

k. Click Next.

4. On the Review page, review the details you have provided and if you are satisfied with the details, then click Deploy Agent to clone the Management Agent.

If you want to modify the details, then click Back repeatedly to reach the page where you want to make the changes.

When you click Deploy Agent and submit the deployment session, you are automatically taken to the Add Host Status page that enables you to monitor the progress of the deployment session.

---

**Note:** On the Add Host Status page, if you see the error message Copying Source Agent Image Failed, then refer to the following log file in the OMS home:

```
$<OMS_HOME>/sysman/prov/agentpush/<timestampdir>/applogs/deployfwk.log
```

This error usually occurs when the job system is not enabled on the source Management Agent you are cloning. Ensure that the job system is enabled.

---

### 7.4.1.1 Supported Additional Parameters

Table 7–2 lists the additional parameters supported for cloning a Management Agent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVENTORY_LOCATION</td>
<td>Enter the absolute path to the Central Inventory (oraInventory).</td>
</tr>
<tr>
<td></td>
<td>For example, INVENTORY_LOCATION=$HOME/oraInventory</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
</tbody>
</table>
7.4.1.2 Format of Host List File

In the Add Host Targets Wizard, you can click Load from File to add the hosts listed in a file. However, ensure that the file you select has one of the following formats:

- Only the host name.
  For Example,
  host1.example.com
  host2.example.com

- The host name followed by the platform name.
  For Example,
  host1.example.com linux
  host2.example.com aix

  The supported platform names are linux_x64, linux, solaris, hpunix, hpi, linux_zseries64, aix, linux_ppc64, windows_x64, solaris_x64, win32.

7.4.2 Cloning in Silent Mode

To clone a Management Agent manually, follow these steps:

1. Set the environment variables described in Table 7–3.
2. Navigate to the agent base directory:
3. Compress the directories and files present in the agent base directory, and create a ZIP file in the temporary directory:

```
zip -r $T_WORK/agentcoreimage.zip core sbin plugins plugins.txt agentimage.properties
```

4. Navigate to the temporary directory:

```
cd $T_WORK
```

5. Copy the `agentDeploy.sh` to the temporary directory:

```
cp $AGENT_HOME/sysman/install/agentDeploy.sh .
```

6. Copy the UNZIP utility to the temporary directory:

```
cd $AGENT_HOME/bin/unzip .
```

7. Copy the `agentimage.properties` to the temporary directory:

```
cd $AGENT_BASE_DIR/agentimage.properties .
```

8. Create the final ZIP file with all the contents to be transferred, in the temporary directory:

```
zip -r agent.zip $T_WORK/*
```

9. Transfer the ZIP file to the installation base directory of the destination host using a file transfer utility (for example, FTP).

10. Extract the contents of the ZIP file.

11. Create a response file titled `agent.rsp` (in the same directory) as described in Table 5-2.

```
Note: The response file you create can have any name, and not necessarily `agent.rsp`. For easy understanding, this chapter uses the name `agent.rsp`. Also, instead of creating a response file, you can choose to pass the values in separate arguments while invoking the deployment script. However, Oracle recommends that you create a response file and capture the information there.
```

12. Invoke the deployment script and pass the response file:

```
<Agent_Base_Directory>/agentDeploy.sh AGENT_BASE_DIR=<absolute_path_to_agentbasedir> RESPONSE_FILE=<absolute_path_to_responsefile>
```
Note:

- Instead of creating a response file, if you choose to pass the values in separate arguments, then invoke the deployment script with some mandatory arguments in the following way:

  ```bash
  <Agent_Base_Directory>/agentDeploy.sh AGENT_BASE_DIR=<absolute_path_to_agentbasedir> OMS_HOST=<oms_hostname> EM_UPLOAD_PORT=<em_upload_port> AGENT_REGISTRATION_PASSWORD=<password>
  ```

- In addition to passing the agent base directory and a response file (or individual mandatory arguments with installation details), you can also pass other options that are supported by the deployment script. For more information, see Section 5.4.2.

### 7.4.2.1 Setting Environment Variables for Cloning Agent Using ZIP File

Table 7–3 lists the environment variables you need to set and describes how you can set them.

#### Table 7–3 Setting Environment Variables for Cloning Agent Using ZIP File

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Command Example</th>
</tr>
</thead>
</table>
| AGENT_BASE_DIR   | Set it to the installation base directory of the Management Agent you want to clone. | In bash terminal, run the following command:  
  ```bash
  export AGENT_BASE_DIR=<absolute_path_to_agent_install_base_dir>
  ```
  For example,  
  ```bash
  export AGENT_BASE_DIR=/u01/app/Oracle/software/agent/core/12.1.0.1.0
  ```
  In other terminals, run the following command:  
  ```bash
  setenv AGENT_BASE_DIR <absolute_path_to_agent_install_base_dir>
  ```
  For example,  
  ```bash
  setenv AGENT_BASE_DIR /u01/app/Oracle/software/agent/core/12.1.0.1.0
  ```
| AGENT_HOME       | Set it to the Oracle home of the Management Agent. For example,  
  ```bash
  /u01/app/Oracle/software/agent/core/12.1.0.1.0
  ```  | In bash terminal, run the following command:  
  ```bash
  export AGENT_HOME=<absolute_path_to_agent_home>
  ```
  For example,  
  ```bash
  export AGENT_HOME=/u01/app/Oracle/software/agent/core/12.1.0.1.0
  ```
  In other terminals, run the following command:  
  ```bash
  setenv AGENT_HOME <absolute_path_to_agent_home>
  ```
  For example,  
  ```bash
  setenv AGENT_HOME /u01/app/Oracle/software/agent/core/12.1.0.1.0
  ```
7.5 After You Clone

After you clone the Management Agent, follow these steps:

1. *(Only for Graphical Mode)* Verify the installation on the Add Host Status page. Review the progress made on each of the phases of the deployment operation — Initialization, Remote Prerequisite Check, and Agent Deployment.

   **Note:** In the Add Host Targets Wizard, after you click Deploy Agent to install one or more Management Agents, you are automatically taken to the Add Host Status page.

   If you want to view the details or track the progress of all the deployment sessions, then from the Setup menu, select Add Target, and then, click Add Targets Manually. On the Add Targets Manually page, select Add Host Targets and click Add Host Results.

   If a particular phase fails or ends up with a warning, then review the details provided for each phase in the Agent Deployment Details section, and do one of the following:

   - Ignore the warning or failure, and continue with the session if you prefer.
     - You can choose to proceed with the deployment of Management Agents only on those remote hosts that have successfully cleared the checks, and you can ignore the ones that have Warning or Failed status. To do so, click Continue and select Continue, Ignoring Failed Hosts.
     - You can choose to proceed with the deployment of Management Agents on all the hosts, including the ones that have Warning or Failed status. To do, click Continue and select Continue, All Hosts.

   - Fix the problem by reviewing the error description carefully, understanding its cause, and taking action as recommended by Oracle.
     - You can choose to retry the deployment of Management Agents with the same installation details. To do so, click Retry and select Retry Using Same Inputs.
     - You can retry the deployment of Management Agents with modified installation details. To do so, click Retry and select Update Inputs and Retry.

**Table 7–3 (Cont.) Setting Environment Variables for Cloning Agent Using ZIP File**

<table>
<thead>
<tr>
<th>T_WORK</th>
<th>Set it to /tmp/clone_work.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In bash terminal, run the following command: export T_WORK=/tmp/clone_work</td>
</tr>
<tr>
<td></td>
<td>In other terminals, run the following command: setenv T_WORK /tmp/clone_work</td>
</tr>
</tbody>
</table>

T_WORK Set it to /tmp/clone_work.

In the Add Host Targets Wizard, after you click Deploy Agent to install one or more Management Agents, you are automatically taken to the Add Host Status page.

If you want to view the details or track the progress of all the deployment sessions, then from the Setup menu, select Add Target, and then, click Add Targets Manually. On the Add Targets Manually page, select Add Host Targets and click Add Host Results.

If a particular phase fails or ends up with a warning, then review the details provided for each phase in the Agent Deployment Details section, and do one of the following:

- Ignore the warning or failure, and continue with the session if you prefer.
  - You can choose to proceed with the deployment of Management Agents only on those remote hosts that have successfully cleared the checks, and you can ignore the ones that have Warning or Failed status. To do so, click Continue and select Continue, Ignoring Failed Hosts.
  - You can choose to proceed with the deployment of Management Agents on all the hosts, including the ones that have Warning or Failed status. To do, click Continue and select Continue, All Hosts.

- Fix the problem by reviewing the error description carefully, understanding its cause, and taking action as recommended by Oracle.
  - You can choose to retry the deployment of Management Agents with the same installation details. To do so, click Retry and select Retry Using Same Inputs.
  - You can retry the deployment of Management Agents with modified installation details. To do so, click Retry and select Update Inputs and Retry.
2. Verify the installation as described in Section 5.5.

3. If you had ignored a prerequisite check warning about wrong time zone settings, follow these steps:
   1. Set the correct time zone on the required host.
      For information on how to set the time zone on a host, refer Time Zone Requirements in Table 7–1.
   2. Deinstall the Management Agent present on the host.
      For information on how to deinstall a Management Agent, refer Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide.
   3. Install a Management Agent on the host.

   **Note:** If you see the error message *Copying Source Agent Image Failed*, then refer to the following log file in the OMS home:

   ```
   $<OMS_HOME>/sysman/prov/agentpush/<timestampdir>/applogs/deployfwk.log
   ```

   This error usually occurs when the job system is not enabled on the source Management Agent you are cloning. Ensure that the job system is enabled.

   **Note:** If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Enterprise Manager Cloud Control. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
Installing Shared Agent

This chapter describes how you can install a *Shared Agent* with the help of a central, shared Oracle home location of an existing Oracle Management Agent (Management Agent) that is installed on an NFS-mounted drive.

- **Overview**
- **Before You Begin**
- **Prerequisites**
- **Installation Procedure**
- **After You Install**

### 8.1 Overview

If you want to install additional Management Agents on hosts that share a mounted drive where a Management Agent is already installed, then the best option is to use the software binaries of the shared Oracle home from the mounted drive and configure the remote hosts to be managed by that Management Agent, thus capitalizing on the NFS visibility and saving hard disk space on the remote hosts.

The Management Agent that shares its software binaries, in this context, is called the *Master Agent*, and the one that is configured with an instance directory on the remote host is called the *Shared Agents* or *NFS Agents*.

You can install a *Shared Agent* in graphical or silent mode. In graphical mode, you use the Add Host Targets Wizard that is accessible from within the Enterprise Manager Cloud Control console. In silent mode, you use the `AgentNFS.pl` script.

The wizard and the script use the software binaries from the shared Oracle home and configure an instance directory on each of the destination hosts for storing configuration files such as `emd.properties`, `targets.xml`, `log` files, and so on.

**Note:** Unlike the Add Host Target Wizard, the `AgentNFS.pl` script must be run only from a destination host, and at a given time, only one Management Agent can be installed at a given time. Therefore, if you want to install only a few Management Agents, then use the `AgentNFS.pl` script

### 8.2 Before You Begin

Before you begin, keep these points in mind:
When you install a Shared Agent, you only configure an instance directory on the destination host to store configuration files; you do not actually install a Management Agent.

The Shared Agent can communicate only with Oracle Management Service 12c and not with any earlier release of Enterprise Manager.

Only the destination host and the Shared Agent installed on it get automatically discovered and monitored in the Enterprise Manager system. The targets running on that destination host do not get automatically discovered and added to the Enterprise Manager system.

The source host (where the Master Agent is running) and the destination host must be running on the same operating system. Therefore, if you have hosts running on different platforms, then you must have one deployment session per platform.

The Master Agent and the Shared Agent must be installed with the same user account.

(Only for Graphical Mode) The Add Host Targets Wizard uses SSH to establish connectivity between Oracle Management Service (OMS) and the remote hosts where you want to install the Management Agents.

(Only for Graphical Mode) Only SSH1 (SSH version 1) and SSH2 (SSH version 2) protocols offered by OpenSSH are supported for deploying a Management Agent.

(Only for Graphical Mode) SSH public key authentication and password-based authentication are supported. So you can use an existing SSH public key authentication without exposing your passwords. You can provide a dummy password in the wizard, and the wizard will internally use the underlying public key infrastructure to perform the installation.

(Only for Graphical Mode) The Add Host Targets Wizard supports Named Credentials that enable you to use a set of credentials registered with a particular name specifically for this operation, by your administrator. This ensures an additional layer of security for your passwords because as an operator, you can only select the named credential, which is saved and stored by an administrator, and not know the actual user name and password associated with it.

In case the named credential you select does not have the root privileges to perform the installation, then you can set the named credential to run as another user (locked user account). In this case, the wizard logs in to the hosts using the named credential you select, but performs the installation using the locked user account you set.

For example, you can create a named credential titled User_A, and set it to run as User_X that has the root privileges. In this case, the wizard logs in to the hosts as User_A, but installs as User_X.

By default, the Add Host Targets Wizard configures only the following types of plug-ins:

- All discovery plug-ins that were configured with the OMS from where the Management Agent software is being deployed.
- Oracle Home discovery plug-in
- Oracle Home monitoring plug-in

You must not install two Management Agents on the same host. This disrupts the communication with the OMS.
8.3 Prerequisites

Before installing a *Shared Agent*, ensure that you meet the following prerequisites:

**Table 8–1 Prerequisites for Installing Shared Agent**

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hardware Requirements</strong></td>
<td>Ensure that you meet the hard disk space and physical memory requirements. For more information, see the chapter on hardware requirements in the <em>Oracle Enterprise Manager Cloud Control Basic Installation Guide</em>.</td>
</tr>
<tr>
<td><strong>Destination Host Disk Space Requirements</strong></td>
<td>Ensure that the <em>Master Agent</em> host has a minimum of 1 GB free hard disk space, and the <em>Shared Agent</em> host has a minimum of 1 MB free hard disk space.</td>
</tr>
<tr>
<td><strong>Software Requirements (Only for Graphical Mode)</strong></td>
<td>(For Microsoft Windows) Ensure that you have installed Cygwin on the destination host. For more information, see the chapter on installing Cygwin in the <em>Oracle Enterprise Manager Cloud Control Basic Installation Guide</em>.</td>
</tr>
</tbody>
</table>
| **Operating System Requirements**                 | Ensure that you install the Management Agent only on certified operating systems as mentioned in the Enterprise Manager Certification Matrix available on *My Oracle Support*. To access this matrix, follow these steps:  
  1. Log in to *My Oracle Support*, and click the **Certifications** tab.  
  2. On the Certifications page, in the **Certification Search** region, from the **Product** list, select **Enterprise Manager Cloud Control**.  
  3. From the **Release** list, select **12.1.0.1.0**, and click **Search**.  
    **Note:** If you use Oracle Solaris 10, then ensure that you have update 9 or higher installed. To verify whether it is installed, run the following command:  
    ```bash
    cat /etc/release
    ```  
    You should see the output similar to the following. Here, `s10s_u6` indicates that update 6 is already installed.  
    **Solaris 10 10/08 s10s_u6wos_07b SPARC**  
    For more information, see the chapter on package requirements in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.                                                                                                                                 |
| **Package Requirements**                          | Ensure that you install all the operating system-specific packages. For more information, see the chapter on package requirements in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.                                                                                                                   |
| **User and Operating System Group Requirement**   | Ensure that the destination host where you want to install the Management Agent has the appropriate users and operating system groups created. For more information, see the chapter on creating operating system groups and users in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.                                                                 |
| **Software Availability Requirements**            | Ensure that you already have Oracle Management Agent 12c installed as a *Master Agent* in a shared, mounted location.                                                                                                                                                                                                                           |
| **/etc/hosts File Requirements (Only for Silent Mode)** | Ensure that the `/etc/hosts` file on the host has the IP address, the fully qualified name, and the short name in the following format:  
  ```
  172.16.0.0 example.com mypc
  ```  
  For more information, see the chapter on creating operating system groups and users in the *Oracle Enterprise Manager Cloud Control Basic Installation Guide*.                                                                                                                   |
### Destination Host Access Requirements

*(Only for Graphical Mode)*

Ensure that the destination hosts are accessible from the host where the OMS is running.

Ensure that the destination host has read-only access to the software binaries of this *Master Agent*.

If the destination host and the host on which OMS is running belong to different network domains, then ensure that you update the `/etc/hosts` file on the destination host to add a line with the IP address of that host, the fully qualified name of that host, and the short name of the host.

For example, if the fully-qualified host name is `example.com` and the short name is `mypc`, then add the following line in the `/etc/hosts` file:

```
172.16.0.0 example.com mypc
```

### Destination Host Credential Requirements

*(Only for Graphical Mode)*

Ensure that all the destination hosts running on the same operating system have the same set of credentials. For example, all the destination hosts running on Linux operating system must have the same set of credentials.

The wizard installs the Management Agent using the same user account. If you have hosts running on the same operating system but with different credentials, then have two different deployment sessions.

---

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Host Access Requirements</td>
<td>Ensure that the destination hosts are accessible from the host where the OMS is running. Ensure that the destination host has read-only access to the software binaries of this <em>Master Agent</em>. If the destination host and the host on which OMS is running belong to different network domains, then ensure that you update the <code>/etc/hosts</code> file on the destination host to add a line with the IP address of that host, the fully qualified name of that host, and the short name of the host. For example, if the fully-qualified host name is <code>example.com</code> and the short name is <code>mypc</code>, then add the following line in the <code>/etc/hosts</code> file: <code>172.16.0.0 example.com mypc</code></td>
</tr>
<tr>
<td>Destination Host Credential Requirements</td>
<td>Ensure that all the destination hosts running on the same operating system have the same set of credentials. For example, all the destination hosts running on Linux operating system must have the same set of credentials. The wizard installs the Management Agent using the same user account. If you have hosts running on the same operating system but with different credentials, then have two different deployment sessions.</td>
</tr>
</tbody>
</table>
Ensure that the time zones of the destination hosts have been set correctly. To verify the time zone of a destination host, log in to the OMS host, and run the following command:

```
ssh -l <install_user> <destination_host_name> /bin/sh -c 'echo $TZ'
```

If the time zone displayed is incorrect, log in to the destination host, and follow these steps:

1. Run the following commands to set the time zone on the destination host:
   - For Korn shell:
     ```
     TZ=<value>
     export TZ
     ```
   - For Bourne shell or Bash shell:
     ```
     export TZ=<value>
     ```
   - For C shell:
     ```
     setenv TZ <value>
     ```

     For example, in the Bash shell, run the following command to set the time zone to America/New_York:

     ```
     export TZ='America/New_York'
     ```

     The time zones you can use are listed in `<AGENT_HOME>/sysman/admin/supportedtzs.lst`.

2. Restart the SSH daemon.

   If the destination host runs on a UNIX based operating system, run the following command:

   ```
   sudo /etc/init.d/sshd restart
   ```

   If the destination host runs on a Microsoft Windows operating system, run the following commands:

   ```
   cygrunsrv -E sshd
   cygrunsrv -S sshd
   ```

3. Verify whether the SSH server can access the `TZ` environment variable by logging in to the OMS host, and running the following command:

   ```
   ssh -l <install_user> <destination_host_name> /bin/sh -c 'echo $TZ'
   ```

**Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the Management Agent install, you must set the correct time zone on the destination hosts after installing the Management Agents. For information on setting time zones post install, refer Section 8.5.
### Prerequisites

**Time Zone Requirements** *(Only for Silent Mode)*

Ensure that the host time zone has been set correctly. To verify the host time zone, run the following command:

```shell
echo $TZ
```

If the time zone displayed is incorrect, run the following commands, before running the `agentDeploy.sh` or `agentDeploy.bat` scripts, to set the correct time zone:

- **For Korn shell:**
  ```shell
  TZ=<value>
  export TZ
  ```
- **For Bourne shell or Bash shell:**
  ```shell
  export TZ=<value>
  ```
- **For C shell:**
  ```shell
  setenv TZ <value>
  ```

For example, in the Bash shell, run the following command to set the time zone to America/New_York:

```shell
export TZ='America/New_York'
```

The time zones you can use are listed in `<AGENT_HOME>/sysman/admin/supportedtzs.lst`.

**Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the Management Agent install, you must set the correct time zone on the host after installing the Management Agent. For information on setting time zones post install, refer [Section 8.5](#).

---

**Temporary Directory Space Requirements**

Ensure that you allocate 400 MB of space for a temporary directory where the executables can be copied.

By default, the temporary directory location set to the environment variable `TMP` or `TEMP` is honored. If both are set, then `TEMP` is honored. If none of them are set, then the following default values are honored: `/tmp` on UNIX hosts and `C:\Temp` on Microsoft Windows hosts.

---

**Instance Directory Requirements**

Ensure that the instance directory you enter is empty and has write permission.

---

**Shared Oracle Home Requirements**

Ensure that the `Master Agent` home is accessible from the destination host where you want to install the `Shared Agent`. Ensure that the `Master Agent` home is mounted with the `setuid` turned on.

Ensure that the `Shared Agent` has read-only access to the software binaries of this `Master Agent`.

---

**SUDO Requirements** *(Only for UNIX)*

- Ensure that the installing user has SUDO privileges to invoke `/bin/sh` as `root`.
- Ensure that you have the following line in the `/etc/sudoers` file:
  ```
  visiblepw
  ```
- Ensure that you comment out the following line in the `/etc/sudoers` file:
  ```
  requiretty
  ```

---

### Table 8–1 (Cont.) Prerequisites for Installing Shared Agent

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Time Zone Requirements <em>(Only for Silent Mode)</em></td>
<td>Ensure that the host time zone has been set correctly. To verify the host time zone, run the following command:</td>
</tr>
</tbody>
</table>
|                                       | ```shell
echo $TZ
```
|                                       | If the time zone displayed is incorrect, run the following commands, before running the `agentDeploy.sh` or `agentDeploy.bat` scripts, to set the correct time zone: |
|                                       | - **For Korn shell:**
|                                       |   ```shell
|                                       |     TZ=<value>
|                                       |     export TZ
|                                       | - **For Bourne shell or Bash shell:**
|                                       |   ```shell
|                                       |     export TZ=<value>
|                                       | - **For C shell:**
|                                       |   ```shell
|                                       |     setenv TZ <value>
|                                       | For example, in the Bash shell, run the following command to set the time zone to America/New_York:                                      |
|                                       | ```shell
|                                       |     export TZ='America/New_York'
|                                       | The time zones you can use are listed in `<AGENT_HOME>/sysman/admin/supportedtzs.lst`.                                                      |
|                                       | **Note:** If you had ignored a prerequisite check warning about wrong time zone settings during the Management Agent install, you must set the correct time zone on the host after installing the Management Agent. For information on setting time zones post install, refer [Section 8.5](#). |
| Temporary Directory Space Requirements | Ensure that you allocate 400 MB of space for a temporary directory where the executables can be copied.                                   |
|                                       | By default, the temporary directory location set to the environment variable `TMP` or `TEMP` is honored. If both are set, then `TEMP` is honored. |
|                                       | If none of them are set, then the following default values are honored: `/tmp` on UNIX hosts and `C:\Temp` on Microsoft Windows hosts.          |
| Instance Directory Requirements       | Ensure that the instance directory you enter is empty and has write permission.                                                              |
| Shared Oracle Home Requirements        | Ensure that the `Master Agent` home is accessible from the destination host where you want to install the `Shared Agent`. Ensure that the `Master Agent` home is mounted with the `setuid` turned on. |
|                                       | Ensure that the `Shared Agent` has read-only access to the software binaries of this `Master Agent`.                                       |
| SUDO Requirements *(Only for UNIX)*    | Ensure that the installing user has SUDO privileges to invoke `/bin/sh` as `root`.                                                           |
|                                       | Ensure that you have the following line in the `/etc/sudoers` file:                                                                           |
|                                       | ```
|                                       |     visiblepw
|                                       | ```
|                                       | Ensure that you comment out the following line in the `/etc/sudoers` file:                                                                  |
|                                       | ```
|                                       |     requiretty
|                                       | ```
### Prerequisites

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PATH Environment Variable Requirements</strong></td>
<td>On the destination host, ensure the following:</td>
</tr>
<tr>
<td>(Only for Graphical Mode)</td>
<td>- <em>(For Microsoft Windows)</em> Ensure that the cygwin software location appears before other software locations in the PATH environment variable. After making it the first entry, restart the SSH daemon (sshd).</td>
</tr>
<tr>
<td></td>
<td>- <em>(For UNIX)</em> On the destination host, ensure that the SCP binaries (for example, /usr/local/bin/scp) are in the PATH environment variable:</td>
</tr>
<tr>
<td><strong>Path Validation Requirements</strong></td>
<td>Validate the path to all command locations. For more information, see the appendix on validating command locations in the Oracle Enterprise Manager Cloud Control Basic Installation Guide.</td>
</tr>
<tr>
<td>(Only for Graphical Mode)</td>
<td></td>
</tr>
<tr>
<td><strong>CLASSPATH Environment Variable Requirements</strong></td>
<td>If the value assigned to the CLASSPATH environment variable has white spaces in it, then ensure that you unset it. You can always reset the environment variable to the original value after the installation is complete.</td>
</tr>
<tr>
<td><strong>IPV 6 Requirements</strong></td>
<td>If you are installing from an ipv6 OMS to a non-ipv6 host, then follow these step:</td>
</tr>
<tr>
<td>(Only for Graphical Mode)</td>
<td>1. Navigate to the following location on the OMS home:</td>
</tr>
<tr>
<td></td>
<td>$&lt;OMS_HOME&gt;/oui/prov/resources/</td>
</tr>
<tr>
<td></td>
<td>2. Check the property value of PING_PATH in the following files in this order:</td>
</tr>
<tr>
<td></td>
<td>a. ssPaths_&lt;plat&gt;.properties</td>
</tr>
<tr>
<td></td>
<td>b. sPaths.properties</td>
</tr>
<tr>
<td></td>
<td>c. Paths.properties</td>
</tr>
<tr>
<td></td>
<td>3. Change the property value of PING_PATH from /bin/ping to /bin/ping6</td>
</tr>
<tr>
<td><strong>Default SSH Port Requirements</strong></td>
<td>Ensure that the SSH daemon is running on the default port (that is, 22) on all the destination hosts. To verify the port, run the following command:</td>
</tr>
<tr>
<td>(Only for Graphical Mode)</td>
<td>netstat -anp</td>
</tr>
<tr>
<td></td>
<td>If the port is a non-default port, that is, any port other than 22, then update the SSH_PORT property in the following file that is present in the OMS home:</td>
</tr>
<tr>
<td></td>
<td>$&lt;OMS_HOME&gt;/oui/prov/resources/Paths.properties</td>
</tr>
<tr>
<td><strong>Ping Requirements</strong></td>
<td>If a firewall configured in your environment does not allow any ping traffic, then ensure that you do the following:</td>
</tr>
<tr>
<td>(Only for Graphical Mode)</td>
<td>1. Take a backup of the following file from the OMS home:</td>
</tr>
<tr>
<td></td>
<td>For Linux Platforms:</td>
</tr>
<tr>
<td></td>
<td>$&lt;OMS_HOME&gt;/oui/prov/resources/sPaths.properties</td>
</tr>
<tr>
<td></td>
<td>For Other Platforms:</td>
</tr>
<tr>
<td></td>
<td>$&lt;OMS_HOME&gt;/oui/prov/resources/ssPaths_&lt;platform&gt;.properties</td>
</tr>
<tr>
<td></td>
<td>For example, ssPaths_aix.properties if the OMS is on AIX platform.</td>
</tr>
<tr>
<td></td>
<td>2. Edit the original properties file and change PING_PATH=/bin/ping to PING_PATH=/bin/true.</td>
</tr>
</tbody>

<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Requirements</td>
<td>Ensure that the default ports described in Section 2.1.6.1 are free.</td>
</tr>
<tr>
<td>Installing User Requirements</td>
<td>■ Ensure that the user installing the Shared Agent is the same as the user who installed the Master Agent.</td>
</tr>
<tr>
<td></td>
<td>■ If the central inventory owner and the user installing the Management Agent are different, then ensure that they are part of the same group.</td>
</tr>
<tr>
<td></td>
<td>■ Ensure that the inventory owner and the group to which the owner belongs have read and write permissions on the inventory directory.</td>
</tr>
<tr>
<td></td>
<td>For example, if the inventory owner is abc and the user installing the Management Agent is xyz, then ensure that abc and xyz belong to the same group, and they have read and write access to the inventory.</td>
</tr>
<tr>
<td>Central Inventory (oraInventory) Requirements</td>
<td>■ Ensure that you allocate 100 MB of space for the Central Inventory.</td>
</tr>
<tr>
<td></td>
<td>■ Ensure that the Oracle Inventory (oraInventory) is not in a shared location. When you use the /etc/oraInst.loc file, ensure that the inventory location specified there is not pointing to a shared location. If it is, change it to a non-shared location.</td>
</tr>
<tr>
<td></td>
<td>■ Ensure that you have read, write, and execute permissions on oraInventory on all remote hosts. If you do not have these permissions on the default inventory (typically at /etc/oraInst.loc) on any remote host, then ensure that you specify the path to an alternative inventory location by using one of the following options in the Additional Parameters field of the Add Host Targets Wizard. However, these parameters are supported only on UNIX platforms, and not on Microsoft Windows platforms.</td>
</tr>
<tr>
<td></td>
<td>INVENTORY_LOCATION=&lt;absolute_path_to_inventory_directory&gt;</td>

<tr>
<td></td>
<td>-invPtrLoc &lt;absolute_path_to_oraInst.loc&gt;</td>
</tr>
<tr>
<td>Agent User Account Permissions and Rights</td>
<td>(For Microsoft Windows) If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that the agent user account has permissions and rights to perform the following:</td>
</tr>
<tr>
<td>(Only for Microsoft Windows)</td>
<td>■ Act as part of the operating system.</td>
</tr>
<tr>
<td></td>
<td>■ Increase quotas.</td>
</tr>
<tr>
<td></td>
<td>■ Replace process level token.</td>
</tr>
<tr>
<td></td>
<td>■ Log in as a batch job.</td>
</tr>
<tr>
<td></td>
<td>To verify whether the agent user has these rights, follow these steps:</td>
</tr>
<tr>
<td></td>
<td>1. Launch the Local Security Settings.</td>
</tr>
<tr>
<td></td>
<td>From the Start menu, click Settings and then select Control Panel. From the Control Panel window, select Administrative Tools, and from the Administrative Tools window, select Local Security Settings.</td>
</tr>
<tr>
<td></td>
<td>2. In the Local Security Settings window, from the tree structure, expand Local Policies, and then expand User Rights Assignment.</td>
</tr>
</tbody>
</table>

<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permissions for cmd.exe (Only for Microsoft Windows)</td>
<td>(For Microsoft Windows) If you are installing the Management Agent on a Microsoft Windows-based operating system, then ensure that you grant the Cmd.exe program Read and Execute permissions for the user account that the batch job runs under. This is a restriction from Microsoft. For more information on this restriction and to understand how you can grant these permissions, access the following URL to Microsoft Web site: <a href="http://support.microsoft.com/kb/867466/en-us">http://support.microsoft.com/kb/867466/en-us</a></td>
</tr>
<tr>
<td>Preinstallation/Postinstallation Scripts Requirements (Only for Graphical Mode)</td>
<td>Ensure that the preinstallation and postinstallation scripts that you want to run along with the installation are available either on the OMS host, destination hosts, or on a shared location accessible to the destination hosts.</td>
</tr>
</tbody>
</table>
| Browser Requirements (Only for Graphical Mode)   | ■ Ensure that you use a certified browser as mentioned in the Enterprise Manager Certification Matrix available on My Oracle Support. To access this matrix, follow these steps:  
  1. Log in to My Oracle Support, and click the Certifications tab.  
  2. On the Certifications page, in the Certification Search region, from the Product list, select Enterprise Manager Cloud Control.  
  3. From the Release list, select 12.1.0.1.0, and click Search.  
  ■ If you use Microsoft Internet Explorer 8 or 9, do the following:  
    ■ Turn off the compatibility view mode. To do so, in Microsoft Internet Explorer, from the Tools menu, click Compatibility View to disable it if it is enabled. Also, click Compatibility View Settings and deregister the Enterprise Manager Cloud Control console URL.  
    ■ Enable XMLHTTP. To do so, from the Tools menu, click Internet Options. Click the Advanced tab, and under the Security heading, select Enable native XMLHTTP support to enable it. |

8.4 Installation Procedure

This section describes the following:

■ Installing in Graphical Mode
■ Installing in Silent Mode
8.4.1 Installing in Graphical Mode

To install a Shared Agent in graphical mode, follow these steps:

1. In Cloud Control, do one of the following:
   - From the Setup menu, select Add Targets, and then, click Auto Discovery Results. On the Auto Discovery Results page, select a host you want to monitor in Enterprise Manager Cloud Control, and click Promote.
   - From the Setup menu, select Add Target, and then, click Add Targets Manually. On the Add Targets Manually page, select Add Host Targets and click Add Host.

2. On the Host and Platform page, do the following:
   a. Accept the default name assigned for this session or enter a unique name of your choice. The custom name you enter can be any intuitive name, and need not necessarily be in the same format as the default name. For example, add_host_operation_1

      A unique deployment activity name enables you to save the installation details specified in this deployment session and reuse them in the future without having to enter all the details all over again in the new session.

   b. Click Add to enter the fully qualified name and select the platform of the host on which you want to install the Management Agent.

   **Note:**
   - Oracle recommends you to enter the fully qualified domain name of the host. For monitoring purpose, Enterprise Manager Cloud Control adds that host and the Management Agent with the exact name you enter here.
   - You must enter only one host name per row. Entering multiple host names separated by a comma is not supported.
   - You must ensure that the host name you enter does not have underscores.

   Alternatively, you can click either Load from File to add host names stored in a file, or Add Discovered Hosts to add host names from a list of hosts discovered by Enterprise Manager. For information on how the host name entries must appear in the host file, see Section 7.4.1.2

   **Note:** When you click Add Discovered Hosts and add hosts from a list of discovered hosts, the host's platform is automatically detected and displayed. The platform name is detected using a combination of factors, including hints received from automated discovery and the platform of the OMS host. This default platform name is a suggestion, so Oracle strongly recommends you to verify the platform details before proceeding to the next step.

As the Shared Agent can be installed only if the source host and the destination host are running on the same platform, set the platform for the first host in the first row of the table and from the Platform list, select Same for All Hosts.
This will ensure that the platform name you selected for the first host is also set for the rest of the hosts in the table.

---

**Note:** If you are installing a Management Agent on a platform that is different from the platform on which the OMS is running, then ensure that you have the software for that platform. If you do not have that software, then go to the Self-Update page within Enterprise Manager Cloud Control, and download the software.

---

c. Click Next.

3. On the Installation Details page, do the following:

a. In the Deployment Type section, select **Add Host to Shared Agent**. Then, for Select Target, click the torch icon and select the Management Agent that is shared and mounted. This location must be visible on all remote hosts.

b. From the table, select the first row that indicates the hosts grouped by their common platform name.

c. In the Installation Details section, provide the installation details common to the hosts selected in Step 3 (b). For **Oracle Home**, validate or enter the location of the shared Management Agent home. Ensure that this location is accessible from all the destination hosts.

d. For **Instance Directory**, enter the absolute path to a directory where all Management Agent-related configuration files can be stored. Ensure that the directory has write permission.

For example, `/usr/home/software/oracle/agentHome/agent_inst`

e. From **Named Credential** list, select an appropriate profile whose credentials can be used for setting up the SSH connectivity between the OMS and the remote hosts, and for installing a Management Agent on each of the remote hosts.

---

**Note:**

- If you do not have a credential profile, or if you have one but do not see it in the **Named Credential** list, then click the plus icon against this list. In the Create New Named Credential window, enter the credentials and store them with an appropriate profile name so that it can be selected and used for installing the Management Agents. Also set the run privilege if you want to switch over from the Named Credential you are creating, to another user who has the privileges to perform the installation.

- If the plus icon is disabled against this list, then you do not have the privileges to create a profile with credentials. In this case, contact your administrator and either request him/her to grant you the privileges to create a new profile or request him/her to create a profile and grant you the access to view it in the **Named Credential** list.

- If you have manually set up the SSH connectivity between the OMS and the remote hosts, then you may not have a password for your user account. In this case, create a named credential with a dummy password. Do NOT leave the password field blank.
f. For **Privileged Delegation Setting**, validate the Privilege Delegation setting to be used for running the root scripts. By default, it is set to the Privilege Delegation setting configured in Enterprise Manager Cloud Control.

If you leave this field blank, the root scripts will not be run by the wizard; you will have to run them manually after the installation. For information about running them manually, see Section 8.5.

This setting will also be used for performing the installation as the user set in the Run As attribute of the selected Named Credential if you had set the user while creating that Named Credential.

---

**Note:** In the Privilege Delegation setting, the `%RUNAS%` is honored as the root user for running the root scripts and as the user set in the Run As attribute of the Named Credential for performing the installation.

---

g. For **Port**, accept the default port (3872) that is assigned for the Management Agent to communicate, or enter a port of your choice.

The custom port you enter must not be busy. If you are not sure, you can leave it blank. Enterprise Manager Cloud Control automatically assigns the first available free port within the range of 1830 - 1849.

h. (Optional) In the Optional Details section, enter the absolute path to an accessible location where the preinstallation and postinstallation scripts you want to run are available. Note that only one preinstallation or one postinstallation script can be specified.

If you want to run the script as `root`, then select **Run as Root**. If the script is on the host where OMS is running and is not on the host where you want to install the Management Agent, then select **Script on OMS**. In this case, the script will be copied from the OMS host to the destination hosts, and then run on the destination hosts.

i. (Optional) For **Additional Parameters**, enter a whitespace-separate list of additional parameters that you want to pass during the installation. For a complete list of supported additional parameters, see Table 7–2.

For example, if you want to provide the inventory pointer location file, then enter `-invPtrLoc` followed by the absolute path to the file location.

However, this parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

j. Repeat Step 3 (b) to Step 3 (h) for every other row you have in the table.

k. Click **Next**.

4. On the Review page, review the details you have provided and if you are satisfied with the details, then click **Deploy Agent** to install the Management Agent.

If you want to modify the details, then click **Back** repeatedly to reach the page where you want to make the changes.

When you click **Deploy Agent** and submit the deployment session, you are automatically taken to the Add Host Status page that enables you to monitor the progress of the deployment session.

### 8.4.2 Installing in Silent Mode

To install a **Shared Agent** in silent mode, follow these steps:
1. Create a response file titled `AgentNFS.rsp` as described in Table 8–2.

   **Note:** The response file you create can have any name, and not necessarily `AgentNFS.rsp`. For easy understanding, this chapter uses the name `AgentNFS.rsp`. Also, instead of creating a response file, you can choose to pass the arguments explicitly while invoking the script. However, Oracle recommends that you create a response file and capture the information there.

2. Invoke the script from the Master Agent home, which is visible as a shared location, and pass the response file.

   ```
   $<AGENT_HOME>/perl/bin/perl <AGENT_HOME>/sysman/install/AgentNFS.pl -responseFile=<absolute_path_to_response_file>
   
   For example,
   
   `/scratch/agent_base_dir/core/12.1.0.1.0/perl/bin/perl /scratch/agent_base_dir/core/12.1.0.1.0/sysman/install/AgentNFS.pl -responseFile=/home/john/AgentNFS.rsp`
   ```
3. When prompted to run the root.sh script, run it from the instance directory of the Management Agent:

```
<AGENT_INSTANCE_HOME>/root.sh
```

If you are not a root user, then use SUDO to change to a root user. For example, run the following command:

```
/usr/local/bin/sudo /scratch/OracleHomes/agent_inst/root.sh
```

4. Repeat Step (1) to Step (3) on the remaining hosts where you want to install the Shared Agent.

### 8.4.2.1 Creating a Response File

For silently installing a Shared Agent, you must invoke the AgentNFS.pl script and pass a response file that captures all the required information. Table 8–2 describes the various parameters you must include in the response file.
After You Install

After you install a Shared Agent, follow these steps:

1.  (Only for Graphical Mode) Verify the installation on the Add Host Status page. Review the progress made on each of the phases of the deployment operation — Initialization, Remote Prerequisite Check, and Agent Deployment.

---

**Note:** In the Add Host Targets Wizard, after you click Deploy Agent to install one or more Management Agents, you are automatically taken to the Add Host Status page.

If you want to view the details or track the progress of all the deployment sessions, then from the Setup menu, select Add Target, and then, click Add Targets Manually. On the Add Targets Manually page, select Add Host Targets and click Add Host Results.

---

### Table 8–2 Creating a Response File for Installing Oracle Management Agent Using the AgentNFS.pl Script

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME</td>
<td>Specify the absolute path to the Master Agent home, which is shared and visible on the destination host. For example, /scratch/agent_base_dir/core/12.1.0.1.0</td>
</tr>
<tr>
<td>AGENT_PORT</td>
<td>(Optional) Enter the port on which the Shared Agent process should be started. You can enter any free port between 1830 and 1849. The same port is used for both HTTP and HTTPS. For example, 1832</td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME</td>
<td>Specify the absolute path to a location on the destination host where you want to store all Management Agent-related configuration files. For example, /home/john/agent_inst</td>
</tr>
<tr>
<td>b_startAgent</td>
<td>Set it to TRUE so that the Shared Agent is started automatically once it is installed and configured. Note: If the Master Agent was installed using the Add Host Targets Wizard, then you must pass this parameter.</td>
</tr>
<tr>
<td>ORACLE_HOSTNAME</td>
<td>(Optional) (Only for Installation on Virtual Hosts) Specify the virtual host name where you are installing the Shared Agent.</td>
</tr>
<tr>
<td>AGENT_REGISTRATION_PASSWORD</td>
<td>Enter a password for registering new Management Agents that join the Enterprise Manager system. By default, the communication between the OMS and the Management Agents is secured, and any new Management Agents that join the Enterprise Manager system must be authenticated before they become part of the system. The password you enter here will be used for authenticating those new Management Agents. For example, Wel456come</td>
</tr>
<tr>
<td></td>
<td>Note: If the Master Agent was installed using the Add Host Targets Wizard, then you must pass this parameter.</td>
</tr>
</tbody>
</table>
After You Install

If a particular phase fails or ends up with a warning, then review the details provided for each phase in the Agent Deployment Details section, and do one of the following:

- Ignore the warning or failure, and continue with the session if you prefer.
  - You can choose to proceed with the deployment of Management Agents only on those remote hosts that have successfully cleared the checks, and you can ignore the ones that have Warning or Failed status. To do so, click Continue and select Continue, Ignoring Failed Hosts.
  - You can choose to proceed with the deployment of Management Agents on all the hosts, including the ones that have Warning or Failed status. To do, click Continue and select Continue, All Hosts.

- Fix the problem by reviewing the error description carefully, understanding its cause, and taking action as recommended by Oracle.
  - You can choose to retry the deployment of Management Agents with the same installation details. To do so, click Retry and select Retry Using Same Inputs.
  - You can retry the deployment of Management Agents with modified installation details. To do so, click Retry and select Update Inputs and Retry.

2. Verify the installation:

   a. Navigate to the Shared Agent instance home and run the following command to see a message that confirms that the Management Agent is up and running:

      ```
      $<INSTANCE_HOME>/bin/emctl status agent
      ```

      **Note:** If the status of the Management Agent is down for some reason, then manually start the Management Agent by running the following command from its Oracle home:

      ```
      $<INSTANCE_HOME>/bin/emctl start agent
      ```

   b. Navigate to the Shared Agent home and run the following command to see a message that confirms that EMD upload completed successfully:

      ```
      $<INSTANCE_HOME>/bin/emctl upload agent
      ```

3. (Only for UNIX Operating Systems) If you had ignored the prerequisite check warning about not having root privileges, SUDO binaries, or SUDO privileges, then manually run the following scripts as a root user from each of the hosts where the cloning was done. If you do not have SUDO privileges, then request your Administrator who has the privileges to run these scripts.

   - If this is the first Oracle product you just cloned on the host, then run the oraInstroot.sh script from the inventory location specified in the oraInst.loc file that is available in the Management Agent home.

     For example, if the inventory location specified in the oraInst.loc file is $HOME/oraInventory, then run the following command:

     ```
     $HOME/oraInventory/oraInstRoot.sh
     ```
After You Install

Run the root.sh script from the Management Agent home:

$<AGENT_HOME>/root.sh

4. If you had ignored a prerequisite check warning about wrong time zone settings, follow these steps:

1. Set the correct time zone on the required host.
   For information on how to set the time zone on a host, refer Time Zone Requirements in Table 8–1.

2. Deinstall the Management Agent present on the host.
   For information on how to deinstall a Management Agent, refer Oracle Enterprise Manager Cloud Control Advanced Installation and Configuration Guide.

3. Install a Management Agent on the host.

5. By default, the host and the Shared Agent get automatically added to the Enterprise Manager Cloud Control console for monitoring. None of the targets running on that host get automatically discovered and monitored.

To monitor the other targets, you need to add them to Enterprise Manager Cloud Control either using the Auto Discovery Results page, the Add Targets Manually page, or the discovery wizards offered for the targets you want to monitor.

For information about discovering targets in Enterprise Manager Cloud Control, refer to the chapter on adding targets in the Oracle Enterprise Manager Cloud Control Administrator’s Guide.
This chapter explains how you can install only the software binaries of Oracle Management Agent (Management Agent) at one point and configure the installation at a later stage. In particular, this chapter covers the following:

- Overview
- Before You Begin
- Prerequisites
- Installation Procedure
- Configuration Procedure
- After You Install

### 9.1 Overview

You can choose to install only the software binaries of the Management Agent at one point and configure it at a later stage to work with the associated Oracle Management Service (OMS). This approach enables you to divide the installation process into two phases, mainly the installation phase and the configuration phase.

During the installation phase, you invoke the `agentDeploy.sh` script passing the `-softwareOnly` argument to copy the software binaries and create an Oracle home for the Management Agent. During the configuration phase, you invoke the same script passing `-configOnly` to configure the software binaries.

Understandably, the installation phase takes much lesser time compared to the configuration phase because the installation phase involves only copying of binaries. This helps you plan your installation according to the time and priorities you have.

---

**Note:** This installation type is available only in silent mode.

---

**Note:** If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Oracle Management Service. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
9.2 Before You Begin

Before you begin installing a Management Agent, review the points outlined in Section 5.2.

9.3 Prerequisites

Before installing the Management Agent, ensure that you meet the prerequisites described in Section 5.3.

9.4 Installation Procedure

To install only the software binaries of a Management Agent in silent mode, follow these steps:

1. Follow the Step (1) to Step (7) outlined in Section 5.4.
2. Invoke the deployment script and pass the response file with the `-softwareOnly` argument:
   
   `<Software_Extracted_Location>/agentDeploy.sh AGENT_BASE_DIR=<absolute_path_to_agentbasedir> RESPONSE_FILE=<absolute_path_to_responsefile> -softwareOnly`

   **Note:** Do not pass the option `-forceConfigure`.

9.5 Configuration Procedure

To configure the software binaries of a Management Agent in silent mode, invoke the deployment script with the following options from the Management Agent home:

   `$<AGENT_HOME>/sysman/install/agentDeploy.sh AGENT_BASE_DIR=<absolute_path_to_agentbasedir> RESPONSE_FILE=<absolute_path_to_responsefile> -configOnly`

   **Note:** The response file you pass here is the same response file you passed in Section 9.4.

   **Note:** Do not pass the option `-forceConfigure`.

   **Note:** Despite a successful installation, if you see some exceptions in the prerequisite error file, you can ignore the exception trace. This issue might happen when an operation attempts to retrieve an element from a collection using a key that does not exist in that collection. You can ignore this exception.

9.6 After You Install

After you install the Management Agent, follow the steps outlined in Section 5.5.
Note: If you want to move your Management Agents from one Enterprise Manager Cloud Control to another, then you must first deinstall those Management Agents and plug-ins, and then redeploy those Management Agents and plug-ins using the new Oracle Management Service. This is typically done when you want to move from an Enterprise Manager Cloud Control in a test environment to an Enterprise Manager Cloud Control in a production environment.
This part describes the advanced installation and configuration tasks you can perform after you have installed Enterprise Manager Cloud Control and have started using the product.

In particular, this part contains the following chapters:

- Chapter 10, "Introduction to Enterprise Manager Advanced Configuration"
- Chapter 12, "Configuring Enterprise Manager for Firewalls"
- Chapter 14, "Installing ADP with Advanced Installation Options"
- Chapter 13, "Sizing Your Enterprise Manager Deployment"
- Chapter 15, "Installing JVMD with Advanced Install Options"
- Chapter 16, "Integrating BI Publisher with Enterprise Manager"
This chapter introduces you to Enterprise Manager advanced configuration and provides basic information about your Enterprise Manager installation. It describes the directory structure and how to make Enterprise Manager accessible to all your users.

After you review this chapter, you can move on to the other advanced configuration tasks described in this manual.

Specifically, this chapter includes the following topics:

- Types of Advanced Configuration Tasks
- Understanding the Enterprise Manager Directory Structure
- Enabling Enterprise Manager Accessibility Features

**10.1 Types of Advanced Configuration Tasks**

Enterprise Manager is designed to install easily with a set of standard configuration settings so you can get up and running with the software quickly.

However, Oracle realizes that hardware and software management requirements vary dramatically among business enterprises. As a result, Enterprise Manager can be reconfigured after installation so you can:

- Implement Enterprise Manager security and firewall features.
- Enable End-User Performance Monitoring for your Web applications.
- Reconfigure Enterprise Manager components when you need to modify the topology of your network environment.
- Maintain and troubleshoot the Enterprise Manager components as your business grows.

**10.2 Understanding the Enterprise Manager Directory Structure**

Before you perform maintenance and advanced configuration tasks, you must be familiar with the directories and files that are copied to disk when you install Enterprise Manager. Understanding where specific files are located can help you if you need to troubleshoot installation or configuration problems.

When installing Enterprise Manager, if you select a location that does not contain WebLogic Server, then JDK will be installed in the jdk16 directory before installation of WebLogic Server.
Use the following sections to become familiar with the directories that are created on your disk when you install Enterprise Manager:

- **Understanding the Enterprise Manager Directories Installed with Oracle Enterprise Manager Cloud Control 12c**
- **Understanding the Enterprise Manager Directories Installed with Management Service**
- **Understanding the Enterprise Manager Directories Installed with Management Agent**
- **Identifying the Agent Instance Home When Using the emctl Command**

### 10.2.1 Understanding the Enterprise Manager Directories Installed with Oracle Enterprise Manager Cloud Control 12c

When you install Oracle Enterprise Manager Cloud Control 12c, you install the Oracle Management Service. With the Oracle Management Service, you install the following Oracle home directories:

- Oracle Management Service home directory
- Middleware WebTier home directory
- Middleware Common home directory
- Oracle Management Service Instance home directory
- Oracle Management Agent home directory
- Oracle Management Service Plugins home
- Oracle Management Agent Plugins home

#### 10.2.1.1 About the Oracle Management Service Home Directory

The Oracle Management Service is a J2EE application that is installed and deployed using the Oracle WebLogic Server.

The installation procedure installs the Enterprise Manager components within the Cloud Control Home, including the Oracle Management Service. For more details about the OMS directories, see [*About the Oracle Management Service Home Directory*](#).

Information about the directories that are specific to the Fusion Middleware installation can be found in the Fusion Middleware documentation.

#### 10.2.1.2 About the Oracle Management Agent Home (AGENT_HOME) Directory

In addition to the Oracle Management Service home directory, the installation procedure installs the Oracle Management Agent that is used to gather management data and perform administration tasks for the targets on the Oracle Management Service host.

The Oracle Management Agent is installed in a separate Oracle home directory which is at the same level as the Fusion Middleware home directory. For more details, see [*Understanding the Enterprise Manager Directories Installed with Management Agent*](#).
10.2.1.3 Summary of the Important Directories in the Oracle Management Service Home

Figure 10–1 shows some of the important directories you should be familiar with in a typical Cloud Control installation. You can use this information as you begin to maintain, troubleshoot, and configure the Oracle Management Service installation.

**Figure 10–1 Directories Installed with Enterprise Manager**

![Diagram of directory structure](image)

Table 10–1 describes the directories installed with Enterprise Manager.

**Table 10–1 Directories Installed with Enterprise Manager**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlservr_10.3, logs, util, modules</td>
<td>These directories contain Fusion Middleware files.</td>
</tr>
<tr>
<td>jdk16</td>
<td>This directory contains JDK configuration files.</td>
</tr>
<tr>
<td>oms</td>
<td>This directory contains OMS configuration files. For more information, see Section 10.2.2.</td>
</tr>
<tr>
<td>plugins</td>
<td>This directory contains metadata plug-ins configuration files installed on the OMS.</td>
</tr>
<tr>
<td>agent</td>
<td>This directory contains agent configuration files. For more details, see Section 10.2.3.</td>
</tr>
<tr>
<td>gc_inst</td>
<td>The OMS instance home directory. For more details, see Section 10.2.2.</td>
</tr>
<tr>
<td>oracle_WT</td>
<td>This directory contains Oracle WebTier configuration files.</td>
</tr>
</tbody>
</table>
10.2.2 Understanding the Enterprise Manager Directories Installed with Management Service

Table 10–2 describes in detail the Oracle Management Service directories installed with Oracle Management Service. In the table, ORACLE_HOME refers to the Oracle Management Service home directory in which the Oracle Management Service is installed and deployed.

Table 10–2 Important Directories in the Management Service Oracle Home

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME/bin</td>
<td>The bin directory in the Management Service home contains commands used to control the components of the Cloud Control installation.</td>
</tr>
<tr>
<td>OMS_INSTANCE_HOME</td>
<td>This directory contains configuration files for OMS home. The default OMS_INSTANCE_HOME location is gc_inst.</td>
</tr>
<tr>
<td>OMS_INSTANCE_HOME/WebTierIH1</td>
<td>This directory contains WebTier instance Oracle Home corresponding to EMGC_OMS#.</td>
</tr>
<tr>
<td>OMS_INSTANCE_HOME/NodeManager</td>
<td>This directory contains WebLogic Node Manager properties, logs, and domain information.</td>
</tr>
<tr>
<td>OMS_INSTANCE_HOME/em</td>
<td>This is the OMS instance directory and contains emgc.properties and Enterprise Manager log files.</td>
</tr>
<tr>
<td>OMS_INSTANCE_HOME/user_projects</td>
<td>This directory contains EMGC_ADMINSERVER and EMGC_OMS# domains and their logs.</td>
</tr>
<tr>
<td>ORACLE_HOME/sysman/log</td>
<td>This directory contains schema log files. The repository log files are under sysman/log/schemamanager. The install logs are under ORACLE_HOME/cfgtoollogs. The operation logs are under OMS_INSTANCE_HOME/em/EMGC_OMS1/sysman/log.</td>
</tr>
</tbody>
</table>

10.2.3 Understanding the Enterprise Manager Directories Installed with Management Agent

The Oracle Management Agent is installed automatically when you install Oracle Management Service. This local instance of the Oracle Management Agent gathers management information about the targets on the Oracle Management Service host. You can then manage those targets, such as the host itself, from the Cloud Control Console.

You can install additional Oracle Management Agents using different installation methods. This enables you to install the Oracle Management Agent on the hosts throughout your enterprise. The Oracle Management Agent can then gather management data about the targets on each host so those targets can be managed from the Cloud Control Console.

Specifically, the Oracle Management Agent files are installed into the same directory structure shown in the agent directory when you install the Oracle Management Service (Figure 10–1).
The agent directory structure, when you install a standalone agent or install the OMS is the same. The AGENT_BASE_DIR is the directory where agent is installed and contains the following main directories:

- AGENT_HOME
- AGENT_INSTANCE_HOME
- SBIN_HOME
- PLUGIN_HOME

The directory that contains the files required to run the Oracle Management Agent is referred to as the AGENT_INSTANCE_HOME directory. For example, to start or stop an Oracle Management Agent, you use the `emctl` command located in the `bin` directory of the AGENT_INSTANCE_HOME. Similarly, to configure files for the Oracle Management Agent, you modify the configuration files in the `sysman/config` directory of the AGENT_INSTANCE_HOME. See Figure 10–2 for the agent directory structure.

**Figure 10–2 Agent Directory Structure**

![Agent Directory Structure Diagram]

### 10.2.3.1 Summary of the Important Directories in the Oracle Management Agent Home

Table 10–3 describes some of the important agent directories.

**Table 10–3 Important Directories in the Oracle Management Home**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGENT_HOME</td>
<td>The AGENT_HOME directory contains all the binaries required to configure and run the Oracle Management Agent on this host. The default AGENT_HOME location is AGENT_BASE_DIR/core/12.1.0.1.0. This directory serves as the Oracle Home for the Oracle Management Agent.</td>
</tr>
<tr>
<td>AGENT_HOME/bin</td>
<td>This directory contains binaries for the Oracle Management Agent.</td>
</tr>
</tbody>
</table>
When you install the Oracle Management Agent on a Windows system, the directory structure of the AGENT_HOME directory is the same as the directory structure for installations on a UNIX system.

### Important Directories in the Oracle Management Home

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGENT_HOME/install</td>
<td>This directory contains installation-related files for deploying the agent.</td>
</tr>
<tr>
<td>AGENT_HOME/prereqs</td>
<td>This directory contains prerequisite files for EMPrereqKit.</td>
</tr>
<tr>
<td>AGENT_HOME/oui</td>
<td>This directory contains files related to the installer framework.</td>
</tr>
<tr>
<td>AGENT_HOME/cfgtoollogs</td>
<td>This directory contains agent deployment and configuration log files.</td>
</tr>
<tr>
<td>AGENT_HOME/EMStage</td>
<td>This directory is used by the provisioning framework for provisioning activities.</td>
</tr>
<tr>
<td>AGENT_HOME/sysman/admin</td>
<td>This directory contains the files used by the Oracle Management Agent to define core target types (such as databases, hosts, and so on), to run configuration scripts, and other administrative tasks.</td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME</td>
<td>The AGENT_INSTANCE_HOME directory contains agent-related configuration files after agent is installed and configured.</td>
</tr>
<tr>
<td></td>
<td>The default AGENT_INSTANCE_HOME location is AGENT_BASE_DIR/agent_inst.</td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME/bin</td>
<td>The AGENT_INSTANCE_HOME/bin directory in the Cloud Control Home contains the emctl command that controls the Oracle Management Agent for this host.</td>
</tr>
<tr>
<td></td>
<td>You use the following emctl commands in this directory to start and stop the Oracle Management Agent on this host:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;AGENT_INSTANCE_HOME&gt;/bin/emctl start agent</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;AGENT_INSTANCE_HOME&gt;/bin/emctl stop agent</code></td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME/sysman/config</td>
<td>This directory contains the configuration files for the Oracle Management Agent. For example, this is where Enterprise Manager stores the emd.properties file. The emd.properties file defines settings such as the Oracle Management Service upload URL for this particular agent.</td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME/sysman/log</td>
<td>This directory contains the log files for the Oracle Management Agent.</td>
</tr>
<tr>
<td>AGENT_INSTANCE_HOME/sysman/emd</td>
<td>The emd directory contains information about targets discovered on hosts.</td>
</tr>
<tr>
<td>SBIN_HOME</td>
<td>This directory contains set UIDs for the agent. The default location is AGENT_BASE_DIR/sbin.</td>
</tr>
<tr>
<td>PLUGIN_HOME</td>
<td>This directory contains all the discovery and monitoring plugins required for the agent. The default location is AGENT_BASE_DIR/plugins.</td>
</tr>
</tbody>
</table>

**10.2.3.2 Understanding the Oracle Management Agent Directory Structure on Windows**

When you install the Oracle Management Agent on a Windows system, the directory structure of the AGENT_HOME directory is the same as the directory structure for installations on a UNIX system.
10.2.4 Identifying the Agent Instance Home When Using the emctl Command

When you install Cloud Control, the resulting directory structure can often include multiple subdirectories with the same name. For example, you can have a bin directory within the agent_instance_home directory. Use the emctl command within the agent_instance_home/bin directory to control the Oracle Management Agent.

In addition, you can have a bin directory within the Oracle Management Service Oracle home. Use the emctl command in this directory to control the Oracle Management Service.

To quickly identify the Agent Instance home that is controlled by the files in a particular bin directory, use the following command:

$PROMPT> emctl getemhome

This command displays the path to the current Agent Instance home that will be affected by commands executed by this instance of the emctl command.

10.3 Enabling Enterprise Manager Accessibility Features

As part of the effort to make Oracle products, services, and supporting documentation accessible and usable to the disabled community, Enterprise Manager offers several features that make management data available to users of assistive technology. Enterprise Manager provides the following accessibility features:

- Support for Screen Reader
- Support for High Contrast
- Support for Large Fonts

To enable Screen Reader support, you must modify the following configuration settings:

1. Enable Accessibility Mode in My Preferences.
2. Set uix-config.xml flag.
3. Set web.xml flag.

10.3.1 Enabling Enterprise Manager Accessibility Mode

To enable screen reader mode, do the following:

1. On the Cloud Control home page, from the Setup menu, select My Preferences and then select Accessibility.
2. In the Accessibility Preference page, select I use a screen reader. Click Apply.

ADF accessibility mode is a session based setting which takes place immediately and does not require you to restart the Enterprise Manager Management Service.

For ADF pages, you will see an Accessibility Preferences dialog after logging into Cloud Control for the first time. The settings in this dialog are the same as those in the Accessibility Preference page mentioned above.

10.3.2 Setting uix-config.xml Flag

To enable screen reader mode for UIX pages, do the following:

1. Locate the uix-config.xml configuration file.
To locate the `uix-config.xml` file in a Cloud Control installation, change directory to the following location in the Oracle Management Service home:

```
./oms/sysman/archives/emgc/deployments/EMGC_DOMAIN/emgc.ear/em.war/WEB-INF/uix-config.xml
```

2. Open the `uix-config.xml` file using a text editor and set the following entry:

```xml
<!-- An alternate configuration that disables accessibility features -->
<default-configuration>
  <accessibility-mode>screenReader</accessibility-mode>
</default-configuration>
```

3. Save and close the file.

4. Restart the Oracle Management Service.

---

**Note:** UIX accessibility mode is a product-wide setting. You will have to restart the Enterprise Manager Management Service for this setting to take effect.

---

### 10.3.3 Configuring `web.xml` File

To configure `web.xml` file, follow these steps:

1. Locate the `web.xml` configuration file.

   To locate the `web.xml` file in a Cloud Control installation, change directory to the following location in the Oracle Management Service home:

   ```
   ./oms/sysman/archives/emgc/deployments/EMGC_DOMAIN/emgc.ear/em.war/WEB-INF/web.xml
   ```

2. Open the `web.xml` file with your favorite text editor and locate the following six lines of the file:

   ```xml
   <!-- Uncomment this to enable textual chart descriptions
   <context-param>
   <param-name>enableChartDescription</param-name>
   <param-value>true</param-value>
   </context-param>
   -->
   ```

3. Remove comments from this section by deleting the first line and the last line of this section so that the section consists of only these 4 lines:

   ```xml
   <context-param>
   <param-name>enableChartDescription</param-name>
   <param-value>true</param-value>
   </context-param>
   ```

4. Save and exit the file.

5. Restart the Oracle Management Service.

---

### 10.3.4 Verifying That Screen Reader Support Is Enabled

Throughout Enterprise Manager, charts are used to display performance data. For most users, these charts provide a valuable graphical view of the data that can reveal trends and help identify minimum and maximum values for performance metrics.
However, charts do not convey information in a manner that can be read by a screen reader. To remedy this problem, you can configure Enterprise Manager to provide a complete textual representation of each performance chart. By default, support for the textual representation of charts is disabled. When textual description for charts is enabled, Enterprise Manager displays a small icon for each chart that can be used as a drill-down link to the textual representation.

To verify whether Screen Reader support has been enabled for ADF pages, follow these steps:

1. On the Cloud Control home page, click Help and then select About Enterprise Manager.
2. In the About Enterprise Manager dialog box, ensure that Accessibility Preference - Screen Reader Support is set to Enabled.
3. If Accessibility Preference - Screen Reader Support is set to Disabled, follow the steps listed in Enabling Enterprise Manager Accessibility Features.

To verify whether Screen Reader support has been enabled for UIX pages, follow these steps:

1. On the Cloud Control home page, from the Enterprise menu, select Reports and then select Information Publisher Reports.
2. In the Information Publisher Reports page, click Hardware Summary. The Hardware Summary page is displayed. If accessibility setting has been enabled, you will see the icon shown in Figure 10–3:

Figure 10–3  Icon Representing Textual Representation of Charts

**********************************************************************************************
11.1 Understanding Default and Custom Data Collections

When you install the Oracle Management Agent on a host computer, Enterprise Manager automatically begins gathering a default set of metrics that you can use to monitor the performance and availability of each target on that host. For some of these target metrics, Enterprise Manager provides default threshold settings that determine when you will be notified that there is a problem with the metric.

For selected metrics, you can customize the default thresholds. When you make these types of customizations, Enterprise Manager saves the new settings in a file on the local disk. The following section provides more information about how these settings are saved.

See Also: About Alerts in the Enterprise Manager online help

11.1.1 How Enterprise Manager Stores Default Collection Information

Enterprise Manager stores the default collection criteria for each target in the following location on each Oracle Management Agent host:

AGENT_HOME/sysman/admin/default_collection/

The path is different with the plugin homes having the default_collection and metadata info for the targets. The agent home contains the collection/metadata details only for the other targets such as host, and oracle_emd.

For some targets, you can use the Oracle Enterprise Manager Release 12c Cloud Control Console to modify the default metric collection settings. For example, you can

Performing Additional Configuration Tasks
modify the default thresholds for your host targets. When you make these types of modifications, Enterprise Manager creates a new instance collection file in the following directory:

AGENT_HOME/sysman/emd/collection/

This collection file overrides the default collection information stored in the sysman/admin/default_collection directory.

11.2 Enabling Multi-Inventory Support for Configuration Management

Every time you install an Oracle software product on a host computer, Oracle Universal Installer saves information about the software installation on your hard disk. The directories and files that contain this software configuration information are referred to as the Oracle Universal Installer inventory.

See Also: Oracle Universal Installer and OPatch User’s Guide

When you use Enterprise Manager to monitor your Oracle software installations, Enterprise Manager takes advantage of information saved in the Universal Installer inventory.

As it gathers information about the configuration of your host computer, by default, Enterprise Manager assumes that you have one Oracle Universal Installer inventory on the host. Specifically, Enterprise Manager recognizes the inventory that Oracle Universal Installer uses when you run the Universal Installer on the host.

However, in some cases, you may have more than one inventory. For example, you may have worked with Oracle Support to clone your Oracle software installations. For those cases, you can use the following procedure to be sure that Enterprise Manager can track and manage the software information in multiple inventories on the same host.

Caution: Enabling support for multiple inventories is optional and available only for advanced users who are familiar with the Oracle Universal Installer inventory architecture and who have previously worked with multiple inventories on a managed host. This procedure is not required for hosts where normal installations have been performed.

To set up Enterprise Manager so it can read multiple inventories on a host, follow these steps:

1. Locate the OUIinventories.add file in the following directory:

   <agent_inst>/sysman/config

   The Management Agent state listed in this example represents an installation for Database Control. For more information about the Management Agent state to use for other installations, see Section 11.2.1, "AGENT_HOME Versus AGENT_STATE Directories" on page 11-3.

2. Open OUIinventories.add using a text editor.

   Instructions within the file describe the format to use when identifying multiple inventories, as well other techniques for mapping Oracle Homes.

3. Carefully review the instructions within the file.
4. Add entries to the file for each additional inventory on the managed host.

5. Save your changes and close the file.

During its next collection of host configuration information, Enterprise Manager will start gathering software configuration information from the inventories that you identified in the `OUIinventories.add` file, in addition to the default inventory that Enterprise Manager normally collects.

Alternatively, to see the data gathered from the additional inventories before the next regularly-scheduled collection, navigate to the Host home page in the Cloud Control console, click the Configuration tab, and click the Refresh Data icon next to the page timestamp.

---

**Note:** If there are any irrecoverable problems during the collection of the default inventory (for example, if the inventory file or directory protections prevent Enterprise Manager from reading the inventory), inventories listed in `OUIinventories.add` file are also not collected.

If the Enterprise Manager is able to read the default inventory, but there is a problem reading an additional inventory listed in the `OUIinventories.add` file, Enterprise Manager issues a collection warning for those inventories. However, Enterprise Manager does collect the configuration information for the other inventories.

---

### 11.2.1 AGENT_HOME Versus AGENT_STATE Directories

The Management Agent recognizes two main directory structures; its installation directory where software binaries and all unchanging metadata are stored, and its configuration/state directory where all customizations and output/log content are stored and/or generated. In a normal Management Agent installation, these two directories are the same. However, they can be different in the following cases:

- Database Control installation (`$ORACLE_HOME` versus `$ORACLE_HOME/<nodename>_<sid>`)  
- State-only Management Agent deployment (using the `emctl deploy agent` command -- `$ORACLE_HOME` versus `$EMSTATE`)

In each of the above cases, there will be multiple instances of the Management Agent running off the same binaries installation. The different instances have different locations to maintain separate configurations but use the same set of binaries. The command `emctl status agent` provides the values of the Management Agent's binaries and state locations.

The AGENT_BASE or ORACLE_BASE directories contain the Management Agent Binaries. This section of the directory is read-only. The new Management Agent creates multiple Oracle Homes under a single parent directory called AGENT_BASE or ORACLE_BASE.

The Agent State directory is usually placed under AGENT_BASE; however, by design the Agent State directory could be located in any location. For example, in the case of an NFS installations, the Agent State Directory is not placed under AGENT_BASE.

This is the only directory into which non-deployment agent code should be written.

The default name set by the installer for the state home (or instance home) is agent_inst. The state home must have world read and execute permission.
11.3 Manually Configuring a Database Target for Complete Monitoring

When you first discover an Oracle Database target, you should check the monitoring credentials to be sure the password for the DBSNMP database user account is set correctly in the database target properties.

Besides setting the monitoring credentials, no other configuration tasks are required to monitor an Oracle Database target.

However, when you monitor an Oracle9i database, there is some additional configuration required if you want to monitor certain types of database performance metrics using the Cloud Control console.

To monitor these additional performance metrics Enterprise Manager requires that Oracle Statspack and some additional Enterprise Manager packages be installed and configured in the database you are monitoring.

See Also: "Using Statspack" in Oracle Database Performance Tuning Guide and Reference in the Oracle9i Documentation Library

If these additional objects are not available and configured in the database, Enterprise Manager will not be able to gather the data for the complete set of performance metrics. In addition, Enterprise Manager will not be able to gather information that otherwise could be readily available from the Database home page, such as Bad SQL and the Top SQL Report.

You can use the Configure Database wizard in the Cloud Control console to install the required packages into the database, or you can use the following manual procedure.

See Also: "Modifying Target Properties" in the Enterprise Manager online help for information on configuring managed targets, including database targets

To manually install Statspack and the other required database objects into an Oracle9i database that you are managing with Enterprise Manager, you can use SQL*Plus and the following procedure:

1. Log in to the database host using an account with privileges that allow you to write to the database home directory and to the Management Agent home directory.
   For each of the commands in this procedure, replace AGENT_HOME with the actual path to the Oracle Management Agent home directory and replace ORACLE_HOME with the path to the database home directory.

2. Start SQL*Plus and connect to the database using the SYS account with SYSDBA privileges.
   For example:
   
   `$PROMPT> ./sqlplus "connect / as sysdba"

3. Enter the following command to run the database dbmon script:
   
   SQL> @AGENT_HOME/sysman/admin/scripts/db/config/dbmon
   
   The script will display the following prompt:
   
   Enter value for dbm_password:

4. When prompted, enter the password for the DBSNMP account.
The script performs several configuration changes and returns you to the SQL*Plus prompt.

5. Connect as the DBSNMP user.
   For example:
   
   SQL> connect DBSNMP

6. Enter the following command:

   SQL> @AGENT_HOME/sysman/admin/scripts/db/config/response.plb
   SQL> grant EXECUTE on dbsnmp.mgmt_response to OEM_MONITOR;

**Note:** The above script should not be run on an Oracle database of version 8.1.7 or prior. Oracle does not support SQL Response Time for 8.1.7 databases or prior.

7. Connect as SYS and enter the following command to create the PERFSTAT user:

   SQL> @ORACLE_HOME/rdbms/admin/spcreate

**Note:** The spcreate script will prompt you for a default tablespace and default temporary tablespace for the PERFSTAT user. Do not specify the SYSTEM tablespace as the default tablespace for the PERFSTAT user. For more information, see "Using Statspack" in the Oracle Database Performance Tuning Guide.

8. Connect as the PERFSTAT user.
   For example:
   
   SQL> connect PERFSTAT

9. Enter the following commands from the PERFSTAT user account:

   SQL> define snap_level='6';
   SQL> define cinterval='1';
   SQL> define cjobno='-1';
   SQL> @AGENT_HOME/sysman/admin/scripts/db/config/spset

10. Connect as the SYS user and enter the following command:

    SQL> grant OEM_MONITOR to dbsnmp;

11. If the database you are modifying is an Oracle8i database, also enter the following commands as the SYS user:

    grant select on sys.ts$ to OEM_MONITOR;
    grant select on sys.seg$ to OEM_MONITOR;
    grant select on sys.user$ to OEM_MONITOR;
    grant select on sys.obj$ to OEM_MONITOR;
    grant select on sys.sys_objects to OEM_MONITOR;
    grant select on sys.file$ to OEM_MONITOR;
    grant select on sys.attrcol$ to OEM_MONITOR;
    grant select on sys.clu$ to OEM_MONITOR;
    grant select on sys.col$ to OEM_MONITOR;
    grant select on sys.ind$ to OEM_MONITOR;
    grant select on sys.indpart$ to OEM_MONITOR;
    grant select on sys.indsubpart$ to OEM_MONITOR;
grant select on sys.lob$ to OEM_MONITOR;
grant select on sys.lobfrag$ to OEM_MONITOR;
grant select on sys.partobj$ to OEM_MONITOR;
grant select on sys.tab$ to OEM_MONITOR;
grant select on sys.tabpart$ to OEM_MONITOR;
grant select on sys.tabsubpart$ to OEM_MONITOR;
grant select on sys.undo$ to OEM_MONITOR;

12. For any supported database version, enter the following command from the SYS account:

SQL> show parameter job_queue_processes

If the output from the show parameter command is zero, then perform the following steps to modify the job_queue_processes initialization parameter:

If you start the database using an spfile, enter the following command:

SQL> alter system set job_queue_processes = 2 SCOPE=BOTH;

Otherwise, do the following:

a. Enter the following command:

SQL> alter system set job_queue_processes = 2;

b. Exit SQL*PLUS and update the init.ora database configuration file with the following entry so the parameter will be applied whenever the database is restarted:

job_queue_processes=2

13. Exit SQL*Plus and change directory to the following directory in the home directory of the Management Agent that is monitoring the database:

AGENT_HOME/bin

14. Reload the Management Agent by entering the following command:

$PROMPT> ./emctl agent reload

15. Using the Cloud Control console, return to the Database home page and verify that the Bad SQL and Top SQL Report metrics are now being gathered.

11.4 Modifying the Default Login Timeout Value

To prevent unauthorized access to the Cloud Control console, Enterprise Manager will automatically log you out of the Cloud Control console when there is no activity for a predefined period of time. For example, if you leave your browser open and leave your office, this default behavior prevents unauthorized users from using your Enterprise Manager administrator account.

By default, if the system is inactive for 45 minutes or more, and then you attempt to perform an Enterprise Manager action, you will be asked to log in to the Cloud Control console again.
To increase or decrease the default timeout period:

1. Set the value for the OMS ORACLE_HOME environment variable. For example:
   ```
   export ORACLE_HOME=/u01/app/oracle/product/Middleware/oms
   ```
2. Navigate to the following directory:
   ```
   OMS $ORACLE_HOME/bin
   ```
3. Issue the following command to increase the timeout. In this example, you can increase the timeout to 60 seconds.
   ```
   ./emctl set property -name oracle.sysman.eml.maxInactiveTime -value 60 -sysman_pwd oracle12
   ```
4. Stop and restart the OMS to reflect the new property value:
   ```
   ./emctl stop oms
   ./emctl start oms
   ```

**Note:** The default timeout value does not apply when you restart the Web server or the Oracle Management Service. In both of those cases, you will be asked to log in to the Cloud Control console, regardless of the default timeout value.

### 11.5 Configuring Clusters and Cluster Databases in Cloud Control

This section describes how to configure cluster databases and discover instances.

#### 11.5.1 Configuring Cluster Databases

After you have added the cluster target, you can add a cluster database target either from the Databases page or from the All Targets page.

To add a cluster database target, perform the following steps:

1. In the Enterprise Manager Cloud Control console, select one of the following entry locations:
   - From the Databases page, click **Add**. The Add Database Instance Target: Specify Host page appears.
   - From the All Targets page, select **Database Instance** from the Add drop-down menu, then click **Go**. The Add Database Instance Target: Specify Host page appears.
2. Specify any host member of the cluster target where the cluster databases reside, then click **Continue**. The Add Database: Specify Source page appears.
3. Keep the default option (on all hosts in the cluster) selected and click **Continue**. This option sends requests to all Management Agents in the cluster to perform discovery.

**Caution:** As stated in the previous paragraphs, the timeout value for logging in to the Cloud Control console is defined in order to protect your system from unauthorized logins. If you make changes to the login timeout value, be sure to consider the security implications of leaving your session open for other than the default timeout period.
After target discovery completes, the newly discovered RAC databases appear in the Targets Discovered on Cluster page. If the databases do not appear, see the Troubleshooting section below.

4. If the desired targets do not appear in the Cluster Databases table, or if the discovered targets are not configured appropriately, click Manually Add. The Properties page of the Configure Cluster Database wizard appears.

5. Provide the required values for the Properties table.

6. You must specify at least one instance in the Instances table. If no instances appear in the table, click Add. The Properties: Add Instance page appears. Provide the required values, then click OK. The Properties page of the Configure Cluster Database wizard reappears.

7. Click Next. For database versions 10.1 and higher, Enterprise Manager bypasses the Install Packages, Credentials, and Parameters steps, and goes directly to the Review page.

8. Click OK. The Targets Discovered on Cluster page reappears, and displays the newly added cluster database and instances.

See Also: The Enterprise Manager online help for more information about configuring cluster databases

11.5.2 Discovering Instances Added to the Cluster Database

If you need to configure additional instances, follow these steps:

1. In Enterprise Manager, select Databases on the Targets page, then navigate to the desired Cluster Database Home page.

2. Click Monitoring Configuration in the Related Links section. The Properties page of the Configure Cluster Database wizard appears.

3. Provide the required information in the Properties table at the top of the page.

4. Examine the Instances table. One or more additional instances may exist, but may not appear in the Instances table. If this is the case, click Add to discover the instance in the cluster database. The Properties: Add Instance page appears.

5. Provide the required information, then click OK. The wizard Properties page reappears, and displays the added instance view.

6. Click Check Connection to ensure that the connection is working.

See Also: The Enterprise Manager online help for more information about discovering instances added to the cluster database

11.5.2.1 Troubleshooting

If you encounter configuration issues, check the following required conditions to ensure that automatic discovery is able to function correctly:

- The host user running the Management Agent is able to run the SRVCTL utility in the Oracle home and retrieve the database configuration.
- The host user running the Management Agent is able to connect to the database through SQLPLUS using OS authentication.
- The Oratab (UNIX) or Registry (Windows) contains information about the database.
If automatic discovery still does not resolve your configuration issues after you have ensured the conditions previously listed, you can manually configure cluster databases (see Section 11.5.1, "Configuring Cluster Databases").

11.6 Collecting Client Configurations

A client is comprised of a host and operating system user. Client configuration data that is collected includes:

- Hardware for the client.
- Operating system (includes information such as operating system properties, file systems, and patches) for the client.
- Operating system-registered software.
- Network data, which includes:
  - Latency to the Web server
  - Bandwidth to the Web server
- Client-specific data items that describe the configuration of the browser used to access the client configuration collection applet, which includes:
  - Browser type (vendor)
  - Browser version
  - JVM vendor (of the JVM used to run the client configuration collection applet)
  - JVM version (of the JVM used to run the client configuration collection applet)
  - Proxy server (if specified)
  - Proxy server exceptions
  - Browser cache size (MB)
  - Browser cache update frequency
  - Supported HTTP version
- Other client-oriented data items, including:
  - Client configuration collection applet identifier (version, defined in the applet code)
  - Application URL (from which the client configuration collection applet was accessed)
  - Boot drive serial number (not available from diskless systems)
  - Collection timestamp (from the client configuration collection applet JSP)
  - Collection durations, in milliseconds
  - Client IP address
  - Effective client IP address - if a network proxy server is being used between the client and the Web server providing the client configuration collection applet, the effective client IP address will be the IP address of the proxy server.
11.6.1 Configuring the Client System Analyzer

The Client System Analyzer (CSA) allows Web server administrators to collect and analyze end-user client data. The client data is collected by an applet, diagnosed and sent back to the CSA application. The Oracle Management Agent uploads this data to the Enterprise Manager Management Repository. After the client configuration data has been collected by the client configuration collection applet and written to the Web server directory specified by the CSA applet, the client configuration data is uploaded to the Oracle Management Repository.

You can either use the Client System Analyzer in the Cloud Control application pre-installed with Enterprise Manager or you can deploy CSA independently to your Web server.

11.6.1.1 Client System Analyzer in Oracle Cloud Control

Client System Analyzer in Cloud Control - An instance of CSA is pre-installed with Enterprise Manager. If you use this option, you can collect client data without setting up a separate Web server. To activate the pre-installed CSA application in Enterprise Manager, click Configuration, then click Client System Analyzer in Cloud Control and use the button provided to activate the application. Once CSA is activated, end-users can use the URL provided to run the CSA applet. The CSA applet can collect base client configuration information from client systems and Oracle Collaboration Suite client information from Oracle Collaboration Suite client systems.

- To download the CSA applet and have it collect base client configuration information, a client should use the Client System Analyzer URL in this format:
  http[\s]://management-service-host:port/em/public/ecm/csa/CSA

- To download the CSA applet and have it collect Oracle Collaboration Suite client configuration information, a client should use the Client System Analyzer URL in this format:
  http[\s]://management-service-host:port/em/public/ecm/csa/CSA?application=OCS

11.6.1.2 Deploying Client System Analyzer Independently

The Client System Analyzer Application can be deployed independently to any J2EE-capable Web server. Click the Deployments tab. Then click Getting Started with Client System Analyzer and click Deploy Client System Analyzer Application. Follow these steps to deploy the CSA applet and collect the client configuration data.

1. Download the CSA Application:

   The CSA application includes the CSA directory along with the necessary JSP applet files. The application is packaged as an EAR file. To download this default EAR file, click Download Client System Analyzer Application. You can customize the default CSA EAR file by modifying the following:

   - Rules - This file contains a default set of rules against which the client data is evaluated. You can customize and add rules before deploying CSA.

   - Context parameters - You can customize the context parameters in the web.xml file.

   - Custom classes - You can provide customized applet classes that can be used to perform tasks like collecting additional data, changing the behavior of the applet, and performing certain operations on the client.

2. Deploy CSA to any J2EE Web server.
The CSA application is deployed on an Application Server as a regular J2EE application. Once the CSA application is deployed, context parameters can be changed similar to other web applications.

3. Direct users to the CSA.

In order for the client data to be collected, the user must access the CSA application. Users can access the CSA JSP page directly or by using a link from another application. Users can be automatically redirected to CSA using the following methods:

- HTTP Server (Apache's `mod_rewrite`) - This option does not require changes in the Web application.
- Servlet Filter - A servlet filter is a program that filters requests to and from the server. The `CSA_filter.jar` file contains the servlet filter classes. The servlet filter and the filter mapping need to be added to the Web application.
- CSA Redirection JSP - The CSA Redirection JSP (`CSARedirect.jsp`) page can be included into the Web application.

4. Configure Enterprise Manager.

Collected client data is recorded in the Receive File Directory on the Web server. To upload the collected client data into Enterprise Manager, you need to do the following:

- Add a CSA Collector Target to the Enterprise Manager Management Agent. To do so, click **Add Collector** and choose a target from the list.
- Specify the absolute path to the Receive File Directory. The path specified must be the same as the path specified in the `outputDir` parameter of the CSA application. By default, the client data is stored in the Receive File Directory `csa_results` under the context root of the Client System Analyzer Web application, but this can be configured by changing the application's `outputDir` context parameter.

5. Test the CSA Deployment.

To verify the CSA deployment, click the URL of the CSA page and check if the client data is collected.

### 11.6.2 Configuration Parameters

The Client System Analyzer (CSA) can be further configured by modifying the context parameters in the CSA application’s WAR file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>alertWhenDone</td>
<td>If set to true, a message indicating that the applet has been executed is displayed.</td>
<td>false</td>
</tr>
<tr>
<td>appletJAR</td>
<td>The name of the JAR file.</td>
<td>CSA.jar</td>
</tr>
<tr>
<td>application</td>
<td>The name of the application associated with this CSA instance. If the application parameter value is not specified, then the Collection Tag has a value of Default.</td>
<td>none</td>
</tr>
<tr>
<td>autoRedir</td>
<td>If set to &quot;true&quot;, this causes the CSA JSP page to automatically use the Sun JVM if JVM was set to JInitiator and the client does not have the appropriate version of JInitiator installed.</td>
<td>false</td>
</tr>
</tbody>
</table>
### Table 11–1  (Cont.) Configuration Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>bwTestFile</td>
<td>The name of the file that is downloaded from the server during the bandwidth test.</td>
<td>CSA.mb (included with CSA)</td>
</tr>
<tr>
<td>bwTestMsec</td>
<td>The amount of time the applet should spend on the bandwidth test. The applet computes bandwidth by counting the number of bytes it can download in this interval.</td>
<td>200 ms</td>
</tr>
<tr>
<td>classid</td>
<td>The &quot;classid&quot; field for the OBJECT tag. Applicable only if JVM is set to &quot;JInitiator.&quot; The classid for Sun is &quot;clsid:8AD9C840-044E-11D1-B3E9-00805F499D93&quot;</td>
<td>None – this field MUST be set if JVM is set to &quot;JInitiator,&quot; and is ignored otherwise</td>
</tr>
<tr>
<td>codebase</td>
<td>The codebase field for the OBJECT tag. Applicable only if the JVM is set to &quot;JInitiator&quot;.</td>
<td>The default for Sun is <a href="http://java.sun.com/products/plugin/autodl/jinstall-1.4_2-windows-i586.cab">http://java.sun.com/products/plugin/autodl/jinstall-1.4_2-windows-i586.cab</a> #Version=1,4,0,0</td>
</tr>
<tr>
<td>collectCookie</td>
<td>The list of the names of cookies to be collected. This parameter is a comma-separated list of cookie names. Only cookies for the current OS user in the current browser will be collected. The Administrator can specify asterisk (*) to collect all of the current user’s cookies for the current browser.</td>
<td>If this field is not present, no cookies will be collected.</td>
</tr>
<tr>
<td>cookieDomain</td>
<td>The domain of the CSA cookie.</td>
<td>If either the domain or path of the cookie is not set, cookies are disabled.</td>
</tr>
<tr>
<td>cookieMaxAge</td>
<td>The maximum duration, in seconds, of the cookie on the client machine.</td>
<td>1 year</td>
</tr>
<tr>
<td>cookiePath</td>
<td>The path of the CSA cookie</td>
<td>If either the domain or path is not specified, cookies are disabled.</td>
</tr>
<tr>
<td>customClass</td>
<td>The name of the class used to collect custom data.</td>
<td>none – the default behavior is for no custom code to be executed</td>
</tr>
<tr>
<td>customKey1</td>
<td>The values of the three custom keys. All client collections done by a CSA JSP page that uses this deployment descriptor will have these values for the custom keys. These values can be overridden by custom code.</td>
<td>If no custom key values are specified, none will be collected (unless they are collected by custom code)</td>
</tr>
<tr>
<td>customKey2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>customKey3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>descriptionFile</td>
<td>The full path of a text file containing the description that will be displayed on the deployment page. The contents of the file should be HTML-formatted text.</td>
<td>None</td>
</tr>
</tbody>
</table>
### Table 11–1 (Cont.) Configuration Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>destURL</td>
<td>Specifies the destination URL. This is the URL to which the &quot;Proceed&quot; button on the CSA JSP page is linked.</td>
<td>If no destURL is specified, the &quot;Proceed&quot; button will take the user to the referring page; if there is no referring page, the &quot;Proceed&quot; button will not be displayed.</td>
</tr>
<tr>
<td>destURLResultsParam</td>
<td>Specifies the name of the URL parameter that will be added to the &quot;destination URL&quot; to indicate the client's compliance level. For example, if the value was &quot;compliance&quot;, and the client's overall compliance level was critical, then the parameter &quot;compliance=critical&quot; would be added to the destination URL.</td>
<td>Sun</td>
</tr>
<tr>
<td>JVM</td>
<td>This determines the type of JVM that is to be used. If the value is &quot;Sun,&quot; the JSP page will direct the browser to use the Sun JVM. If the value is &quot;Oracle,&quot; the page will direct the browser to use Oracle Jinitiator. If the value is &quot;any,&quot; the JSP will write out the standard &quot;applet&quot; tag, which causes the client to use whichever JVM is plugged into the browser.</td>
<td>Sun</td>
</tr>
<tr>
<td>maxExecInterval</td>
<td>Parameter that is added to CSA cookie payload. When the redirection logic reads the cookie, if the timestamp of the cookie differs from the current time by more than this value, the applet is deployed again. This parameter can be overridden by the &quot;csa execInterval&quot; context parameter in the redirection JSP filter.</td>
<td>90 days</td>
</tr>
<tr>
<td>maxFileSize</td>
<td>Maximum amount of data, in KB, that can be posted back to the receiver in a single request. If the size of the posted data exceeds this limit, the request is rejected and any data already written to the hard drive is deleted.</td>
<td>100</td>
</tr>
<tr>
<td>maxOutputFiles</td>
<td>Maximum number of output files that can be present in XML OutputDir.</td>
<td>100</td>
</tr>
<tr>
<td>outputDir</td>
<td>Directory to which CSA configuration xml files will be written. Both the applet page and the receiver page must read this parameter, and this parameter must be identical for both pages.</td>
<td>By default, the output files are written into the &quot;csa_results&quot; subdirectory of the application root directory (if the application root directory exists, and if the subdirectory exists or can be created). Using the default value for this parameter is not recommended.</td>
</tr>
<tr>
<td>outputEnabled</td>
<td>Enables or disables creation of output XML files. Applicable to both applet and receiver pages.</td>
<td>By default, the XML files are created and stored in the XMLOutputDir.</td>
</tr>
</tbody>
</table>
In addition to these parameters, the CSA redirection parameters can also be configured. Redirection can be enabled either by using a servlet filter or by including a CSA redirection JSP file in some other page. The following context parameters must be available for the redirection to work.

**Table 11–2 Configuration Parameters**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>csaURL</td>
<td>The URL of the CSA JSP page to which the user should be redirected.</td>
<td>No default: This value must be set or redirection cannot work.</td>
</tr>
<tr>
<td>execInterval</td>
<td>The interval, in seconds, between executions of CSA. If the difference between the cookie's age and the current server time is greater than execInterval, the user is redirected.</td>
<td>None. If the execInterval is not set, then the user is only redirected if there is a CSA cookie.</td>
</tr>
<tr>
<td>redirectURL</td>
<td>The URL to which the user should be directed after CSA has executed</td>
<td>None. If this parameter is not set, the user is directed back to the originally requested page</td>
</tr>
<tr>
<td>UIMode</td>
<td>0 - synchronous (in the current browser window) 1 - asynchronous visible 2 - asynchronous invisible</td>
<td>synchronous</td>
</tr>
</tbody>
</table>

**11.6.2.1 Associating the Parameters with an Application**

In certain cases, different sets of parameters may be required for different applications. For example, two different applications may have different rule sets and custom code, and the administrator may want to associate them with different CSA Collector Targets. In this scenario, the administrator can specify the `ruleFile`, `appletJar`, `script`, and `outputDir` parameters for a particular application by using the context parameters.
Collecting Client Configurations

Performing Additional Configuration Tasks

<application name> ruleFile, <application name> appletJar, and so on. If an application is specified, either as a context parameter or through the URL, then CSA is executed using the parameter values specific to the application. If no application is specified, or if one of the parameters for an application is not overridden, the default parameters are used.

11.6.3 Rules

Custom rules can be supplied to the CSA application so that the users receive immediate feedback as to whether their systems satisfy certain constraints. A sample RULES file is shown in Example 11–1 followed by a description of each tag contained in the file.

**Example 11–1 Sample RULES**

```xml
<RULES>
  <RULE>
    <NAME>Client has sufficient memory</NAME>
    <DESCRIPTION>Checks to see if the client has enough memory to run the application</DESCRIPTION>
    <VIOLATION> //ROWSET[@TABLE='MGMT_ECM_HW']/ROW/AVAIL_MEMORY_SIZE_IN_MB[number() &lt; $arg=SIZE$] </VIOLATION>
    <SEVERITY level="CRITICAL">
      <PARAM id='SIZE'>100</PARAM>
      <MOREINFO>
        <TEXT>Application cannot run with less than 100 MB.</TEXT>
      </MOREINFO>
    </SEVERITY>
    <SEVERITY level="WARNING">
      <PARAM id='SIZE'>150</PARAM>
      <MOREINFO>
        <TEXT>Approaching minimum memory level</TEXT>
      </MOREINFO>
    </SEVERITY>
  </RULE>
</RULES>
```

Example 11–1 demonstrates a rule that can be used to check whether or not the client has sufficient memory to run the application. The <VIOLATION> is an XPATH expression that the applet will evaluate against an XML file that contains all of the data it has collected. Since the violation is an XPATH expression embedded in an XML file, certain characters in the XPATH, such as '<', '>', and '&', must be replaced with entities. If the XPATH expression returns a non-null node set, the rule has failed. In this case, the rule will fail if the client's available memory is less than a certain amount. The actual amount that triggers a violation can be configured by using different severity levels.

In Table 11–3, the applet will first replace the substring "$arg=SIZE$" in the VIOLATION expression with "100" and then evaluate the expression. If the client's available memory is less than 100 MB, then the rule will fail with critical status. The applet will indicate the status along with the message Application cannot run with less than 100 MB of memory. If the rule passes through successfully, the applet will then replace $arg=SIZE$ with 150 and try again; if the rule fails, the applet will display the message Approaching minimum memory level. If the applet goes through all specified severity levels and does not find a violation, the rule is successful.
<table>
<thead>
<tr>
<th>Tag Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RULES</td>
<td>This is the top-level tag for the XML file</td>
</tr>
<tr>
<td>BUNDLE</td>
<td>This tag specifies the resource bundles used for translation. The value of the tag is either the name of a file or a Java class name. The rule engine reads this string and first attempts to find a file in the applet JAR that has this name. This file is expected to contain a mapping of resource IDs to strings in various languages. If such a file does not exist, then the string is treated as the name of a Java resource bundle class. Strings in a resource bundle are referenced using the syntax <code>&lt;resource id&gt;@&lt;bundle id&gt;</code>.</td>
</tr>
<tr>
<td>PRECONDITION</td>
<td>This tag is used to specify an XPATH expression that must return a non-null node set in order for a rule to be evaluated. The &quot;id&quot; attribute specified the ID of the precondition. A rule can specify a list of preconditions that should be evaluated by listing their IDs.</td>
</tr>
<tr>
<td>RULE</td>
<td>This tag represents an individual node that is to be evaluated. The rule's severity is specified using a <code>&lt;SEVERITY&gt;</code> tag. At least one severity tag must be specified for a rule. The tag has an optional &quot;precondition&quot; attribute, which is used to specify a list of precondition IDs separated by commas. Before the rule is evaluated, all of the preconditions must be met. If the pre-conditions are not met, the rule has a status of &quot;Not Applicable&quot; and is not displayed in the client UI at all. The children of a RULE tag are NAME, DESCRIPTION, VIOLATION, SEVERITY, and MOREINFO.</td>
</tr>
<tr>
<td>NAME</td>
<td>This tag specifies the name of the rule and identifies the tag in the repository.</td>
</tr>
<tr>
<td>Note:</td>
<td>This tag must contain a value and cannot be blank.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>This is the description of the rule.</td>
</tr>
<tr>
<td>VIOLATION</td>
<td>This tag lists the violations that are to be checked for a given rule. The violation is specified in the CSA Condition Language.</td>
</tr>
<tr>
<td>SEVERITY</td>
<td>A rule can have three severity levels: INFO, WARNING, and CRITICAL. The SEVERITY node must contain a number of ARG children equal to the number of arguments that can be accepted by the expression in the VIOLATION node. When the rule engine evaluates a rule, it evaluates the condition in VIOLATION for each of the sets of arguments specified in the severity levels, starting with CRITICAL and moving down in order of severity. As soon as the engine encounters a condition that fails, the rule is declared a failure, with a severity level equal to the severity level of the argument that caused the failure. If the conditions for all specified levels are met, the rule passes.</td>
</tr>
<tr>
<td>PARAM</td>
<td>This tag specifies the value of an argument that should be substituted into an expression. The 'id' attribute of the tag must match the name of one of the arguments in the expression.</td>
</tr>
<tr>
<td>MOREINFO</td>
<td>This tag specifies the information that is displayed if the user clicks the &quot;more information&quot; button that is displayed next to a failed rule. The children of MOREINFO are TEXT and ARG.</td>
</tr>
<tr>
<td>Note:</td>
<td>The MOREINFO node can be a child either of the severity node (in the case where multiple severities are specified) or of the rule itself.</td>
</tr>
</tbody>
</table>
In addition to writing custom classes to collect custom properties, the administrator can also specify custom properties in the deployment descriptor. Custom property names are specified by including a context parameter of the form `csa value_<name>`. The `<name>` field of the context parameter name is treated by the Client System Analyzer (CSA) as the custom property name, and the value of the parameter is treated as the custom property value. Similarly, administrators can specify the type, `type_ui`, `name_ui`, `display_ui`, and `history_tracking` fields for a custom property by using `csa_type_<name>`, `csa_type_ui_<name>`, `csa_name_ui_<name>`, `csa_display_ui_<name>`, and `csa_history_tracking_<name>` parameters, respectively. Custom properties can also be specified on the CSA Applet URL, using the same naming convention.

### 11.6.5 CSA Deployment Examples

The following sections outline sample use cases for client configurations.

#### 11.6.5.1 Using Multiple Collection Tags

An administrator can check the compatibility of users with two distinct Web applications. The first is an online teaching website that delivers content using a number of various plug-ins, allowing an administrator to be sure that all users have the required installed plug-ins. The second is a software distribution portal that allows an administrator to ensure that all users downloading software from the portal have the required hardware and operating system. In this case, though both applications require their own set of rules, the administrator can use a single CSA instance for both applications through the use of collection tags displayed in the following list:

1. Choose a collection tag for each application, such as "teaching" and "distribution".
2. Create two separate rule files, one for each application.
3. Use context parameters to map each rule file to the corresponding application, as shown in Example 11–2.
4. Create the appropriate links from each application to CSA. The links from the teaching and distribution applications should have `application=teaching` and `application=distribution`, respectively, in the query string. This ensures that users of each application have the correct collection tags when running CSA.

---

<table>
<thead>
<tr>
<th>Tag Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXT</td>
<td>This tag specifies the text to be displayed when the &quot;More Info&quot; button is clicked. The &quot;resource&quot; attribute specifies a string in a resource bundle – if this string is not present, the value of the node is displayed instead. The text (either in the resource bundle or in the node itself) can specify a location for arguments to be inserted by using &quot;[0]&quot;, &quot;[1]&quot;, and so on. In this case, the expressions in the ARG nodes are evaluated and inserted into the text in the order in which they are specified. If there are more ARG nodes specified than there are slots in the string, the extra nodes are ignored.</td>
</tr>
<tr>
<td>ARG</td>
<td>This tag specifies an expression in the CSA Condition Language that can be evaluated and inserted into the MOREINFO text.</td>
</tr>
</tbody>
</table>
Example 11–2 Using Collection Tags for Selecting a Rule File

```xml
<context-param>
  <param-name>csa teaching ruleFile</param-name>
  <param-value>teaching_rules.xml</param-value>
</context-param>

<context-param>
  <param-name>csa distribution ruleFile</param-name>
  <param-value>distribution_rules.xml</param-value>
</context-param>
```

Example 11–2 shows only the use of collection tags for selecting a rule file. However, collection tags can be used for any of the CSA context parameters.

Collection tags also affect how client configurations are stored in the Enterprise Manager Management Repository. If the user comes to CSA using the link from the teaching application in Example 11–2, then in addition to running the rules for the teaching collection tag, CSA also causes this tag to be stored with the client configuration data in the Management Repository. The collection tag forms part of the unique identifier for the client configuration, which makes it possible for a single client to have multiple configurations in the Management Repository, each with its own tag. Collection tags can be associated with Enterprise Manager targets in order to restrict access to client data; an Enterprise Manager user can only view a client configuration if he or she has view privileges on a target that is associated with the collection tag for that client configuration.

In Example 11–2, suppose that host H1, application server A1, and database D1 are used to host the teaching application, while host H2, application server A2, and database D2 are used for the distribution application. All 6 targets are monitored by Enterprise Manager, with user X having access to A1, H1, and D1 and user Y having access to A2, H2, and D2. Since each of the two Enterprise Manager users is monitoring the resources used for one of the applications, it may also make sense to have each user also monitor the application’s clients. In that case, an Enterprise Manager super user would associate the teaching tag with A1, D1, or H1 and associate the distribution tag with A2, D2, or H2. This allows user X to see all client configurations with the teaching tag and user Y to see all configurations with the distribution tag.

11.6.5.2 Privilege Model for Viewing Client Configurations

Collection Tags are used to restrict access to client data in Enterprise Manager. A client configuration is visible to the user only if the Collection Tag for that configuration is associated with a target on which the user has View privileges. For example, if collection tag C is associated with target T1, then only those users that can view target T1 will be able to see client configurations that have tag X. In Example 11–2, user X will be able to see client configurations with the teaching tag because user X has view privileges on targets that are associated with the teaching tag. However, user X will not be able to see any client configurations with the distribution tag because that tag is not associated with any targets that user X can see. Super users can associate collection tags with targets by using the Collection Tag Associations page, which can be accessed from the Deployments tab or from the Client System Analyzer in Cloud Control link on the Setup page. Super users can view all client configurations regardless of any collection tag associations.
11.6.5.3 Using the Customization API Example

If the administrator is interested in the user’s settings for an e-mail client in addition to the normal CSA data, the administrator can add this information to the other data collected by CSA through the use of the customization API, as shown in Example 11–3.

1. Create the Java classes required to gather the information. The administrator can create as many classes as necessary, but there must be at least one class that implements `oracle.sysman.eml.ecm.csa.CSAResultInterface` and one that implements `oracle.sysman.eml.ecm.csa.CSACustomInterface`, both of which are shown in Example 11–3. Assume that the former is `acme.csa.custom` and the latter is `acme.csa.result`.

2. Set the value of the "customClass" parameter in CSA to "acme.csa.custom"

Example 11–3  Customization API

```java
public interface CSACustomInterface {

   /**
    * requires: none
    * effects: returns a CSAResultInterface object that may contain custom properties. Other effects are determined by the customActions method
    * in the implementing class
    * modifies: unknown - dependent on implementing class.
    * @param inputData contains client config data collected by default, plus applet parameters, etc. None of the data in the inputData is guaranteed to be there as there could have been collection errors.
    * @return a data structure that may contain custom properties
    */
   CSAResultInterface customActions(CSAInputInterface inputData);
}

public interface CSAResultInterface {

   /**
    * requires: none
    * effects: returns an array of custom properties
    * modifies: none
    * @return String[][] where ...
    * 
    * String[i][0] is a name
    * String[i][1] is a value of the i-th row. (Type and name must be unique.)
    * String[i][2] is a type/category of data (could be null),
    * String[i][3] is the displayed value of the name of the property
    * String[i][4] is the displayed value of the type of the property
    * String[i][5] indicates data item (ie "Y") whose history should be computed
    * String[i][6] indicates data item (ie "Y") should be displayed in default UI
    */
   String[][] getResultsData();
}

public interface CSAInputInterface {

   /**
    * Get data value for given name
    * requires: name is not null
    * effects: returns the data value associated with the name
    * modifies: none
    * @param name the name of the key whose value is to be returned
    * @return the value associated with name
    */
}
```
String getDataValue(String name);

/**
* Get table-formatted data.
* requires: name is not null
* effects: returns the table with this name
* modifies: none
* @param name the name of the table
* @return the rows of the child tables
*/

CSAInputInterface[] getDataTable(String name);

The additional data collected by the custom code will be stored in the table MGMT_ECM_CSA_CUSTOM. To add data to this table, the custom code returns it in an object that implements CSAResultInterface. The custom code can also manipulate the normal data collected by CSA by modifying the CSAInputInterface object passed to the customActions method by the applet.

Since the custom code is executed before rules are evaluated, the administrator can also write rules based on the custom data. For example, if the administrator wants to write a rule that raises a critical error if the user does not have the correct IMAP server set up his or her e-mail client, the administrator would write custom code that retrieves the IMAP server settings and stores them in the MGMT_ECM_CSA_CUSTOM table and then writes a rule that checks these values.

### 11.6.5.4 Using the CSA Servlet Filter Example

Since CSA does not involve the use of a Management Agent on the user’s machine, there is no way to keep the data in the Management Repository up to date unless end users run CSA periodically. One way to ensure that they do is to check whether or not users have run CSA recently, and if they have not, to inform them to run CSA again. This check can be accomplished using the CSA servlet filter provided by Oracle.

The CSA servlet filter works by checking the cookie that CSA sets in the user's browser whenever it runs. The payload of this cookie indicates the time at which CSA was last run. To use the filter, the administrator places it in front of some frequently accessed application, such as an employee portal. The administrator then sets the interval at which he or she wants users to run CSA. Whenever a user tries to connect to the portal application, the filter intercepts the request and checks the CSA cookie. If the cookie is not present or if it is older than the execution interval specified by the administrator, the user is directed to the CSA page; if not, the user is allowed to proceed to the application.

Assume that Acme Corporation has a CSA instance deployed at www.acme.com/csa/CSA.jsp. Assume also that the company has a portal at www.acme.com/portal that can be used by employees to check e-mail, access their personal information, or display news about the company. Because the portal is accessed frequently by employees, the administrator at Acme decides that the portal can be used to keep CSA data up to date. The administrator would take the following steps:

1. Download the CSA servlet filter classes. These classes are contained in a JAR file, CSA_filter.jar, which can be downloaded from the Deploy Client System Analyzer page in the Enterprise Manager Cloud Control console.
2. Place the JAR file in the WEB-INF/lib directory of the application to which the filter will be applied.

3. Specify context parameters for the filter. In this case, the administrator wants users to run CSA every 30 days and return to the portal homepage after CSA has finished.

   ```xml
   <context-param>
   <param-name>csa csaURL</param-name>
   <param-value>www.acme.com/csa/CSA.jsp</param-value>
   </context-param>

   <context-param>
   <param-name>csa execInterval</param-name>
   <param-value>2592000</param-value>
   </context-param>
   ```

   An alternative is to have CSA run in a separate browser window in the background. This can be set up by using the `csa_uiMode` parameter. If the parameter is set to 1, the filter will open a new browser window that is the same size as the original window and go to the CSA page. If the parameter is set to 2, CSA will run in invisible mode; in this case, the filter will open a new browser window and immediately minimize it, and it will close the window as soon as CSA has completed.

11.6.5.5 Sample Deployments

In the following sample deployment examples, there are three primary actors. The first is the CSA administrator, who is responsible for setting up CSA. The second is the Enterprise Manager user, who will be viewing the client data in Enterprise Manager. The third is the end user, whose data is being collected by CSA.

11.6.5.5.1 Example 1: Helpdesk

In this example, the CSA administrator is using CSA to support the operations of a helpdesk. End users who have problems running a particular application can call customer support, and the customer support technician can, if necessary, instruct the user to go to a particular URL and run CSA. The Enterprise Manager users are the support personnel who will use the data collected by CSA to assist the end user. To speed up the process of diagnosing the customer’s problem, the CSA administrator creates some rules in a file called `rules.xml` so that the helpdesk personnel can quickly identify potential problems. In the simplest case, suppose that the helpdesk is being set up to provide support for a single application. The application is running on an application server on host application.acme.com, which has an Enterprise Manager Management Agent installed on it that sends data back to the Management Service at oms.acme.com/em. The helpdesk personnel who will be looking at client data can log into Enterprise Manager as the user `helpdesk`, which does not have super user privileges.

1. The CSA administrator adds `rules.xml` to the CSA.war file contained in CSA.ear.
2. Deploy the EAR file to the application server using the Application Services Control console.
3. Use the Application Services Control console to set the necessary context parameters, such as `ruleFile` and `outputDir`.
4. Optionally, the administrator can choose a collection tag for the CSA data by specifying a value for the `application` context parameter. If no tag is chosen, the tag `Default` will be used.
5. An Enterprise Manager user with super user privileges adds a CSA Collector Target to the Management Agent on application.acme.com and sets its receive file directory to the directory specified in the `outputDir` parameter of CSA.

6. An Enterprise Manager superuser creates the collection tag associations needed to allow the helpdesk users to look at the data. For example, the superuser could associate the tag `Default` with host `application.acme.com` and then give the helpdesk Enterprise Manager user view privileges on the host.

With the setup previously described, when a user calls the helpdesk to ask for support with the application, the helpdesk technician can instruct the user to run CSA from the appropriate URL on application.acme.com. The Management Agent collects the data after a certain interval and loads it into the Management Repository. The helpdesk technician can then log into Enterprise Manager as helpdesk and find the customer’s information by searching for an identifying field such as the customer’s operating system user name or host name. By default, the Management Agent will check the output directory for new data every two minutes, but this interval can be shortened by editing the file $ORACLE_HOME/sysman/admin/default_collection/oracle_csa_collector.xml.

11.6.5.5.2 Example 2: Inventory

In Example 11–4, a system administrator is in charge of keeping track of the hardware and software used by employees in two different departments, Human Resources (HR) and Sales. This administrator serves as both the Enterprise Manager user and the CSA administrator. The setup for this case is similar to the one described in the example on using servlet filters, but in this case, each department has its own portal application, at hr.acme.com/portal and sales.acme.com/portal, respectively. The administrator sets up an application server on host `server1.acme.com` and deploys CSA with the URL `http://server1.acme.com/csa/CSA.jsp`. A Management Agent on server1.acme.com collects data and sends to an Oracle Management Service at `oms.acme.com/em`. The administrator would like to collect data once every 30 days and to have CSA run in invisible mode. The administrator would also like to distinguish data from the two different departments by using two separate collection tags, `hr` and `sales`. The administrator can log into Enterprise Manager as sysman and will thus be able to see clients with both tags.

The administrator arranges to have users directed to CSA by deploying the CSA servlet filter on both applications. Most of the filter context parameters for the two applications will be identical. However, because each application corresponds to a different tag, the values of the `csa csaURL` parameter will be slightly different. For the HR portal, the value would be `http://server1.acme.com/csa/CSA.jsp?application=hr`, and for the sales portal, the value would be `http://server1.acme.com/csa/CSA.jsp?application=sales`.

**Example 11–4 Inventory Code**

```xml
<context-param>
    <param-name>csa csaURL</param-name>
    <param-value>www.acme.com/csa/CSA.jsp?application=sales</param-value>
</context-param>

<context-param>
    <param-name>csa execInterval</param-name>
    <param-value>2592000</param-value>
</context-param>

<context-param>
    <param-name>csa uiMode</param-name>
</context-param>
```
Under this setup, users in the HR department who are directed to CSA from the HR portal will have the tag hr, and users from the sales department will have the tag sales. Thus, if the administrator wants to see information about only hardware on machines in the HR department, he or she can simply use the Collection Tag filter on the Client Configurations page in Enterprise Manager and set it to hr.

### 11.6.5.5.3 Example 3: Problem Detection

In this example, the goal is to use CSA to inform end users of potential problems they may experience while running an application. The setup is similar to the one used in Example 2. In this example, however, the CSA administrator creates rules for each application. In addition, the administrator wants CSA to run in the original browser window to ensure that end users are aware of any potential problems.

Example 11–5 displays the context parameter values for the CSA servlet filter on the sales portal.

#### Example 11–5  Context Parameter Values for CSA Servlet Filter

```
<context-param>
  <param-name>csa csaURL</param-name>
  <param-value>www.acme.com/csa/CSA.jsp?application=sales</param-value>
</context-param>

<context-param>
  <param-name>csa execInterval</param-name>
  <param-value>2592000</param-value>
</context-param>

<context-param>
  <param-name>csa uiMode</param-name>
  <param-value>0</param-value>
</context-param>
```

Example 11–6 represents the context parameter definitions to map rules to collection tags.

#### Example 11–6  Context Parameter Definitions Mapping Rules to Collection Tags

```
<context-param>
  <param-name>csa sales ruleFile</param-name>
  <param-value>sales_rules.xml</param-value>
</context-param>

<context-param>
  <param-name>csa distribution ruleFile</param-name>
  <param-value>hr_rules.xml</param-value>
</context-param>
```

### 11.7 Configuring Privilege Delegation Providers

A privilege delegation provider is defined as a program that allows a logged in user to perform an activity with the privileges of another user. Typically, the privileges that are granted to a specific user are administered centrally.
Enterprise Manager preferred credentials allow you to use two types of privilege delegation providers:

- **Sudo**

  Sudo allows a permitted user to execute a command as the super user or another user, as specified in the sudo user administration file (`sudoers`). If the invoking user is root or if the target user is the same as the invoking user, no password is required. Otherwise, sudo requires that users authenticate themselves with a password by default.

  **Note:** (In the default configuration, this is the user’s password, not the root password.)

  Sudo determines who is an authorized user by consulting the file `/etc/sudoers` file. Once a user has been authenticated, a timestamp is updated and the user may then use sudo without a password for a short period of time (5 minutes unless overridden in the `sudoers` file).

- **PowerBroker**

  Symark PowerBroker enables UNIX system administrators to specify the circumstances under which other users may run certain programs such as root (or other important accounts). The result is that responsibility for such actions as adding user accounts, fixing line printer queues, and so on, can be safely assigned to the appropriate people, without disclosing the root password. The full power of root is thus protected from potential misuse or abuse. For example, modifying databases or file permissions, or erasing disks.

  Symark PowerBroker can access existing programs as well as its own set of utilities that execute common system administration tasks. Utilities being developed to run on top of Symark PowerBroker can manage passwords, accounts, backups, line printers, file ownership or removal, rebooting, logging people out, killing their programs, deciding who can log in to where from where, and so on. They can also provide TCP/IP, Load Balancer, cron, NIS, NFS, FTP, rlogin, and accounting subsystem management. Users can work from within a restricted shell or editor to access certain programs or files as root.

  For additional information about Sudo or PowerBroker, see their respective product documentation.

Using Enterprise Manager’s command line interface (EM CLI), you can set/edit privilege delegation provider properties for a host. See the *Oracle Enterprise Manager Command Line Interface* guide for more information. See your privilege delegation provider documentation for detailed setup and configuration information.

### 11.7.1 Creating a Privilege Delegation Setting

A privilege delegation setting can be created using the Enterprise Manager CLI command line interface’s `create_privilege_delegation_setting` verb.

You can also configure a host with a Privilege Delegation setting, apply a Privilege Delegation setting template or unconfigure the Privilege Delegation setting by choosing **Setup**, then **Security** on the Enterprise Manager home page, then selecting **Privilege Delegation** from the left menu panel.
11.7.1.1 Creating a Sudo Setting Using EM CLI

Use the `create_privilege_delegation_setting` EM CLI verb to create a sudo privilege delegation setting. For explicit syntax and examples, see EM CLI command line help or the Oracle Enterprise Manager Command Line Interface guide.

**Variables**

You can use the following variables when using EM CLI to set the privilege delegation settings. Variables are case-sensitive.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>%RUNAS%</td>
<td>Run the command as this user.</td>
</tr>
<tr>
<td>%USERNAME%</td>
<td>Name of the user running the command.</td>
</tr>
<tr>
<td>%COMMAND%</td>
<td>Sudo Command</td>
</tr>
</tbody>
</table>

**Syntax**

```
emcli create_privilege_delegation_setting -setting_name=sudo_setting_1 -setting_type=SUDO -settings="SETTINGS:<command to be used with all the options>"
```

The following example illustrates using EM CLI to create a sudo setting. Here, sudo is installed in /opt/sudo/bin.

**Example 11–7 Using EM CLI to Create a Sudo Setting**

```
>emcli create_privilege_delegation_setting -setting_name=sudo_setting_1 -setting_type=SUDO -settings="SETTINGS:/opt/sudo/bin/sudo -S -u %RUNAS% %command%"
```

11.7.1.2 Creating a PowerBroker Setting Using EM CLI

Use the `create_privilege_delegation_setting` EM CLI verb to create a PowerBroker privilege delegation setting.

**Variables**

You can use the following variables when using EM CLI to set the privilege delegation settings. Variables are case-sensitive.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>%RUNAS%</td>
<td>Run the command as this user.</td>
</tr>
<tr>
<td>%USERNAME%</td>
<td>Name of the user running the command.</td>
</tr>
<tr>
<td>%COMMAND%</td>
<td>Sudo Command</td>
</tr>
<tr>
<td>%PROFILE%</td>
<td>Use this profile to run the command</td>
</tr>
</tbody>
</table>

**Syntax**

```
>emcli create_privilege_delegation_setting -setting_name=powerbroker_setting_1 -setting_type=POWERBROKER -settings="SETTINGS:<command to be used with all the options>"
```
Example 11–8 Using EM CLI to Create a Sudo Setting

```
./emcli create_privilege_delegation_setting -setting_name=sudo_setting_1 -setting_type=SUDO -settings="SETTINGS: /opt/powerbroker/bin/pbrun -u %RUNAS% %command%"
```

Note: In this example, PowerBroker is installed in /opt/powerbroker directory and its password prompt is "Password:"

### 11.7.2 Applying Privilege Delegation Settings

Once you have created a privilege delegation setting, you must apply this setting to selected targets. As with the setting creation process, you use EM CLI to apply the privilege delegation setting to specified targets. The setting can be applied to one or more hosts or to a composite (Group) target (the group must contain at least one host target).

You can also apply a Privilege Delegation setting using the Cloud Control console by selecting Setup on the Enterprise Manager Home page, then choosing Manage Privilege Delegation Settings from the left menu panel.

#### 11.7.2.1 Applying Settings to Host Targets Using EM CLI

Use the `apply_privilege_delegation_setting` EM CLI verb to apply privilege delegation settings to a host target.

**Syntax**

```
emcli apply_privilege_delegation_setting -setting_name=<setting name> -target_type=host -target_names="host1;host2;..." -input_file="FILE:hosts.txt" -force="yes/no"
```

To apply privilege delegation properties to a large number of hosts, you can specify a file containing all hosts by using the `-input_file` option in place of the `-target_names` option, as shown in the following example.

**Example 11–9 Using EM CLI to Apply Privilege Delegation Settings to a Host Target**

```
./emcli apply_privilege_delegation_setting -setting_name=<setting name> -target_type=host -input_file="FILE: /mydirectory/file.txt" -force=yes
```

#### 11.7.2.2 Applying Settings to a Composite Target

Use the `apply_privilege_delegation_setting` EM CLI verb to apply privilege delegation settings to a composite (group) target.

**Syntax**

```
emcli apply_privilege_delegation_setting -setting_name=<setting name> -target_type=composite -target_names="group" -force="yes/no"
```

**Example 11–10 Using EM CLI to Apply Privilege Delegation Settings to a Composite Target**

```
./emcli apply_privilege_delegation_setting -setting_name=<setting name> -target_type=composite -input_file="FILE: /mydirectory/file.txt" -force=yes
```
Once the setting has been applied successfully to host targets, you can set their preferred credentials using EM CLI or through the Cloud Control console.

11.7.3 Disabling Host Privilege Delegation Provider Settings Using EM CLI

To disable a privilege delegation setting, an administrator can create a new setting with disabled status and can apply it to the targets. This disabled setting can be applied to any privilege delegation provider (Sudo/PowerBroker). It will remove the setting from the host.

1. Create a new privilege delegation setting.
   
   ./emcli create_privilege_delegation_setting -setting_name= disabled_setting
   -setting_type=SUDO -disabled=yes

2. Apply the new setting to one or more targets.
   
   ./emcli apply_privilege_delegation_setting -setting_name= disabled_setting
   -target_type=host -target_names="host1;host2;..." -force=yes

11.7.4 Sudo Configuration: Sudoers File

Enterprise Manager uses a trust-based model that permits specification of responsibilities with a high degree of granularity. Administrators can set up sudo or pbrun configuration entries to assign specific Enterprise Manager functional privileges to their OS users. A new executable has been introduced in the Management Agent called nmosudo. Administrators will be able to configure sudo/pbrun such that a less privileged user can run nmosudo as a more privileged user.

In the following example, if an administrator wants user 'joe' to run any Enterprise Manager job as user 'oracle', the corresponding entry in the /etc/sudoers file would be:

(JOB_USERS) ALL : (RUNAS_USERS) AGENT_HOME /bin/nmosudo *

Where 'joe' would be in the JOB_BACKUP_USERS list and 'oracle' would be in the RUNAS_USERS list.

Enterprise Manager will guarantee that the nmosudo executable will only honor requests to run remote operation requests from the OMS via the Management Agent. nmosudo will not run the remote operation if it cannot validate that the request came from the Management Agent. Thus, as shown in the example above, it will not be possible for user 'joe' to invoke nmosudo directly from the command line and run a Perl script as user 'oracle'.

---

**Note:** To ensure system security, the administrator must provide the full path to the nmosudo executable.

11.7.5 Configuring Privilege Delegation Providers Using Cloud Control Console

Enterprise Manager Cloud Control allows you to configure Privilege Delegation Providers through functionality provided through its user interface. Using Cloud Control, you can avoid the command line interface while performing essentially the same functions.

The following sections describe the functions you can perform using the Cloud Control interface.
11.7.5.1 Configuring Sudo Settings For a Host Using Enterprise Manager Cloud Control Console

You can use Enterprise Manager to create a Sudo setting by using the Cloud Control console. You can create privilege delegation settings either by creating the setting directly on a host target, or by creating a PDP setting template that you can apply to multiple hosts.

To create a privilege delegation Sudo setting directly on a host, follow these steps:

1. Navigate to the Manage Privilege Delegation Settings page. From the Setup menu, select Manage, then select Privilege Delegation Settings.
2. For any host target appearing in the table, click Edit. Enterprise Manager takes you to the Host Privilege Delegation Setting page.
3. Select the Sudo privilege delegation type.
4. Enter the privilege delegation command to be used.
5. Click Update to apply the settings to the host.

---

Note: If the host has been configured with either the Sudo or Powerbroker setting, choosing None on this page will remove (or disable) the setting.

---

11.7.5.2 Configuring PowerBroker Settings For a Host Using the Cloud Control Console

You can create privilege delegation settings either by creating the setting directly on a host target, or by creating a PDP setting template that you can apply to multiple hosts.

To create a privilege delegation PowerBroker setting directly on a host, follow these steps:

1. Navigate to the Manage Privilege Delegation Settings page. From the Setup menu, select Manage, then choose Manage Privilege Delegation Settings.
2. For any host target appearing in the table, click Edit. Enterprise Manager takes you to the Host Privilege Delegation Setting page.
3. Select the PowerBroker privilege delegation type.
4. Enter the privilege delegation command to be used and the optional Password Prompt.
5. Click Update to apply the settings to the host.

---

Note: If the host has been configured with either the Sudo or Powerbroker setting, choosing None on this page will remove (or disable) the setting.

---

11.7.5.3 Applying Settings to Multiple Host Targets Using the Cloud Control Console

You apply Privilege Delegation settings to a target using Privilege Delegation setting templates. If no template with the desired Privilege Delegation settings exists, you must first create the template on the Manage Privilege Delegation Settings Template page.

To create a template, follow these steps:
1. Navigate to the Manage Privilege Delegation Settings page. From the Setup menu, select Manage, then choose Manage Privilege Delegation Settings.

2. From the Related Links section, click Manage Privilege Delegation Setting Templates.

3. Select a privilege delegation type (Sudo or PowerBroker), then click Go.

4. Fill in the requisite privilege delegation setting information.

5. Click Save.

If the desired privilege delegation settings template already exists, you need only apply the template to the desired host(s). To apply the template to the hosts, follow these steps:

1. Navigate to the Manage Privilege Delegation Settings page. From the Setup menu, select Manage, then choose Manage Privilege Delegation Settings.

2. Select the desired privilege delegation settings template from the Apply drop-down menu.

3. Click Go to access the Apply Settings page.

4. Add the targets (hosts) to which you want to apply the privilege delegation settings template.

5. Click Apply. Enterprise Manager displays the Past Apply Operations page where you can view the queue of scheduled apply operations along with those that are scheduled/pending. From this page, you can Stop or Delete apply operations.

You can also apply privilege delegation settings from the Manage Privilege Delegation Setting Templates page.

11.7.5.4 Disabling Host Privilege Delegation Provider Settings For One or More Hosts Using Cloud Control Console

You can disable a Privilege Delegation setting using the Cloud Control console. To disable a privilege delegation setting using this method, follow these steps:

1. Click Setup to access the Enterprise Manager Configuration page.

2. From the left menu, click Manage Privilege Delegation Settings.

   Cloud Control displays the Manage Privilege Delegation Settings Page.

3. Select the host(s) from which to clear the privilege delegation settings.

4. Click Clear. Enterprise Manager asks you whether to proceed with the privilege setting disable operation.

5. Click Yes.
Firewalls protect a company’s Information Technology (IT) infrastructure by providing the ability to restrict network traffic by examining each network packet and determining the appropriate course of action.

Firewall configuration typically involves restricting the ports that are available to one side of the firewall, for example the Internet. It can also be set up to restrict the type of traffic that can pass through a particular port such as HTTP. If a client attempts to connect to a restricted port (a port not covered by a security "rule") or uses a protocol that is incorrect, then the client will be disconnected immediately by the firewall. Firewalls can also be used within a company Intranet to restrict user access to specific servers.

You can deploy the components of Oracle Enterprise Manager on different hosts throughout your enterprise. These hosts can be separated by firewalls. This chapter describes how firewalls can be configured to allow communication between the Enterprise Manager components.

This chapter contains the following sections:

- Firewall Configuration Considerations
- Overview of Enterprise Manager Components and Ports
- Firewall Configurations for Enterprise Management Components

### 12.1 Firewall Configuration Considerations

Firewall configuration should be the last phase of Enterprise Manager deployment. Before you configure your firewalls, make sure you are able to log in to the Cloud Control console and that your Management Agents are up and monitoring targets.

If you are deploying Enterprise Manager in an environment where firewalls are already installed, open the default Enterprise Manager communication ports for all traffic until you have completed the installation and configuration processes and are certain that you are able to log in to Cloud Control and that your Management Agents are up and monitoring targets.

The default communication ports for Enterprise Manager are assigned during the installation. If you modify the default ports, be sure to use the new port assignments when you configure the firewalls.

If you are enabling Enterprise Manager Framework Security for the Oracle Management Service, the final step in that configuration process is to restrict uploads from the Management Agents to secure channels only. Before completing that step, configure your firewalls to allow both HTTP and HTTPS traffic between the Management Agent and Management Repository and test to be sure that you can log
in to Enterprise Manager and that data is being uploaded to the Management Repository.

After you have confirmed that the Oracle Management Service and Management Agents can communicate with both protocols enabled, complete the transition to secure mode and change your firewall configuration as necessary. If you incrementally configure your firewalls, it will be easier to troubleshoot any configuration problems.

### 12.1.1 Enabling ICMP Echo Requests on Firewalls

Oracle Management Service uses the Internet Control Message Protocol (ICMP) Echo Request to check the status target host machines. If the ICMP Echo Request is blocked by the firewall, a host machine will appear to be down.

To determine the status of any machine in the environment, ICMP Echo Requests must be enabled on the firewall. If the ICMP Echo Request is enabled, the `ping` command can be issued by Oracle Management Service to check the status of the machine.

By default, port 7 will be used for the ICMP Echo Request.

### 12.2 Overview of Enterprise Manager Components and Ports

As described in the previous sections of this chapter, it is important to understand and identify the ports used by each of the Enterprise Manager components before you configure your firewalls.

#### 12.2.1 Viewing a Summary of the Ports Assigned During Installation

The last panel in the Enterprise Manager Cloud Control installer, which is displayed just before the actual installation is started, lists all of the ports assigned during the installation.

Post-installation, you can view these values in the `staticports.ini` file at the following location on the OMS host:

```
MIDDLEWARE_HOME/.gcinstall_temp/staticports.ini
```

You can get the Middleware Home value by viewing the Oracle Home target for the Oracle Management Service in Cloud Control.

#### 12.2.2 Default Port Assignments for Enterprise Manager Components

Table 12–1 notes the default ports and/or port ranges assigned to various Enterprise Manager components that should be accessible through a firewall. These components include WebLogic Server components created as part of the WebLogic domain the Enterprise Manager installation belongs to, as well as optional components such as JVM Diagnostics and Application Dependency and Performance.

<table>
<thead>
<tr>
<th>Port</th>
<th>Default Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Manager Upload HTTP Port</td>
<td>4889 - 4898</td>
</tr>
<tr>
<td>Enterprise Manager Upload HTTPS (SSL) Port</td>
<td>1159, 4899 - 4908</td>
</tr>
<tr>
<td>Management Agent Port</td>
<td>3872</td>
</tr>
<tr>
<td>Management Repository Database Port</td>
<td>1521</td>
</tr>
<tr>
<td>Cloud Control Console HTTP Port</td>
<td>7788 - 7798</td>
</tr>
</tbody>
</table>
12.3 Firewall Configurations for Enterprise Management Components

Your main task in enabling Enterprise Manager to work in a firewall-protected environment is to take advantage of proxy servers whenever possible, to make sure only the necessary ports are open for secure communications, and to make sure that only data necessary for running your business is allowed to pass through the firewall.

Figure 12–1 provides a topology of an Enterprise Manager grid environment that is using a firewall, and also illustrates the default ports that can be used.

Table 12–1 (Cont.) Default Ports and Port Ranges for Enterprise Manager Components

<table>
<thead>
<tr>
<th>Port</th>
<th>Default Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Control Console HTTPS (SSL) Port</td>
<td>7799 - 7809</td>
</tr>
<tr>
<td>EM Domain WebLogic Admin Server HTTP Port</td>
<td>7001</td>
</tr>
<tr>
<td>EM Domain WebLogic Admin Server HTTPS (SSL) Port</td>
<td>7101 - 7200</td>
</tr>
<tr>
<td>Cloud Control Managed Server HTTP Port</td>
<td>7201 - 7300</td>
</tr>
<tr>
<td>Cloud Control Managed Server HTTPS (SSL) Port</td>
<td>7301 - 7400</td>
</tr>
<tr>
<td>WebLogic Node Manager HTTPS (SSL) Port</td>
<td>7401 - 7500</td>
</tr>
<tr>
<td>JVM Diagnostics Managed Server</td>
<td>3800</td>
</tr>
<tr>
<td>JVM Diagnostics Managed Server (SSL)</td>
<td>3801</td>
</tr>
<tr>
<td>Application Dependency and Performance RMI Registry Port</td>
<td>51099</td>
</tr>
<tr>
<td>Application Dependency and Performance Java Provider Port</td>
<td>5503</td>
</tr>
<tr>
<td>Application Dependency and Performance Remote Service Controller Port</td>
<td>55000</td>
</tr>
</tbody>
</table>
The conventions used in the preceding illustration are as follows:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Is the entity that is making the call.</td>
</tr>
<tr>
<td>*</td>
<td>Enterprise Manager will default to the first available port within an Enterprise Manager set range.</td>
</tr>
<tr>
<td>**</td>
<td>Enterprise Manager will default to the first available port.</td>
</tr>
<tr>
<td>***</td>
<td>Database listener ports.</td>
</tr>
</tbody>
</table>

Notes:
- The direction of the arrows specify the direction of ports.
- Port 1159, 4898-4989 indicates that 1159 is the default. If this port is not available, the Oracle Management Service will search in the specified range (4889 - 4897).
- To clone between two target hosts separated by a firewall, the agents will need to communicate to each other on the agent ports. The initiating Management Agent will make the call.

The following sections describe the ports and types of data required by Enterprise Manager in a secure, firewall-protected environment:

- **Firewalls Between Your Browser and the Cloud Control Console**
- **Configuring the Management Agent on a Host Protected by a Firewall**
- **Configuring the Oracle Management Service on a Host Protected by a Firewall**
- **Firewalls Between the Oracle Management Service and the Management Repository**
- **Firewalls Between Cloud Control and a Managed Database Target**
- **Firewalls Used with Multiple Oracle Management Services**
- **Configuring Firewalls to Allow ICMP and UDP Traffic for Beacons**

### 12.3.1 Firewalls Between Your Browser and the Cloud Control Console

Connections from your browser to the Cloud Control console are performed over the default port used for your Oracle HTTP Server.

For example, the default, non-secure port for the Oracle HTTP Server is usually port 7788. If you are accessing the Cloud Control console using the following URL and port, then you must configure the firewall to allow the Cloud Control console to receive HTTP traffic over port 7788:

http://omshost.example.com:7788/em

On the other hand, if you have enabled security for your Oracle HTTP Server, you are likely using the default secure port for the server, which is usually port 7799. If you are accessing the Cloud Control console using the following URL and port, then you must configure the firewall to allow the Cloud Control console to receive HTTPS traffic over port 7799:
12.3.2 Configuring the Management Agent on a Host Protected by a Firewall

If your Management Agent is installed on a host that is protected by a firewall and the Oracle Management Service is on the other side of the firewall, you must perform the following tasks:

- Configure the Management Agent to use a proxy server for its uploads to the Oracle Management Service.
- Configure the firewall to allow incoming HTTP traffic from the Oracle Management Service on the Management Agent port. Regardless of whether or not Enterprise Manager Framework Security has been enabled, the default port is 3872. Incoming traffic can be received only if the port corresponding to the Management Agent is open in the firewall.

12.3.2.1 Configuring the Management Agent to Use a Proxy Server

You can configure the Management Agent to use a proxy server for its communications with a Oracle Management Service outside the firewall, or to manage a target outside the firewall.

1. From the Setup menu, select Agents.
2. Click the Agent you want to configure in the Name column in the Management Agents table. The target home page for the Management Agent opens.
3. Select Properties from the Agent menu.
4. Select Advanced Properties from the pull down menu.
5. Supply the correct values for the proxyHost and proxyPort properties.
6. Click Apply to save your changes, which will be saved to the AGENT_HOME/sysman/config/emd.properties file.

Note: The proxy password will be obfuscated when you restart the Management Agent.

12.3.2.2 Configuring the Firewall to Allow Incoming Communication From the Oracle Management Service

While the Management Agents in your environment must upload data from your managed hosts to the Oracle Management Service, the Oracle Management Service must also communicate with the Management Agents. As a result, if the Management Agent is protected by a firewall, the Oracle Management Service must be able to contact the Management Agent through the firewall on the Management Agent port.

By default, the Enterprise Manager installation procedure assigns port 3872 to the Management Agent. However, if that port is occupied, the installation may assign an alternate port number.

After you determine the port number assigned to the Management Agent, you must then configure the firewall to allow incoming HTTP or HTTPS traffic (depending upon whether or not you have enabled Enterprise Manager Framework Security) on that port.

See Also: Your firewall documentation for more information about opening specific ports for HTTP or HTTPS traffic.
12.3.3 Configuring the Oracle Management Service on a Host Protected by a Firewall

If your Oracle Management Service is installed on a host that is protected by a firewall and the Management Agents that provide management data are on the other side of the firewall, you must perform the following tasks:

- Configure the Oracle Management Service to use a proxy server for its communications to the Management Agents.
- Configure the firewall to allow incoming HTTP traffic from the Management Agents on the Management Repository upload port.

If you have enabled Enterprise Manager Framework Security, the upload URL uses port 1159 by default. If this port is not available, Enterprise Manager will default to first available port in the range 4899-4908. If you have not enabled Enterprise Manager Framework Security, the upload port is the first available port in the range 4889 - 4897.

12.3.3.1 Configuring the Oracle Management Service to Use a Proxy Server to Communicate with Management Agents

This section describes how to configure the Oracle Management Service to use a proxy server for its communications with Management Agents outside the firewall.

To configure the Oracle Management Service to use a proxy server, do the following:

1. From the Setup menu, select Proxy Settings.
3. Supply the necessary HTTP or HTTPS property values for your configuration.
4. Click Apply to save your changes to the OMS_HOME/sysman/config/emd.properties file for the OMS instance.
5. After you have supplied your configuration, supply a Management Agent URL (or use the URL supplied by default) to test it.

12.3.3.2 Configuring the Firewall to Allow Incoming Management Data From the Management Agents

While the Management Agents in your environment must contact the Management Agents on your managed hosts, the Oracle Management Service must also be able to receive upload data from the Management Agents. If the Oracle Management Service is behind a firewall, you must configure the firewall to allow the Management Agents to upload data on the upload port.

By default, the Enterprise Manager installation procedure assigns port 4889 as the Repository upload port. However, if that port is occupied, the installation will assign an alternate port number.

In addition, when you enable Enterprise Manager Framework Security, the upload port is automatically changed to the secure 1159 HTTPS port.

Administrators can also change the upload port after the installation.

After you determine the port number assigned to the Oracle Management Service upload port, you must then configure the firewall to allow incoming HTTP or HTTPS traffic (depending upon whether or not you have enabled Enterprise Manager Framework Security) on that port.

See Also: Your firewall documentation for more information about opening specific ports for HTTP or HTTPS traffic
12.3.3 Enabling Oracle Management Service to Access My Oracle Support

Unless online access to the Internet is strictly forbidden in your environment, Oracle Management Service should be enabled to access My Oracle Support. This access is necessary to enable updates and patches to be downloaded, for example.

At minimum, the following URLs should be made available through the firewall:

- aru-akam.oracle.com
- ccr.oracle.com
- login.oracle.com
- support.oracle.com
- updates.oracle.com

12.3.3.4 About the dontProxyFor Property

When you configure the Oracle Management Service or a Management Agent to use a proxy server, it is important to understand the purpose of the `dontProxyFor` property, which identifies specific URL domains for which the proxy will not be used.

For example, suppose the following were true:

- You have installed the Oracle Management Service and several Management Agents on hosts that are inside the company firewall. These hosts are in the internal `.example.com` and `.example.us.com` domains.
- You have installed several additional Management Agents on hosts that are outside the firewall. These hosts are installed in the `.example.uk` domain.
- You have configured Enterprise Manager to automatically check for critical software patches on My Oracle Support.

In this scenario, you want the Oracle Management Service to connect directly to the Management Agents inside the firewall without using the proxy server. On the other hand, you want the Oracle Management Service to use the proxy server to contact the Management Agents outside the firewall, as well as the My Oracle Support site, which resides at the following URL:

http://support.oracle.com

The following properties will prevent the Oracle Management Service from using the proxy server for connections to the Management Agents inside the firewall. Connections to My Oracle Support and to Management Agents outside the firewall will be routed through the proxy server:

```
proxyHost=proxy42.example.com
proxyHost=80
dontProxyFor=.example.com, .example.us.com
```

12.3.4 Firewalls Between the Oracle Management Service and the Management Repository

Secure connections between the Management Service and the Management Repository are performed using features of Oracle Advanced Security. As a result, if the Management Service and the Management Repository are separated by a firewall, you must configure the firewall to allow Oracle Net firewall proxy access.
12.3.5 Firewalls Between Cloud Control and a Managed Database Target

When you are using the Cloud Control console to manage a database, you must log in to the database from the Cloud Control console in order to perform certain monitoring and administration tasks. If you are logging in to a database on the other side of a firewall, you will need to configure the firewall to allow Oracle Net firewall proxy access.

Specifically, to perform any administrative activities on the managed database, you must be sure that the firewall is configured to allow the Oracle Management Service to communicate with the database through the Oracle Listener port.

You can obtain the Listener port by reviewing the Listener home page in the Cloud Control console.

12.3.6 Firewalls Used with Multiple Oracle Management Services

Enterprise Manager supports the use of multiple Oracle Management Services that communicate with a common Management Repository. For example, using more than one Oracle Management Service can be helpful for load balancing as you expand your central management capabilities across a growing e-business enterprise.

When you deploy multiple Oracle Management Services in an environment protected by firewalls, be sure to consider the following:

- Each Management Agent is configured to upload data to one Oracle Management Service. As a result, if there is a firewall between the Management Agent and its Oracle Management Service, you must configure the firewall to allow the Management Agent to upload data to the Management Service using the upload URL.

  See Also: Section 12.3.2, "Configuring the Management Agent on a Host Protected by a Firewall"

  Section 12.3.3, "Configuring the Oracle Management Service on a Host Protected by a Firewall"

- In addition, each Oracle Management Service must be able to contact any Management Agent in your enterprise so it can check for the availability of the Management Agent. As a result, you must be sure that your firewall is configured so that each Oracle Management Service you deploy can communicate over HTTP or HTTPS with any Management Agent in your enterprise.

  Otherwise, a Oracle Management Service without access to a particular Management Agent may report incorrect information about whether or not the Management Agent is up and running.

  See Also: "About Availability" in the Enterprise Manager online Help for information about how Enterprise Manager determines host and Management Agent availability

12.3.7 Configuring Firewalls to Allow ICMP and UDP Traffic for Beacons

Oracle Beacons provide application performance availability and performance monitoring. They are part of the Service Level Management features of Enterprise Manager.

  See Also: "About Service Level Management" in the Enterprise Manager Online Help
Enterprise Manager uses the industry-standard Internet Control Message Protocol (ICMP) and User Datagram Protocol (UDP) to transfer data between Beacon and the network components you are monitoring. There may be situations where your Web application components and the Beacons you use to monitor those components are separated by a firewall. In those cases, you must configure your firewall to allow ICMP, UDP and HTTP traffic.
Sizing Your Enterprise Manager Deployment

Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1 has the ability to scale for hundreds of users and thousands of systems and services on a single Enterprise Manager implementation.

This chapter describes techniques for achieving optimal performance using the Oracle Enterprise Manager application. It can also help you with capacity planning, sizing and maximizing Enterprise Manager performance in a large scale environment. By maintaining routine housekeeping and monitoring performance regularly, you insure that you will have the required data to make accurate foreccasts of future sizing requirements. Receiving good baseline values for the Enterprise Manager Cloud Control vital signs and setting reasonable warning and critical thresholds on baselines allows Enterprise Manager to monitor itself for you.

This chapter contains the following sections:
- Overview of Oracle Enterprise Manager Cloud Control Architecture
- Enterprise Manager Cloud Control Sizing
- Enterprise Manager Cloud Control Performance Methodology
- Overview of Repository and Sizing Requirements for Fusion Middleware Monitoring

13.1 Overview of Oracle Enterprise Manager Cloud Control Architecture

The architecture for Oracle Enterprise Manager Cloud Control exemplifies two key concepts in application performance tuning: distribution and parallelization of processing. Each component of Cloud Control can be configured to apply both these concepts.

The components of Enterprise Manager Cloud Control include:
- The Management Agent - A process that is deployed on each monitored host and that is responsible for monitoring all services and components on the host. The Management Agent is also responsible for communicating that information to the middle-tier Management Service and for managing and maintaining the system and its services.
- The Management Service - A J2EE Web application that renders the user interface for the Cloud Control console, works with all Management Agents to process monitoring and jobs information, and uses the Management Repository as its data store.
The Management Repository - The schema is an Oracle Database that contains all available information about administrators, services, and applications managed within Enterprise Manager.

For more information about the Cloud Control architecture, see the Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1 documentation:

- Oracle Enterprise Manager Grid Control Installation and Basic Configuration
- Oracle Enterprise Manager Concepts

The Oracle Enterprise Manager 12c documentation is available at the following location on the Oracle Technology Network (OTN):

http://otn.oracle.com/documentation/oem.html

13.2 Enterprise Manager Cloud Control Sizing

Oracle Enterprise Manager provides a highly available and scalable deployment topology. This chapter lays out the basic minimum sizing and tuning recommendations for initial capacity planning for your Oracle Enterprise Manager deployment. This chapter assumes a basic understanding of Oracle Enterprise Manager components and systems. A complete description of Oracle Enterprise Manager can be obtained from http://docs.oracle.com/cd/E24628_01/doc.121/e25353/overview.htm.

This information is a starting point for site sizing. Every site has its own characteristics and should be monitored and tuned as needed.

Sizing is a critical factor for Enterprise Manager performance. Inadequately sized Enterprise Manager deployments will result in frustrated users and the overall benefits of Enterprise Manager may be compromised. The resources required for Enterprise Manager OMS and Repository tiers will vary significantly based on the number of monitored targets. While there are many additional aspects to be considered when sizing Enterprise Manager infrastructure, the following guidelines provide a simple methodology that can be followed to determine the minimum required hardware resources and initial configuration settings for the OMS and Repository tiers.

13.2.1 Overview of Sizing Guidelines

The following sections provide an overview of the sizing guidelines.

13.2.1.1 Hardware Information

The sizing guidelines outlined in this chapter were obtained by running a virtual environment on the following hardware and operating system combination.

- Hardware -- Oracle's Sun Fire X4170 M2
- Hypervisor -- 64 bit Linux Oracle Virtual Server
- Operating System of Virtual Machines -- 64 bit Oracle Enterprise Linux

The virtual environment setup had a one to one mapping of CPUs between the Oracle Virtual Server (OVS) host and the virtual machines running on it. The OVS servers had enough RAM to support all virtual machines without memory swapping.

This information is based on a 64 bit Oracle Enterprise Linux environment. If you are running on other platforms, you will need to convert the sizing information based on similar hardware performance. This conversion should be based on single-thread performance. Running on a machine with 24 slow cores is not equivalent to running
on a machine with 12 fast cores even though the total machine performance might be
the same on a throughput benchmark. Single thread performance is critical for good
Enterprise Manager user interface response times.

13.2.1.2 Sizing Specifications
The sizing guidelines for Oracle Enterprise Manager are divided into three sizes:
Small, Medium and Large. The definitions of each size are shown in Table 13–1.

Table 13–1 Oracle Enterprise Manager Site Sizes

<table>
<thead>
<tr>
<th>Size</th>
<th>Agent Count</th>
<th>Target Count</th>
<th>Concurrent User Sessions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>&lt; 100</td>
<td>&lt; 1000</td>
<td>&lt;10</td>
</tr>
<tr>
<td>Medium</td>
<td>&gt;= 100, &lt; 1000</td>
<td>&gt;= 1000, &lt; 10,000</td>
<td>&gt;= 10, &lt; 25</td>
</tr>
<tr>
<td>Large</td>
<td>&gt;= 1000</td>
<td>&gt;= 10,000</td>
<td>&gt;= 25, &lt;= 50*</td>
</tr>
</tbody>
</table>

For larger user loads see Section 13.2.3.1, "Large Concurrent UI Load".

13.2.1.3 Sizing for Upgraded Installs
For upgraded installs the following queries can be run as the sysman user to obtain the
Management Agent and target counts for use in Table 1.

- Agent count - select count(*) from mgmt_targets where target_type = ‘oracle_emd’
- Target count – select count(*) from mgmt_targets where target_type != ‘oracle_emd’

13.2.1.4 Minimum Hardware Requirements
Table 13–2 lists the minimum hardware requirements for the three configurations.

Table 13–2 Oracle Enterprise Manager Minimum Hardware Requirements

<table>
<thead>
<tr>
<th>Size</th>
<th>OMS Machine Count*</th>

<td>16</td>
<td>2 (RAC)</td>
<td>8</td>
<td>16</td>
</tr>
</tbody>
</table>

*The OMS and database instances are not co-located

13.2.1.5 Network Topology Considerations
A critical consideration when deploying Enterprise Manager Cloud Control is network
performance between tiers. Enterprise Manager Cloud Control ensures tolerance of
network glitches, failures, and outages between application tiers through error
tolerance and recovery. The Management Agent in particular is able to handle a less
performant or reliable network link to the Management Service without severe impact
to the performance of Enterprise Manager as a whole. The scope of the impact, as far
as a single Management Agent’s data being delayed due to network issues, is not
likely to be noticed at the Enterprise Manager Cloud Control system wide level.

The impact of slightly higher network latencies between the Management Service and
Management Repository will be substantial, however. Implementations of Enterprise
Manager Cloud Control have experienced significant performance issues when the network link between the Management Service and Management Repository is not of sufficient quality.

The Management Service host and Repository host should be located in close proximity to each other. Ideally, the round trip network latency between the two should be less than 1 millisecond.

13.2.2 Software Configurations

The following sections provide information about small, medium and large configurations.

13.2.2.1 Small Configuration

The Small configuration is based on the minimum requirements that are required by the Oracle Enterprise Manager installer.

Minimum OMS Settings

No additional settings are required.

Minimum Database Settings

Table 13–3 lists the minimum recommended database settings.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Minimum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>processes</td>
<td>300</td>
</tr>
<tr>
<td>pga_aggregate_target*</td>
<td>1024M</td>
</tr>
<tr>
<td>sga_target*</td>
<td>2G</td>
</tr>
<tr>
<td>redo log file size</td>
<td>300M</td>
</tr>
<tr>
<td>shared_pool_size</td>
<td>600M</td>
</tr>
</tbody>
</table>

*memory_target of 3GB can be used in place of sga_target and pga_aggregate_target

13.2.2.2 Medium Configuration

The Medium configuration modifies several out-of-box Oracle Enterprise Manager settings.

Minimum OMS Settings

The Oracle Management Service (OMS) heap size should be set to 4096m.

Minimum Repository Database Settings

Table 13–4 lists the minimum repository database settings that are recommended for a Medium configuration.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Minimum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>processes</td>
<td>600</td>
</tr>
<tr>
<td>pga_aggregate_target*</td>
<td>1280M</td>
</tr>
</tbody>
</table>

*memory_target of 5.25GB can be used in place of sga_target and pga_aggregate_target
13.2.2.3 Large Configuration

The Large configuration modifies several out-of-box Oracle Enterprise Manager settings.

Minimum OMS Settings

Table 13–5 lists the minimum OMS settings that are recommended for Large configurations.

<table>
<thead>
<tr>
<th>OMS Count</th>
<th>Heap Size Minimum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>8192M</td>
</tr>
<tr>
<td>4</td>
<td>4096M</td>
</tr>
</tbody>
</table>

Minimum Repository Database Settings

Table 13–6 lists the minimum repository database settings that are recommended for a Large configuration.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Minimum Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>sga_target*</td>
<td>4G</td>
</tr>
<tr>
<td>redo log file size</td>
<td>600M</td>
</tr>
<tr>
<td>shared_pool_size</td>
<td>600M</td>
</tr>
</tbody>
</table>

*memory_target of 5.25GB can be used in place of sga_target and pga_aggregate_target

13.2.2.4 Repository Tablespace Sizing

Table 13–7 lists the required minimum storage requirements for the Management Repository.
13.2.3 Additional Configurations

Some Enterprise Manager installations may need additional tuning settings based on larger individual system loads. Additional settings are listed below.

### 13.2.3.1 Large Concurrent UI Load

If more than 50 concurrent users are expected per OMS, the following settings should be altered as seen in Table 13–8.

<table>
<thead>
<tr>
<th>Process</th>
<th>Parameter</th>
<th>Value</th>
<th>Where To Set</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMS</td>
<td>-Djbo.recyclethreshold</td>
<td>Number of concurrent users / number of OMS</td>
<td>Per OMS</td>
</tr>
<tr>
<td>OMS</td>
<td>-Djbo.ampool.maxavailablesize</td>
<td>Number of concurrent users / number of OMS</td>
<td>Per OMS</td>
</tr>
<tr>
<td>OMS</td>
<td>Heap Size</td>
<td>Additional 4GB for every increment of 50 users</td>
<td>Per OMS</td>
</tr>
<tr>
<td>Database</td>
<td>sga_target</td>
<td>Additional 1GB for every increment of 50 users</td>
<td>Per Instance</td>
</tr>
</tbody>
</table>

Higher user loads will require more hardware capacity. An additional 2 cores for both the database and OMS hosts for every 50 concurrent users.

Example: A site with 1500 agents and 15,000 targets with 150 concurrent users would require at a minimum the setting modifications listed in Table 13–9 (based on a LARGE 2 OMS configuration).

<table>
<thead>
<tr>
<th>Process</th>
<th>Parameter</th>
<th>Value</th>
<th>Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMS</td>
<td>-Djbo.recyclethreshold</td>
<td>75 (set on each OMS)</td>
<td>150 users / 2 OMS</td>
</tr>
</tbody>
</table>
Minimum Additional Hardware required is listed in Table 13–10.

**Table 13–10 Large Concurrent UI Load Minimum Additional Hardware Example For 2 OMS Configurations**

<table>
<thead>
<tr>
<th>Tier</th>
<th>Parameter</th>
<th>Value</th>
<th>Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>OMS</td>
<td>-Djbo.ampool.maxavailables ize</td>
<td>75 (set on each OMS)</td>
<td>150 users / 2 OMS</td>
</tr>
<tr>
<td>OMS</td>
<td>Heap Size</td>
<td>12GB (set on each OMS)</td>
<td>8GB (standard large setting) + ((150 users – 50 default large user load) / 2 OMS)* (4GB / 50 users)</td>
</tr>
<tr>
<td>Database</td>
<td>sga_target</td>
<td>8GB</td>
<td>6GB (standard large setting) + (150 users - 50 default large user load) * (1GB / 50 users)</td>
</tr>
</tbody>
</table>

The physical memory of each machine would have to be increased to support running this configuration as well.

**13.2.3.2 BI Publisher Configuration**

If you plan on integrating BI Publisher version 11.1.1.5 with Enterprise Manager Release 12c Cloud Control, which is required for BI Publisher reports to function, add 1.5 GB to the host memory requirements stated above.

**13.3 Enterprise Manager Cloud Control Performance Methodology**

An accurate predictor of capacity at scale is the actual metric trend information from each individual Enterprise Manager Cloud Control deployment. This information, combined with an established, rough, starting host system size and iterative tuning and maintenance, produces the most effective means of predicting capacity for your Enterprise Manager Cloud Control deployment. It also assists in keeping your deployment performing at an optimal level.

Here are the steps to follow to enact the Enterprise Manager Cloud Control sizing methodology:

1. If you have not already installed Enterprise Manager Cloud Control, choose a rough starting host configuration as listed in Table 13–1.
2. Periodically evaluate your site’s vital signs (detailed later).
3. Eliminate bottlenecks using routine DBA/Enterprise Manager administration housekeeping.

4. Eliminate bottlenecks using tuning.

5. Extrapolate linearly into the future to plan for future sizing requirements.

Step one need only be done once for a given deployment. Steps two, three, and four must be done, regardless of whether you plan to grow your Enterprise Manager Cloud Control site, for the life of the deployment on a regular basis. These steps are essential to an efficient Enterprise Manager Cloud Control site regardless of its size or workload. You must complete steps two, three, and four before you continue on to step five. This is critical. Step five is only required if you intend to grow the deployment size in terms of monitored targets. However, evaluating these trends regularly can be helpful in evaluating any other changes to the deployment.

13.3.1 Step 1: Choosing a Starting Platform Cloud Control Deployment

For information about choosing a starting platform Cloud Control deployment, see Section 13.2.1, "Overview of Sizing Guidelines".

13.3.2 Step 2: Periodically Evaluating the Vital Signs of Your Site

This is the most important step of the five. Without some degree of monitoring and understanding of trends or dramatic changes in the vital signs of your Enterprise Manager Cloud Control site, you are placing site performance at serious risk. Every monitored target sends data to the Management Repository for loading and aggregation through its associated Management Agent. This adds up to a considerable volume of activity that requires the same level of management and maintenance as any other enterprise application.

Enterprise Manager has "vital signs" that reflect its health. These vital signs should be monitored for trends over time as well as against established baseline thresholds. You must establish realistic baselines for the vital signs when performance is acceptable. Once baselines are established, you can use built-in Oracle Enterprise Manager Cloud Control functionality to set baseline warning and critical thresholds. This allows you to be notified automatically when something significant changes on your Enterprise Manager site. The following table is a point-in-time snapshot of the Enterprise Manager Cloud Control vital signs for two sites:

<table>
<thead>
<tr>
<th>Module</th>
<th>Metrics</th>
<th>EM Site 1</th>
<th>EM Site 2</th>
</tr>
</thead>
<tbody>
<tr>

The two Enterprise Manager sites are at the opposite ends of the scale for performance.

EM Site 1 is performing very well with high loader rows/sec/thread and high rollup rows/sec. It also has a very low percentage of hours run for the loader and the rollup. The CPU utilization on both the OMS and Management Repository Server hosts are low. Most importantly, the UI Page Response times are excellent. To summarize, Site 1 is doing substantial work with minimal effort. This is how a well configured, tuned and maintained Oracle Enterprise Manager Cloud Control site should look.

Conversely, EM Site 2 is having difficulty. The loader and rollup are working hard and not moving many rows. Worst of all are the UI page response times. There is clearly a bottleneck on Site 2, possibly more than one.

The following table outlines metric guidelines for the different modules based on tests that were run with the configurations outlined. It can serve as a reference point for you to extrapolate information and data based on the metrics and test environment used in the specified environment.

</table>

The Metrics are collected for 5 hours after 2 OMS instances were started and each agent had 50 MB of upload backlog files.
These vital signs are all available from within the Enterprise Manager interface. Most values can be found on the All Metrics page for each host, or the All Metrics page for OMS. Keeping an eye on the trends over time for these vital signs, in addition to assigning thresholds for warning and critical alerts, allows you to maintain good performance and anticipate future resource needs. You should plan to monitor these vital signs as follows:

- Take a baseline measurement of the vital sign values seen in the previous table when the Enterprise Manager Cloud Control site is running well.
- Set reasonable thresholds and notifications based on these baseline values so you can be notified automatically if they deviate substantially. This may require some iteration to fine-tune the thresholds for your site. Receiving too many notifications is not useful.
- On a daily (or weekly at a minimum) basis, watch for trends in the 7-day graphs for these values. This will not only help you spot impending trouble, but it will also allow you to plan for future resource needs.

The next step provides some guidance of what to do when the vital sign values are not within established thresholds. Also, it explains how to maintain your site's performance through routine housekeeping.

### 13.3.3 Step 3: Using DBA and Enterprise Manager Tasks To Eliminate Bottlenecks

It is critical to note that routine housekeeping helps keep your Enterprise Manager Cloud Control site running well. The following are lists of housekeeping tasks and the interval on which they should be done.

#### 13.3.3.1 Offline Monthly Tasks

Enterprise Manager Administrators should monitor the database built-in Segment Advisor for recommendations on Enterprise Manager Repository segment health. The Segment Advisor advises administrators which segments need to be rebuilt/reorganized and provides the commands to do so.

For more information about Segment Advisor and issues related to system health, refer to notes 242736.1 and 314112.1 in the My Oracle Support Knowledge Base.
13.3.4 Step 4: Eliminating Bottlenecks Through Tuning

The most common causes of performance bottlenecks in the Enterprise Manager Cloud Control application are listed below (in order of most to least common):

1. Housekeeping that is not being done (far and away the biggest source of performance problems)
2. Hardware or software that is incorrectly configured
3. Hardware resource exhaustion

When the vital signs are routinely outside of an established threshold, or are trending that way over time, you must address two areas. First, you must ensure that all previously listed housekeeping is up to date. Secondly, you must address resource utilization of the Enterprise Manager Cloud Control application. The vital signs listed in the previous table reflect key points of resource utilization and throughput in Enterprise Manager Cloud Control. The following sections cover some of the key vital signs along with possible options for dealing with vital signs that have crossed thresholds established from baseline values.

13.3.4.1 High CPU Utilization

When you are asked to evaluate a site for performance and notice high CPU utilization, there are a few common steps you should follow to determine what resources are being used and where.

1. Use the Processes display on the Enterprise Manager Host home page to determine which processes are consuming the most CPU on any Management Service or Management Repository host that has crossed a CPU threshold.

2. Once you have established that Enterprise Manager is consuming the most CPU, use Enterprise Manager to identify what activity is the highest CPU consumer. Typically this manifests itself on a Management Repository host where most of the Management Service's work is performed. Here are a few typical spots to investigate when the Management Repository appears to be using too many resources.

   a. Click the CPU Used database resource listed on the Management Repository's Database Performance page to examine the SQL that is using the most CPU at the Management Repository.

   b. Check the Database Locks on the Management Repository's Database Performance page looking for any contention issues.

High CPU utilization is probably the most common symptom of any performance bottleneck. Typically, the Management Repository is the biggest consumer of CPU, which is where you should focus. A properly configured and maintained Management Repository host system that is not otherwise hardware resource constrained should average roughly 40 percent or less total CPU utilization. An OMS host system should average roughly 20 percent or less total CPU utilization. These relatively low average values should allow sufficient headroom for spikes in activity. Allowing for activity spikes helps keep your page performance more consistent over time. If your Enterprise Manager Cloud Control site interface pages happen to be responding well (approximately 3 seconds) while there is no significant (constant) loader backlog, and it is using more CPU than recommended, you may not have to address it unless you are concerned it is part of a larger upward trend.

The recommended path for tracking down the root cause of high Management Repository CPU utilization is captured under step 3.b above. This allows you to start at the Management Repository Performance page and work your way down to the
SQL that is consuming the most CPU in its processing. This approach has been used very successfully on several real world sites.

If you are running Enterprise Manager on Intel based hosts, the Enterprise Manager Cloud Control Management Service and Management Repository will both benefit from Hyper-Threading (HT) being enabled on the host or hosts on which they are deployed. HT is a function of certain late models of Intel processors, which allows the execution of some amount of CPU instructions in parallel. This gives the appearance of double the number of CPUs physically available on the system. Testing has proven that HT provides approximately 1.5 times the CPU processing power as the same system without HT enabled. This can significantly improve system performance. The Management Service and Management Repository both frequently have more than one process executing simultaneously, so they can benefit greatly from HT.

13.3.4.2 Loader Vital Signs

The vital signs for the loader indicate exactly how much data is continuously coming into the system from all the Enterprise Manager Agents. The most important items here are the percent of hour runs and rows/second/thread. The (Loader) % of hour run indicates whether the loader threads configured are able to keep pace with the incoming data volume. As this value approaches 100%, it becomes apparent that the loading process is failing to keep pace with the incoming data volume. The lower this value, the more efficiently your loader is running and the less resources it requires from the Management Service host. Adding more loader threads to the OMS can help reduce the percent of hour run for the loader.

Rows/Second/Thread is a precise measure of each loader thread’s throughput per second. The higher this number, the better. Rows/Second/Thread as high as 1200 have been observed on some smaller, well configured and maintained Enterprise Manager Cloud Control sites. If you have not increased the number of loader threads and this number is trending down, it may indicate a problem later. One way to overcome a decreasing rows/second/thread is to add more loader threads.

The number of Loader Threads is always set to one by default in the OMS configuration file. Each OMS can have a maximum of 10 loader threads. Adding loader threads to a OMS typically increases the overall host CPU utilization by 2% to 5% on a Enterprise Manager Cloud Control site with many Management Agents configured. Customers can change this value as their site requires. Most medium size and smaller configurations will never need more than one loader thread. Here is a simple guideline for adding loader threads:

Max total (across all OMS instances) loader threads = 2 X number of Management Repository host CPUs

There is a diminishing return when adding loader threads. You will not yield 100% capacity from the second, or higher, thread. There should be a positive benefit, however. As you add loader threads, you should see rows/second/thread decrease, but total rows/hour throughput should increase. If you are not seeing significant improvement in total rows/hour, and there is a constantly growing loader file backlog, it may not be worth the cost of the increase in loader threads. You should explore other tuning or housekeeping opportunities in this case.

To add more loader threads, you can change the following configuration parameter where n is a positive integer [1-10]:

```
em.loader.threadPoolSize=n
```

The default is 1 and any value other than [1-10] will result in the thread pool size defaulting to 1. This property file is located in the
The following two parameters are set for the Receiver module which receives files from agents.

1. **em.loader.maxDataRecvThreads=n (Default 75)**

   Where \( n \) is a positive integer and default value is 75. This is used to limit the maximum number of concurrent data file receiver threads. So at the peak time only 75 receiver threads will be receiving files and an extra request will be rejected with a \textit{Server Busy} error. These rejected requests will be resent by the agent after the default retry time.

   Care should be taken while setting this value as too high a value will put an increased load on the OMS machine and shared receiver directory box. If too low a value is set then data file receive throughput will be low.

2. **oracle.sysman.emRep.dbConn.maxConnForReceiver=n (Default 25)**

   Where \( n \) is a positive integer and default value is 25. This is used to set the maximum number of Repository Database connections for the receive threads. Oracle recommends you set this value equal to \textit{em.loader.maxDataRecvThreads}, as each Receiver thread gets one DB session and there will be no wait for DB connections.

### 13.3.4.3 Rollup Vital Signs

The rollup process is the aggregation mechanism for Enterprise Manager Cloud Control. The two vital signs for the rollup are the rows/second and \% of hour run. Due to the large volume of data rows processed by the rollup, it tends to be the largest consumer of Management Repository buffer cache space. Because of this, the rollup vital signs can be great indicators of the benefit of increasing buffer cache size.

Rollup rows/second shows exactly how many rows are being processed, or aggregated and stored, every second. This value is usually around 2,000 (+/- 500) rows per second on a site with a decent size buffer cache and reasonable speedy I/O. A downward trend over time for this value may indicate a future problem, but as long as \% of hour run is under 100 your site is probably fine.

If rollup \% of hour run is trending up (or is higher than your baseline), and you have not yet set the Management Repository buffer cache to its maximum, it may be advantageous to increase the buffer cache setting. Usually, if there is going to be a benefit from increasing buffer cache, you will see an overall improvement in resource utilization and throughput on the Management Repository host. The loader statistics will appear a little better. CPU utilization on the host will be reduced and I/O will decrease. The most telling improvement will be in the rollup statistics. There should be a noticeable improvement in both rollup rows/second and \% of hour run. If you do not see any improvement in any of these vital signs, you can revert the buffer cache to its previous size. The old Buffer Cache Hit Ratio metric can be misleading. It has been observed in testing that Buffer Cache Hit Ratio will appear high when the buffer cache is significantly undersized and Enterprise Manager Cloud Control performance is struggling because of it. There will be times when increasing buffer cache will not help improve performance for Cloud Control. This is typically due to resource constraints or contention elsewhere in the application. Consider using the steps listed in the High CPU Utilization section to identify the point of contention. Cloud Control also provides advice on buffer cache sizing from the database itself. This is available on the database Memory Parameters page.
One important thing to note when considering increasing buffer cache is that there may be operating system mechanisms that can help improve Enterprise Manager Cloud Control performance. One example of this is the "large memory" option available on Red Hat Linux. The Linux OS Red Hat Advanced Server™ 2.1 (RHAS) has a feature called big pages. In RHAS 2.1, bigpages is a boot up parameter that can be used to pre-allocate large shared memory segments. Use of this feature, in conjunction with a large Management Repository SGA, can significantly improve overall Cloud Control application performance. Starting in Red Hat Enterprise Linux™ 3, big pages functionality is replaced with a new feature called huge pages, which no longer requires a boot-up parameter.

13.3.4.4 Rollup Process
The Rollup process introduces the concept of rollup participating instance; where rollup processing will be distributed among all participating instances. To add a candidate instance to the participating EMROLLUP group, the parameter instance_groups should be set on the instance level as follows:

- Add EMROLLUP_1 to the instance_group parameter for node 1
- Add EMROLLUP_2 to the instance_group parameter for node 2
- Introduce the PQ and PW parallel processing modes where:
  - PQ is the parallel query/parallel dml mode. In this mode, each participating instance will have one worker utilizing the parallel degree specified.
  - PW is the parallel worker mode. In this mode, each participating instance will have a number of worker jobs equal to the parallel level specified
- Distribute the work load for all participating RAC instances as follows:
  - Each participating instance will be allocated equal number of targets. So for (n) number of participating instances with total workload (tl), each instance will be allocated (tl/n).
  - Each worker on any participating instance will be allocated equal number of targets of that instance workload. So for (il) number of targets per instance with (w) number of workers, each worker will be allocated (il/w).
  - For each worker, the load is further divided into batches to control the number of times the rollup SQL is executed. The number of rows per batch will be the total number of rows allocated for the worker divided by the number of batches.

Use the following recommendations as guidelines during the Rollup process:

- Use the parallel worker (PW) mode, and utilize the participating EMROLLUP_xx instance group.
- The recommendation is to use the parallel worker mode.
- Splitting the work among more workers will improve the performance and scalability until a certain point where the diminishing returns rule will apply. This is dependent on the number of CPUs available on each RAC node. In this test case, running with 10 workers was the optimal configuration, balancing the response time, machine CPU and IO utilization.
- It is important to set a proper batch size (10 recommended). The optimal run was the one with 10 batches, attributed to balancing the number of executions of the main SQL (calling EMD_1HOUR_ROLLUP) and the sort space needed for each individual execution.
Start by setting the number of batches to 10 bearing in mind the number of batches can be changed based on the data distribution.

The recommendations above will yield the following results. Using the multi-instance parallel worker (8 PW) mode (with the redesigned code described earlier) improves the performance by a factor of 9-13 when utilizing two participating RAC instances.

### 13.3.4.5 Job, Notification, and Alert Vital Signs

Jobs, notifications, and alerts are indicators of the processing efficiency of the Management Service(s) on your Enterprise Manager Cloud Control site. Any negative trends in these values are usually a symptom of contention elsewhere in the application. The best use of these values is to measure the benefit of running with more than one OMS. There is one job dispatcher in each OMS. Adding OMS instances will not always improve these values. In general, adding OMS instances will improve overall throughput for Cloud Control when the application is not otherwise experiencing resource contention issues. Job, Notification, and Alert vital signs can help measure that improvement.

### 13.3.4.6 I/O Vital Signs

Monitoring the I/O throughput of the different channels in your Enterprise Manager Cloud Control deployment is essential to ensuring good performance. At minimum, there are three different I/O channels on which you should have a baseline and alert thresholds defined:

- Disk I/O from the Management Repository instance to its data files
- Network I/O between the OMS and Management Repository
- RAC interconnect (network) I/O (on RAC systems only)

You should understand the potential peak and sustained throughput I/O capabilities for each of these channels. Based on these and the baseline values you establish, you can derive reasonable thresholds for warning and critical alerts on them in Cloud Control. You will then be notified automatically if you approach these thresholds on your site. Some Cloud Control site administrators can be unaware or mistaken about what these I/O channels can handle on their sites. This can lead to Enterprise Manager Cloud Control saturating these channels, which in turn cripples performance on the site. In such an unfortunate situation, you would see that many vital signs would be impacted negatively.
To discover whether the Management Repository is involved, you can use Cloud Control to check the Database Performance page. On the Performance page for the Management Repository, click the wait graph showing the largest amount of time spent. From this you can continue to drill down into the actual SQL code or sessions that are waiting. This should help you to understand where the bottleneck is originating.

Another area to check is unexpected I/O load from non-Enterprise Manager Cloud Control sources like backups, another application, or a possible data-mining co-worker who engages in complex SQL queries, multiple Cartesian products, and so on.

Total Repository I/O trouble can be caused by two factors. The first is a lack of regular housekeeping. Some of the Cloud Control segments can be very badly fragmented causing a severe I/O drain. Second, there can be some poorly tuned SQL statements consuming much of the site I/O bandwidth. These two main contributors can cause most of the Cloud Control vital signs to plummet. In addition, the lax housekeeping can cause the Management Repository’s allocated size to increase dramatically.

One important feature of which to take advantage is asynchronous I/O. Enabling asynchronous I/O can dramatically improve overall performance of the Cloud Control application. The Sun Solaris™ and Linux operating systems have this capability, but may be disabled by default. The Microsoft Windows™ operating system uses asynchronous I/O by default. Oracle strongly recommends enabling of this operating system feature on the Management Repository hosts and on Management Service hosts as well.

Automatic Storage Management (ASM) is recommended for Enterprise Manager Cloud Control repository database storage.

### 13.3.4.7 About the Oracle Enterprise Manager Performance Page

There may be occasions when Enterprise Manager user interface pages are slow in the absence of any other performance degradation. The typical cause for these slow downs will be an area of Enterprise Manager housekeeping that has been overlooked. The first line of monitoring for Enterprise Manager page performance is the use of Enterprise Manager Beacons. These functionalities are also useful for web applications other than Enterprise Manager.

Beacons are designed to be lightweight page performance monitoring targets. After defining a Beacon target on an Management Agent, you can then define UI performance transactions using the Beacon. These transactions are a series of UI page hits that you will manually walk through once. Thereafter, the Beacon will automatically repeat your UI transaction on a specified interval. Each time the Beacon transaction is run, Enterprise Manager will calculate its performance and store it for historical purposes. In addition, alerts can be generated when page performance degrades below thresholds you specify.

When you configure the Enterprise Manager Beacon, you begin with a single predefined transaction that monitors the home page you specify during this process. You can then add as many transactions as are appropriate. You can also set up additional Beacons from different points on your network against the same web application to measure the impact of WAN latency on application performance. This same functionality is available for all Web applications monitored by Enterprise Manager Cloud Control.

After you are alerted to a UI page that is performing poorly, you can then use the second line of page performance monitoring in Enterprise Manager Cloud Control. This new end-to-end (or E2E) monitoring functionality in Cloud Control is designed to
allow you to break down processing time of a page into its basic parts. This will allow
you to pinpoint when maintenance may be required to enhance page performance.
E2E monitoring in Cloud Control lets you break down both the client side processing
and the server side processing of a single page hit.

The next page down in the Middle Tier Performance section will break out the
processing time by tier for the page. By clicking the largest slice of the Processing Time
Breakdown pie chart, which is JDBC time above, you can get the SQL details. By
clicking the SQL statement, you break out the performance of its execution over time.

The JDBC page displays the SQL calls the system is spending most of its page time
executing. This SQL call could be an individual DML statement or a PL/SQL
procedure call. In the case of an individual SQL statement, you should examine the
segments (tables and their indexes) accessed by the statement to determine their
housekeeping (rebuild and reorg) needs. The PL/SQL procedure case is slightly more
involved because you must look at the procedure's source code in the Management
Repository to identify the tables and associated indexes accessed by the call.

Once you have identified the segments, you can then run the necessary rebuild and
reorganization statements for them with the OMS down. This should dramatically
improve page performance. There are cases where page performance will not be
helped by rebuild and reorganization alone, such as when excessive numbers of open
alerts, system errors, and metric errors exist. The only way to improve these calls is to
address (for example, clean up or remove) the numbers of these issues. After these
numbers are reduced, then the segment rebuild and reorganization should be
completed to optimize performance. These scenarios are covered in Section 13.3.3. If
you stay current, you should not need to analyze UI page performance as often, if at
all.

13.3.4.8 Determining the Optimum Number of Middle Tier OMS Servers

Determining the optimum number of middle tier OMS servers is not a trivial task. A
number of data points must be considered for an informed, justified and acceptable
decision for introducing additional OMS instances. The number of monitored targets
is one of the first considerations, but its weight in decision making is normally not
substantial.

The following items should be considered and examined as part of this exercise:

- The volume of job automation and scheduling used
- The number of administrators working simultaneously in the console
- Network bandwidth and data channel robustness from agents to the OMS servers
- Number of triggered violations and notifications
- Speed and stability of the IO system the OMS servers use

Careful investigation of each category is essential to making an informed decision. In
some cases, just adding an OMS server or providing more CPU or memory to the same
host may not make any difference in performance enhancement. You can use the
current running OMS instances to collect accurate statistics on current OMS
performance to calculate the number of required OMS servers for current or future
deployments. Enterprise Manager has "vital signs" that reflect its health. These vital
signs should be monitored for trends over time as well as against established baseline
thresholds.
13.3.5 Step 5: Extrapolating Linearly Into the Future for Sizing Requirements

Determining future storage requirements is an excellent example of effectively using vital sign trends. You can use two built-in Cloud Control charts to forecast this: the total number of targets over time and the Management Repository size over time.

Both of the graphs are available on the All Metrics page for the Management Service. It should be obvious that there is a correlation between the two graphs. A straight line applied to both curves would reveal a fairly similar growth rate. After a target is added to Enterprise Manager Cloud Control for monitoring, there is a 31-day period where Management Repository growth will be seen because most of the data that will consume Management Repository space for a target requires approximately 31 days to be fully represented in the Management Repository. A small amount of growth will continue for that target for the next year because that is the longest default data retention time at the highest level of data aggregation. This should be negligible compared with the growth over the first 31 days.

When you stop adding targets, the graphs will level off in about 31 days. When the graphs level off, you should see a correlation between the number of targets added and the amount of additional space used in the Management Repository. Tracking these values from early on in your Enterprise Manager Cloud Control deployment process helps you to manage your site's storage capacity proactively. This history is an invaluable tool.

The same type of correlation can be made between CPU utilization and total targets to determine those requirements. There is a more immediate leveling off of CPU utilization as targets are added. There should be no significant increase in CPU cost over time after adding the targets beyond the relatively immediate increase. Introducing new monitoring to existing targets, whether new metrics or increased collections, would most likely lead to increased CPU utilization.

13.3.6 Using Returning Query Safeguards to Improve Performance

On the All Targets page, Enterprise Manager uses a safeguard that prevents a flood of data from slowing performance and consuming excessive resources within the OMS by limiting the number of rows that can be returned from a query. By default, the limit is set to 2000, but an Enterprise Manager administrator can modify the limit with the following command:

```
emctl set property -name oracle.sysman.emSDK.eml.maxRows -value 2000
```

Providing a value equal to 0 will turn off the safeguard and fetch all rows. The new value takes immediate effect; no OMS restart is required. If the value is less than 0, the default value (2000) will be used instead. The only way to indicate that no limiting should be performed is to set the value to exactly 0.

When there are too many results returned from a query and this limit comes into effect, the following message appears under the results table:

"This table of search results is limited to 2000 targets. Narrow the results by using Refine Search or Search Target Name. See the tuning guide for how to modify this limit."

Similar behaviors (and messages) are applied to other large tables throughout Enterprise Manager. The same OMS property (oracle.sysman.emSDK.eml.maxRows) controls the maximum limit for all of them together. This matches the behavior (and reuses the existing property) from previous Enterprise Manager releases.
13.4 Overview of Repository and Sizing Requirements for Fusion Middleware Monitoring

A Fusion Middleware target is like any other Enterprise Manager target. Therefore any repository or sizing guideline that is applicable for an Enterprise Manager target would be applicable on a Fusion Middleware target.

One major concern in the case of Fusion Middleware discovery is that too many targets may be discovered, created and monitored. This adds additional load on the OMS instance, repository and agent. In the case of very large number of targets, after target discovery Oracle recommends that users should review all the targets and their respective metrics.

Based on requirements, users should finalize which targets and metrics should be monitored and the required frequency those targets should be monitored.

After discovery, Oracle recommends you allow Fusion Middleware/ADP/JVMD monitoring to run for some duration (a few days to possibly a few weeks) and continuously monitor the database size and Operating System file system growth (in the case of ADP; ADP Manager requires a minimum of 10GB of disk space) until it becomes constant. You can then fine tune various parameters associated with these different features.

In version 12c of Enterprise Manager, both ADP and JVMD use Enterprise Manager repository as their repository. Their data are stored in the MGMT_AD4J_TS tablespace.

13.4.1 ADP Monitoring

Use the following information when utilizing ADP Monitoring.

- ADP Manager Resources Requirement

  While managing 70K managed entities, if the number of managed entities is high you must allocate resources accordingly.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Minimum Disk Space</td>
<td>10 GB</td>
</tr>
</tbody>
</table>

- ADP Data requirement

  To monitor each entity per JVM, the MGMT_AD4J_TS tablespace must have 8 MB available.

- ADP Data Retention Policy

  ADP maintains sophisticated multi-tiered logic for aggregation (or compression) of performance data. This helps to optimize performance of interaction with the internal data repository both when querying data for presentation or inserting new performance metrics.

  Users who want to store longer term data should look for this section in Acsera.properties:

Example 13–1

```
# Production setting
```

Sizing Your Enterprise Manager Deployment  13-21
# NOTE: use Model.GlobalSamplingRateSecs to configure Metric.Grain.0

Metric.Grain.0 0s
Metric.TableInterval.0 = 4h
Metric.DataLife.0 = 2d

Metric.Grain.1 = 3m
Metric.TableInterval.1 = 1d
Metric.DataLife.1 = 8d

#Metric.Grain.2 = 30m
#Metric.TableInterval.2 = 7d
#Metric.DataLife.2 = 420d

Uncomment the last 3 lines for the Metric.*.2 properties.

13.4.2 JVMD Monitoring

Use the following information when employing JVMD Monitoring.

- **JVMD Manager Resources Requirement**
  
  To manage 200-300 jvms, JVMD manager requires physical memory of 1 GB. 
  JVMD manager caches monitoring data in the TEMP space for each pool and 
  flushes to the database frequently. Usually, depending on the number of pools 
  the manager is monitoring and the amount of data being gathered from each pool, 
  the size requirement of these temporary cache files varies, but it is rare to see more 
  than a few MBs for each pool. If this is a concern, the TEMP space should 
  be allocated accordingly.

- **JVMD Data requirement**
  
  To monitor every JVM with OOB settings, the MGMT_AD4J_TS tablespace must 
  have 50-100MB available.

- **JVM Diagnostics Historical Data and its Retention policy**
  
  Historical data is available at three summary levels 0, 1 and 2.
  
  - Summary level 0 - is raw sample data taken at the specified pool polling 
    interval (default 2 seconds). If you look at data within one hour on the 
    Performance Diagnostics page, it shows summary level 0 data. Level 0 data is 
    retained for 24 hours and subsequently purged. It can be changed via the 
    Console Setup page, but before increasing the value, you should ensure that 
    the repository is tuned properly to handle such large amounts of data.
  
  - Summary level 1 - is aggregated data. If you view data after more than one 
    hour but less than 5 hours, it is summary level 1 data. The default aggregation 
    interval is 90 seconds. This value can be changed via the Console Setup page. 
    Level 1 data is retained for 20 days and subsequently purged.
  
  - Summary level 2 - is further aggregated data. If you view data more than five 
    hours old, it is summary level 2 data. This data is aggregated every 60 
    minutes. Level 2 data is retained for 400 days and subsequently purged.

  There are two JVMD features that can drastically affect MGMT_AD4J_TS tablespace 
  usage:

  - **JVMD Heap Dumps**
    
    Analyzing heap requires massive tablespace resources. Oracle recommends 
    having 5 times the size of the heap dump file you are loading free in your
tablespace. Since you will have the heap dump file and know its size before you run the load script, you should ensure that you have adequate space to accommodate the dump before you load it into your database.

- **Thread Traces**

  While these are smaller than heaps by an order of magnitude, these are loaded into the database automatically by default when you initiate a trace at the console. The size of these traces can vary dramatically depending on the number of active threads during the trace, the duration of the trace, and the sample interval of the trace. They should generally be under 100MB each, but a user utilizing a large number of these could manually fill up the database quickly. Again, since these are created only by manual intervention, you should ensure that there is adequate space to accommodate traces before initiating them.
This chapter describes how you can install Application Dependency and Performance (ADP) in the Enterprise Manager Cloud Control environment.

In particular, this chapter covers the following:

- Application Dependency and Performance Architecture
- Before you Begin
- Prerequisites
- Installation Procedure
- After You Install

### 14.1 Application Dependency and Performance Architecture

Application Dependency and Performance (ADP) is one of the critical functionalities in Enterprise Manager Cloud Control that allows you to analyze Java EE, SOA, and Portal applications. It captures the complex relationships among various application building blocks in its application schema model - the core of the Oracle intelligent platform. To manage these applications effectively, enterprises must first gain an understanding of the complex relationships among the business functions, associated interconnected components, and the underlying runtime environments. To enable clear and accurate understanding, IT organizations need holistic, service-oriented views that span across heterogeneous environments.

Using the insights stored in Application Schema, ADP is able to deliver an Application Service Management (ASM) environment that self-customizes out-of-the-box, evolves with change, minimizes expert involvement, and delivers a holistic, service-oriented view across heterogeneous environments.

ADP employs a multi-tier, fully distributed, configurable architecture to provide the scalability and flexibility to meet the changing needs of enterprise deployments.
Figure 14–1  ADP Architecture

ADP Manager is the core analytical engine of the ADP ASM system. In real-time, ADP Manager performs complex mathematical modeling and statistical calculations with summarized data from all ADP Java Agents. ADP Manager can be configured with a backup to provide higher level of availability.

ADP Java Agents are the data collectors of the ADP ASM system. ADP Java Agents are deployed to all managed application servers to perform a series of tasks including collecting performance managements, tracking contextual relationships, and summarizing data in real-time while introducing as little overhead as possible.

14.2 Before you Begin

Before installing an ADP Manager, or an ADP Agent, review the points outlined in the Basic Install Guide.

14.3 Prerequisites

Before installing an ADP Manager, or an ADP agent, ensure that you meet the prerequisites described in the Basic Install Guide.
14.4 Installation Procedure

This section describes the following:

- Deploying ADP Manager on a Previously Created Managed Server
- Deploying ADP Agents (Remote Deployment)

14.4.1 Deploying ADP Manager on a Previously Created Managed Server

To deploy ADP Manager on a previously created managed server, you must log in with `SYSMAN` account (a default Super Administrators account that is installed with Enterprise Manager).

This section contains the following topics:

- Deploying ADP Manager on an OMS Host
- Deploying ADP Manager on a Separate Host from OMS (Remote Deployment)

14.4.1.1 Deploying ADP Manager on an OMS Host

To deploy ADP Manager on a previously created managed server running on an OMS host, perform the following steps:

1. In Cloud Control, from the Setup menu, select Middleware Diagnostics.
2. On the Middleware Diagnostics page, click Deploy ADP Manager.

The ADP Manager deployment page appears.

3. To deploy ADP Manager on an existing managed server, select Deploy on an existing managed server.

Perform the following steps

a. From the Managed Server menu, select the WebLogic Managed Server on which you want to deploy the ADP Manager application. Ensure that you select managed server with the name `EMGC_ADPMANAGER*` to deploy the ADP manager application.

   For example, `EMGC_ADPMANAGER1`, `EMGC_ADPMANAGER2`, and so on.

b. The Port numbers for ADP Manager Registry Port, ADP Manager Java Provider Port, and ADP Manager Controller Port are populated with the default values 51099, 55003, and 55000 respectively. You can change these values by entering custom value if required.

**Note:** An ADP Manager can only be deployed on a managed server that is part of the EMGC domain.
4. Depending on the host selected in the previous step, you are prompted for the credentials. The following cases are possible:

- If you select the same host (`EMGC_OMS1`) where the Administration Server is running, then you must enter the **Oracle WebLogic Administration Server Host Credentials** and **Oracle WebLogic Domain Credentials**.

- If you select a host (`EMGC_OMS2`) different from the Administration Server to deploy ADP Manager, then in addition to **Oracle WebLogic Administration Server Host Credentials** and **Oracle WebLogic Server Domain Credentials**, you must provide **Oracle WebLogic Managed Server Host Credentials**.

Where,

Oracle WebLogic Administration Server Host Credentials are credentials for the host where the WebLogic Administration Server is running.

Oracle WebLogic Server Domain Credentials are credentials of the WebLogic domain for Enterprise Manager Cloud Control.

Oracle WebLogic Managed Server Host Credentials are the credentials of the host machine where the managed server is running.

5. Click **Deploy** to submit the job.

The ADP Deployment Status Page appears with a link to the job status page, click the link to see the status of the job that you submitted.

14.4.1.2 Deploying ADP Manager on a Separate Host from OMS (Remote Deployment)

To deploy ADP Manager on a separate host from OMS (remote deployment), you must perform the following tasks:

- **Prerequisites**
- **Installation Procedure**

**Prerequisites**

Before deploying ADP Manager on a separate host from OMS (remote deployment), perform the following steps:

---

**Note:** This section will use the following convention:

- `host-a` is the host where the OMS server is running
- `host-b` is the remote host which means that there is no OMS running on the host machine.

---

1. Install a Management Agent on `host-b` (remote host)

For information about installing a Management Agent, see *Basic Install Guide*.

2. Install WebLogic Server on `host-b` using Enterprise Manager Software Only installation option.

For information about performing a software only install, see

These WebLogic Server bits must be registered with the Enterprise Manager Domain running on `host-a`, so that all the managed servers appear under the same WebLogic Domain.
### Installation Procedure

---

**Note:** For a successful installation, all managed servers running on different hosts in a WebLogic Domain must have the same version and patch level.

---

3. Configure a new managed server (ADPRemoteServer) using the WebLogic Server Administration Console as follows:

   a. Log into the Enterprise Manager WebLogic Domain console (EMGC_DOMAIN) of host-a.
      
      The WebLogic Server Administration Console home page appears.

   b. In Weblogic Server Administration Console, from the Domain Structure section, select Environment and then click **Servers**.

   c. On the Create a New Server page, enter the Server Name, Server Listen Address, and Server Listen port.

   **Note:** Ensure that the Server Listen Address corresponds to the listen address of the remote host, and the Server Listen port is free on the remote host.

---

4. Configure a new machine using the WebLogic Server Administration Console as follows:

   a. Log into the Enterprise Manager WebLogic Domain console (EMGC_DOMAIN) of host-a.
      
      The WebLogic Server Administration Console home page appears.

   b. In WebLogic Server Administration Console, from the Domain Structure section, select Environment and click **Machines**.

   c. To associate this machine with the nodemanager running on host-b, associate this machine with the nodemanager running on host-b, enter the **Listen Address** of the remote host, and the node manager port number which is 5556 by default.
      
      This node manager primarily controls the start and stop of a remote host.

   d. Click **Finish** to create the machine.

---

5. Select the new created machine, and click on **Servers** to add the managed server (ADPRemoteServer) to this machine. This step associates the machine with the nodemanager running on host-b.

6. To extend the WebLogic Domain, a template of the Enterprise Manager Cloud Control domain running on host-a is created using the following command:

   ```bash
   ./pack.sh - domain = $DOMAIN_HOME -template = <absolute_path_to_the_new_weblogic_template> - template_name="My WebLogic Domain" -managed={true}
   ```

   Where:

   - `$DOMAIN_HOME` is the location of EMGC domain on host-a.

   - `<absolute_path_to_the_new_weblogic_template>` is the location where you want to create the template.
7. Copy emgcdomain.jar from host-a (where the OMS is running) to host-b (remote host).

8. Run the following command to unpack emgcdomain.jar template on host-b:

```bash
./unpack.sh -domain = $DOMAIN_HOME -template= <absolute_path_to_domain_template_created>
```

Where:

- $DOMAIN_HOME is the domain location of EMGC on host-b (remote host)
- `<absolute_path_to_domain_template_created>` is the location of the template on host-b where emgcdomain.jar template is present.

9. To enroll the WebLogic Domain with node manager, perform the following steps on host-b:
   a. Run the following command to update the node manager properties file so that it can start monitoring the remote host:

   ```bash
   $WEBLOGIC_HOME/common/bin/wlst.sh nmEnroll($DOMAIN_HOME)
   ```

   b. Start the Node Manager as follows:

   ```bash
   $WEBLOGIC_HOME/bin/startNodeManager.sh
   ```

   c. Perform the following steps to modify startWebLogic.sh:
      a. Navigate to the following location:
         - On Unix: `$DOMAN_HOME/bin/startWebLogic.sh`
         - On Windows: `$DOMAN_HOME/bin/startWebLogic.cmd`
      b. Set maximum heap size (`-Xmx`) to 1.7GB for 64 bit systems and set maximum permanent generation (`-XX:MaxPermSize`) to 768M for 64 bit systems as follows:

         ```bash
         USER_MEM_ARGS="-Xms256m -Xmx1740m -XX:MaxPermSize=768m"
         ```
      c. Set max heap size to 1.4GB for 32 bit systems and set maximum permanent generation to 512M for 32 bit system as follows:

         ```bash
         USER_MEM_ARGS="-Xms256m -Xmx1434m -XX:MaxPermSize=512m"
         ```

10. Perform the following steps on host-a, and then start the ADPRemoteServer as follows:
    a. Copy the emreposauthbean.jar located in $OMS_HOME/sysman/jlib, to `<middleware_home>/wlserver_10.3/server/lib/mbeantypes"
Installation Procedure

11. Perform the following steps to discover the new managed server running on host-b:
   a. In cloud Control, from Targets menu, select Middleware.
      On the Middleware page, from the list of WebLogic Servers running, select the
      WebLogic Domain (EMGC_DOMAIN) where the managed server is deployed.
   b. On The Cloud Control Domain page, from the WebLogic Domain menu,
      select Refresh WebLogic Domain.
      The new server now gets registered in the Enterprise Manager Cloud Control
      Domain.

12. Restart the server for all the changes to take effect.

Installation Procedure
To deploy ADP Manager on a separate host from OMS (remote deployment), perform
the following steps:

Note: For a successful remote deployment, ensure that:
   - You install Enterprise Manager agent on the remote machine, and point it to the OMS running on a different managed server present in the same Enterprise Manager Cloud Control domain (EMGC_DOMAIN)
   - The remote WebLogic Server version and patch level should match with servers in Enterprise Manager Domain (EMGC_DOMAIN). To ensure that the versions and patch levels match, Oracle recommends that you install WebLogic by selecting the Software Only install option in the Enterprise Manager OUI install.

1. In Cloud Control, from Setup menu, select Middleware Diagnostics.
2. From the Middleware Diagnostics page, click Deploy Application Dependency and Performance Manager (ADP).
   The ADP Manager deployment page appears.
3. To deploy ADP Manager on the managed server running on a separate host from OMS, perform the following steps:
   a. Select Deploy on an existing Managed Server. For example, EMGC_ADPMANAGER2, EMGC_ADPMANAGER3, and so on.
   b. The Port numbers for ADP Manager Registry Port, ADP Manager Java Provider Port, and ADP Manager Controller Port are populated with the default values 51099, 55003, and 55000 respectively. You can change these values by entering custom value if required.
4. In the Credentials section, provide **Oracle WebLogic Administration Server Host Credentials**, **Oracle WebLogic Domain Credentials**, and **Oracle WebLogic Managed Server Host Credentials**.

   Where,

   - Oracle WebLogic Administration Server Host Credentials are credentials for the host where the WebLogic Administration Server is running.
   - Oracle WebLogic Domain Credentials are credentials of the WebLogic domain in the Enterprise Manager Cloud Control.
   - Oracle WebLogic Managed Server Host Credentials are the credentials of the host machine where the Managed Server is running.

5. Click **Deploy** to submit the job.

   The progress page appears with a link to the job processing page. Click the link to see the status of the job that you submitted.

### 14.4.2 Deploying ADP Agents (Remote Deployment)

To deploy ADP Agents on a Weblogic Domain which is monitored by the Management Agent present in the Enterprise Manager WebLogic Domain, perform the following steps:

---

**Note:** This section will use the following convention:

- **host-a** corresponds to the WebLogic Domain where the ADP Agent will be deployed.
- **host-b** corresponds to the Enterprise Manager Domain (**EMGC_DOMAIN**) where the Management Agent is deployed to monitor the WebLogic Domain on host-a.

---

1. In Cloud Control, from **Targets** menu, select **Middleware**.

   The Middleware page displays a list of all the Middleware targets discovered and managed in Cloud Control. Click target name to select the desired target.

2. On the Middleware page, click **Oracle WebLogic Domain**. Ensure that the selected domain is not an Enterprise Manager Cloud Control domain (**EMGC_DOMAIN**).

   **Note:** ADP Agent cannot be deployed on a managed server (WebLogic Server) present in the Enterprise Manager domain.

---

All the managed servers present in the selected domain appear on the domain home page.

3. From the **WebLogic Domain** menu, select **Diagnostics**, and then click **Setup Diagnostics Agents** to deploy ADP agents to the selected managed servers.

4. On the Deploy Diagnostics Agents page, choose the Oracle WebLogic Server (managed server) to which you want to deploy the ADP agents.
By default, the following servers appear deselected:

- The Administration server.
- All the managed servers that are not up and running.
- If the Deployed Version and the Version to Deploy are the same, and the status of the already deployed ADP agent is up and running.

5. In the Diagnostics Agent Configuration section, enter the ADP Configuration Properties for the selected agents:

- Select the desired ADP Manager from the ADP Manager list.
  The ADP agents after deployment will report to the selected ADP Manager.

- If you select the Update Remote Start configuration option, then some configuration scripts run in the background to facilitate the monitoring process. Select this option if you use node manager to stop or start the WebLogic Servers to which ADP agent is being deployed.
**Important:** If WebLogic domain on host-a is discovered using Management Agent on host-b, then you must do the following:

1. Navigate to the following location:
   `<WEBLOGIC_HOME>/server/lib`

   Where,  
   `<WEBLOGIC_HOME>` is the full abstract path to the Weblogic home for the monitored WebLogic domain on host-a.

2. Do the following to generate `wlfullclient.jar`:
   - If the WebLogic Server version is 10.3.x or higher, then run the following command:
     ```java
     java -jar wljarbuilder.jar
     ```
   - If the WebLogic Server version is less than 10.3.x or equal to 10.3.0, then use other WebLogic installations (10.3.x or higher) to create the `wlfullclient.jar`.
   - For example, you can use the `<WEBLOGIC_DOMAIN>` corresponding to the EMGC domain for generating the `wlfullclient.jar`, since Enterprise Manager setup uses JDK6.

3. Copy the following files from `<WEBLOGIC_HOME>/server/lib/` to `<AGENT_HOME>/sysman/jlib` directory:
   - `wlfullclient.jar`
   - `wljmxcclient.jar`
   - `webserviceclient+ssl.jar`
   - `wlcipher.jar`

   Where `<AGENT_HOME>` is the Oracle home for the Management agent on host-b.

6. If Management Agent present on host-b is used to monitor the WebLogic Domain on host-a (remote Agent) where the ADP Agent will be deployed, then you must provide credentials for **Oracle WebLogic Administration Server Host Credentials**, **Oracle WebLogic Domain Credentials**, **Oracle Enterprise Manager WebLogic Administration Server Host Credentials**, and **Oracle Enterprise Manager WebLogic Domain Credentials**.

   Where,
   - Oracle WebLogic Administration Server Host Credentials are the credentials for the host-b, where the Management Agent used to discover the monitored domain is present.
   - Oracle WebLogic Domain Credentials are credentials of the WebLogic domain of host-a, where the ADP Agent will be deployed.
   - Oracle Enterprise Manager WebLogic Administration Server Host Credentials are credentials of host-b where the Administrator Server of EMGC_DOMAIN exists.
   - Oracle Enterprise Manager WebLogic Domain Credentials are credentials of the WebLogic Domain of host-b (EMGC_DOMAIN).

7. Click **Deploy** to submit the job.
The status page appears with a link to the job status. Click the link to see the status of the job that you submitted.

---

**Note:**

- Restart the administration server, and the managed servers to which the ADP Agents have been deployed. These servers should be restarted only after the deployment has completed successfully.

- If the ADP Agent deployment fails with an SSL handshake error, see “SSL Handshake Failure Agent Deployment Errors” to fix the problem.

---

### 14.5 After You Install

After installing the ADP Managed Server, or the ADP Agent, follow the steps outlined in the *Basic Installation Guide*
This chapter describes how you can install JVM Diagnostics (JVMD) in the Enterprise Manager Cloud Control environment.

In particular, this chapter covers the following:

- JVMD Architecture
- Before you Begin
- Prerequisites
- Installation Procedure
- After You Install

15.1 JVMD Architecture

JVM Diagnostics is integrated with Oracle Enterprise Manager Cloud Control. It primarily enables administrators to diagnose performance problems in Java applications in the production environment. By eliminating the need to reproduce problems, it reduces the time required to resolve these problems thus improving application availability and performance. Using JVMD, administrators will be able to identify the root cause of performance problems in the production environment without having to reproduce them in the test or development environment.

The following diagram shows the JVMD Architecture:
JVMD Manager is the core analytical engine of the JVMD monitoring system. JVMD Manager collects runtime data from JVMD Agents on request from OMS or while monitoring during which it sends periodic requests to the JVMD agents and collects runtime JVM data and stores it into repository. Multiple JVMD Managers can be configured.

JVMD Agents are the data collectors of the target JVM. JVMD Agents are deployed to managed application servers to collect JVM monitoring data related to JVM threads, stacks, heap and CPU usage in real-time while introducing minimal overhead.

The JVMD Manager runs as an Enterprise JavaBeans (EJB) Technology on a WebLogic Server. The JVMD Agent is deployed on the targeted JVM (the one running a production WebLogic Server). It collects real-time data and transmits it to the JVM Diagnostics Manager. This data is stored in the Management Repository, and the collected information is displayed on Enterprise Manager Cloud Control console for monitoring purposes. The communication between the JVMD Manager and the JVMD Agent can be a secure (SSL) or non-secure connection.
15.2 Before you Begin
Before installing an JVMD Manager, or an JVMD Agent, review the points outlined in the Basic Install Guide.

15.3 Prerequisites
Before installing the JVMD Manager, or the JVMD agent, ensure that you meet the prerequisites described in the Basic Install Guide.

15.4 Installation Procedure
This section contains the following topics:
- Deploying JVMD Manager
- Deploying JVMD Agents

15.4.1 Deploying JVMD Manager
To deploy JVMD Manager on a previously created managed server, you must log in with SYSMAN account (a default Super Administrators account that is installed with Enterprise Manager).

The following deployment options are possible:
- Deploying JVMD Manager on an OMS Host
- Deploying JVMD Manager on a Separate Host from OMS (Remote Deployment)
- Deploying JVMD Manager Manually
- Redeploying JVMD Manager

15.4.1.1 Deploying JVMD Manager on an OMS Host
To deploy JVMD Manager on a previously created managed server which is running on an OMS host, perform the following steps:

1. In Cloud Control, from Setup menu, select Middleware Diagnostics.

2. On the Middleware Diagnostics page, click Deploy JVM Diagnostics Manager (JVMD).

   The JVMD Manager deployment page appears.

3. To deploy JVMD Manager on the managed server running on an OMS host, perform the following steps:
   a. Select Deploy on an existing Managed Server.
   b. From the Managed Server menu, select the managed server on which you want to deploy the JVMD Manager. For example, EMGC_JVMDMANAGER1, EMGC_JVMDMANAGER2, and so on.
The managed server selected for deploying JVMD Manager should be part of the Enterprise Manager Cloud Control domain.

4. Specify the Oracle Management Server Host Credentials and Oracle WebLogic Server Domain Credentials:

   Where,

   Oracle Management Server Host Credentials are the credentials for the host machine where the Managed Server is created.

   Oracle WebLogic Server Domain Credentials are credentials of the Weblogic domain in the Enterprise Manager Cloud Control.

5. Click Deploy to submit the job.

   The progress page appears with a link to the job processing page. Click the link to see the status of the job that you submitted.

15.4.1.2 Deploying JVMD Manager on a Separate Host from OMS (Remote Deployment)

To deploy JVMD Manager on a separate host from OMS (remote deployment), you must perform the following tasks:

- Prerequisites
- Installation Procedure

**Prerequisites**

Before deploying JVMD Manager on a separate host from OMS (remote deployment), perform the following steps:

---

**Note:** This section will use the following convention:

- host-a is the host where the OMS is running
- host-b is the remote host which does not have an OMS on the machine.

---

1. Install a Management Agent on host-b (remote)

   For information about installing a Management Agent, see Basic Install Guide.

2. Install WebLogic Server on host-b using Enterprise Manager Software Only installation option.

   For information about performing a software only install, see Basic Install Guide
These WebLogic Server bits must be registered with the Enterprise Manager Domain running on host-a, so that all the managed servers appear under the same WebLogic Domain.

---

**Note:** For a successful installation, all managed servers running on different hosts in a WebLogic Domain must have the same version and patch level.

---

3. Configure a new managed server (JVMDRemoteServer) using the WebLogic Server Administration Console as follows:

   a. Log into the Enterprise Manager WebLogic Domain console (EMGC_DOMAIN) of host-a. The WebLogic Server Administration Console home page appears.

   b. In Weblogic Server Administration Console, from the Domain Structure section, select Environment and then click **Servers**.

   c. On the Create a New Server page, enter the Server Name, Server Listen Address, and Server Listen port.

   ---

   **Note:** Ensure that the Server Listen Address corresponds to the listen address of the remote host, and the Server Listen port is free on the remote host.

   ---

4. Configure a new machine using the WebLogic Server Administration Console as follows:

   a. Log into the Enterprise Manager WebLogic Domain console (EMGC_DOMAIN) of host-a. The WebLogic Server Administration Console home page appears.

   b. In Weblogic Server Administration Console, from the Domain Structure section, select Environment and click **Machines**.

   c. On the Create a New Machine page, to associate this machine with the nodemanager running on host-b, enter the **Listen Address** of the remote host, and the node manager port number which is 5556 by default.

   This node manager primarily controls the start and stop of a remote host.

   d. Click **Finish** to create the machine.

5. Select the new created machine, and click on **Servers** to add the managed server (JVMDRemoteServer) to this machine. This step associates the machine with the nodemanager running on host-b.
6. To extend the WebLogic Domain, a template of the Enterprise Manager Cloud Control domain running on host-a is created using the following command:

   ```
   ./pack.sh -domain = $DOMAIN_HOME -template = <absolute_path_to_the_new_weblogic_template> -template_name="My WebLogic Domain" -managed=(true)
   ```

   Where:
   
   $DOMAIN_HOME is the location of EMGC domain on host-a.
   
   `<absolute_path_to_the_new_weblogic_template>` is the location where you want to create the template.

7. Copy emgcdomain.jar from host-a (where the OMS is running) to host-b (remote host).

8. Run the following command to unpack emgcdomain.jar template on host-b:

   ```
   ./unpack.sh -domain = $DOMAIN_HOME -template = <absolute_path_to_domain_template_created>
   ```

   Where:
   
   $DOMAIN_HOME is the domain location of EMGC on host-b (remote host)
   
   `<absolute_path_to_domain_template_created>` is the location of the template on host-b where emgcdomain.jar template is present.

9. To enroll the WebLogic Domain with node manager, perform the following steps on host-b:

   a. Run the following command to update the node manager properties file so that it can start monitoring the remote host:

   ```
   $WEBLOGIC_HOME/common/bin/wlst.sh
   nmEnroll($DOMAIN_HOME)
   ```

   b. Start the Node Manager as follows:

   ```
   <Weblogic Home>server/bin/startNodeManager.sh
   ```

Note: After the JVMD Application is successfully deployed on the targeted managed server, to view the managed server in the WebLogic Domain, or to add a JVMD agents, ensure that you refresh the WebLogic Domain as follows:

1. In Cloud Control, from Targets menu, select Middleware. On the Middleware home page, select the WebLogic Domain on which the JVMD Manager application is deployed.

2. From the WebLogic Domain menu, select Refresh Weblogic Domain, and click Continue.

3. All the newly added targets are discovered in the WebLogic Domain, and then click Add Targets.

4. After adding the targets successfully, close the dialog box, and then click OK.
c. Perform the following steps to modify startWebLogic.sh:

a. Navigate to the following location:
   - On Unix: `${DOMAN_HOME}/bin/startWebLogic.sh`
   - On Windows: `${DOMAN_HOME}/bin/startWebLogic.cmd`

b. Set maximum heap size (-Xmx) to 1 GB for 64 bit systems and set maximum permanent generation (-XX:MaxPermSize) to 768M for 64 bit systems as follows:
   
   ```
   USER_MEM_ARGS="-Xms256m -Xmx1024m -XX:MaxPermSize=768m"
   ```

   **Note:** If the remote Managed Server is started using sun JVM, then you must add following memory options to `USER_MEM_ARGS`: `-XX:+UnlockDiagnosticVMOptions` and `-XX:+UnsyncloadClass`.

   c. Set max heap size to 1 GB for 32 bit systems, and maximum permanent generation to 512M for 32 bit system as follows:
   
   ```
   USER_MEM_ARGS="-Xms256m -Xmx1024m -XX:MaxPermSize=512m"
   ```

10. Perform the following steps on host-a, and then start the JVMDRemoteServer as follows:

   a. Copy the emreposauthbean.jar located in `${OMS_HOME}/sysman/jlib`, to `<middleware_home>/wlserver_10.3/server/lib/mbeantypes`

   Where, `${OMS_HOME}` is the location of the OMS server on host-a, and `<middleware_home>` is on host-b.

   b. Import SSL Certificate to Enterprise Manager Agent Trust store present on the host where managed server (JVMDRemoteServer) is running.

   c. Start the managed server (JVMDRemoteServer) from the WebLogic Server Administration Console to complete the WebLogic Server setup.

11. Perform the following steps to discover the new managed server running on host-b:

   a. In cloud Control, from Targets menu, select Middleware.

   On the Middleware page, from the list of WebLogic Servers running, select the WebLogic Domain (`EMGC_DOMAIN`) where the managed server is deployed.

   b. On the Cloud Control Domain page, from the WebLogic Domain menu, select Refresh WebLogic Domain.

   The new server now gets registered in the Enterprise Manager Cloud Control Domain.

12. Restart the server for all the changes to take effect.
Installation Procedure
To deploy JVMD Manager on a separate host from OMS (remote deployment), perform the following steps:

### Note:
For a successful remote deployment, ensure that:
- You install Enterprise Manager agent on the remote machine, and point it to the OMS running on a different managed server present in the same Enterprise Manager Cloud Control domain (EMGC_DOMAIN).
- The remote WebLogic Server version and patch level should match with servers in Enterprise Manager Domain (EMGC_DOMAIN). To ensure that the versions and patch levels match, Oracle recommends that you install WebLogic by selecting the Software Only install option in the Enterprise Manager OUI install.

1. In Cloud Control, from Setup menu, select Middleware Diagnostics.
2. From the Middleware Diagnostics page, click Deploy JVM Diagnostics Manager (JVMD).
   The JVMD Manager deployment page appears.
3. To deploy JVMD Manager on the managed server running on a separate host from OMS, perform the following steps:
   a. Select Deploy on an existing Managed Server.
   b. From the Managed Server menu, select the managed server on which you want to deploy the JVMD Manager. For example, EMGC_JVMDMANAGER1, EMGC_JVMDMANAGER2, and so on.
4. Specify the Oracle WebLogic Managed Server Host Credentials and Oracle WebLogic Domain Credentials:
   Where,
   - Oracle WebLogic Domain Credentials are credentials of the Weblogic domain in the Enterprise Manager Cloud Control.
   - Oracle WebLogic Managed Server Host Credentials are the credentials for the host machine where the Managed Server is created.
5. Click Deploy to submit the job.
   The progress page appears with a link to the job processing page. Click the link to see the status of the job that you submitted.

15.4.1.3 Deploying JVMD Manager Manually
To deploy JVMD Manager manually, you must perform the following tasks:
- Downloading jvmd.zip
- Deploying JVMD Manager
**Downloading jvmd.zip**

Before deploying JVMD Manager ensure that you have downloaded the jvmd.zip. To do so, in Enterprise Manager 12c, navigate to the following default location to access the jvmd.zip file:

```
<Middleware HOME>/plugins/oracle.sysman.emas.oms.plugin_12.1.0.0.0/archives/jvmd.
```

You can download this file to your local machine, and run the following command to extract the contents of the zip file:

```
unzip jvmd.zip
```

The jvmd.zip file contains the following:

- inflated: jamagent.war
- inflated: jammanager.war
- inflated: jammanager_dummy.ear
- extracted: loadheap.zip
- inflated: DeployAD4jManager.cmd
- inflated: DeployAD4jManager.py
- inflated: DeployAD4jManager.sh

- created: customprov/
  - inflated: customprov/DeployJVMDAgent.cmd
  - inflated: customprov/DeployJVMDAgent.py
  - inflated: customprov/DeployJVMDAgent.sh
  - inflated: customprov/deploy_jvmdagent.pl
  - inflated: customprov/README.txt
  - inflated: customprov/sample_jyjmdagent_deploy.properties
  - inflated: customprov/README.txt
  - inflated: upgrade/README.txt
  - inflated: upgrade/jvmd_monitoringupgradell_12.sql
  - inflated: upgrade/jvmd_targetupgradell-12.sql
  - inflated: upgrade/jvmd_traceupgradell_12.sql

The jvmd.zip file contains the following scripts:

- **DeployAD4jManager.cmd**: This script enables you to deploy the JVMD Manager on a Windows host.
- **DeployAD4jManager.sh**: This script enables you to deploy JVMD Manager on a Linux host.
- **DeployAD4jManager.py**: This script is invoked by the DeployAD4jManager.cmd and DeployAD4jManager.sh scripts to deploy the JVMD Manager.
- **jamagent.war**: JVMD Agent.
- **jammanager_dummy.ear**: A dummy JVMD Manager is deployed by deployment scripts on the OMS, and is deleted when JVMD Manager deployment is complete.
- **jammanager.ear**: JVMD Manager
- **loadheap.zip**: The zip file contains the processlog for each platform, and scripts for loading the heap.
- **customprov Folder**: The customprov folder contains the scripts used to deploy the JVMD agent from the command line, and is specifically suitable for mass deployment.
- **upgrade Folder**: The folder contains scripts for upgradation.
Deploying JVMD Manager

To deploy the JVMD Manager from the command line, follow these steps:

1. Navigate to the following location, and download the jvmd.zip file here:
   <middleware_home>/oms/jvmd

2. Run the following command to extract all the scripts from the jvmd.zip file:
   unzip jvmd.zip

3. Select the SSL port or the Non-SSL ports to be assigned to the Managed Server, that will be created on the host where you want to deploy the JVMD Manager.

   Note: To verify if the ports are free or not, run the following command:
   netstat -a|grep <port_number>

4. Run the following script from the command line to deploy JVMD Manager.

   On Linux:
   ./DeployAD4JManager.sh

   On Windows:
   DeployAD4JManager.cmd

   The script updates the default values for many of the parameters. If you want to change any of the parameter values, you can provide them when prompted, if not, press Enter to choose the default values.

   Note: A temporary file jammanager_dummy.ear is deployed on the OMS so that JVMD manager can access the repository. This file is deleted once the deployment is complete.

Once the deployment is successful, you will see a status as follows:

   Current Status of your Deployment:
   Deployment command type : deploy
   Deployment State        : completed
   Deployment Message      : no message

5. Once the connection to the repository is established, a server is created in the Enterprise Manager Cloud Control WebLogic Domain on which the JVMD Manager gets installed. By default, this server is called EMAD4JAMANAGER. You will see an output as follows:

   Starting server EMAD4JAMANAGER
   Server with name EMAD4JAMANAGER started successfully

15.4.1.4 Redeploying JVMD Manager

To redeploy a JVMD Manager, follow these steps:

1. Enter the following URL: https://<machine_name>:<EM_ADMINSERVER_SSL_PORT>/console to log in to the WebLogic Administration Console.
2. Perform a **Force Shutdown** to stop the existing JVMD Manager, and then click Delete to delete all the files associated with it.

**Note:** Sometimes the Java processes are not completely removed, and continue to run even after the instance has been stopped and deleted. To avoid this, Oracle recommends that you use new set of port numbers when you redeploy the JVMD manager.

3. Copy the jvmd.zip archive file to your local drive, and replace it with your version of the jvmd.zip file.

4. Either perform the steps mentioned in Section 15.4.1.3 to deploy the JVMD Manager manually, or use the steps outlined in Section 15.4.1.1 for deploying the JVMD manager from UI.

**Note:** The previously deployed JVMD Managers will continue to appear the Middleware Diagnostics page unless you use the same server name while redeploying the JVMD Manager.

### 15.4.2 Deploying JVMD Agents

This section contains the following:

- Deploying JVMD Agents Using Enterprise Manager Cloud Control
- Downloading and Deploying JVMD Agents
- Redeploying JVMD Agents on WebLogic Servers
- Deploying JVMD Database Agent
- Connecting JVMD Agent to the JVMD Manager Secure Port

#### 15.4.2.1 Deploying JVMD Agents Using Enterprise Manager Cloud Control

To deploy JVMD Agents on a Weblogic Domain which is monitored by the Management Agent present in the Enterprise Manager Weblogic Domain, perform the following steps:

**Note:** This section will use the following convention:

- **host-a** corresponds to the WebLogic Domain where the JVMD Agent will be deployed.
- **host-b** corresponds to the Enterprise Manager Domain (**EMGC_DOMAIN**) where the Management Agent is deployed to monitor the WebLogic Domain on host-a.

1. In Cloud Control, from **Targets** menu, select **Middleware**.
   
The Middleware page displays a list of all the Middleware related targets discovered, and being managed in Cloud Control. Click target name to select the desired target.

2. From the Middleware page, click **Oracle WebLogic Domain**.
   
   All the managed server present in the domain appear in the domain home page.
3. From the **WebLogic Domain** menu, select **Deploy Diagnostics Agents** to deploy agents to the selected managed servers.

4. On the Deploy Diagnostics Agents page, choose the Oracle WebLogic Server (managed server) to which you want to deploy the JVMD Agents.

**Note:** Ensure that you retain the selection of only those Diagnostic Agent(s) that you want to deploy to each of the managed server, deselect the others.

By default, the following servers appear deselected:

- The Administration server.
- All the managed servers that are not up and running.
- If the **Deployed Version** and the **Version to Deploy** are the same, and the status of the already deployed JVMD agent is up and running.

5. In the Diagnostics Agent Configuration section, enter the **JVMD Configuration Properties** for the selected agents.

Select the desired JVMD manager from the **JVMD Manager** list. The JVMD agents selected for deployment will report to this JVMD Manager.
**Important:** If WebLogic domain on host-a is discovered using Management Agent on host-b, then you must do the following:

1. Navigate to the following location:
   `<WEBLOGIC_HOME>/server/lib`

   Where,
   `<WEBLOGIC_HOME>` is the full abstract path to the Weblogic home for the monitored WebLogic domain on host-a.

2. Do the following to generate `wlfullclient.jar`:
   If the WebLogic Server version is 10.3.x or higher, then run the following command:
   ```
   java -jar wljarbuilder.jar
   ```

   If the WebLogic Server version is less than 10.3.x or equal to 10.3.0, then use other WebLogic installations (10.3.x or higher) to create the `wlfullclient.jar`.

   For example, you can use the `<WEBLOGIC_DOMAIN>` corresponding to the EMGC domain for generating the `wlfullclient.jar`, since Enterprise Manager setup uses JDK6.

3. Copy the following files from `<WEBLOGIC_HOME>/server/lib/` to `<AGENT_HOME>/sysman/jlib` directory:
   - `wlfullclient.jar`
   - `wljmxclient.jar`
   - `webserviceclient+ssl.jar`
   - `wlcipher.jar`

   Where `<AGENT_HOME>` is the Oracle home for the Management agent on host-b.

6. If Management Agent present on host-b is used to monitor the Weblogic Domain on host-a (remote Agent) where the JVMD Agent will be deployed, then you must provide credentials for **Oracle Weblogic Administration Server Host Credentials** and **Oracle WebLogic Domain Credentials**.

   Where,
   Oracle WebLogic Administration Server Host Credentials are the credentials for the host-b, where the Management Agent used to discover the monitored domain is present.
   Oracle WebLogic Domain Credentials are credentials of the WebLogic Domain of host-a, where the JVMD Agent will be deployed.

7. Click **Deploy** to submit the job.

   The progress page appears with a link to the job processing page. Click the link to see the status of the job that you submitted.

---

**Note:** If the JVMD Agent deployment fails with an SSL handshake error, see "SSL Handshake Failure Agent Deployment Errors" to fix the problem.
15.4.2.2 Downloading and Deploying JVMD Agents
To complete the process of deploying JVMD Agents, follow the sequence of the steps listed in this section:

- **Step1: Downloading jamagent.war File**
- **Step 2: Deploying JVMD Agent**

**Step1: Downloading jamagent.war File**
Use one of the following methods to download the jamagent.war file:

- **Using Cloud Control to Download the jamagent.war File**
- **Procuring jvmd.zip File from the Shiphome Location**

**Using Cloud Control to Download the jamagent.war File**
Follow these steps:

1. In Cloud Control, from Setup menu, select Middleware Diagnostics.
2. On the Middleware Diagnostics page, click Setup JVM Diagnostics.
3. On the JVM Diagnostics Setup page, click JVMs and Pools, then click Download. The Download JVM Diagnostics Component dialog box appears.

4. From the JVMD Component menu, select JVMD Agent, and click Ok. The JVM Diagnostics Agent web.xml parameters dialog box appears.

5. From the Available Managers menu, select a Managed Server on one of the ports from the list, and click Download:
   - Select the Non-SSL port (3800) to connect to the JVMD Manager.
   - Select the SSL port (3801) to securely connect to the JVMD Manager.

For example:
- Non-SSL port: slc01.us.example.com:3800
- SSL port: slc01.us.example.com:3801 (Secure Communication)

**Note:** If you do not want to select an existing manager, you can select Other from the Available Managers menu, and specify the hostname and port for the agent to connect to. This is specially useful when multiple JVMD Managers are load balanced.
6. The downloaded jamagent.war file is ready for deployment either from the WebLogic Administration Console or using a Non WebLogic Server.

   To deploy a JVMD agent using a Non-WebLogic Server, do the following:
   
   a. Copy the jamagent.war file to your Application Server host machine, and make a note of its location.
   
   b. Add following JVM options to your application server start up command:

   ```
   -classpath <original classpath>:<full path to jamagent.war inclusive>
   jamagent.jamrun jamconshost=<jamconshost> jamconsport=<jamconsport>
   jamjvmid=<a unique identifier, e.g. 1234> jamtimeout=30 jamloglevel=3
   ```

**Procuring jvmd.zip File from the Shiphome Location**

Follow these steps:

1. Navigate to the following location, and download the jvmd.zip file here:

   ```
   <middleware_home>/oms/jvmd
   ```

2. Run the following command to extract the JVMD Agent script present in the jvmd.zip file:

   ```
   unzip jamagent.war
   ```

3. Navigate to the following location: WEB-INF/web.xml.

4. Edit the web.xml file to update the values of the parameters jamconshost and jamconsport.

   Where,

   - `jamconshost` is the IP of the machine on which the JVMD Manager (jammanager) is deployed.
   - `jamconsport` is the port of the host on which the JVMD Manager is deployed.
5. Run the following command to reassemble the `jamagent.war` file:

   ```
   jar -cMvf jamagent.war META-INF WEB-INF jamagent oracle
   ```

6. The updated `jamagent.war` file is ready for deployment either from the WebLogic Administration Console or using a Non WebLogic Server.

---

### Step 2: Deploying JVMD Agent

Deployment of JVMD Agents is possible either using Oracle WebLogic Server or from a Non-WebLogic Server.

- Deploying JVMD Agents on a WebLogic Server
- Deploying JVMD Agents on a Non-WebLogic Server

#### Deploying JVMD Agents on a WebLogic Server

Use one of the following methods to deploy the JVMD Agents:

You can either use the WebLogic Administration Server Console to deploy the JVMD Agents, or deploy them using the Custom Provisioning Script. To deploy using the Custom Provisioning script, follow these steps:

1. Make a copy of the Deployment profile `sample_jvmdagent_deploy.properties` available in the `jvmd.zip` file. Basically, update the details like: location of `jamagent.war` file, the WebLogic domain, and server information, and save the profile as `jvmdagent_deploy.properties`.

   For more information about the parameters, see the README.txt file present in the customprov folder.

2. Run the following perl script available in the customprov folder to deploy JVMD Agent on all the specified servers.

   ```
   perl deploy_jvmdagent.pl
   ```

---
Installing JVMD with Advanced Install Options

Deploying JVMD Agents on a Non-WebLogic Server

To deploy a JVMD agent using a Non-WebLogic Server, do the following:

1. Copy the jamagent.war file to your Application Server host machine, and make a note of its location.

2. Add following JVM options to your application server start up command:

```
-classpath <original classpath>:<full path to jamagent.war inclusive>
jamagent.jamrun jamconshost=<jamconshost> jamconsport=<jamconsport> jamjvmid=<a unique identifier, e.g. 1234> jamtimeout=30 jamloglevel=3
```

For example:

If earlier the command to start the server was:

```
java –classpath x.jar -Dfoo=value server.Main
```

now it would be:

```
java –classpath x.jar:<absolute path of jamagent.war> -Dfoo=value jamagent.jamrun jamconshost=<jamconshost> jamconsport=<jamconsport> jamjvmid=<a unique identifier, e.g. 1234> jamtimeout=30 jamloglevel=3 server.Main
```

15.4.2.3 Redeploying JVMD Agents on WebLogic Servers

On the Deploy Diagnostics Agents page, if the Deployed Version and the Version to Deploy are different, then it could mean that there is a higher version of the JVMD Agent available. For redeploying the agent to a higher version, use the UI, and follow the steps listed in Downloading and Deploying JVMD Agents.

Alternately, you can manually stop the JVMD Agent and delete the earlier deployed agent, and then perform the steps listed in Step 2: Deploying JVMD Agent to manually deploy the JVMD Agents.

15.4.2.4 Deploying JVMD Database Agent

If you need JVMD Database Agent, download the JVMD Agent from Cloud Control as it can serve as a Database Agent too. If the JVMD Agent is downloaded and installed on the same host as the Database, then you do not require a separate Database Agent. The JVMD Agent itself orchestrates between the Database and the JVMD Manager. However, if the JVMD Agent and the Database are on separate hosts, then you need a Database Agent to collect the Database specific information, and transmit the data to JVMD Manager.

Note: JVMD Database Agents are supported on the platforms on which the JVMD Agents are supported except for Windows, and need Java 1.4.X or higher to run.

For downloading and deploying JVMD agents, do the following:

1. Follow the steps listed in Step1: Downloading jamagent.war File to download the jamagent.war file using Cloud Control.

2. To start the Database Agent, run the following command:

```
$JAVA_HOME/bin/java -Xms126M -Xmx512M -cp ./jamagent.war jamagent.Dbagent
```
**15.4.2.5 Connecting JVMD Agent to the JVMD Manager Secure Port**

To deploy the JVMD Agents from the command line, you can follow the steps outlined in Section 15.4.2.2.

**Note:** For ensuring secure communication with JVMD Manager, the JVM should have the access to a KeyStore in which the certificate of the Managed Server on which manager is deployed, is added. The KeyStore of the Cloud Control Domain in which the Managed Server (MANAGER) is created can be used for same.

If you have access to Enterprise Manager Cloud Control Domain, then do the following:

1. Locate the KeyStore, it is normally available in the following location:
   
   `<weblogic_directory>/server/lib/DemoTrust.jks`
   
   Where, WebLogic home refers to the installation directory of WebLogic Server.

2. Add the following to the command line of the JVMD Agent, and start it:
   
   ```
   -Djavax.net.debug=ssl 
   -Djavax.net.ssl.trustStore=<location of DemoTrust.jks of the manager server> 
   -Djavax.net.ssl.trustStorePassword=DemoTrustKeyStorePassPhrase
   ```

   **Note:** The default password for the WebLogic Key Store is `DemoTrustKeyStorePassPhrase`.

If you do not have access to Enterprise Manager Cloud Control Domain, then do the following:

1. If the target server already has a KeyStore, for example `DemoTrust.jks`, then use `DemoTrust.jks`. Otherwise, you need to create a new KeyStore, for example `KeyStore.jks`. To create a new KeyStore, see step 3.

2. Follow these steps to download the certificate of the Managed Server:
   
   a. Enter the URL: `https://<jamconshost>:<jamconsport(secure)>`

   b. On the home page of the JVMD Agent, select **Details** Tab, then click **Export**.

   c. Save the certificate as `myCert.crt`.

3. To add certificate to an existing keystore `DemoTrust.jks`, or to create a new KeyStore `keystore.jks` and add certificate to it, run the following command:
keytool -import -trustcacerts -alias root -file myCert.crt
-keystore <keystore/DemoTrust>.jks

The command creates a new KeyStore with a default password changeit.

15.5 After You Install

After installing the JVMD Managed Server, or the JVMD Agent, follow the steps outlined in the Basic Installation Guide.
Oracle Business Intelligence (BI) Publisher is Oracle’s primary reporting tool for authoring, managing, and delivering all your highly formatted documents. BI Publisher ships standard with Enterprise Manager Cloud Control 12c.

**IMPORTANT:** Only BI EE 11.1.1.5.0, which contains BI Publisher 11.1.1.5.0, is supported for use with Enterprise Manager 12c Cloud Control 12.1.0.1.

This chapter covers the following topics:

- Overview
- BI Publisher Installation and Integration with Enterprise Manager 12c
- Verifying Integration of BI Publisher with Enterprise Manager
- Allowing Access to BI Publisher for Enterprise Manager Administrators
- Granting the EMBIP* roles to Enterprise Manager/BI Publisher Administrators
- Allowing Access to BI Publisher for Enterprise Manager Administrators in a LDAP environment
- Configuring BI Publisher with a Custom Trust Store
- BI Publisher Administration
- EMBIP* Roles: Granting Access to Folders and Catalog Objects
- Access to Enterprise Manager Repository
- Troubleshooting
- Managing Enterprise Manager - BI Publisher Connection Credentials
- Managing the BI Publisher Server

### 16.1 Overview

Though BI Publisher is still deployed as a separate installation, Enterprise Manager can be configured to integrate a BI Publisher installation within an Enterprise Manager domain: BI Publisher is installed into the same WebLogic Server domain as Enterprise Manager. Once configured, you will be able to take advantage of the standard features of BI Publisher such as:
Highly formatted, professional quality, reports, with pagination and headers/footers.

PDF, Excel, Powerpoint, Word, and HTML output of reports.

Develop your own custom reports against the Enterprise Manager repository. (read-only repository access)

Integration with Enterprise Manager Security.

Grant varying levels of BI Publisher functionality to different Enterprise Manager administrators.

Use BI Publisher’s scheduling capabilities and delivery mechanisms such as e-mail and FTP.

Format (report) can be edited separately from the data definition (data model).

Standardized Enterprise Manager subtemplate for headers.

Full NLS support for BI Publisher Report output.

---

**Note:** The Information Publisher (IP) reporting framework is still supported for Enterprise Manager 12c, however, new report development using this framework has been deprecated for Enterprise Manager 12c release 12.1.0.1.

---

### 16.1 Limitations

The following are limitations apply to the use of reports and data sources.

- There is no guarantee that the data sources will remain consistent from release to release.
- Out-Of-The-Box reports cannot be edited.
- If Out-Of-The-Box reports are copied, there is no guarantee that the copies will work with future product releases.

### 16.2 Downloading Oracle BI Publisher

Only Oracle Business Intelligence (BI) Publisher version 11.1.1.5.0 can be used with Enterprise Manager Cloud Control 12.1.0.1. Oracle BI Publisher version 11.1.1.6.0 or later are not compatible with Enterprise Manager Cloud Control 12.1.0.1. You can download Oracle Business Intelligence Publisher version 11.1.1.5.0 directly from the Enterprise Manager Cloud Control download Web site.

See the link titled *Oracle Business Intelligence Publisher 11.1.1.5.0.*

### 16.2 BI Publisher Installation and Integration with Enterprise Manager 12c

The following procedures assume that you are familiar with both BI Publisher and Enterprise Manager installations. Refer to the *Oracle Enterprise Manager Basic Installation Guide* and the *Oracle Enterprise Manager Advanced Installation and Configuration Guide* for detailed information about Enterprise Manager.
16.2.1 Enterprise Manager and BI Publisher Inventory

Both Enterprise Manager and BI Publisher must be installed with a centralized inventory file. This means that `/etc/oraInst.loc` points to the same directory for both installs. Although it is possible to install both products with a special inventory specific to each product, this configuration is not a supported and will not allow complete integration between Enterprise Manager 12c and BI Publisher 11g.

16.2.2 Installing Enterprise Manager and Required Infrastructure

In order to support the required resources for BI Publisher, the first OMS system (where BI Publisher is initially installed) needs the following additional system requirements above and beyond what is already required by Enterprise Manager:

- +1.5 GB of RAM
- +7 GB of disk space
- Any additional OMSes that are added to the domain, after BI Publisher has been installed on the first OMS, will also require an additional 7 GB of disk space.

**Run the Enterprise Manager 12c installer.** Some Enterprise Manager-provided BI Publisher reports are part of the Chargeback and Trending plug-ins. These plug-ins must be installed in order for these reports to be available. They can be installed using any supported Enterprise Manager installation method.

---

**Note:** Refer to the *Oracle Enterprise Manager Basic Installation Guide* for complete installation specifics.

---

16.2.2.1 Installing BI EE Using Software-only Install

**Important:** Integration requires Oracle Business Intelligence Enterprise Edition 11g (version 11.1.1.5.)

Do a software-only install of BI EE using the below steps:

1. Run the BI EE Publisher Installer: (`Disk1/runInstaller`).
2. (Optional) Choose E-Mail address for updates and click **Next**.
3. **VERY IMPORTANT:** Choose the **Software-only Install**.
4. Click **Next**. Prerequisite checks will run.
5. After passing prerequisite checks run, click **Next**.
6. Choose the Middleware home of your Enterprise Manager installation. This is the Middleware home that you created previously.
7. BI Oracle Home name must be left as the default *Oracle_BII*. Click **Next**.
8. (Optional) Enter MOS credentials to be notified of security updates. Click **Next**.

When the software-only install of BI EE completes successfully, proceed to Section 16.2.2.2.

16.2.2.2 Integrating BI Publisher with Enterprise Manager Using the configureBIP Script

1. Integrating BI Publisher with Enterprise Manager will require changing the domain configuration. It is highly recommended to back up the domain in case of unforeseen errors during configuration. File permissions for the domain files must
be maintained when creating a backup. For example, from the `<Instance_Home>/user_projects/domains` directory, run:
```bash
zip -r GCDomain.zip GCDomain
```

2. From the OMS instance’s `ORACLE_HOME/bin` directory, execute the `configureBIP` script from the command line. The script takes four inputs and then performs the Repository Creation Utility (RCU) step and then takes two more inputs, performs the extend-domain operations and finally deploys the Enterprise Manager-supplied BI Publisher Reports to the newly installed BI Publisher Web application.

**Script Input**

1. Enter a database user with SYSDBA privileges (typically ‘sys’), then enter the password. (Enterprise Manager repository database)
2. Enter the `adminserver` and then the `nodemanager` password. These accounts are part of Enterprise Manager WebLogic Domain.

**Script Operation (RCU Steps)**

1. RCU runs to create the BI Publisher schema. Note there will be some output printed on the screen.
2. You will know that RCU was successful, if you see the following:

```
Repository Creation Utility - Create : Operation Completed
```

**Extend Domain Steps**

1. You will then be asked to enter BI Publisher HTTP and HTTPS ports (either one or both). The script will identify free ports and ask if you want to take them as a default. Once entered, Extend Domain will then run
2. The Enterprise Manager-supplied BI Publisher Reports will be deployed to the newly installed BI Publisher Web application.
3. Once processing is complete, you will see something like the following screen output:

```
Extending domain with BI Publisher. This may take a few minutes...
BI Publisher server running at http://host.us.oracle.com:9701/xmlpserver.
BI Publisher server running at https://host.us.oracle.com:9702/xmlpserver.
Registering BI Publisher with Enterprise Manager and deploying reports...
Successfully setup BI Publisher with Enterprise Manager
```

### 16.3 Verifying Integration of BI Publisher with Enterprise Manager

1. Log in to Enterprise Manager.
2. From the **Enterprise** menu, choose **Reports** and then **BI Publisher Enterprise Reports**.
3. Click the **refresh** icon at the top right of the Enterprise Manager window.
4. Enterprise Manager displays a tree list showing all of the Enterprise Manager-supplied BI Publisher reports as shown in the following graphic.
5. Click on the provided Enterprise Manager Sample Report: Targets_of_Specified_Type

6. Log in to BI Publisher using your Enterprise Manager credentials.

7. You will see the sample report rendered on the screen. You can then use the full capabilities of BI Publisher such as PDF report generation and e-mail.

16.4 Allowing Access to BI Publisher for Enterprise Manager Administrators

Once integrated, BI Publisher reports conform to the Enterprise Manager security model. The primary security attributes that apply to BI Publisher Reports are:

- Permissions
- Roles (or groups in the LDAP case)

16.4.1 Permissions

Enterprise Manager ships with certain Oracle-provided BI Publisher catalog objects. These catalog objects consist of:

- Folders
- Reports (layout definitions and translations)
- Datamodels (SQL queries against the Enterprise Manager repository)
- Subtemplates (standard Enterprise Manager header shown above all pages of all report output)

These catalog objects are created when BI Publisher is installed and integrated with Enterprise Manager. They are placed in the "Enterprise Manager Cloud Control" folder. These catalog objects are created with certain permissions that, combined with the roles/groups below, achieve the desired security model.

16.4.2 Roles (groups in the LDAP case)

When BI Publisher is installed, four roles are created (non-LDAP), or in the LDAP case, four groups need to be created. These roles/groups are combined with the permissions on the catalog objects in the aforementioned folder to achieve the rules shown in the following sections.
16.4.3 BI Publisher Security Model

Below is a description of the effective security model placed on BI Publisher catalog objects that ship with Enterprise Manager.

- **None** - Enterprise Manager administrators without any BI Publisher role can receive BI Publisher Reports via delivery channels such as e-mail or FTP.
- **EMBIPViewer** - Enterprise Manager administrators with this BI Publisher role can receive e-mails plus can view the Enterprise Manager-supplied BI Publisher reports.
- **EMBIPScheduler** - Enterprise Manager administrators with this BI Publisher role can receive e-mails and can schedule the Enterprise Manager-supplied BI Publisher reports if they also have the **EMBIPViewer** role.
- **EMBIPAuthor** - Enterprise Manager administrators with this BI Publisher role can receive e-mails, view the Enterprise Manager-supplied BI Publisher reports, and can create new reports in their private folder. They can also copy the Enterprise Manager-supplied BI Publisher reports and customize them.
- **EMBIPAdministrator** (Super Users) - Enterprise Manager administrators with this BI Publisher role have complete access to BI Publisher.

The following diagram shows the hierarchy of the above roles:

![Role Hierarchy Diagram]

**Enterprise Manager Super Administrators**

In a non-LDAP environment, all Enterprise Manager Super Administrators are automatically granted the **EMBIPAdministrator** role to facilitate setting up BI Publisher.

In an LDAP environment, Enterprise Manager Super Administrators are not automatically granted **EMBIPAdministrator** access to BI Publisher. See Section 16.5 for more information on allowing access to BI Publisher for Enterprise Manager Administrators in a LDAP environment.

16.5 Granting the EMBIP* roles to Enterprise Manager/BI Publisher Administrators

In the non-LDAP case, the domain policy store (OPSS) is used to control Enterprise Manager administrator access to objects in the BI Publisher catalog.

OPSS is the repository of system and application-specific policies. Details regarding OPSS can be found in the Oracle® Fusion Middleware Security Guide. In a given domain, there is one store that stores all policies (and credentials) that all applications deployed in the domain may use. As both Enterprise Manager and BI Publisher are
separate applications, it is necessary to grant BI Publisher specific roles to Enterprise Manager administrators

In a non-LDAP environment, the command-line tool `wlst.sh` (on `wlst.bat` Microsoft Windows) is used to manipulate the OPSS.

### 16.5.1 Granting BI Publisher roles to Enterprise Manager Administrators (non-LDAP)

#### Using `wlst.sh` (`wlst.bat` on Microsoft Windows)

`wlst.sh` (on `wlst.bat` Microsoft Windows) can be used to grant access to the BI Publisher UI to Enterprise Manager administrators.

The following `wlst.sh` usage example demonstrates of using `wlst.sh` to grant view access to the Enterprise Manager administrator named "JERRY" (italicized items are entered at the command-line). It is important to use uppercase letters for Enterprise Manager Administrator names.

```
$MW_HOME/oracle_common/common/bin/wlst.sh
wls:/EMGC_DOMAIN/serverConfig> connect('weblogic','<pw>','t3s://host:port')

wls:/EMGC_DOMAIN/serverConfig>
grantAppRole(appStripe="obi",appRoleName="EMBIPViewer",principalClass="weblogic.security.principal.WLSUserImpl",principalName="JERRY")
```

To revoke access to View BI Publisher reports from the user JERRY (case is important), enter the following:

```
wls:/EMGC_DOMAIN/serverConfig>
revokeAppRole(appStripe="obi",appRoleName="EMBIPViewer",principalClass="weblogic.security.principal.WLSUserImpl",principalName="JERRY")
```

#### 16.5.2 Propagation Time for Changes to OPSS

When changing an Enterprise Manager administrator's BI Publisher access privileges (EMBIPViewer, EMBIPAdministrator, EMBIPScheduler, EMBIPAuthor) the Super Administrator needs to wait 15 minutes for the changes to propagate through OPSS and become effective. The change will then be effective the next time the administrator logs into BI Publisher.

### 16.6 Allowing Access to BI Publisher for Enterprise Manager Administrators in a LDAP environment

As both Enterprise Manager and BI Publisher are separate applications, it is necessary to grant BI Publisher specific roles to Enterprise Manager administrators, which in this case are groups defined in the external LDAP. These different BI Publisher groups allow varying access to the BI Publisher UI. So, you can add an external LDAP user as a member of one or more of these external LDAP group above, and BI Publisher will expose specific parts of the BI Publisher UI to that user when they log in to BI Publisher. These groups, which need to be created as described in the following section, are coordinated with the permissions of the catalog object in the "Enterprise Manager Cloud Control" folder.

In an LDAP environment, similar concepts are employed to grant access to BI Publisher for different Enterprise Manager administrators. However, in an LDAP environment, Enterprise Manager administrators credentials are stored in the LDAP system.
In order to achieve the required security model described in Section 16.4.3, the following steps must be performed:

- The administrator of the LDAP server needs to create the following four external groups:
  - EMBIPAdministrators
  - EMBIPViewers
  - EMBIPSchedulers
  - EMBIPAuthors

- Make EMBIPAdministrators member of EMBIPAuthors
- Make EMBIPAdministrators member of EMBIPSchedulers
- Make EMBIPAuthors member of EMBIPViewers

**Note:** In LDAP, the terminology and concepts can seem backwards and confusing. For example, you want the EMBIPAuthors group to have as a member the EMBIPAdministrators group.

Then, in order to grant access to BI Publisher and its catalog objects, the administrator of the LDAP server needs to make respective Enterprise Manager/LDAP users a member of one or more of the above LDAP groups.

### 16.7 Configuring BI Publisher with a Custom Trust Store

If you reconfigure your AdminServer to use a custom trust store, then you must also configure BI Publisher accordingly. This also requires the trust store for the OMS to contain the certificate for the BI Publisher-managed server.

In order to use a trusted certificate from a signing authority, create a Java Key Store (JKS) containing the user certificate of BI Publisher server.

**Note:** If you use an e-mail server with SSL, you will need to add the e-mail server's certificate to your trust store as well.

### 16.8 BI Publisher Administration

Please refer to the BI Publisher documentation for instructions on configuring BI Publisher settings.

Common administrative tasks:

- Configuring server properties
- Configuring report delivery options

### 16.9 EMBIP* Roles: Granting Access to Folders and Catalog Objects

By default, the shipping security model (as described in Section 16.4.3, applies to BI Publisher catalog objects that are inside the "Enterprise Manager Cloud Control" folder. This is due to the fact that the catalog objects that exist in this folder are set up with a default set of permissions. See Section 16.4.1. BI Publisher catalog objects that are outside of this folder will not automatically contain these same permissions. For
example, BI Publisher ships with numerous reports in a shared folder called "Samples". If it is desired to grant access to this folder to Enterprise Manager/BI Publisher users, other than EMBIPAdministrator, it is necessary for a BI Publisher super administrator (EMBIPAdministrator) to change the permissions of this folder. They do so by selecting the folder "Samples" and choosing "Permissions" in the bottom left task bar. They then need to add the four privileges (EMBIPAdministrator, EMBIPViewer, EMBIPAuthor, EMBIPScheduler) and grant appropriate access to that privilege such as View report, run report online, to EMBIPViewer. The administrator can model the appropriate privileges to grant based on any of the shipping Enterprise Manager reports (for example, Targets_of_Specified_Type).

Individual users, who have EMBIPAuthor, can develop reports in their own private folders. These reports will not be available to other users.

---

**Note:** The shared folder "Enterprise Manager Cloud Control" contains Enterprise Manager-provided BI Publisher Reports and is reserved for such. No custom-developed reports may be put in this folder hierarchy, and the default security model that ships with Enterprise Manager specifically prohibits this.

---

**Note:** Only reports in the "Enterprise Manager Cloud Control" will show up in the Enterprise Manager BI Publisher Enterprise Reports menu (Enterprise -> Reports -> BI Publisher Enterprise Reports).

---

If a BI Publisher administrator (EMBIPAdministrator) wishes to create a new shared folder outside of the "Enterprise Manager Cloud Control" folder, they can do so. These reports would not show up in the Enterprise Manager BI Publisher reports menu but would be available to other Enterprise Manager administrators as long as appropriate permissions are granted as previously described.

### 16.10 Access to Enterprise Manager Repository

All BI Publisher reports are granted read-only access to the Enterprise Manager Repository. This access is via the BI Publisher data source named `EMREPOS`. This access is via the Enterprise Manager user `MGMT_VIEW`, which is a special internal Enterprise Manager user who has read-only access to the Enterprise Manager Published `MGMT$` and `GC$` database views. In addition, when reports are run, they are further restricted to the target-level security of the user running the report. For example, if user JOE has target-level access to "hostabc" and "database3", when user JOE runs a BI Publisher report (any report) he can only view target-level data associated with these two targets.

### 16.11 Troubleshooting

- Before attempting to re-run `configureBIP`, be sure to kill any existing BI Publisher processes.
- If BI Publisher is able to run successfully, but BI Publisher registration with Enterprise Manager fails, you can retry the registration by running:
  
  ```
  emcli login -username=<admin username> -password=<admin password>
  emcli sync
  emcli setup_bipublisher -proto=http[s] -host=<bip_host> -port=<bip_port> -uri=xmlpserver
  ```

---

**Note:** The shared folder "Enterprise Manager Cloud Control" contains Enterprise Manager-provided BI Publisher Reports and is reserved for such. No custom-developed reports may be put in this folder hierarchy, and the default security model that ships with Enterprise Manager specifically prohibits this.

---

**Note:** Only reports in the "Enterprise Manager Cloud Control" will show up in the Enterprise Manager BI Publisher Enterprise Reports menu (Enterprise -> Reports -> BI Publisher Enterprise Reports).
If the domain becomes corrupted, and you created a backup of your domain, you can restore your domain using the backup file.

1. Stop the OMS and AdminServer using `emctl stop oms -all`
2. Go to `<Instance_Home>/user_projects/domains`, move the `<domain name>` folder, and unzip the backed up `<domain name>` folder into its place.
3. Restart the OMS and AdminServer using `emctl start oms`.

16.12 Managing Enterprise Manager - BI Publisher Connection Credentials

Accessing BI Publisher from Enterprise Manager requires a direct connection between the two products in order to retrieve, display, and manage report definitions. Example: From the Enterprise menu, choose Reports and then BI Publisher Enterprise Reports. A tree view displaying BI Publisher reports within the Enterprise Manager Cloud Control shared folder appears as shown in the following graphic.

![BI Publisher Enterprise Reports](image)

The first time you run the `configureBIP` script to configure BI Publisher to integrate with Enterprise Manager, a dedicated WebLogic user is automatically created with the requisite credentials solely for the purpose of installation/configuration. Beginning with Enterprise Manager release 12.1.0.1.1, you can configure these credentials using the EMCTL command `config oms`.

**Verb Syntax**

```text
emctl config oms -store_embipws_creds [-admin_pwd <weblogic_pwd>] [-embipws_user <new_embipws_username>] [-embipws_pwd <new_embipws_pwd>]
```

The `config oms` command allows you to change the password, and optionally the username, used by Enterprise Manager to access the installed BI Publisher Web Server. Running the `config oms` command requires the WebLogic Admin user’s password.
Note 1: The config oms command only changes the user credentials required for the Enterprise Manager - BI Publisher connection. The Enterprise Manager - BI Publisher connection credentials should match the credentials used elsewhere by the user. Example: Enterprise Manager users (database authentication), LDAP users, and WebLogic Server users. Use the corresponding application/console to create or manage the user within the installed credential store.

Note 2: This command is operational only if BI Publisher has been installed.

Note 3: It is not necessary to restart any managed server, such as EMGC_OMSnnnn or BIPnnnn.

Any valid credential that WebLogic supports is acceptable as long as that user also has the EMBIPAdministrators privilege (either in OPSS or LDAP, as appropriate).

Example: You have configured Enterprise Manager to use single sign-on (SSO) (backed by an LDAP credential store). The following steps illustrate the credential update process:

1. Create the LDAP user. Example: Create EM_BIP_INTERNAL_USER and assign this LDAP user a password such as XYZ123.
2. Make EM_BIP_INTERNAL_USER a member of the EMBIPAdministrators LDAP group. For more information about LDAP groups and Enterprise Manager-BI Publisher integration, see Section 16.6, "Allowing Access to BI Publisher for Enterprise Manager Administrators in a LDAP environment".
3. Execute the EMCTL config oms command:

   emctl config oms -store_embipws_creds -embipws_user EM_BIP_INTERNAL_USER
   Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
   Copyright (c) 1996, 2012 Oracle Corporation. All rights reserved.
   Enter Admin User's Password: <pw>
   Enter new password that Enterprise Manager will use to connect to BI Publisher : XYZ123
   Successfully updated credentials used by Enterprise Manager to connect to BI Publisher.

If you later change the EM_BIP_INTERNAL_USER password in the LDAP server, you can change the LDAP user’s password by executing the config oms command with the -store_embipws_creds option. In the following example, the password is changed to ABC123.

   emctl config oms -store_embipws_creds
   Oracle Enterprise Manager Cloud Control 12c Release 12.1.0.1.0
   Copyright (c) 1996, 2012 Oracle Corporation. All rights reserved.
   Enter Admin User's Password: <pw>
   Enter new password that Enterprise Manager will use to connect to BI Publisher : ABC123
   Successfully updated credentials used by Enterprise Manager to connect to BI Publisher.

16.13 Managing the BI Publisher Server

BI Publisher operates as a separate, managed server in the same WebLogic domain that contains the OMS(s) and the AdminServer.

In order to shut down the BI Publisher managed server, do the following:

1. Log in to the AdminServer console as the WebLogic user with the correct password.
2. Click Servers.

3. Click the Control tab underneath the text Summary of Servers.

4. Place a check-mark next to the managed server BIP.

5. Double-check to make sure the check-mark is next to the BI Publisher managed server, as opposed to EMGS_OMSx or EMGC_ADMINSERVER managed servers.

6. Click Shutdown and choose when work completes.

7. Wait until BI Publisher has shut down. You can monitor the status of this operation by clicking on the refresh icon (the two arrows in a circle) above the text Customize this Table.

To start the BI Publisher managed server, do the following:

1. Navigate to the control page using steps 1-4 above.

2. Place a check-mark next to the managed server BIP.

3. Double-check to make sure the check-mark is next to the BI Publisher managed server and not the EMGS_OMSx or EMGC_ADMINSERVER managed servers.

4. Click Start.

5. Wait until BI Publisher has started. You can monitor the status of this operation by clicking on the refresh icon (the two arrows in a circle) above the text Customize this Table.
Part V
Deinstallation

In particular, this part contains the following chapters:

- Chapter 17, "Deinstalling Enterprise Manager Cloud Control"
- Chapter 18, "Deinstalling Oracle Management Agent"
- Chapter 19, "Deinstalling ADP and JVMD"
Deinstalling Enterprise Manager Cloud Control

This chapter describes how you can deinstall Enterprise Manager Cloud Control (the entire Enterprise Manager system, or one or more Oracle Management Services). In particular, this chapter covers the following:

- Prerequisites
- Deinstallation Procedure
- After You Deinstall

17.1 Prerequisites

Before you deinstall Enterprise Manager Cloud Control, follow these steps:

1. Deconfigure and delete Oracle Management Service (OMS):

   `$<OMS_HOME>/bin/omsca delete -full`

   **Note:** You are prompted to confirm your action, and furnish the AdminServer credentials and the repository database details such as the database host name, listener port, SID, and password. Once you provide the required details, the command automatically stops the OMS, Oracle WebLogic Server, and also Oracle WebTier.

2. Shut down Oracle Management Agent (Management Agent) by running the following command from the Management Agent home:

   `$<AGENT_HOME>/bin/emctl stop agent`

3. If you want to deinstall the entire Enterprise Manager system, including Oracle Management Repository (Management Repository) that is configured in your database, then follow these steps:

   a. Ensure that there are no SYSMAN users logged in.

   b. Drop the Enterprise Manager Cloud Control schema (SYSMAN schema) and the Metadata schema (MDS schema) from the Management Repository by running the following command from the OMS home:

      `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <database_host> <repository_database_port> <repository_database_sid> -action dropall -dbUser <repository_database_user> -dbPassword <repository_database_password> -dbRole`
17.2 Deinstallation Procedure

This section describes the following:

- Deinstalling in Graphical Mode
- Deinstalling in Silent Mode

17.2.1 Deinstalling in Graphical Mode

To deinstall Enterprise Manager Cloud Control in graphical mode, follow these steps:

**Note:** Deinstall the components in the order described in this procedure. Otherwise, the installation wizard displays an error.

1. Deinstall Oracle WebLogic Server 11g Release 1 (10.3.5) following the instructions outlined in the *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server*. See the chapter that describes how you can deinstall the software.

   The *Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server* is available in the Oracle WebLogic Server documentation library available at:

**Note:** Deinstall Oracle WebLogic Server 11g Release 1 (10.3.5) only if it was installed by the installation wizard while installing the Enterprise Manager system.

2. Invoke the installer from the OMS home by running the following command:

   ```
   $<OMS_HOME>/oui/bin/runInstaller -deinstall ORACLE_HOME=<absolute_path_to_oms_home> [-removeallfiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]
   ```

   **Note:**
   - You can invoke the installer even from the directory where you downloaded the software. For example, `<software_location>/`.
   - The `-invPtrLoc` parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.
   - When you run `runInstaller -help`, you will see the option `-nowarningonremovefiles` listed. This option is currently not supported and has no effect even if you use it.

3. In the installation wizard, on the My Oracle Support Details screen, click **Installed Products**.

4. On the Inventory screen, select the plug-in homes, and click **Remove**.

5. On the Inventory screen, select the `sbin` home, and click **Remove**.

6. On the Inventory screen, select the Java Development Kit (JDK) home, and click **Remove**.

   **Note:** Deinstall JDK only if it was installed by the installation wizard while installing the Enterprise Manager system. Otherwise, you can skip this step.
Deinstallation Procedure

Note: After deinstalling JDK, do NOT exit the installer. If you exit the installer inadvertently, then follow these steps:

1. Manually download and install JDK 1.6 v24+ on the OMS host. If you already have this supported version, then you can reuse it.
2. Invoke the installer again and pass the absolute path to the location where you have JDK:

   `$<OMS_HOME>/oui/bin/runInstaller -deinstall -jreLoc <JDK_HOME> [-removeallfiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]`

7. On the Inventory screen, select the Oracle WebTier home, and click Remove.
8. On the Inventory screen, select the following, and click Remove.
   - OMS home
   - Management Agent home
   - Oracle Common directory
9. On the Inventory screen, click Close to exit the wizard.
10. Manually delete the middleware home:
    - For UNIX platforms:
      ```
      rm -rf <absolute_path_to_middleware_home>
      ```
    - For Microsoft Windows platforms:
      ```
      del <absolute_path_to_middleware_home>
      ```

Note: If you see an error stating that the middleware home could not be deleted because of a long path, then shorten the middleware home name in one of the following ways:

   - Rename the middleware home to a short name.
     For example, change `C:\Oracle\Middleware` to `C:\OR\MW`.
   - Mount a drive to the middleware home path.
     For example, if `C:\Oracle\Middleware\oms\bin` is the directory that is causing an issue, then shorten the path in such a way that path length decreases to a reasonable extent (the file path limits differ from one operating system to another).

     Mount `C:\Oracle\Middleware\oms` to drive Z.

     - Navigate to drive Z, and deleted the files:
       ```
       prompt>Z:
       prompt>del bin
       ```
     - Navigate to the middleware home, and delete the leftover files:
       ```
       prompt:>C:
       prompt>del C:\Oracle\Middleware\oms\bin
       ```
Deinstallation Procedure

17.2.2 Deinstalling in Silent Mode

To deinstall Enterprise Manager Cloud Control in silent mode, follow these steps:

---

**Note:** Deinstall the components in the order described in this procedure. Otherwise, the installation wizard displays an error.

---

1. Deinstall Oracle WebLogic Server 11g Release 1 (10.3.5) following the instructions outlined in the Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server. See the chapter that describes how you can deinstall the software.

   The Oracle Fusion Middleware Installation Guide for Oracle WebLogic Server is available in the Oracle WebLogic Server documentation library available at:

   **Note:** Deinstall Oracle WebLogic Server 11g Release 1 (10.3.5) only if it was installed by the installation wizard while installing the Enterprise Manager system.

---

2. Deinstall the plug-in homes:

   ```
   $<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_plug-in_home}" ORACLE_HOME=<absolute_path_to_oms_home> [-removeallfiles -invPtrLoc <absolute_path_to_oraInst.loc>]
   ```

   **Note:**
   - You can invoke the installer even from the directory where you downloaded the software. For example, `<software_location>/`. If you invoke the installer from here, then do NOT pass -removeallfiles.
   - When you run runInstaller -help, you will see the option -nowarningonremovefiles listed. This option is currently not supported and has no effect even if you use it.
   - To deinstall multiple plug-ins, enter the plug-in homes separated by a comma.
   - The -invPtrLoc parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.

   For example,

   ```
   $<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES=/home/oracle/middleware/agent/plugins/oracle.sysman.ss.a.oms.plugin_12.1.0.1.0,/home/oracle/middleware/agent/plugins/oracle.sysman.emas.oms.plugin_12.1.0.1.0" ORACLE_HOME=/home/oracle/middleware/oms -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc
   ```
3. Deinstall the sbin home:

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_sbin_home}" ORACLE_HOME=<absolute_path_to_oms_home> [-removeAllFiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]
```

For example,

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES=/home/oracle/middleware/agent/sbin" ORACLE_HOME=/home/oracle/middleware/oms -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc
```

4. Deinstall the Java Development Kit (JDK) home:

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_jdk_home}" ORACLE_HOME=<absolute_path_to_oms_home> [-removeAllFiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]
```

For example,

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES=/home/oracle/middleware/jdk16" ORACLE_HOME=/home/oracle/middleware/oms -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc
```

**Note:** Deinstall JDK only if it was installed by the installation wizard while installing the Enterprise Manager system. Otherwise, you can skip this step.

5. Manually download and install JDK 1.6 v24+ on the OMS host. If you already have this supported version, then you can reuse it.

You must reinstall JDK because the installer has a dependency on it. The new JDK can be installed anywhere on the OMS host, not necessarily in the same location where it existed before. However, ensure that you pass the `-jreLoc` parameter (as described in the following steps) while invoking the installer to indicate the location where you have installed the JDK.

6. Deinstall the Oracle WebTier home:

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_web_tier}" -jreLoc <JDK_HOME> ORACLE_HOME=<absolute_path_to_oms_home> [-removeAllFiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]
```

For example,

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES=/home/oracle/middleware/Oracle_WT" -jreLoc /home/oracle/jdk ORACLE_HOME=/home/oracle/middleware/oms -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc
```

7. Deinstall the OMS, the Management Agent, and the Oracle Common directory:

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_oracle_homes_and_directories_to_be_deinstalled}" -jreLoc <JDK_HOME> ORACLE_HOME=<absolute_path_to_oms_home>
```

```bash
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={absolute_path_to_oracle_homes_and_directories_to_be_deinstalled}" -jreLoc <JDK_HOME> ORACLE_HOME=<absolute_path_to_oms_home>
```
to_oms_home> [-removeAllFiles] [-invPtr <absolute_path_to_oraInst.loc>]

---

**Note:** The argument REMOVE_HOMES accepts more than one path separated by a comma.

---

For example,

```
$<OMS_HOME>/oui/bin/runInstaller -deinstall -silent "REMOVE_HOMES={/home/oracle/middleware/oms,/home/oracle/middleware/agent/core/12.1.0.1.0,/home/oracle/middleware/oracle_common}" -jreLoc </home/oracle/jdk> ORACLE_HOME=/home/oracle/middleware/oms -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc
```

8. Manually delete the middleware home:

   For UNIX platforms:
   ```
   rm -rf <absolute_path_to_middleware_home>
   ```

   For Microsoft Windows platforms:
   ```
   del <absolute_path_to_middleware_home>
   ```

17.3 After You Deinstall

The Oracle homes you deinstalled are deregistered from the central inventory. However, some files might still remain in these Oracle homes. You might also see the OMS instance base directory and the Oracle home for Web Tier. You can manually delete these files and directories.

You must also manually delete the auto-start script titled S98gcstartup. To do so, navigate to the `/etc/rc.d/` directory, and search for the auto-start script `S98gcstartup`. This script is usually present in a subdirectory within the `/etc/rc.d/` directory. Navigate to the subdirectory where the script is found and delete the script. For example, `/etc/rc.d/rc3.d/S98gcstartup`. 
This chapter describes how you can deinstall Oracle Management Agent (Management Agent). In particular, this chapter covers the following:

- Prerequisites
- Deinstallation Procedure
- After You Deinstall

Note: On a cluster, ensure that you deinstall the Management Agents from all the nodes one by one. To do so, follow the instructions outlined in this chapter.

18.1 Prerequisites

Before you deinstall a Management Agent, do the following:

1. Shut it down by running the following command from the Management Agent home:

   `$<AGENT_HOME>/bin/emctl stop agent`

2. Wait for the Management Agent to go to the unreachable state in the Cloud Control console.

3. Delete the Management Agent targets and their monitored targets (from any host where EM CLI is installed):

   `emcli delete_target`
   `-name=*example.com:1836*`
   `-type="oracle_emd*`
   `-delete_monitored_targets`

Note: For information on EM CLI and instructions to set it up, see Oracle Enterprise Manager Command Line Interface Guide.

18.2 Deinstallation Procedure

This section describes the following:

- Deinstalling Oracle Management Agent in Graphical Mode
- Deinstalling Oracle Management Agent in Silent Mode
Deinstallation Procedure

- Deinstalling Shared Agent
- Deinstalling Oracle Management Agent Installed Using an RPM File

18.2.1 Deinstalling Oracle Management Agent in Graphical Mode

To deinstall a Management Agent in graphical mode, follow these steps:

---

**Note:** Deinstall the components in the order described in this procedure. Otherwise, the installation wizard displays an error.

---

1. Invoke the installer from the Management Agent home by running the following command:

   ```
   $<AGENT_HOME>/oui/bin/runInstaller -deinstall ORACLE_HOME=<absolute_path_to_agent_home> [-removeallfiles]
   [-invPtrLoc <absolute_path_to_oraInst.loc>]
   ```

   **Note:**

   - You can invoke the installer even from the directory where you downloaded the software. For example, `<software_location>/.
   
   - When you run `runInstaller -help`, you will see the option `-nowarningonremovefiles` listed. This option is currently not supported and has no effect even if you use it.
   
   - The `-invPtrLoc` parameter is supported only on UNIX platforms, and not on Microsoft Windows platforms.
   
   - For Microsoft Windows, invoke the `setup.exe` file.

   **Note:** When you invoke `runInstaller` or `setup.exe`, if the Enterprise Manager Cloud Control Installation Wizard does not appear, then it is possible that you do not access to the `/stage` directory.

   There is a classpath variable that the installation wizard computes for OPatch as `../stage/Components/`, and when the TEMP variable is set to `/tmp`, the installation wizard tries to look for the opatch JAR file in the `/tmp/../stage` directory, which is equivalent to `/stage`. However, if you do not have the permission on `/stage`, then the installation wizard can hang. Under such circumstances, verify if you have access to the `/stage` directory. If you do not have access to it, then set the TEMP variable to a location where the install user has access to, and then relaunch the installation wizard.

2. In the installation wizard, click **Installed Products**.

3. On the Inventory screen, select the plug-in homes, and click **Remove**.

4. On the Inventory screen, select the `sbin` home, and click **Remove**.

5. On the Inventory screen, select the Management Agent, and click **Remove**.
6. Manually delete the agent base directory. For information on installation base
directory, see Section 2.3.5.
   For UNIX platforms:
   \texttt{rm -rf <absolute_path_to_agent_base_dir>}
   For Microsoft Windows platforms:
   \texttt{del <absolute_path_to_agent_base_dir>}

18.2.2 Deinstalling Oracle Management Agent in Silent Mode

This section describes the following methods to deinstall the Management Agent in
silent mode:

- **Deinstalling in Silent Mode Using the Installer**
- **Deinstalling in Silent Mode Using AgentDeinstall.pl Script**

18.2.2.1 Deinstalling in Silent Mode Using the Installer

To deinstall a Management Agent in silent mode using the installer, follow these steps:

\begin{itemize}
  \item \textbf{Note:} Deinstall the components in the order described in this
  procedure. Otherwise, the installation wizard displays an error.
\end{itemize}

1. Deinstall the plug-in homes:

   \texttt{$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
   *REMOVE_HOMES={absolute_path_to_plug-in_home}" ORACLE_HOME=<absolute_path_to_agent_home>
   [-removeallfiles]
   [-invPtrLoc <absolute_path_to_oraInst.loc>]
   }

   \begin{itemize}
   \item When you run \texttt{runInstaller -help}, you will see the option
   \texttt{-nowarningonremovefiles} listed. This option is currently not
   supported and has no effect even if you use it.
   \item On Microsoft Windows, invoke the \texttt{setup.exe} file.
   \item The \texttt{-invPtrLoc} parameter is supported only on UNIX
   platforms, and not on Microsoft Windows platforms.
   \item To deinstall multiple plug-ins, enter the plug-in homes separated
   by a comma.
   \end{itemize}

   For example,

   \texttt{$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
   *REMOVE_HOMES={/home/oracle/agent/plugins/oracle.sysman.emas.oms.plugin_12.1.0.1.0,
   /home/oracle/agent/plugins/oracle.sysman.emct.oms.plugin_12.1.0.1.0}" ORACLE_HOME=/home/oracle/middleware/agent/core/12.1.0.1.0
   -removeAllFiles -invPtrLoc /home/oracle/oraInst.loc}

2. Deinstall the \texttt{sbin} home:
Deinstallation Procedure

$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
"REMOVE_HOMES={absolute_path_to_sbin_directory}" ORACLE_HOME=<absolute_path_to_agent_home> [-removeAllFiles] [-invPtrLoc <absolute_path_to_oraInst.loc>]

For example,

$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
"REMOVE_HOMES={/home/oracle/agent/sbin}" ORACLE_HOME=/home/oracle/middleware/agent/core/12.1.0.1.0
-removeAllFiles -invPtrLoc /home/oracle/oraInst.loc

3. Deinstall the Management Agent:

$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
"REMOVE_HOMES={absolute_path_to_oracle_home}" ORACLE_HOME=<absolute_path_to_agent_home> -removeAllFiles -invPtrLoc <absolute_path_to_oraInst.loc>

For example,

$<AGENT_HOME>/oui/bin/runInstaller -deinstall -silent
"REMOVE_HOMES={/home/oracle/core/12.1.0.1.0}" ORACLE_HOME=/home/oracle/middleware/agent/core/12.1.0.1.0
-removeAllFiles -invPtrLoc /home/oracle/oraInst.loc

4. Manually delete the agent base directory. For information on agent base directory, see Section 2.3.5.

For UNIX platforms:

rm -rf <absolute_path_to_install_base_dir>

For Microsoft Windows platforms:

del <absolute_path_to_install_base_dir>

18.2.2.2 Deinstalling in Silent Mode Using AgentDeinstall.pl Script

To deinstall a Management Agent in silent mode using the AgentDeinstall.pl script, follow these steps:

1. Invoke the AgentDeinstall.pl script:

$<AGENT_HOME>/perl/bin/perl <AGENT_HOME>/sysman/install/AgentDeinstall.pl -agentHome <AGENT_HOME>

Note: The AgentDeinstall.pl script is available only after you apply the Bundle Patch 1 released in February 2012.

For example,

$/u01/app/Oracle/core/12.1.0.1.0/perl/bin/perl
/u01/app/Oracle/core/12.1.0.1.0/sysman/install/AgentDeinstall.pl -agentHome /u01/app/Oracle/core/12.1.0.1.0/

2. Manually remove the targets, which were being monitored by the Management Agent you deinstalled, from the Enterprise Manager Cloud Control console.

3. Manually delete the agent base directory. For information on agent base directory, see Section 2.3.5.
For UNIX platforms:
```
rm -rf <absolute_path_to_install_base_dir>
```
For Microsoft Windows platforms:
```
del <absolute_path_to_install_base_dir>
```

### 18.2.3 Deinstalling Shared Agent

To deinstall a Shared Agent, run the following command from the Master Agent home that is visible on the host where your Shared Agent is installed:
```
$<AGENT_HOME>/perl/bin/perl  <AGENT_HOME>/sysman/install/NFSAgentDeInstall.pl AGENT_INSTANCE_HOME=<absolute_path_to_agent_instance_home> ORACLE_HOME=<absolute_path_to_agent_home>
```
For example,
```
/home/john/software/oracle/agent/core/12.1.0.1.0/perl/bin/perl /home/john/software/oracle/agent/core/12.1.0.1.0/sysman/install/NFSAgentDeInstall.pl AGENT_INSTANCE_HOME=/home/john/software/oracle/agent/agent_inst ORACLE_HOME=/home/john/software/oracle/agent/core/12.1.0.1.0
```

**Note:** If you encounter an error while deinstalling the Shared Agent, then refer to Section E.3.

### 18.2.4 Deinstalling Oracle Management Agent Installed Using an RPM File

To deinstall a Management Agent that was installed using a `.rpm` file, follow these steps:

1. Deinstall the Management Agent as described in one of the following sections:
   - To deinstall in graphical mode, see Section 18.2.1.
   - To deinstall in silent mode, see Section 18.2.2.
2. Run the following command as a root user:
   ```
rpm -e <rpm_name>
```

**Note:** As a prerequisite, ensure that you have Resource Package Manager (RPM) installed on the host.

### 18.3 After You Deinstall

After you deinstall the Management Agent, follow these steps:

1. *(Only for Graphical Mode)* Verify whether the Oracle homes and other directories were successfully deinstalled. To do so, follow these steps:
   a. Invoke the installation wizard by running the following command from the Management Agent home:
   ```
   $<AGENT_HOME>/oui/bin/runInstaller
   ```
After You Deinstall

**b.** In the installation wizard, on the My Oracle Support Details screen, click **Installed Products**.

**c.** On the Inventory screen, check whether or not the Oracle homes and other directories you deinstalled appear. If the deinstallation was successful, then those Oracle homes and directories should not appear.

2. The Oracle homes you deinstalled are deregistered from the central inventory. However, some files might still remain in these Oracle homes. If they do, you can manually delete them.

You must also manually delete the auto-start script titled S98gcstartup. To do so, navigate to the `/etc/rc.d/` directory, and search for the auto-start script `S98gcstartup`. This script is usually present in a subdirectory within the `/etc/rc.d/` directory. Navigate to the subdirectory where the script is found and delete the script. For example, `/etc/rc.d/rc3.d/S98gcstartup`.

**Note:** These auto-start scripts are not available on Microsoft Windows.

3. If you deinstalled on a Microsoft Windows platform, then follow these steps. Ensure that you are logged in as a user with Administrator privileges on that host.

**Remove Entries from Microsoft Windows Registry**

**a.** Start the registry editor by selecting **Start** and then **Run**. Type `regedit` and click **OK**.

**b.** In the Registry Editor window, in the left pane, expand **HKEY_LOCAL_MACHINE**, **SOFTWARE**, and then **Oracle**. Under the **Oracle** directory, delete the following:
   (a) KEY_agent12g
   (b) KEY_sbin12g

**Note:** Here, *n* refers to a numeral indicating the agent instance. For example, `KEY_sbin12g9` for the first agent installation.

**c.** Expand **HKEY_LOCAL_MACHINE**, **SOFTWARE**, **Oracle**, and then **Sysman**. Under the **Sysman** directory, delete the Management Agent service. For example, `Oracleagent12g9Agent`.

**d.** Expand **HKEY_LOCAL_MACHINE**, **SYSTEM**, **CurrentControlSet**, and then **Services**. Under the **Services** directory, delete the Management Agent keys.

**e.** Expand **HKEY_LOCAL_MACHINE**, **SYSTEM**, **ControlSet002**, and then **Services**. Under the **Services** directory, delete the Management Agent service.

**f.** Close the registry editor.

**Clean Up Environment Settings**

1. Open the Environment Variables window.
On Microsoft Windows NT, select Start, Settings, Control Panel, System, and then Environment.

On Microsoft Windows XP or 2000, select Start, Settings, Control Panel, System, Advanced, and then Environment Variables.

2. In the System Variables section, click the variable PATH and modify the value.
3. Delete Management Agent home.
4. Click Apply and then click OK.
5. Close the Control Panel window.
6. Restart the host.
This chapter describes how you can deinstall Application Dependency and Performance (ADP), and JVM Diagnostics (JVMD) in the Enterprise Manager Cloud Control environment.

In particular, this chapter covers the following:

- Deinstallation Procedure for ADP
- Deinstallation Procedure for JVMD

19.1 Deinstallation Procedure for ADP

The section contains the following topics:

- Deinstalling ADP Manager
- Deinstalling ADP Agents

19.1.1 Deinstalling ADP Manager

To remove the ADP Manager application running on the Managed Server, perform the following steps:

1. In Cloud Control, from the Targets menu, select Middleware.
2. On the Middleware page, from Middleware Features menu, select Application dependency and Performance.
   
   The Application dependency and Performance is displayed.
3. From the Registration tab, select the ADP manager application, and click Remove.
4. Log in to WebLogic Administration Console of Enterprise Manager Domain.
5. On the Home Page, click Servers.
6. From the Summary of Servers page, click Control tab, then select the ADP Manager Servers.
7. From the Shutdown menu, select Force Shutdown Now to stop the servers.
8. Click the Configuration tab, select ADP Manager Servers, then click Delete.
9. Undeploy the ADP applications. For example, ADPManager_EMGC_ADPMANAGER1 for ADP.
10. Connect to the host machine where the Managed Server was present, and navigate to the following location to manually delete the Managed Server:

    $DOMAIN_HOME/<ADP Managed Server>
19.1.2 Deinstalling ADP Agents

To remove the agents which are deployed to the ADP Manager, perform the following steps:

1. In Cloud Control, from Targets menu, select Middleware.
2. On the Middleware page, from Middleware Features menu, select Application dependency and Performance.
   The Application dependency and Performance is displayed.
3. From the Configuration tab, select the desired ADP Manager application on which the agent(s) have been deployed.
4. Expand the ADP Manager menu, select Resource Configuration.
5. From the Resource table, select the agent name, and click Edit Resource, and then click Deploy.
6. From the Deploy Parameters table, select the servers to undeploy the agent. Change the default menu select from Deploy to:
   - Remove, to erase all the agent files from the application servers.
   - Disable, to remove the agent startup arguments from the application servers.

Note: Select the Server Started by Node Manager option only when the node manager is used.

19.2 Deinstallation Procedure for JVMD

This section contains the following:

- Deinstalling JVMD Managers
- Deinstalling JVMD Agents

19.2.1 Deinstalling JVMD Managers

To remove the JVMD Manager application running on the Managed Server, perform the following steps:

1. Log in to WebLogic Administration console.
2. On the Home Page, click Deployments.
3. Select the JVMD application (jammanagerEMGC_JVMDMANAGER1), from Stop menu, select Force Stop Now.
4. After they are stopped, select the same applications, and click Delete.
5. Click Home to go back to the WebLogic Administration home page. From the Environment table, select Servers.
6. From the Summary of Servers page, click Control tab, then select the JVMD Manager Servers that need to be shut down.
7. From the Shutdown menu, select Force Shutdown Now to stop the servers.
8. Click the Configuration tab, select JVMD Manager Servers, then click Delete.
19.2.2 Deinstalling JVMD Agents

To remove the agents which are deployed to the JVMD Manager, perform the following steps:

1. Log in to the Domain Administration Console of the target server.
2. On the Home Page, click Deployments.
3. Select the JVMD Agent application (javadiagnosticagent<servername>.ear or jamagent.ear), from Stop menu, select Force Stop Now.
4. After they are stopped, select the same applications, and click Delete.
5. Log in to Enterprise Manager Cloud Control.
6. In Cloud Control, from Targets menu, click Middleware.
7. On the Middleware page, in the Search table, search for targets of type Java Virtual Machine, select the target corresponding to the server, and click Remove.
This part contains the following appendixes:

- Appendix A, "Using RepManager Utility"
- Appendix B, "Installation and Configuration Log Files"
- Appendix C, "Collecting OCM Data Using Oracle Harvester"
- Appendix E, "Troubleshooting"
This appendix describes the RepManager utility. In particular, this appendix covers the following:

- Overview
- Supported Actions and Commands

A.1 Overview

RepManager is a utility that enables you to upgrade and drop Oracle Management Repository, selectively purge plug-ins, and load dlif messages to Oracle Management Repository. This utility is available in the Oracle Management Service (OMS) home:

For UNIX operating systems:

`$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager`

For Microsoft Windows operating systems:

`$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager.bat`

This utility is invoked by Repository Configuration Assistant while installing a complete Enterprise Manager system, and by Repository Upgrade Configuration Assistant while upgrading to Enterprise Manager Cloud Control. For information about these Configuration Assistants, see Section 2.5.1.

**Note:** If you want to drop the Enterprise Manager schema completely, then use the RepManager available in the OMS home. Do not use the one in database home because it cannot remove the Enterprise Manager schema completely.

A.2 Supported Actions and Commands

Table A–1 shows the list of actions and their associated commands supported by the RepManager utility.
<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| preupgrade | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -dbUser sys -dbPassword <sys_password> -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> -action preupgrade [-mwHome <middleware home>] -pluginDepList *<pluginid1>=<pluginid1 home>,<pluginid2>=<pluginid2 home> -dlfSources "<oms home>,<plugin1 home>,<plugin2home>"` | Use this action to perform steps before upgrading an Oracle Management Repository with the following parameters:  
  - Specify the host, port, and SID to connect to Oracle RDBMS where Oracle Management Repository is to be upgraded.  
  - Specify the database user and password, repository name (SYSMAN) and password for SYSMAN user, and middleware home to upgrade the Oracle Management Repository.  
  - Specify the comma-separated list of plugin-information according to dependency to be deployed. You can pass a file with this option, the contents being the comma-separated list of plugin-information according to dependency to be deployed. If the pluginDepList is missing or has a value of empty list i.e. "[]", `$<OMS_HOME>/sysman/admin/emdrep/plugininfo/pluginDepList` is read, by default, to get plugin dependency list.  
  - Specify the comma-separated locations for DLF files from platform/plugins. You can pass a file with this option, the contents being the comma-separated locations for DLF files from platform/plugins. If the dlfSources option is missing or has a value of empty list i.e., "[]", `$<OMS_HOME>/sysman/admin/emdrep/plugininfo/dlfSources` is read, by default, to get dlf resource locations. If this option is missing and default dlfSources file is not present, only dlf files for platform will be picked. If this is present, only the DLFs under these sources will be picked up. | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -dbUser sys -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> preupgrade -mwHome /scratch/weblogic/middleware -pluginDepList <pluginid1>=<pluginid1 home>,<pluginid2>=<pluginid2 home>`                       |

</thead>
</table>
| upgrade | `!\(<!OMS_HOME!/sysm/an/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -dbUser sys -dbPassword <sys password> -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> -action upgrade [-mwHome <middleware home>] -pluginDepList "<pluginid1>=<pluginid1 home>,<pluginid2>=<pluginid2 home>,<pluginid3>=<pluginid3 home>,<pluginid4>=<pluginid4 home>,<pluginid5>=<pluginid5 home>"` | Use this action to upgrade an Oracle Management Repository with the following parameters:  
- Specify the host, port, and SID to connect to Oracle RDBMS where Oracle Management Repository is to be upgraded.  
- Specify the database user and password, repository name (SYSMAN) and password for SYSMAN user, and middleware home to upgrade the Oracle Management Repository.  
- Specify the comma-separated list of plugin-information according to dependency to be deployed. You can pass a file with this option, the contents being the comma-separated list of plugin-information according to dependency to be deployed. If the pluginDepList is missing or has a value of empty list i.e. "[]", `$<!OMS_HOME!/sysman/admin/emdrep/plugininfo/pluginDepList` is read, by default, to get plugin dependency list.  
- Specify the comma-separated locations for DLF files from platform/plugins. You can pass a file with this option, the contents being the comma-separated locations for DLF files from platform/plugins. If the dlfSources option is missing or has a value of empty list i.e. "[]", `$<!OMS_HOME!/sysman/admin/emdrep/plugininfo/dlfSources` is read, by default, to get dlf resource locations. If this option is missing and default dlfSources file is not present, only dlf files for Platform would be picked. If this is present, only the DLFs under these sources will be picked up. | `$<!OMS_HOME!/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -dbUser sys -dbRole sysdba -reposName sysman -action upgrade -mwHome /scratch/weblogic/middleware -pluginDepList <pluginid1>=<pluginid1 home>,<pluginid2>=<pluginid2 home>,<pluginid3>=<pluginid3 home>,<pluginid4>=<pluginid4 home>,<pluginid5>=<pluginid5 home>` |

**Note:** Run preupgrade before performing upgrade action.
### Table A–1 (Cont.) Actions and Commands Supported by RepManager

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| transX | `<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -reposName sysman -reposPassword <password of sysman user> -action transx [-mwHome <middleware home>] -dlfSources "<oms home>,<plugin1 home>,<plugin2home>" | Use this action to load the translation resources to the Oracle Management Repository with the following parameters:  
- Specify the host, port, and SID to connect to Oracle RDBMS to load translation resources to Oracle Management Repository.  
- Specify the database user and password, repository name (SYSMAN) and password for SYSMAN user, and middleware home to load translation resources to Oracle Management Repository.  
- Specify the comma-separated locations for DLF files from platform/plugins. You can pass a file with this option, the contents being the comma-separated locations for DLF files from platform/plugins. If the dlfSources option is missing or has a value of empty list i.e. "[]", `$<OMS_HOME>/sysman/admin/emdrep/plugininfo/dlfSources` is read, by default, to get dlf resource locations. If this option is missing and default dlfSources file is not present, only dlf files for Platform would be picked. If this is present, only the DLFs under these sources will be picked up. | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -reposName sysman -action transx -mwHome /scratch/Weblogic/middleware/oms/sysman` |
| resume | `<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -dbUser sys -dbPassword <syspassword> -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> -resume retry -checkpointLocation <directory where schemamanager stores checkpoints> [-mwHome <middleware home>] | Use this action to resume the last failed action, for example, upgrade.  
- Specify the host, port, and SID to connect to Oracle RDBMS where the action is to be resumed.  
- Specify the database user and password, repository name (SYSMAN) and password for SYSMAN user, and middleware home where the action is to be resumed.  
- Specify the location at which to resume the step. The checkpoint location is `$<OMS_HOME>/sysman/log/schemamanager`. | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -dbUser sys -dbRole sysdba -reposName sysman -resume retry -checkpointLocation /scratch/weblogic/middleware/oms/sysman/log/schema manager -mwHome /scratch/weblogic/middleware` |
### Table A–1 (Cont.) Actions and Commands Supported by RepManager

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| drop    | Use this action to drop the SYSMAN schema as follows:  
- Specify the host, port, and SID to connect to Oracle RDBMS from which the SYSMAN schema is to be dropped.  
- Specify the database user and password, repository name (SYSMAN) and password for the SYSMAN user, and middleware home. | `<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -dbUser sys -dbPassword <sys password> -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> -action drop [-mwHome /scratch/weblogic/middleware]` | `emctl stop oms -all on all OMSes.` |
Use this action to remove all Enterprise Manager repository schemas as follows:

- Specify the host, port, and SID to connect to Oracle RDBMS from which all schemas are to be dropped.
- Specify the database user and password, repository name (SYSMAN) and password for SYSMAN user, and middleware home.

### Table A–1 (Cont.) Actions and Commands Supported by RepManager

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td>dropall</td>
<td><code>$&lt;OMS_HOME&gt;/sysman/admin/emdrep/bin/RepManager &lt;repository_database_host&gt; &lt;repository_database_port&gt; &lt;repository_database_sid&gt; -dbUser sys -dbPassword &lt;sys_password&gt; -dbRole sysdba -reposName sysman -reposPassword &lt;password of sysman user&gt; -action dropall [-mwHome &lt;middleware home&gt;] [-mwOraHome &lt;Oracle Home&gt;]</code></td>
<td>Use this action to remove all Enterprise Manager repository schemas as follows:</td>
<td><code>$&lt;OMS_HOME&gt;/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -dbUser sys -dbRole sysdba -reposName sysman -action dropall -mwHome /scratch/weblogic/middleware -mwOraHome /scratch/weblogic/middleware</code></td>
</tr>
</tbody>
</table>

**Note:** Ensure that there are no active sessions for SYSMAN, SYSMAN_MDS, SYSMAN_OPSS, and SYSMAN_APM. To ensure this, stop the OMS using the command `emctl stop oms -all` on all OMSes.

**Note:** If BI Publisher (BIP) had been installed and configured, then BIP should be stopped using the Admin Server before running this command.
Table A–1 (Cont.) Actions and Commands Supported by RepManager

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| pluginpurge  | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -dbUser sys -dbPassword <sys password> -dbRole sysdba -reposName sysman -reposPassword <password of sysman user> -action pluginpurge -pluginPurgeList "<plugin_name>=<plugin_location>" [-mwHome <middleware home>] -mwOraHome <Oracle Home>` | Use this action to deinstall a plug-in from the repository as follows:  
  - Specify the host, port, and SID to connect to Oracle RDBMS from which the plug-in is to be deinstalled.  
  - To specify the comma-separated list of plug-in-information to be purged from Enterprise Manager Repository with EM-EXT model. | `$<OMS_HOME>/sysman/admin/emdrep/bin/RepManager example.com 1521 db3 -dbUser sys -dbRole sysdba -reposName sysman -action pluginpurge -pluginPurgeList *oracle.sysman.myemwpxax.oms.plugin_12.1.0.1.0=/scratch/weblogic/middleware/oracle.sysman.myemwpxax.oms.plugin_12.1.0.1.0 -mwHome /scratch/weblogic/middleware` |

**Note:** RepManager 12.1 and 11.1 support "-action dropall" (drops users SYSMAN, SYSMAN_BIP, SYSMAN_MDS, SYSMAN_APM, BIP, and SYSMAN_OPSS in 12g, drops users SYSMAN and SYSMAN_MDS in 11g) and "-action drop" (drops only SYSMAN). However, RepManager 10.2.0.5 supports only "-action drop" (drops only SYSMAN, the only users associated with the repository in this version).

**Note:** If you do not specify passwords during RepManager actions, you will be prompted to do so.
This appendix lists the locations of the various log files that are created during the prerequisites check, installation, and configuration phases of Enterprise Manager Cloud Control components.

In particular, this appendix covers the following:
- Enterprise Manager Cloud Control Installation Logs
- Add Host Log Files

### B.1 Enterprise Manager Cloud Control Installation Logs

This section describes the following log files that are created while installing Enterprise Manager Cloud Control:
- Installation Logs
- Configuration Logs

#### B.1.1 Installation Logs

The following are the installation logs, which provide complete information on the installation status:
- `oraInventory/logs/installActions<timestamp>.log`
- `<ORACLE_HOME>/cfgtoollogs/oui/installActions<timestamp>.log`

**Note:** The `installActions` log file is located in the `oraInventory` directory by default. This log file will be copied on to the above-mentioned Oracle home location after the installation is complete.

#### B.1.2 Configuration Logs

This section describes the following configuration logs:
- General Configuration Logs
- Repository Configuration Logs
- Secure Logs
B.1.2.1 General Configuration Logs
The Oracle Management Service (OMS) configuration logs are located in the following location of the Oracle home of the OMS.

<ORACLE_HOME>/cfgtoollogs/omsca

Table B–1 lists the configuration logs for different installation types.

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install a new or Upgrade Enterprise Manager system</td>
<td>- &lt;ORACLE_HOME&gt;/cfgtoollogs/CfmLogger</td>
</tr>

<td>&lt;ORACLE_HOME&gt; refers to the Oracle home of the Management Agent.</td>
</tr>
</tbody>
</table>

B.1.2.2 Repository Configuration Logs
This section describes the following repository configuration logs:

- SYSMAN Schema Operation Logs
- MDS Schema Operation Logs

B.1.2.2.1 SYSMAN Schema Operation Logs
The SYSMAN schema operation logs are available in the following location of the Oracle home of the OMS. Listed in this directory is an overall log file, emschema.log, which logs all the actions performed by all the instances of RepManager run.

$<ORACLE_HOME>/sysman/log/schemanager/

In this location, for each run of RepManager, a new subdirectory is created based on the time at which the RepManager was run.

For example, if the RepManager was run and an instance was created at 09/29/2007 12:50PM, then the following subdirectory is created.

$<ORACLE_HOME>/sysman/log/schemanager/m_092907_1250_PM/

An instance of RepManager (or equivalently RepManager) can have multiple schema actions, mainly CREATE, DROP, UPGRADE, TRANSX, and RESUME_RETRY. For each action, a subdirectory is created.

For example, if a CREATE action is performed by a RepManager instance at 09/29/2006 12:51PM, then the following subdirectory is created. Listed under this
subdirectory are RCU-related log files and emschema.log.CREATE log file that logs the CREATE action-specific messages.

$<ORACLE_HOME>/sysman/log/schemamanager/m_092907_1250_PM/m_092907_1251_PM.CREATE/

In general, in $<ORACLE_HOME>/sysman/log/schemamanager/m_<time-stamp>/m_<time-stamp>.<schema-action>, the following files are created:

- RCU per component (i.e. init, common, modify, drop, config, outofbox, preupgrade log
- RCU log
- Schema action-specific RCU logs
- TransX action-specific log (emrep_config.log)

If the any of the schema operations (CREATE/UPGRADE/PREUPGRADE/DROP) fail in SQL execution, and if you retry the operation by clicking Retry, then a separate subdirectory titled m_<time-stamp>.RESUME_RETRY is created.

The following shows the overall directory structure of repository operation logs for different schema actions:

$<ORACLE_HOME>/sysman/log/schemamanager
  emschema.log
  m_030210_0349_AM
    m_030210_0325_AM.TRANSX
      emrep_config.log
      emschema.log.TRANSX
    m_030210_0438_AM
      m_030210_0438_AM.DROP (Same structure for Drop and Dropall actions)
        rcu.log
        emschema.log.DROP
        em_repos_drop.log
      m_030210_0450_AM
        m_030210_0450_AM.CREATE
          custom_comp_create_tbs.log
          em_repos_common.log
          em_repos_init.log
          emrep_config.log.3
          emrep_config.log.2
          emrep_config.log.1
          emrep_config.log
          emschema.log
          rcu.log
          emschema.log.CREATE
          em_repos_config.log
    m_030210_1006_PM
      m_030210_1006_PM.RESUME_RETRY
        emrep_config.log.3
        emrep_config.log.2
        emrep_config.log.1
        emrep_config.log
        emschema.log
        rcu.log
        emschema.log.RESUME_RETRY
        em_repos_modify.log
  m_030210_1021_PM
    m_030210_1021_PM.UPGRADE
      em_repos_init.log
B.1.2.2.2 EMPrereqKit Logs

For EMPrereqKit, the logs are available at the `<oraInventoryLoc>/logs/` location. The details of execution of the prerequisites per prerequisite components location is available at:

`<oraInventoryLoc>/logs/emdbprereqs/LATEST/repository.log` or `emprereqkit.log`

The details of execution of the EMPrereqkit is available at:

`<oraInventoryLoc>/logs/emdbprereqs/LATEST/emprereqkit.log`

The errors are located at

`<oraInventoryLoc>/logs/emdbprereqs/LATEST/emprereqkit.err.log`

B.1.2.2.3 MDS Schema Operation Logs

**MDS Schema Creation Log**

For MDS schema creation operation, the following log is available in the Oracle home of the OMS:

`$<ORACLE_HOME>/cfgtoollogs/cfgfw/emmdscreate_<timestamp>.log`

For more information, review the following logs from the Oracle home of the OMS:

`$<ORACLE_HOME>/sysman/log/schemamanager/m_<timestamp>/m_<timestamp>.CREATE/mds.log`

`$<ORACLE_HOME>/sysman/log/schemamanager/m_<timestamp>/m_<timestamp>.CREATE/rcu.log`

**MDS Schema Drop Logs**
For MDS schema drop operation, the following logs are available in the location you specified by using the -logDir argument while invoking the MDS schema drop command:

$<user_specified_location>/mds.log
$<user_specified_location>/emmdsdrop_<timestamp>.log

However, if you did not specify any custom location while invoking the MDS schema drop command, then the logs are created in the Oracle home of the OMS. For example, 
/scratch/OracleHomes/oms12c/mds.log and 
/scratch/OracleHomes/oms12c/emmdsdrop_<timestamp>.log.

B.1.2.3 Secure Logs

For OMS, the following secure log is available in the OMS Instance Base location. Here, <oms_name>, for example, can be EMGC_OMS1.

<OMS_INSTANCE_HOME>/em/<oms_name>/sysman/log/secure.log

For Management Agents, the following secure log is available in the Oracle home of the Management Agent.

<Agent_Instance_Home/sysman/log/secure.log

B.1.2.4 Oracle Management Service Logs

The following log files that provide information about the running OMS are available in the OMS Instance Base location. Here, <oms_name>, for example, can be EMGC_OMS1.

<OMS_INSTANCE_HOME>/em/<oms_name>/sysman/log/emoms.trc
<OMS_INSTANCE_HOME>/em/<oms_name>/sysman/log/emoms.log

B.2 Add Host Log Files

This section describes the locations for the following Add Host log files:

- Initialization Logs
- Application Prerequisite Logs
- System Prerequisite Logs
- Agent Installation Logs
- Other Add Host Logs

B.2.1 Initialization Logs

Table B–2 lists the initialization logs of the remote host and their locations. Note that <ORACLE_HOME> mentioned in this table refer to the Oracle home of the OMS.

<table>
<thead>
<tr>
<th>Log File</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;hostname&gt;_&lt;deploy.log</td>
<td>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;timestamp&gt;/applogs</td>
</tr>
</tbody>
</table>
B.2.2 Application Prerequisite Logs

Table B–3 lists the application prerequisite logs and their locations. Note that `<ORACLE_HOME>` mentioned in this table refer to the Oracle home of the OMS, and the `<install_type>` mentioned in this table refer to one of the installation types mentioned in Table B–4.

Table B–3 Prerequisite Logs

<table>
<thead>
<tr>
<th>Log File</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>prereq&lt;time_stamp&gt;.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/&lt;install_type&gt;_logs/&lt;hostname&gt;/</code></td>
</tr>
<tr>
<td>prereq&lt;time_stamp&gt;.out</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/&lt;install_type&gt;_logs/&lt;hostname&gt;/</code></td>
</tr>
<tr>
<td>prereq&lt;time_stamp&gt;.err</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/&lt;install_type&gt;_logs/&lt;hostname&gt;/</code></td>
</tr>
</tbody>
</table>

Table B–4 Install Types

<table>
<thead>
<tr>
<th>Install Type</th>
<th>Description</th>
<th>Target Operating System Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>emagent_install</td>
<td>New Agent Installation</td>
<td>UNIX</td>
</tr>
<tr>
<td>emagent_clone</td>
<td>Agent Cloning</td>
<td>UNIX</td>
</tr>
<tr>
<td>nfs_install</td>
<td>Shared Agent Installation</td>
<td>UNIX</td>
</tr>
</tbody>
</table>

B.2.3 System Prerequisite Logs

Table B–5 lists the system prerequisite logs and their locations. Note that `<ORACLE_HOME>` mentioned in this table refer to the Oracle home of the OMS.

Table B–5 System Prerequisite Logs

<table>
<thead>
<tr>
<th>Log File</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>prereq&lt;time_stamp&gt;.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/productprereq_logs/&lt;hostname&gt;/</code></td>
</tr>
<tr>
<td>prereq&lt;time_stamp&gt;.out</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/productprereq_logs/&lt;hostname&gt;/</code></td>
</tr>
<tr>
<td>prereq&lt;time_stamp&gt;.err</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/prereqlogs/productprereq_logs/&lt;hostname&gt;/</code></td>
</tr>
</tbody>
</table>

B.2.4 Agent Installation Logs

Table B–6 lists the agent installation logs and their locations. Note that `<ORACLE_HOME>` mentioned in this table refer to the Oracle home of the OMS.
B.2.5 Other Add Host Logs

Table B–6 Agent Installation Logs

<table>
<thead>
<tr>
<th>Log File</th>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>install.log/.err</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/logs/&lt;hostname&gt;</code></td>
<td>Fresh and Cloned Agent install logs</td>
</tr>
<tr>
<td>nfs_install.log/.err</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/logs/&lt;hostname&gt;</code></td>
<td>Shared Agent installation logs</td>
</tr>
<tr>
<td>cfgfw/*.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/cfgtoollogs/&lt;hostname&gt;</code></td>
<td>Agent Configuration logs</td>
</tr>
</tbody>
</table>

Table B–7 Other Add Host Logs

<table>
<thead>
<tr>
<th>Logs</th>
<th>Location</th>
<th>Description</th>

<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/logs/</code></td>
<td>Agent Deploy application logs.</td>
</tr>
<tr>
<td>remoteInterfaces&lt;TIMESTAMP&gt;.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/logs/</code></td>
<td>Logs of the remote interfaces layer.</td>
</tr>
<tr>
<td>deployfwk.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/applogs/</code></td>
<td>Add Host Deployment Framework logs</td>
</tr>
<tr>
<td>ui.log</td>
<td><code>&lt;ORACLE_HOME&gt;/sysman/prov/agentpush/&lt;time-stamp&gt;/applogs/</code></td>
<td>Add Host User Interface logs.</td>
</tr>
</tbody>
</table>
Collecting OCM Data Using Oracle Harvester

My Oracle Support provides a key set of features and functionality that greatly enhance the customer’s interaction with Oracle Support. My Oracle Support streamlines the Service Request submission process by providing in-context information specific to a customer’s configurations, as well as proactive support. To enable these features within My Oracle Support, the customer’s configuration information must be uploaded to Oracle. When the configuration data is uploaded on a regular basis, customer support representatives can analyze this data and provide better service to customers.

The following mechanisms are provided to customers for collecting and uploading configuration data to Oracle.

■ Oracle Enterprise Manager Harvester (Oracle Harvester)
■ Oracle Configuration Manager (OCM)

In particular:

■ When installing any product, the first screen asks for My Oracle Support credentials. THIS IS A PIVOTAL SCREEN in the installation. The user name and password that you provide are the credentials against which the configuration data is uploaded to Oracle.

■ Configuration collections run and the configuration data is uploaded to Oracle every 24 hours.

■ Once the data is uploaded, it can be viewed by logging into My Oracle Support (https://support.oracle.com) using the same credentials supplied during product installation.

Note: If you use Enterprise Manager to manage your applications, we recommend that you use Oracle Harvester to upload your configurations to Oracle. Otherwise, use OCM.

C.1 Oracle Harvester

Oracle Harvester only harvests data for targets that are managed by Enterprise Manager. Because Oracle Harvester has the same OCM dependencies, Oracle Harvester enables the gathering of target configuration data by leveraging Enterprise Manager collection methods thus precluding the need to install OCM on target homes managed by Oracle Harvester.

Highlights of Oracle Harvester

The following are highlights of Oracle Harvester:
Data is uploaded by default against the same credentials with which OCM in the Oracle Management Service (OMS) home is configured.

- Requires OCM to be configured and running in the OMS home for Enterprise Manager.
- Gathers target configuration data from the Management Repository
- Automatically runs periodically so no user intervention is required

**Oracle Harvester and OCM**

When you install Enterprise Manager, Oracle Harvester and Oracle Configuration Manager are automatically installed as are all the necessary subcomponents. The Oracle Harvester will run as long as the OCM in the OMS home is configured and running.

OCM must be enabled in the Oracle Home of the OMS and configured (and running in connected mode) in the Instance Home of the OMS. The reason is that the Oracle OMS target will not be discovered by the OCM collector if ORACLE_CONFIG_HOME is not set.

Perform the following steps to ensure the Oracle OMS target is discovered:

1. Locate the OMS instance home.
   
   In the $ORACLE_HOME/sysman/config/emInstanceMapping.properties file (where ORACLE_HOME is the Oracle Home of the OMS), there is an entry referencing a file called emgc.properties.
   
   The directory in which the emgc.properties file is located is the “instance home” of the OMS. In the following example, /u01/app/oracle/product/gc_inst/em/EMGC_OMS1 is the instance home of the OMS:

   EMGC_OMS1=/u01/app/oracle/product/gc_inst/em/EMGC_OMS1/emgc.properties

2. Set the environment variable ORACLE_CONFIG_HOME to the directory of this emgc.properties file.
   
   Example:

   $export ORACLE_CONFIG_HOME=/u01/app/oracle/product/gc_inst/em/EMGC_OMS1

3. Configure OCM.

**New For Enterprise Manager Release 12.1**

By default, all targets are uploaded using the credentials used to register Oracle Configuration Manager in the OMS Home. In Enterprise Manager release 12.1, you have the option of assigning a Customer Support Identifier (CSI) to each target home.

The Oracle Harvester supports uploading configuration data to different CSIs for each different Oracle Home.

The steps include:

1. Ensuring that the Oracle Harvester has run. This job runs automatically. The status of the run can be monitored from the Support Identifier Assignment page. To access this page from the Enterprise Manager home page, select Setup, then select My Oracle Support. From the menu, select Support Identifier Assignment.
2. Setting My Oracle Support preferred credentials. From the Enterprise Manager home page, select **Setup**, then select **My Oracle Support**. From the menu, select **Set credentials** and supply any valid My Oracle Support credentials.

3. Assigning the Support Identifier.
   a. From the Enterprise Manager home page, select **Setup**, then select **My Oracle Support**. Select **Support Identifier Assignment** and provide the correct user name and password. Select **Set credentials**.
   b. Select **Home**. Click **Assign** button. Select CSI and click **OK**.

4. Ensuring the message displays indicating the assignment was successful. The message reads:

   Support Identifier has been assigned for 1 Oracle homes. The changes in the Customer Support Identifiers will be reflected in My Oracle Support after the next Harvester run.

**Viewing CSIs in Enterprise Manager**

You can see the CSI associated with a target by viewing the target property or by doing a configuration search with CSI set as the search criteria. Any user with operator privilege on all targets for a given Oracle Home can assign a CSI for that Oracle Home.

Refer to the help in the Enterprise Manager interface on how to access this information.

**C.1.1 Supported Targets in Oracle Harvester**

Oracle Harvester collects configuration data from Enterprise Manager for the same set of targets collected by OCM. See Table C–1 for the list of targets.

<table>
<thead>
<tr>
<th>Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
</tr>
<tr>

<tr>
<td>Oracle Fusion Applications</td>
</tr>
<tr>
<td>Oracle Fusion Middleware</td>
</tr>
<tr>
<td>Oracle Management Service</td>
</tr>
<tr>
<td>Oracle SOA Suite</td>
</tr>
</tbody>
</table>
C.1.2 Configuration Data Not Available in My Oracle Support

In previous versions of Enterprise Manager, Oracle Harvester configuration data was only uploaded to My Oracle Support when 30 days had passed since the last upload of data by a standalone OCM Collector if such data already existed in My Oracle Support.

This restriction has been lifted in Enterprise Manager 12c. Configuration data for targets collected from Oracle Harvester running in Enterprise Manager release 12c displays in My Oracle Support immediately, regardless of how recently data was uploaded by a standalone OCM Collector.

C.2 Oracle Configuration Manager

Oracle Configuration Manager is installed and configured automatically when you install an Oracle product. It is installed in the product Home and collects configuration data for all targets installed in that Home.

The OCM setup requires specifying the My Oracle Support account and password, or My Oracle Support account and Customer Support Identifier (CSI). Configuration data will be uploaded using this information and can be viewed by logging in to My Oracle Support using the same credentials.

OCM must be installed in every Oracle Home from which you want to upload configuration data to Oracle. In addition to being part of the product installation, OCM can also be downloaded from My Oracle Support. The Mass Deployment tool is available to help with deploying OCM across data centers. The OCM kit is available from the Collector tab on My Oracle Support.

Once OCM is installed, no additional work is required. By default, automatic updates are enabled and you are encouraged to use this feature to ensure you are always running the latest version of OCM. This feature can be disabled if required, for example, for security reasons. If you disable the feature, you can turn it on by executing the following command:

<ocm_install_root>/ccr/bin/emCCR automatic_update on

C.3 Additional Information

To find additional information about My Oracle Support, see:

https://support.oracle.com

To find more information about OCM, perform the following steps:

1. Log into My Oracle Support at https://support.oracle.com

C.4 Troubleshooting Configuration Data Collection Tools

The following sections describe how to resolve issues with the configuration data collections.

In Enterprise Manager releases 10.2.0.5 and 11.1, ensure that collection data is uploaded to Oracle by using the emccr status command. Look at the last uploaded date and time.
Troubleshooting Configuration Data Collection Tools

Collecting OCM Data Using Oracle Harvester

Note: This emccr status command shows that collected data was uploaded, but does not ensure the Oracle Harvester collections were successful and uploaded.

Location of error logs:

- Oracle Harvester error logs:
  - For Enterprise Manager release 10.2.0.5 look at:
    ORACLE_HOME/sysman/log/emoms.trc
  - For Enterprise Manager release 11.1, look at:
    INSTANCE_HOME/sysman/log/emoms.trc
  - For Enterprise Manager release 12.1, look at:
    INSTANCE_HOME/sysman/log/emoms_pbs.trc
  - UI errors, for example CSI Assignment errors, look at:
    INSTANCE_HOME/sysman/log/emoms.trc
    for example: /gc_inst/user_projects/domains/GCDomain/servers/EMGC_OMS1/sysman/log/emoms.trc

- Ops Center Harvester error log is located at:
  /var/opt/sun/xvm/logs/ocharvester.log

- Oracle Configuration Manager log is located at:
  ccr/hosts/<hostname>/log/collector.log

C.4.1 Oracle Harvester Collection Fails If the state/upload/external Directory Is Missing

If the Oracle Harvester collection fails with the following error, the required directory named external is missing.

[JobWorker 75210:Thread-61] ERROR gcharvester.GcCollectionMgr initOcm.? - GC OCM Harvester: Caught GC Harvester exception from GCInit.init(): The installed version of Oracle Configuration Manager in the ORACLE_HOME (/scratch/aime/work/midlwre8937/oms11g) is prior to 10.3.1. The Grid Control Configuration harvesting requires at a minimum, 10.3.1

To resolve this issue, create the external directory:

$ORACLE_INSTANCE_HOME/ccr/state/upload/external

(Bug 12795503)

C.4.2 Oracle Configuration Manager Is Not Running

When OCM is not running, you may see the following error:

2011-08-29 16:34:20,709 [JobWorker 97285:Thread-60] WARN gcharvester.HarvesterJobUtils performOCMCollections.? - GC OCM Harvester: OCM was stopped and is not running

To resolve this issue, verify that the OCM was installed and configured in the appropriate directories (execute emCCR status).
In particular, OCM must be installed in the OMS Oracle Home and configured (and running in connected mode) in the OMS Instance Home.

C.4.3 Configuration Data Not Available in My Oracle Support

When you look at My Oracle Support and do not find configuration data, it could be that the Oracle Harvester collection did not run.

To resolve this issue, verify that the OCM was installed and configured in the appropriate directories (execute `emCCR status`). In particular, OCM must be installed in the OMS Oracle Home and configured (and running in connected mode) in the OMS Instance Home.

To verify that OCM is running, perform the following steps:

1. Set `ORACLE_CONFIG_HOME` to the `INSTANCE HOME`
2. Execute `$ORACLE_HOME/ccr/bin/emCCR status`

C.4.4 Only a Subset of the Targets Is Collected by the Oracle Harvester

If many targets are uploaded to the Management Repository but only a subset of the targets is collected by the Oracle Harvester, it could be because the same error was encountered 10 times during a collection, causing the Oracle Harvester to stop collecting. Look at the appropriate log file to verify that this error has occurred.

Resolve the issue by running the following SQL script against the Management Repository. This script forces the Oracle Harvester to ignore this collection error and continue collecting the remaining target information.

```
sql> insert into mgmt_ocm_upl_props (name,str_value) values('ignore_errors','true');
sql> commit;
```

Bounce the OMS after executing the SQL script.

(Bug 11734389)
Installing Additional Oracle Management Service in Silent Mode

Oracle recommends you to use the Add Management Service deployment procedure to install an additional Oracle Management Service (OMS). The Add Management Service deployment procedure offers a GUI-rich, interactive way of installing an additional OMS. For instructions, refer to Oracle Enterprise Manager Cloud Control Basic Installation Guide.

However, if you have any security restrictions or audit demands in your environment, or if you are not permitted to use Oracle credentials to log in over the network for installation, then follow these steps to manually install an additional OMS in silent, non-interactive mode.

1. If Oracle Software Library (Software Library) is configured on the main OMS, which comes with Enterprise Manager Cloud Control, then ensure that that Software Library is accessible from the remote host where you plan to install the additional OMS.

   In this procedure, for easy understanding, the OMS that comes with Enterprise Manager Cloud Control is referred to as the first OMS, and the additional OMS you install is referred to as the additional OMS.

2. On the remote host, perform a software-only installation of the additional OMS as described in Section 4.4.1.
3. On the additional OMS, apply all the patches you applied on the first OMS so that both OMS instances are identical and are in sync.

To identify the patches you applied on the first OMS, run the following commands from its Oracle home:

```
$<OMS_HOME>/OPatch/opatch lsinventory
```

4. Export the configuration details from the first OMS. To do so, run the following command from the Oracle home of the first OMS and pass the location where you want to configuration details can be exported as a file.

```
$<OMS_HOME>/bin/emctl exportconfig oms -dir <absolute_path_to_directory>
```

5. Copy the exported configuration details file from the first OMS host to the additional OMS host.

---

**Note:**

- Ensure that you install the software binaries in the same middleware location as that of the first OMS.
- Ensure that you select the same set of plug-ins as the ones on the first OMS.

If you had installed additional plug-ins that were not part of the Enterprise Manager Cloud Control software you used for installing the first OMS, then follow these steps:

1. Connect to the Management Repository and run the following SQL query to retrieve a list of plug-ins installed:

   ```
   SELECT epv.plugin_id, epv.version, epv.rev_version FROM em_plugin_version epv, em_current_deployed_plugin ecp WHERE epv.plugin_type NOT IN ('BUILT_IN_TARGET_TYPE', 'INSTALL_HOME') AND ecp.dest_type='2' AND epv.plugin_version_id = ecp.plugin_version_id
   ```

2. Make a note of the additional plug-ins you installed.

3. Download the additional plug-ins from the following URL:

4. Invoke the installer with the `-pluginLocation` argument, and pass the absolute path to the directory where you downloaded the additional plug-ins:

   ```
   runInstaller -pluginLocation <absolute_path_to_plugin_dir>
   ```
6. Copy the configuration details onto the additional OMS. To do so, run the following command from the Oracle home of the additional OMS:

```
$<OMS_HOME>/bin/omsca recover -ms -backup_file <absolute_path_to_the_file_copied_in_step4> [-AS_HTTPS_PORT <port> -MSPORT <port> -MS_HTTPS_PORT <port> -EM_NODEMGR_PORT <port> -EM-upload_PORT <port> -EM UPLOAD_HTTPS_PORT <port> -EM_CONSOLE_PORT <port> -EM_CONSOLE_HTTPS_PORT <port> -config_home <absolute_path_to_instance_dir> -EM_INSTANCE_HOST <second_oms_host_name>]
```

For example,

```
```

7. Configure the Management Agent on the additional OMS host by running the following command from the OMS home:

```
$<AGENT_HOME>/sysman/install/agentDeploy.sh AGENT_BASE_DIR=<middleware_home>/agent OMS_HOST=<second_oms_host_name> EM_UPLOAD_PORT=<second_oms_port> AGENT_REGISTRATION_PASSWORD=<password> -configOnly
```

**Note:** If you have Server Load Balancer (SLB) configured, then directly enter the host name and port number of the SLB. If SLB is not configured, then enter the secure upload port of the first OMS.

8. Deploy the required plug-ins on the Management Agent.

For information about deploying plug-ins, refer to the section *Deploying and Updating Plug-ins* in the chapter *Updating Cloud Control*, in the *Oracle Enterprise Manager Cloud Control Administrator's Guide*.

9. Import the trusted certificate on the additional OMS host, where you configured the Management Agent as described in Step (7). When prompted for a password, enter `welcome1`.

```
$<AGENT_HOME>/bin/emctl secure add_trust_cert_to_jks
```

10. Manually discover the Oracle WebLogic Server target.

a. Ensure that both the first and the additional OMS instances are up and running.

b. In the Cloud Control console, from the *Targets* menu, select *Middleware*.

c. On the Middleware page, click *EMGC_DOMAIN*.

d. On the *EMGC_DOMAIN* home page, from the *Farm* menu, select *Refresh WebLogic Domain*.

e. On the Refresh WebLogic Domain page, click *Continue*.

   Enterprise Manager Cloud Control refreshes the WebLogic Domain and discovers the second managed server on the additional OMS host.
For information about discovering the other targets, refer to the chapter *Adding Targets* in the *Oracle Enterprise Manager Cloud Control Administrator’s Guide.*

For configuring the shared Oracle Software Library location and the Server Load Balancer, refer to *Oracle Enterprise Manager Cloud Control Administrator’s Guide.*
This appendix describes how to troubleshoot issues that you might encounter while working with Enterprise Manager Cloud Control.

- Troubleshooting Configuration Assistant Failures
- Troubleshooting ADP and JVMD Failures

### E.1 Troubleshooting Configuration Assistant Failures

This section describes the log files you must review and the actions you must take when the following configuration assistants fail:

- Plugins Prerequisites Check Configuration Assistant
- Repository Configuration Assistant
- MDS Schema Configuration Assistant
- OMS Configuration Assistant
- Plugins Deployment and Configuration Configuration Assistant
- Start Oracle Management Service Configuration Assistant
- Plugins Inventory Migration Configuration Assistant
- Oracle Configuration Manager Repeater Configuration Assistant
- OCM Configuration for OMS Configuration Assistant
- Agent Configuration Assistant
- Agent Upgrade Configuration Assistant
- Repository Upgrade Configuration Assistant

#### E.1.1 Plugins Prerequisites Check Configuration Assistant

**Log Files**

Review the following log files:

- `$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log`
- `$<OMS_HOME>/cfgtoollogs/pluginca/configplugin_prereq_check_<timestamp>.log`

**Workaround Steps**

Run the following command:
Troubleshooting Configuration Assistant Failures

```bash
$<OMS_HOME>/oms/bin/pluginca -action prereqCheck -oracleHome <oms_home_path> -middlewareHome <middleware_home_path> -plugins <plugin_id>=<plugin_version>
```

**Note:** For multiple plug-ins, separate the plug-in details with a comma. For example, -plugins <plugin_id>=<plugin_version>, <plugin_id>=<plugin_version>

---

### E.1.2 Repository Configuration Assistant

#### Log Files

Review the following log files:

- `$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log`
- `$<OMS_HOME>/sysman/log/schemamanager/m_<timestamp>/m_<timestamp>.<ACTION>/`

**Note:** `<ACTION>` refers to any of the schema actions, for example, CREATE, TRANSX, MY_ORACLE_SUPPORT, and so on.

---

#### Workaround Steps

Follow these steps:

1. Resolve the cause of the issue.

2. Clean up the Management Repository by running the following command:

   ```bash
   $<OMS_HOME>/sysman/admin/emdrep/bin/RepManager <repository_database_host> <repository_database_port> <repository_database_sid> -action dropall -dbUser <repository_database_user> -dbPassword <repository_database_password> -dbRole <repository_database_user_role> -mwHome <middleware_home> -mwOraHome <oms_oracle_home> -oracleHome <oms_oracle_home>
   ```

   **Note:**
   - For Microsoft Windows, invoke RepManager.bat.
   - RepManager 12.1 and 11.1 from the OMS home support -action dropall (drops SYSMAN as well as SYSMAN_MDS) and -action drop (drops only SYSMAN).
   - RepManager 10.2.0.5 supports -action drop (drops only SYSMAN).
   - The action dropall might not drop all the repository objects. For learn more about this issue and the workaround to be used, see My Oracle Support note 1365820.1.

3. Rerun the configuration assistant.

   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click *Retry*. 

---
If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

If you are installing in silent mode, then rerun the `runConfig.sh` script from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

---

**Note:** For Microsoft Windows, run `runConfig.bat`.

### E.1.3 MDS Schema Configuration Assistant

**Log Files**

Review the following log file:

```bash
$<OMS_HOME>/cfgtoollogs/cfgfw/emmdscreate_<timestamp>.log
```

For more information, review the following log files:

- `<OMS_HOME>/sysman/log/schemamanager/m_<timestamp>/m_<timestamp>.CREATE/mds.log`
- `$<OMS_HOME>/sysman/log/schemamanager/m_<timestamp>/m_<timestamp>.CREATE/rcu.log`

**Workaround Steps**

Follow these steps:

1. **Drop the MDS schema by running the following command from the OMS home:**

   ```bash
   $<OMS_HOME>/sysman/admin/emdrep/bin/mdsschemamanager.pl -action=-dropRepository -connectString=<database_connect_string> -dbUser= <database_user> -dbPassword=<database_password> -oracleHome=<OMS_oracle_home> -mwHome=<middleware_home>
   ```

   Where `<database_connect_string>` must be in the following format: `<database_host>[:<database_port>]:<database_sid>`

2. **Rerun the Configuration Assistant.**

   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click **Retry**.

   If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from OMS home:

   ```bash
   $<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
   ```

   If you are installing in silent mode, then rerun the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from the OMS home:
Troubleshooting Configuration Assistant Failures

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path>
MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

**Note:** For Microsoft Windows, run `runConfig.bat`.

E.1.4 OMS Configuration Assistant

**Log Files**
Review the following log files:

- If the installer fails BEFORE the OMS configuration assistant starts running, then review the following log file:

  `$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log`

- If the installer fails AFTER the OMS configuration assistant starts running, then review the following log file:

  `$<OMS_HOME>/cfgtoollogs/omsca/omsca_<timestamp>.log`

**Workaround Steps**
Follow these steps:

1. Check whether any Java processes are running from the middleware home. To do so, run the following command from the host where the OMS is running:

   ```bash
   ps -ef | grep java | grep <Oracle_Middleware_Home>
   ```

2. Kill all the running processes, except for installer-related Java processes, by the running the following command. The installer-related Java processes run from the temp directory, so you can ignore the processes from that directory.

   ```bash
   kill -9 <process_id>
   ```

3. Remove the Oracle Management Service Instance Base by running the following command:

   ```bash
   rm -rf <OMS_Instance_Home>
   ```

4. Rerun the Configuration Assistant.

   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click **Retry**.

   If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (`runConfig.bat` on Microsoft Windows) from the OMS home:

   ```bash
   $<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path>
   MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
   ```

   If you are installing in silent mode, then rerun the `runConfig.sh` script (`runConfig.bat` on Microsoft Windows) from the OMS home:

   ```bash
   $<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path>
   MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
   ```
E.1.5 Plugins Deployment and Configuration Configuration Assistant

Log Files
Review the following log files:

- `$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log`
- `$<OMS_HOME>/cfgtoollogs/pluginca/configplugin_deploy_<timestamp>.log`

Workaround Steps
Run the following command:

```
$<OMS_HOME>/oms/bin/pluginca -action deploy -oracleHome <oms_home_path> -middlewareHome <middleware_home_path> -plugins <plugin_id>=<plugin_version>
```

Note: For multiple plug-ins, separate the plug-in details with a comma. For example, `-plugins <plugin_id>=<plugin_version>, <plugin_id>=<plugin_version>`

E.1.6 Start Oracle Management Service Configuration Assistant

Log Files
Review the following log file:

```
$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log
```

Workaround Steps
Run the following command:

```
$<OMS_HOME>/bin/emctl start oms
```

E.1.7 Plugins Inventory Migration Configuration Assistant

Log Files
Review the following log file:

```
$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log
```

Workaround Steps
Follow these steps:

1. Resolve the cause of the issue.
2. Rerun the configuration assistant.

   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click Retry.
If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

If you are installing in silent mode, then rerun the `runConfig.sh` script from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

**Note:** For Microsoft Windows, run `runConfig.bat`.

---

### E.1.8 Oracle Configuration Manager Repeater Configuration Assistant

**Log Files**

Review the following log file:

```bash
$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log
```

**Workaround Steps**

Follow these steps:

1. Resolve the cause of the issue.
2. Rerun the configuration assistant.

   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click **Retry**.

   If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

   If you are installing in silent mode, then rerun the `runConfig.sh` script (runConfig.bat on Microsoft Windows) from the OMS home:

```bash
$<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
```

**Note:** For Microsoft Windows, run `runConfig.bat`.

---

### E.1.9 OCM Configuration for OMS Configuration Assistant

**Log Files**

Review the following log file:

```bash
$<OMS_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log
```

**Note:**

For Microsoft Windows, run `runConfig.bat`.
Workaround Steps
Follow these steps:

1. Resolve the cause of the issue.

2. Rerun the configuration assistant.
   
   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click **Retry**.
   
   If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (`runConfig.bat` on Microsoft Windows) from the OMS home:

   ```bash
   $<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path>
   MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
   ```

   If you are installing in silent mode, then rerun the `runConfig.sh` script (`runConfig.bat` on Microsoft Windows) from the OMS home:

   ```bash
   $<OMS_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<oms_home_path>
   MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}
   ```

   **Note:** For Microsoft Windows, run `runConfig.bat`.

---

**E.1.10 Agent Configuration Assistant**

**Log Files**

Review the following log files:

- `$<AGENT_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log`
- If secure fails, then review the following log file:
  
  `$<AGENT_HOME>/sysman/log/secure.log`
- In the log file, search for the following statement:
  
  `SEVERE:Plugin configuration has failed.`
  
  If you find this statement, then review the following log file:

  `$<AGENT_INSTANCE_HOME>/install/logs/agentplugindeploy_<timestamp>.log`

**Workaround Steps**

Follow these steps:

1. Resolve the cause of the issue.

2. Rerun the configuration assistant.
   
   If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click **Retry**.
   
   If you accidentally exit the installer before clicking **Retry**, then do NOT restart the installer to reach the same screen; instead, invoke the `runConfig.sh` script (`runConfig.bat` on Microsoft Windows) from the OMS home:
 Troubleshooting Configuration Assistant Failures

$<AGENT_HOME>/oui/bin/runConfig.sh ORACLE_HOME=<agent_home_path> MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}

Note: For Microsoft Windows, run runConfig.bat.

If you are installing in silent mode, then run the following command from the Management Agent home:

$<AGENT_HOME>/sysman/install/agentDeploy.sh OMS_HOST=<oms_host_name> EM_UPLOAD_PORT=<oms_upload_https_port> AGENT_REGISTRATION_PASSWORD=<agent_reg_password>

Note: Enter the HTTPS port (secure port) for the EM_UPLOAD_PORT argument.

E.1.11 Agent Upgrade Configuration Assistant

Log Files
If the agent upgrade configuration assistant fails, then review the following log file:

$<AGENT_HOME>/cfgtoollogs/cfgfw/CfmLogger_<timestamp>.log

Workaround Steps
Resolve the cause of the issue, and rerun the configuration assistant from the Jobs page of the Enterprise Manager Cloud Control console.

Note: The Jobs page referred to here is the page within the earlier release of the Enterprise Manager Cloud Control console.

E.1.12 Repository Upgrade Configuration Assistant

Log Files
Review the following log files:

$<OMS_HOME>/cfgtoollogs/cfgfw/emmdscreate_<timestamp>.log
$<OMS_HOME>/sysman/log/schemamanager/m_<timestamp>/<ACTION>/<timestamp>.<ACTION>/

Note: (<ACTION> refers to any of the schema actions, for example, PREUPGRADE, UPGRADE, TRANSX, and so on.)

Workaround Steps
Follow these steps:

1. Resolve the cause of the issue.
2. Rerun the configuration assistant.

If you are installing in graphical mode, then return to the Enterprise Manager Cloud Control Installation Wizard and click Retry.
If you accidentally exit the installer before clicking Retry, then do NOT restart the installer to reach the same screen; instead, invoke the runConfig.sh script (runConfig.bat on Microsoft Windows) from the OMS home:

$$<\text{OMS\_HOME}/oui/bin/runConfig.sh \ \text{ORACLE\_HOME}=<\text{oms\_home\_path}>$$

MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}

If you are installing in silent mode, then rerun the runConfig.sh script (runConfig.bat on Microsoft Windows) from the OMS home:

$$<\text{OMS\_HOME}/oui/bin/runConfig.sh \ \text{ORACLE\_HOME}=<\text{oms\_home\_path}>$$

MODE=perform ACTION=configure COMPONENT_XML={encap_oms.1_0_0_0_0.xml}

---

**Note:** For Microsoft Windows, run runConfig.bat.

### E.2 Troubleshooting ADP and JVMD Failures

This section describes how to troubleshoot the errors encountered while deploying ADP/JVMD Managers, and ADP/JVMD Agents:

- ADP Manager Name Conflict
- Failure to Deploy ADP Agent On a Target
- SSL Handshake Failure Agent Deployment Errors
- Copying ADP Agent Zip or Javadiagnosticagent Ear Step Failure

#### E.2.1 ADP Manager Name Conflict

**Error Message**

When you deploy ADP Manager to an existing managed server whose instance (for example: EMGC_ADPMANAGER2) has not been completely removed, then the new deployment of ADP manager with the same name fails on the unzip step with the following error:

```
@ Are you sure you haven't deployed adp manager to a managed server with name <ADP_managed_server> already?
```

**Workaround Steps**

To remove the existing managed server completely, perform the following steps:

1. Follow the steps listed in Chapter 19 to remove the ADP Manager application and the managed server to which the ADP application is deployed.

2. Connect to the host machine where the managed server was present, and navigate to the following location to manually delete the managed server (EMGC_ADPMANAGER2):

   $$\text{DOMAIN\_HOME}/<\text{ADP\_managed\_server}>$$

   Where, $\text{DOMAIN\_HOME}$ is the location of the Cloud Control domain
E.2.2 Failure to Deploy ADP Agent On a Target

**Error Message**
While deploying the ADP Agent, the deployment job may fail on the Deploy ADP Agent On Target step, with the following error:

Failed to connect to
https://<host>:<port>/HttpDeployer/HttpDeployerServlet

Also, if you check the output of the Deploy HttpDeployer OnTarget (the previous step), then you will see a message as follows:

Operation is pending and will be activated or cancelled when the ongoing edit session is activated or cancelled.

**Workaround Steps**
To correct this error, perform the following steps:

1. Log into WebLogic Administration Console of the domain where the ADP Agent was to be deployed.
2. On the Administration home page, click **Save Changes** or **Discard Changes**, and start deploying the ADP agent afresh.

E.2.3 SSL Handshake Failure Agent Deployment Errors

**Error Message**
If the WebLogic Domain is SSL enabled using a demo certificate, then the agent deployment may fail due to an SSL Handshake Failure. The following error normally occurs because the demo certificate is not present in `AgentTrust.jks`:

Certificate chain received from myhost.acme.com - 123.34.11.11 was not trusted causing SSL handshake failure. Check the certificate chain to determine if it should be trusted or not. If it should be trusted, then update the client trusted CA configuration to trust the CA certificate that signed the peer certificate chain. If you are connecting to a WLS server that is using demo certificates (the default WLS server behavior), and you want this client to trust demo certificates, then specify `-Dweblogic.security.TrustKeyStore=DemoTrust` on the command line for this client.

**Note:** If the WebLogic Domain is using a production certificate, then this issue will not occur as `AgentTrust.jks` has trusted certificates from all well known CA’s.

**Workaround Steps**
To correct the error, import WebLogic demo certificate to Management Agent keystore as follows:

1. Export WebLogic Demo certificate from `cacerts` file. This file is present under the WebLogic home of the Middleware installation at the following location:

    keytool -export -keystore $WEBLOGIC_HOME/server/lib/cacerts
    -alias certgencab -file mycert.cer

    Press **Enter** when prompted for a password.
2. Import WebLogic Demo certificate to TrustStore of Oracle Management Agent as follows:

```bash
keytool -import -keystore $ORACLE_HOME/core/12.1.0.0.0/stage/sysman/config/montrust/AgentTrust.jks -alias wlscertgencab -file mycert.cer
```

Enter the password `welcome` when prompted, and press Enter.

To check if the certificate has been imported correctly, run the following command:

```bash
keytool -list -keystore $ORACLE_HOME/core/12.1.0.0.0/stage/sysman/config/montrust/AgentTrust.jks
```

Where, `$ORACLE_HOME` is Oracle Management Agent home.

Press Enter when prompted for password, a certificate with the name `wlscertgencab` is generated with the current date.

### E.2.4 Copying ADP Agent Zip or Javadiagnosticagent Ear Step Failure

**Error Message**

If the users who installed the OMS, and the Management Agent are not in the same group, then the job fail on Copying ADP Agent Zip step for an ADP agent, and Copy Javadiagnosticagent Ear step for a JVMD agent, with the following error:

```
oracle.sysman.emSDK.emd.comm.RemoteOperationException: Error while streaming JobReader:java.io.IOException: Broken pipe
```

**Workaround Steps**

To correct the error, either install the Enterprise Manager Agent using OMS host user credentials.

**OR**

Enable `sudo` or `Powerbroker` settings for the agent host, so that the job runs as if run by an OMS host user.

To set the `sudo`, or `Powerbroker` settings, do the following:

1. In Cloud Control, from the **Setup** menu, select **Security**, and then click **Privilege Deligation**.

2. On the Manage Privilege Delegation Settings page, do the following:
   a. Select the **Sudo** or **PowerBroker** from the type menu.
   b. Enter the host name, or alternatively select the name from the list of host targets. Ensure that the host selected corresponds to the EM Agent; this agent must be the one monitoring the WebLogic Domain where the ADP/JVMD agents have to be deployed.
   c. Click **Go**.

### E.3 Troubleshooting Deinstallation Failures

While deinstalling the **Shared Agent** as described in Section 18.2.3, you might see the following error:

```
SEVERE:The home <AGENT_HOME> cannot be deinstalled. Please deinstall all referenced home(s) <REFERENCE_HOME>
```
For example,

SEVERE: The home /tmp/agt_install/core/12.1.0.1.0 cannot be deinstalled. Please
deinstall all referenced home(s) /tmp/agt_install/plugins

If you see the error, then deinstall the *Shared Agent* following these steps:

1. Identify the dependent plug-ins and the sbin home to be detached from the
   Central Inventory:
   a. On the host where the *Shared Agent* is installed, open the following file
      from the Central Inventory:
      
      `<absolute_path>/oraInventory/ContentsXML/inventory.xml`

   b. Make a note of the dependent plug-ins listed within the `<REFHOMELIST>` and
      `<REFHOMELIST>` tags.
      For example,
      
      `<HOME NAME="nfs5515" LOC="/home/john/software/oracle/agent/core/12.1.0.0.0" TYPE="O" IDX="1">
        <REFHOMELIST>
          <REFHOME LOC="/home/john/software/oracle/agent/plugins/oracle.sysman.oh.discovery.plugin_12.1.0.0.0"/>
          <REFHOME LOC="/home/john/software/oracle/agent/plugins/oracle.sysman.db.discovery.plugin_12.1.0.0.0"/>
          <REFHOME LOC="/home/john/software/oracle/agent/plugins/oracle.sysman.emas.discovery.plugin_12.1.0.0.0"/>
          <REFHOME LOC="/home/john/software/oracle/agent/plugins/oracle.sysman.oh.agent.plugin_12.1.0.0.0"/>
        </REFHOMELIST>
      </HOME>

   c. Make a note of the sbin directory listed within the `<REFHOMELIST>` and
      `<REFHOMELIST>` tags.
      For example,
      
      `<HOME NAME="nfs5515" LOC="/home/john/software/oracle/agent/core/12.1.0.0.0" TYPE="O" IDX="1">
        <REFHOMELIST>
          <REFHOME LOC="home/john/software/oracle/agent/sbin"/>
        </REFHOMELIST>
      </HOME>

   d. Detach the dependent plug-ins you identified in Step 1 (b) from the Central
      Inventory. To do so, run the following command from the *Master Agent*
      home that is visible on the host where your *Shared Agent* is installed:
      
      `$<AGENT_HOME>/oui/bin/runInstaller -detachHome -silent -waitForCompletion -invPtrLoc <absolute_path>/oraInst.loc
       ORACLE_HOME=<plug-in_home> -nogenerateGUID`
      
      For example,
      
      `/home/john/software/oracle/agent/core/12.1.0.1.0/oui/bin/runInstaller -detachHome -silent -waitForCompletion -invPtrLoc
       /home/john/software/oracle/agent/core/12.1.0.1.0/oraInst.loc`
oc ORACLE_HOME=/home/john/software/oracle/agent/plugins/oracle.sysman.emas.discovery.plugin_12.1.0.1.0  -nogenerateGUID

**Note:** This step detaches only one plug-in at a time. Therefore, if you have multiple plug-ins, repeat this step to detach every other dependent plug-in.

e. Detach the sbin home you identified in Step 1 (c) from the Central Inventory. To do so, run the following command from the Master Agent home that is visible on the host where your Shared Agent is installed:

```
$<AGENT_HOME>/oui/bin/runInstaller -detachHome -silent -waitForCompletion -invPtrLoc <absolute_path>/oraInst.loc ORACLE_HOME=<sbin_home>  -nogenerateGUID
```

For example,

```
/home/john/software/oracle/agent/core/12.1.0.1.0/oui/bin/runInstaller -detachHome -silent -waitForCompletion -invPtrLoc /home/john/software/oracle/agent/core/12.1.0.1.0/oraInst.loc ORACLE_HOME=/home/john/software/oracle/agent/sbin -nogenerateGUID
```

2. Deinstall the Shared Agent. To do so, run the following command from the Master Agent home that is visible on the host where your Shared Agent is installed:

```
$<AGENT_HOME>/perl/bin/perl  <AGENT_HOME>/sysman/install/NFSAgentDeInstall.pl AGENT_INSTANCE_HOME=<absolute_path_to_agent_instance_home> ORACLE_HOME=<absolute_path_to_agent_home>
```

For example,

```
/home/john/software/oracle/agent/core/12.1.0.1.0/perl/bin/perl /home/john/software/oracle/agent/core/12.1.0.1.0/sysman/install/NFSAgentDeInstall.pl AGENT_INSTANCE_HOME=/home/john/software/oracle/agent/agent_inst ORACLE_HOME=/home/john/software/oracle/agent/core/12.1.0.1.0
```
