

Oracle® Database

Graph Developer's Guide for Property Graph

25.3
G36674-03
August 2025

ORACLE®

Contributors: Prashant Kannan, Chuck Murray, Melliya Annamalai, Korbinian Schmid, Jorge Barba, Oskar van Rest, Ana Estrada, Albert Godfrind, Steve Serra, Ryota Yamanaka, Bill Beauregard, Hector Briseno, Hassan Chafi, Eugene Chong, Souripriya Das, Juan Garcia, Florian Gratzner, Zazhil Herena, Sungpack Hong, Roberto Infante, Hugo Labra, Gabriela Montiel-Moreno, Eduardo Pacheco, Joao Paiva, Matthew Perry, Diego Ramirez, Siva Ravada, Carlos Reyes, Jane Tao, Edgar Vazquez, Zhe (Alan) Wu

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Changes in This Release for This Guide

Key Property Graph Features in Oracle Database Release 23ai	ii
Deprecated Features	iii
Desupported Features	viii

Part I Getting Started with Oracle Property Graphs

1 Introduction to Property Graphs

1.1	What Are Property Graphs?	1
1.2	About the Property Graph Feature of Oracle Database	2
1.3	Overview of Property Graph Architecture	3
1.3.1	Architecture Model for Running Graph Queries in the Database	3
1.3.2	Architecture Model for Running Graph Analytics	4
1.3.3	Developing Applications Using Graph Server Functionality as a Library	5
1.4	Learn About the Graph Server (PGX)	5
1.4.1	Overview of the Graph Server (PGX)	6
1.4.1.1	Design of the Graph Server (PGX)	6
1.4.1.2	Usage Modes of the Graph Server (PGX)	7
1.5	Security Best Practices with Graph Data	9
1.6	About Oracle Graph Server and Client Accessibility	10

2 Running Oracle Graph Quickstart Container Image

3	Using Oracle Graph with the Autonomous Database	
3.1	Two-Tier Deployments of Oracle Graph with Autonomous Database	1
3.2	Three-Tier Deployments of Oracle Graph with Autonomous Database	2

Part II SQL Property Graphs

4	Introduction to SQL Property Graphs	
4.1	Quick Start for Working with SQL Property Graphs	2
4.2	Quick Start: Creating a SQL Property Graph by Importing Graph Data from Neo4j	6

5	SQL DDL Statements for Property Graphs	
5.1	Creating a SQL Property Graph	1
5.1.1	About Vertex and Edge Graph Element Tables	4
5.1.2	About Vertex and Edge Table Keys	4
5.1.3	About Labels and Properties	6
5.1.4	Using Graph Options to Create SQL Property Graphs	8
5.1.5	Granting System and Object Privileges for SQL Property Graphs	11
5.1.6	Retrieving Metadata for SQL Property Graphs	12
5.1.7	Retrieving SQL Creation DDL Using the DBMS_METADATA Package	13
5.1.8	Limitations of Creating a SQL Property Graph	14
5.2	Revalidating a SQL Property Graph	14
5.3	Renaming a SQL Property Graph	15
5.4	Dropping a SQL Property Graph	15
5.5	JSON Support in SQL Property Graphs	15

6	SQL Graph Queries	
6.1	About Graph Pattern	2
6.1.1	Graph Element Variables	4
6.1.2	Path Variables	4
6.1.3	Label Expressions	5
6.1.4	Accessing Label Properties	7
6.1.5	Using the IS LABELED Predicate	9
6.1.6	Using the PROPERTY_EXISTS Predicate	10
6.2	Variable Length Path Patterns	10
6.3	Complex Path Patterns	11
6.4	Vertex and Edge Identifiers	11
6.5	Using ONE ROW PER Clause in a SQL Graph Query	13
6.5.1	Using the MATCHNUM Function	14

6.5.2	Using the PATH_NAME Function	15
6.5.3	Using the ELEMENT_NUMBER Function	15
6.6	Using Aggregate Functions in SQL Graph Queries	16
6.7	Selecting All Properties in the COLUMNS Clause	17
6.8	Using the SOURCE and DESTINATION Predicates	17
6.9	Running SQL Graph Queries at a Specific SCN	18
6.10	Privileges to Query a SQL Property Graph	18
6.11	Examples for SQL Graph Queries	19
6.11.1	Setting Up Sample Data in the Database	37
6.12	Supported Features and Limitations for Querying a SQL Property Graph	39
6.13	Tuning SQL Property Graph Queries	40
6.14	Type Compatibility Rules for Determining Property Types	42
6.15	Viewing and Querying SQL Property Graphs Using SQL Developer	43

7 Loading a SQL Property Graph into the Graph Server (PGX)

7.1	Loading a SQL Property Graph Using the readGraphByName API	1
7.1.1	Loading a SQL Property Graph from a Different Schema	3
7.1.2	Loading a SQL Property Graph Using PropertyLoadingMode Options	4
7.1.3	Loading a SQL Property Graph Using Graph Optimization Options	6
7.1.4	Loading a SQL Property Graph Using OnMissingVertex Options	9
7.1.5	Loading a SQL Property Graph with Properties Mapped to CLOB Data Type Columns	10
7.2	Loading a Subgraph Using PGQL Queries	12
7.3	Expanding a Subgraph	14
7.4	Handling Vertex and Edge Identifiers in the Graph Server (PGX)	15
7.5	Mapping Oracle Database Types to PGX Types	15
7.6	Privileges to Load a SQL Property Graph	16
7.7	Loading Graphs with Unsupported Key Types	17
7.8	Loading SQL Property Graphs with Composite Keys	17

8 Executing PGQL Queries Against SQL Property Graphs

8.1	Creating a SQL Property Graph Using PGQL	2
8.2	Executing PGQL SELECT Queries on a SQL Property Graph	4
8.3	Migrating PGQL Property Graphs to SQL Property Graphs	5
8.4	Supported PGQL Features and Limitations for SQL Property Graphs	7

9 Visualizing SQL Graph Queries Using the APEX Graph Visualization Plug-in

9.1	About the APEX Graph Visualization Plug-in	1
9.2	Getting Started with the APEX Graph Visualization Plug-in	2

9.2.1	Importing the Sample Graph Visualizations Application in APEX	5
9.3	Configuring Attributes for the APEX Graph Visualization Plug-in	7
9.3.1	Settings	7
9.3.2	Appearance	8
9.3.3	Layout	11
9.3.4	Captions	13
9.3.5	Evolution	14
9.3.6	Schema	15
9.3.7	Advanced Options	16
9.3.7.1	General Settings	17
9.3.7.2	Rule-Based Styles	17
9.3.7.3	Base Styles	18
9.3.7.4	Smart Groups	19
9.3.7.5	Evolution Settings	20
9.3.8	Callbacks Options	20
9.3.8.1	Expand	21

10 Getting Started with the Graph Visualization Extension for VS Code

Part III PGQL Property Graphs

11 About PGQL Property Graphs

11.1	Creating PGQL Property Graphs on Oracle Database Tables	1
11.1.1	Retrieving Metadata for PGQL Property Graphs	4
11.1.2	Privileges for Working with PGQL Property Graphs	8
11.2	Creating a PGQL Property Graph By Importing a GraphSON file	9
11.2.1	Additional Information on the GraphImporter Parameters	12
11.2.2	Mapping GraphSON Types to Oracle Database Data Types	14
11.3	Using JSON to Store Vertex and Edge Properties	14

12 Loading a PGQL property graph into the Graph Server (PGX)

12.1	Loading a PGQL Property Graph Using the readGraphByName API	1
12.1.1	Specifying Options for the readGraphByName API	3
12.1.2	Specifying the Schema Name for the readGraphByName API	5
12.1.3	Specifying PropertyLoadingMode Options for the readGraphByName API	6
12.2	Loading a Subgraph from a PGQL Property Graph	8
12.2.1	PGQL Based Subgraph Loading	8
12.2.2	Prepared PGQL Queries	11

12.2.3	Providing Database Connection Credentials	12
12.2.4	Dynamically Expanding a Subgraph	13

13 Quick Starts for Using PGQL Property Graphs

13.1	Using Sample Graph Data	1
13.2	Quick Start: Working with PGQL Property Graphs	2
13.3	Quick Start: Using Graph Machine Learning on PGQL Property Graphs	9
13.4	Quick Start: Using the Python Client as a Module	15
13.5	Oracle LiveLabs Workshops for Graphs	18

14 Getting Started with the Client Tools

14.3	Using the Graph Visualization Web Client	1
14.4	Using the Jupyter Notebook Interface	2
14.1	Interactive Graph Shell CLIs	3
14.1.1	Starting the OPG4J Shell	4
14.1.2	Starting the OPG4Py Shell	6
14.2	Using Autonomous Database Graph Client	7
14.2.1	Prerequisites for Using Autonomous Database Graph Client	15
14.2.2	Using the PGX JDBC Driver with the AdbGraphClient API	16
14.5	Additional Client Tools for Querying PGQL Property Graphs	18
14.5.1	Using Oracle SQLcl	18
14.5.2	Using SQL Developer with PGQL Property Graphs	21

15 Property Graph Query Language (PGQL)

15.1	Creating a Property Graph Using PGQL	1
15.1.1	Creating a PGQL Property Graph with the BASE_GRAPHS Clause	5
15.1.2	Creating a PGQL Property Graph with Arbitrary Property Expressions	8
15.2	Pattern Matching with PGQL	9
15.3	Edge Patterns Have a Direction with PGQL	9
15.4	Vertex and Edge Labels with PGQL	10
15.5	Variable-Length Paths with PGQL	10
15.6	Aggregation and Sorting with PGQL	11
15.7	Executing PGQL Queries Against PGQL Property Graphs	11
15.7.1	Supported PGQL Features and Limitations for PGQL Property Graphs	12
15.7.1.1	Additional Information on Supported PGQL Features with Examples	15
15.7.2	SQL Translation for a PGQL Query	22
15.7.3	Performance Considerations for PGQL Queries	23
15.7.3.1	Recursive Queries	23
15.7.3.2	Using Query Optimizer Hints	25

15.7.3.3	Speed Up Query Translation Using Graph Metadata Cache and Translation Cache	26
15.7.4	Using the Java and Python APIs to Run PGQL Queries	27
15.7.4.1	Creating a PGQL Property Graph	27
15.7.4.2	Executing PGQL SELECT Queries	29
15.7.4.3	Executing PGQL Queries to Modify PGQL Property Graphs	39
15.7.4.4	Dropping a PGQL Property Graph	42

Part IV Installing Oracle Graph Server (PGX) and Client

16 Oracle Graph Server and Client Installation

16.1	Before You Begin	1
16.1.1	Verifying Database Compatibility	2
16.1.2	Downloading Oracle Graph Server and Client	2
16.2	Oracle Graph Server Installation	3
16.2.1	System Requirements for Installing Oracle Graph Server	3
16.2.2	Using the RPM Installation	4
16.2.2.1	Prerequisites for Installing Oracle Graph Server	4
16.2.2.2	Installing Oracle Graph Server	5
16.2.2.3	Configuring the Graph Server Using a Quick Setup Script	6
16.2.2.4	Uninstalling Oracle Graph Server	7
16.2.2.5	Upgrading Oracle Graph Server	8
16.2.3	Deploying Oracle Graph Server to a Web Server	9
16.2.3.1	Deploying to Apache Tomcat	9
16.2.3.2	Deploying to Oracle WebLogic Server	10
16.2.4	Running Oracle Graph Quickstart Container Image	12
16.2.5	User Authentication and Authorization	14
16.2.5.1	Basic Steps for Using an Oracle Database for Authentication	14
16.2.5.2	Prepare the Graph Server for Database Authentication	18
16.2.5.3	Store the Database Password in a Keystore	20
16.2.5.4	Adding Permissions to Publish the Graph	24
16.2.5.5	Token Expiration	25
16.2.5.6	Customizing Roles and Permissions	26
16.2.5.7	Revoking Access to the Graph Server	29
16.2.5.8	Examples of Custom Authorization Rules	29
16.2.5.9	Kerberos Enabled Authentication for the Graph Server (PGX)	32
16.3	Oracle Graph Client Installation	35
16.3.1	Graph Clients	35
16.3.1.1	Oracle Graph Java Client	35
16.3.1.2	Oracle Graph Python Client	40
16.3.2	Running the Graph Visualization Web Client	44

16.4	Setting Up Transport Layer Security	45
16.4.1	Using a Self-Signed Server Keystore	46
16.4.1.1	Generating a Self-Signed Server Keystore	46
16.4.1.2	Configuring the Graph Server (PGX) When Using a Server Keystore	47
16.4.1.3	Configuring a Client to Trust the Self-Signed Keystore	48
16.4.2	Using a CA-Signed SSL Certificate	49

17 Getting Started with the Graph Server (PGX)

17.1	Starting the Graph Server (PGX)	1
17.1.1	Starting and Stopping the Graph Server (PGX) Using the Command Line	1
17.1.2	Configuring the Graph Server (PGX)	2
17.2	Connecting to the Graph Server (PGX)	5
17.2.1	Connecting with the Graph Client CLIs	5
17.2.2	Connecting with Java	10
17.2.2.1	Starting and Stopping the PGX Engine	11
17.2.3	Connecting with Python	12

Part V Using the Graph Server (PGX)

18 Developing Applications with Graph Analytics

18.1	Using the Graph Server Administrator Dashboard	1
18.1.1	Memory Usage	2
18.1.2	Sessions	3
18.1.3	Graphs	4
18.2	About Vertex and Edge IDs	4
18.3	Graph Management in the Graph Server (PGX)	7
18.3.1	Reading Graphs from Oracle Database into the Graph Server (PGX)	7
18.3.1.1	Enabling Lazy Loading of Graphs	8
18.3.1.2	Reading Entity Providers at the Same SCN	10
18.3.1.3	Progress Reporting and Estimation for Graph Loading	13
18.3.1.4	Graph Configuration Options	14
18.3.1.5	Data Loading Security Best Practices	21
18.3.1.6	Data Format Support Matrix	22
18.3.1.7	Immutability of Loaded Graphs	22
18.3.2	Storing a Graph Snapshot on Disk	22
18.3.3	Publishing a Graph	23
18.3.4	Deleting a Graph	32
18.3.5	Graph Sharing Options and Validating Graph Permissions	34
18.4	Keeping the Graph in Oracle Database Synchronized with the Graph Server	37
18.4.1	Synchronizing a SQL Property Graph	38

18.4.2	Synchronizing a PGQL Property Graph	42
18.5	Optimizing Graphs for Read Versus Updates in the Graph Server (PGX)	46
18.6	Executing Built-in Algorithms	46
18.6.1	About Built-In Algorithms in the Graph Server (PGX)	48
18.6.2	Getting the Progress of a Running Algorithm	48
18.6.3	Centrality Algorithms	51
18.6.3.1	Degree Centrality	52
18.6.3.2	Closeness Centrality	54
18.6.3.3	Harmonic Centrality	55
18.6.3.4	Vertex Betweenness Centrality	57
18.6.3.5	PageRank	59
18.6.4	Running the Triangle Counting Algorithm	61
18.7	Using Custom PGX Graph Algorithms	62
18.7.1	Writing a Custom PGX Algorithm	62
18.7.1.1	Collections	63
18.7.1.2	Iteration	64
18.7.1.3	Reductions	64
18.7.2	Compiling and Running a Custom PGX Algorithm	65
18.7.3	Example Custom PGX Algorithm: PageRank	67
18.7.4	Tracking the Progress of a Running Custom PGX Graph Algorithm	68
18.8	User-Defined Functions (UDFs) in PGX	70
18.9	Using Graph Server (PGX) as a Library	74
18.9.1	Using the PGX JDBC Driver when Graph Server (PGX) is Utilized as a Library	75

19 Using the Machine Learning Library (Pgxml) for Graphs

19.1	Using the DeepWalk Algorithm	2
19.1.1	Loading a Graph	3
19.1.2	Building a Minimal DeepWalk Model	4
19.1.3	Building a Customized DeepWalk Model	5
19.1.4	Training a DeepWalk Model	6
19.1.5	Getting the Loss Value For a DeepWalk Model	7
19.1.6	Computing Similar Vertices for a Given Vertex	7
19.1.7	Computing Similar Vertices for a Vertex Batch	8
19.1.8	Getting All Trained Vertex Vectors	9
19.1.9	Storing a Trained DeepWalk Model	10
19.1.9.1	Storing a Trained Model in Another Database	11
19.1.10	Loading a Pre-Trained DeepWalk Model	12
19.1.10.1	Loading a Pre-Trained Model From Another Database	13
19.1.11	Destroying a DeepWalk Model	15
19.2	Using the Supervised GraphWise Algorithm (Vertex Embeddings and Classification)	15
19.2.1	Loading a Graph	17

19.2.2	Building a Minimal GraphWise Model	19
19.2.3	Advanced Hyperparameter Customization	20
19.2.4	Building a GraphWise Model Using Partitioned Graphs	23
19.2.5	Supported Property Types for Supervised GraphWise Model	26
19.2.6	Classification Versus Regression Models on Supervised GraphWise Models	29
19.2.7	Setting a Custom Loss Function and Batch Generator (for Anomaly Detection)	30
19.2.8	Training a Supervised GraphWise Model	32
19.2.9	Getting the Loss Value For a Supervised GraphWise Model	34
19.2.10	Getting the Training Log for a Supervised GraphWise Model	34
19.2.11	Inferring the Vertex Labels for a Supervised GraphWise Model	35
19.2.12	Evaluating the Supervised GraphWise Model Performance	37
19.2.13	Inferring Embeddings for a Supervised GraphWise Model	38
19.2.13.1	Inferring Embeddings for a Model in Another Database	39
19.2.14	Storing a Trained Supervised GraphWise Model	40
19.2.15	Loading a Pre-Trained Supervised GraphWise Model	41
19.2.16	Destroying a Supervised GraphWise Model	42
19.2.17	Explaining a Prediction of a Supervised GraphWise Model	42
19.3	Using the Supervised EdgeWise Algorithm (Edge Embeddings and Classification)	46
19.3.1	Loading a Graph	47
19.3.2	Building a Minimal Supervised EdgeWise Model	49
19.3.3	Advanced Hyperparameter Customization	50
19.3.4	Applying EdgeWise for Partitioned Graphs	53
19.3.5	Supported Property Types for Supervised EdgeWise Model	56
19.3.6	Classification Versus Regression on Supervised EdgeWise Models	59
19.3.7	Setting a Custom Loss Function and Batch Generator (for Anomaly Detection)	60
19.3.8	Setting the Edge Embedding Production Method	62
19.3.9	Training a Supervised EdgeWise Model	63
19.3.10	Getting the Loss Value for a Supervised EdgeWise Model	65
19.3.11	Getting the Training Log for a Supervised EdgeWise Model	66
19.3.12	Inferring Edge Labels for a Supervised EdgeWise Model	67
19.3.13	Evaluating Model Performance	69
19.3.14	Inferring Embeddings for a Supervised EdgeWise Model	70
19.3.15	Storing a Supervised EdgeWise Model	71
19.3.16	Loading a Pre-Trained Supervised EdgeWise Model	72
19.3.17	Destroying a Supervised EdgeWise Model	73
19.3.18	Example: Predicting Ratings on the Movielens Dataset	74
19.4	Using the Unsupervised GraphWise Algorithm (Vertex Embeddings)	77
19.4.1	Loading a Graph	79
19.4.2	Building a Minimal Unsupervised GraphWise Model	80
19.4.3	Advanced Hyperparameter Customization	81
19.4.4	Supported Property Types for Unsupervised GraphWise Model	85
19.4.5	Building an Unsupervised GraphWise Model Using Partitioned Graphs	87

19.4.6	Training an Unsupervised GraphWise Model	90
19.4.7	Getting the Loss Value for an Unsupervised GraphWise Model	92
19.4.8	Getting the Training Log for an Unsupervised GraphWise Model	93
19.4.9	Inferring Embeddings for an Unsupervised GraphWise Model	94
19.4.10	Classifying the Vertices Using the Obtained Embeddings	95
19.4.11	Storing an Unsupervised GraphWise Model	96
19.4.12	Loading a Pre-Trained Unsupervised GraphWise Model	97
19.4.13	Destroying an Unsupervised GraphWise Model	98
19.4.14	Explaining a Prediction for an Unsupervised GraphWise Model	98
19.5	Using the Unsupervised EdgeWise Algorithm	102
19.5.1	Loading a Graph	104
19.5.2	Building a Minimal Unsupervised EdgeWise Model	106
19.5.3	Advanced Hyperparameter Customization	106
19.5.4	Supported Property Types for Unsupervised EdgeWise Model	110
19.5.5	Applying Unsupervised EdgeWise for Partitioned Graphs	112
19.5.6	Setting the Edge Combination Production Method	115
19.5.7	Training an Unsupervised EdgeWise Model	116
19.5.8	Getting the Loss Value for an Unsupervised EdgeWise Model	118
19.5.9	Getting the Training Log for an Unsupervised EdgeWise Model	119
19.5.10	Inferring Embeddings for an Unsupervised EdgeWise Model	120
19.5.11	Classifying the Edges Using the Obtained Embeddings	121
19.5.12	Storing an Unsupervised EdgeWise Model	122
19.5.13	Loading a Pre-Trained Unsupervised EdgeWise Model	123
19.5.14	Destroying an Unsupervised Anomaly Detection GraphWise Model	124
19.5.15	Example: Computing Edge Embeddings on the Movielens Dataset	124
19.6	Using the Unsupervised Anomaly Detection GraphWise Algorithm (Vertex Embeddings and Anomaly Scores)	126
19.6.1	Loading a Graph	128
19.6.2	Building a Minimal Unsupervised Anomaly Detection GraphWise Model	129
19.6.3	Advanced Hyperparameter Customization	130
19.6.4	Building an Unsupervised Anomaly Detection GraphWise Model Using Partitioned Graphs	133
19.6.5	Training an Unsupervised Anomaly Detection GraphWise Model	136
19.6.6	Getting the Loss Value for an Unsupervised Anomaly Detection GraphWise Model	136
19.6.7	Inferring Embeddings for an Unsupervised Anomaly Detection GraphWise Model	137
19.6.8	Inferring Anomalies	138
19.6.9	Storing an Unsupervised Anomaly Detection GraphWise Model	140
19.6.10	Loading a Pre-Trained Unsupervised Anomaly Detection GraphWise Model	141
19.6.11	Destroying an Unsupervised Anomaly Detection GraphWise Model	142
19.7	Using the Pg2vec Algorithm	143
19.7.1	Loading a Graph	144

19.7.2	Building a Minimal Pg2vec Model	145
19.7.3	Building a Customized Pg2vec Model	146
19.7.4	Training a Pg2vec Model	148
19.7.5	Getting the Loss Value For a Pg2vec Model	148
19.7.6	Computing Similar Graphlets for a Given Graphlet	149
19.7.7	Computing Similars for a Graphlet Batch	150
19.7.8	Inferring a Graphlet Vector	151
19.7.9	Inferring Vectors for a Graphlet Batch	152
19.7.10	Storing a Trained Pg2vec Model	153
19.7.11	Loading a Pre-Trained Pg2vec Model	154
19.7.12	Destroying a Pg2vec Model	155
19.8	Model Repository and Model Stores	155
19.8.1	Database-Backed Model Repository	156

20 Executing PGQL Queries Against the Graph Server (PGX)

20.1	Getting Started with PGQL	1
20.2	Creating Property Graphs Using Options	3
20.3	Supported PGQL Features and Limitations on the Graph Server (PGX)	5
20.3.1	Support for Selecting All Properties	8
20.3.2	Unnesting of Variable-Length Path Queries	9
20.3.3	Using INTERVAL Literals in PGQL Queries	12
20.3.4	Using Path Modes with PGQL	13
20.3.5	Support for PGQL Lateral Subqueries	15
20.3.6	Support for PGQL GRAPH_TABLE Operator	16
20.3.7	OPTIONAL MATCH Clause	17
20.3.8	Limitations on Quantifiers	18
20.3.9	Limitations on WHERE and COST Clauses in Quantified Patterns	18
20.4	Java APIs for Executing CREATE PROPERTY GRAPH Statements	19
20.5	Python APIs for Executing CREATE PROPERTY GRAPH Statements	20
20.6	Executing PGQL Queries Using the PGX JDBC Driver	20
20.6.1	Limitations of the PGX JDBC Driver	22
20.6.2	PGX Data Type Compatibility and Casting	22
20.7	Java APIs for Executing SELECT Queries	24
20.7.1	Executing SELECT Queries Against a Graph in the Graph Server (PGX)	25
20.7.2	Executing SELECT Queries Against a PGX Session	25
20.7.3	Iterating Through a Result Set	25
20.7.4	Printing a Result Set	27
20.8	Java APIs for Executing UPDATE Queries	28
20.8.1	Updatability of Graphs Through PGQL	28
20.8.2	Executing UPDATE Queries Against a Graph in the Graph Server (PGX)	29
20.8.3	Executing UPDATE Queries Against a PGX Session	30

20.8.4	Altering the Underlying Schema of a Graph	30
20.9	Python APIs for Executing UPDATE Queries	31
20.10	PGQL Queries with Partitioned IDs	34
20.11	Security Tools for Executing PGQL Queries	35
20.11.1	Using Bind Variables	36
20.11.2	Using Identifiers in a Safe Manner	37
20.12	Best Practices for Tuning PGQL Queries	37
20.12.1	Memory Allocation	38
20.12.2	Parallelism	38
20.12.3	Query Plan Explaining	38

21 REST Endpoints for the Graph Server

21.1	Graph Server REST API Version 2	1
21.1.1	Get an Authentication Token	1
21.1.2	Refresh an Authentication Token	3
21.1.3	Get Graphs	4
21.1.4	Run a PGQL Query	5
21.1.5	Get the Database Version	8
21.1.6	Get User	9
21.1.7	Asynchronous REST Endpoints	10
21.1.7.1	Run an Asynchronous PGQL Query	10
21.1.7.2	Check Asynchronous Query Completion	12
21.1.7.3	Retrieve Asynchronous Query Result	12
21.1.7.4	Cancel an Asynchronous Query Execution	14
21.2	Graph Server REST API Version 1	14
21.2.1	Login	15
21.2.2	Get Graphs	16
21.2.3	Run a PGQL Query	16
21.2.4	Get User	19
21.2.5	Logout	19
21.2.6	Asynchronous REST Endpoints	19
21.2.6.1	Run an Asynchronous PGQL Query	20
21.2.6.2	Check Asynchronous Query Completion	20
21.2.6.3	Retrieve Asynchronous Query Result	21
21.2.6.4	Cancel an Asynchronous Query Execution	23

Part VI Graph Visualization Application

22 About the Graph Visualization Application

23 Using the Graph Visualization Application

23.1	Visualizing Graph Queries on SQL Property Graphs	2
23.1.1	Visualizing the Schema of a SQL Property Graph	3
23.2	Visualizing PGQL Queries on Graphs Loaded Into the Graph Server (PGX)	5
23.3	Visualizing PGQL Queries on PGQL Property Graphs	8
23.4	Graph Visualization Modes and Graph Legends	9
23.5	Managing the Display Size of the Graph	11
23.6	Graph Visualization Settings	12
23.6.1	Enabling Cluster Option in Graph Visualization	17
23.6.2	Using the Geographical Layout	17
23.6.3	Using Network Evolution in Graph Visualization	18
23.6.4	Importing and Exporting Graph Visualization Settings	20

24 Embedding the Graph Visualization Library in a Web Application

Part VII Graph Server (PGX) Advanced User Guide

25 Graph Server (PGX) Configuration Options

25.1	Configuration Parameters for the Graph Server (PGX) Engine	1
25.2	Configuration Parameters for Connecting to the Graph Server (PGX)	13

26 Memory Consumption by the Graph Server (PGX)

26.1	Memory Management	1
26.1.1	Configuring On-Heap Limits	2
26.1.2	Configuring Off-Heap Limits	4

27 Deploying Oracle Graph Server Behind a Load Balancer

27.1	Using HAProxy for PGX Load Balancing and High Availability	1
27.2	Deploying Graph Server (PGX) Using OCI Load Balancer	3
27.3	Health Check in the Load Balancer	6

28 Namespaces and Sharing

28.1	Defining Graph Names	1
28.2	Retrieving Graphs by Name	1
28.3	Checking Used Names	2
28.4	Property Name Resolution and Graph Mutations	2

29 PGX Programming Guides

29.1	Design of the Graph Server (PGX) API	2
29.2	Data Types and Collections in the Graph Server (PGX)	4
29.2.1	Using Collections and Maps	6
29.2.1.1	Collection Data Types	7
29.2.1.2	Map Data Types	11
29.2.2	Using Datetime Data Types	17
29.2.2.1	Loading Datetime Data	17
29.2.2.2	Specifying Custom Datetime Formats	19
29.2.2.3	APIs for Accessing Datetime Data	20
29.2.2.4	Querying Datetime Data Using PGQL	21
29.2.2.5	Accessing Datetimes from PGQL Result Sets	23
29.3	Handling Asynchronous Requests in Graph Server (PGX)	25
29.3.1	Blocking Operation	25
29.3.2	Chaining Operation	26
29.3.3	Cancelling Operation	27
29.3.4	Handling Concurrent Asynchronous Operations	27
29.4	Graph Client Sessions	27
29.4.1	Creating a Session	28
29.4.2	Updating Session Idle Timeout	28
29.4.3	Destroying a Session	30
29.5	Graph Mutation and Subgraphs	31
29.5.1	Altering Graphs	31
29.5.1.1	Loading Or Removing Additional Vertex or Edge Providers	32
29.5.2	Simplifying and Copying Graphs	40
29.5.3	Transposing Graphs	42
29.5.4	Undirecting Graphs	43
29.5.5	Advanced Multi-Edge Handling	44
29.5.5.1	Picking	44
29.5.5.2	Merging	45
29.5.5.3	StrategyBuilder in General	46
29.5.6	Creating a Bipartite Subgraph	47
29.5.7	Creating a Sparsified Subgraph	47
29.6	Graph Builder and Graph Change Set	48

29.6.1	Creating a Partitioned Graph Using the GraphBuilder Interface	48
29.6.1.1	KEYS_AS_IDS Strategy	49
29.6.1.2	PARTITIONED_IDS Strategy	52
29.6.1.3	UNSTABLE_GENERATED_IDS Strategy	54
29.6.2	Modifying Loaded Graphs Using ChangeSet	56
29.6.2.1	Modifying Vertices	56
29.6.2.2	Adding Edges	57
29.6.2.3	GraphChangeSet with Partitioned IDs	58
29.6.2.4	Error Handling when Using a ChangeSet	59
29.7	Managing Transient Data	60
29.7.1	Managing Transient Properties	61
29.7.2	Managing Collections and Scalars	62
29.8	Graph Versioning	64
29.8.1	Configuring the Snapshots Source	64
29.8.2	Creating a Snapshot via Refreshing	65
29.8.3	Creating a Snapshot via ChangeSet	67
29.8.4	Checking Out the Latest Snapshots of a Graph	70
29.8.5	Checking Out Different Snapshots of a Graph	70
29.8.6	Directly Loading a Specific Snapshot of a Graph	71
29.9	Labels and Properties	73
29.9.1	Setting and Getting Property Values	73
29.9.2	Getting Label Values	75
29.10	Filter Expressions	75
29.10.1	Syntax	76
29.10.2	Type System	80
29.10.3	Path Finding Filters	81
29.10.4	Subgraph Filters	81
29.10.5	Operations on Filter Expressions	82
29.10.5.1	Defining Filter Expressions	82
29.10.5.2	Defining Result Set Filters	83
29.10.5.3	Creating a Subgraph from PGQL Result Set	85
29.10.5.4	Defining Collection Filters	86
29.10.5.5	Creating a Subgraph from Collection Filters	88
29.10.5.6	Combining Filter Expressions	90
29.10.5.7	Creating a Subgraph Using Filter Expressions with Partitioned IDs	91
29.11	Advanced Task Scheduling Using Execution Environments	92
29.11.1	Prerequisites for Using the Enterprise Scheduler	92
29.11.2	Enabling Enterprise Scheduler Features	93
29.11.3	Retrieving and Inspecting the Execution Environment	93
29.11.4	Modifying and Submitting Tasks Under an Updated Environment	95
29.11.5	Using Lambda Syntax	96
29.11.6	Enterprise Scheduler Configuration Guide	97

29.12	Admin API	99
29.12.1	Get a Server Instance	99
29.12.2	Get Inspection Data	100
29.12.3	Get Active Sessions	101
29.12.4	Get Cached Graphs	103
29.12.5	Get Published Graphs	104
29.12.6	Get Currently Loading Graphs	104
29.12.7	Get Tasks	105
29.12.8	Get Available Memories	105
29.13	PgxFrames Tabular Data-Structure	105
29.13.1	Converting PgqlResultSet to a PgxFrame	106
29.13.2	Storing a PgxFrame to a Database	107
29.13.3	Storing a PgxFrame to a CSV File	110
29.13.4	Union of PGX Frames	110
29.13.5	Joining PGX Frames	111
29.13.6	Printing the Content of a PgxFrame	113
29.13.7	Destroying a PgxFrame	114
29.13.8	Loading and Storing Vector Properties	115
29.13.9	Flattening Vector Properties	118
29.13.10	PgxFrame Helpers	119
29.13.11	Converting a PgxFrame to PgqlResultSet	122
29.13.12	PgxFrame to Pandas DataFrame Conversions	123
29.13.13	Loading a PgxFrame from a Database	123
29.13.14	Loading a PgxFrame from a CSV File	127
29.13.15	Loading a PgxFrame from Client-Side Data	128
29.13.16	Creating a Graph from Multiple PgxFrame Objects	132

30 Working with Files Using the Graph Server (PGX)

30.1	Loading Graph Data from Files	1
30.1.1	Graph Configuration for Loading from File	5
30.1.2	Specifying the File Path	9
30.1.3	Supported File Access Protocols	9
30.1.4	Plain Text Formats	9
30.1.4.1	Comma-Separated Values (CSV)	11
30.1.4.2	Adjacency List (ADJ_LIST)	15
30.1.4.3	Edge List (EDGE_LIST)	16
30.1.4.4	Two Tables (TWO_TABLES)	17
30.1.5	XML File Formats	18
30.1.6	Binary File Formats	20
30.2	Loading Graph Data in Parallel from Multiple Files	25
30.3	Exporting Graphs Into a File	27

30.3.1	Exporting a Graph to Disk	28
30.4	Exporting a Graph into Multiple Files	30

31 Log Management in the Graph Server (PGX)

31.1	Configuring Logback Logging	1
------	-----------------------------	---

Part VIII Supplementary Information for Property Graph Support

A Mapping Graph Server Roles to Default Privileges

B Disabling Transport Layer Security (TLS) in Graph Server

C Migrating Property Graph Applications from Before Release 21c

D Upgrading From Graph Server and Client 20.4.x to 21.x

E Third-Party License Information for Oracle Graph Server and Client

E.1	Third-Party License Information for Graph Visualization Toolkit	E-149

Preface

This document provides conceptual and usage information about Oracle Database support for working with property graph data.

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

Audience

This document is intended for database and application developers in an Oracle Database environment.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

For more information, see the following documents:

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Changes in This Release for This Guide

The following changes apply to property graph support that is shipped with Oracle Graph Server and Client.

Oracle Graph Server and Client is required for using the property graph feature of Oracle Database (see [Oracle Graph Server and Client Installation](#)), and is released four times a year.

New Features in Oracle Graph Server and Client 25.3

Features That Work With Oracle Database Release 23ai and Prior Oracle Database Releases

- Added support for loading property graphs with selected properties into the graph server (PGX).
See [Loading a SQL Property Graph Using PropertyLoadingMode Options](#) for more information.
- Added support for unloading a database graph from the graph server memory (PGX).
See [Loading or Unloading a Database Property Graph Into or From the Graph Server \(PGX\) Memory](#) for more information.
- Added support for dynamically controlling the display size of the graph in the Graph Visualization Application.
See [Managing the Display Size of the Graph](#) for more information.
- Added support for visualizing the schema of a SQL property graph in the Graph Visualization Application
See [Visualizing the Schema of a SQL Property Graph](#) for more information.
- Added support for **Run table-only query** mode to view the query results only in tabular format in the Graph Visualization Application.
See [Figure 23-1](#) for more information.
- Added support to customize the visibility toggle behavior of the legend items through Graph Visualization **Settings**.
See [Visibility Toggle Mode](#) for more information.
- Added support for schema visualization when using the APEX Graph Visualization Plug-in.
See [Getting Started with the APEX Graph Visualization Plug-in](#) for more information.
- Added support for new PL/SQL scripts to import graph data from Neo4j and create a SQL property graph in your Oracle Autonomous Database instance or an on-premises Oracle Database.
See [Quick Start: Creating a SQL Property Graph by Importing Graph Data from Neo4j](#) for more information.
- Added support for **Oracle SQL Developer Graph Visualization for VSCode** extension that allows you to visualize the results of SQL graph queries in Visual Studio Code (VS Code).
See [Getting Started with the Graph Visualization Extension for VS Code](#) for more information.

- [Key Property Graph Features in Oracle Database Release 23ai](#)
Learn about the key property graph features in Oracle Database 23ai.
- [Deprecated Features](#)
Review the deprecated features in Oracle Graph Server and Client.
- [Desupported Features](#)
Review the desupported features in Oracle Graph Server and Client.

Key Property Graph Features in Oracle Database Release 23ai

Learn about the key property graph features in Oracle Database 23ai.

New Feature in Release Update 23.9

- Added support for declaring path variables when there are multiple path patterns in a SQL graph query.
See [Path Variables](#) for more information.
- Added support for referencing a path variable using the `IN` path clause within `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in a SQL graph query.
See [Using IN Path Clause](#) for more information.
- Added support for using `PATH_NAME` function in combination with `ONE ROW PER VERTEX` or `ONE ROW PER STEP` to return the name of the path that the iterator variables are currently iterating over.
See [Using the PATH_NAME Function](#) for more information.
- Added support for `IS LABELED` and `PROPERTY_EXISTS` predicates in SQL graph queries.
See the following topics for more information:
 - [Using the IS LABELED Predicate](#)
 - [Using the PROPERTY_EXISTS Predicate](#)

New Feature in Release Update 23.8

- Added support for `MATCHNUM` and `ELEMENT_NUMBER` functions in the `COLUMNS` clause of SQL graph queries.
See the following topics for more information:
 - [Using the MATCHNUM Function](#)
 - [Using the ELEMENT_NUMBER Function](#)

New Feature in Release Update 23.7

- Added support for retrieving results using `ONE ROW PER MATCH`, `ONE ROW PER VERTEX`, or `ONE ROW PER STEP` option in SQL graph queries. These options are supported in combination with variable-length path patterns.
See [Using ONE ROW PER Clause in a SQL Graph Query](#) for more information.

New Feature in Release Update 23.6

- Added support for using `binding_count` in SQL graph queries. `binding_count` is an aggregate to count the number of bindings to an element variable.
See [Using binding_count\(\) in SQL Graph Queries](#) for more information.

New Features in Release Update 23.4

- Support for selecting all the vertex or edge properties in the `COLUMNS` clause of a SQL graph query.
See [Selecting All Properties in the COLUMNS Clause](#) for more information.
- Support for determining the direction of edges using the `SOURCE` and `DESTINATION` predicates inside the `WHERE` or `COLUMNS` clause of a SQL graph query.
See [Using the SOURCE and DESTINATION Predicates](#) for more information.

Property Graph Features in Oracle Database Release 23ai

- Support for creating SQL property graph objects in Oracle Database.
See [Introduction to SQL Property Graphs](#) for more information.
- Support for running graph queries on SQL property graphs.
See [SQL Graph Queries](#) for more information.
- Support for using aggregate functions in SQL graph queries.
See [Using Aggregate Functions in SQL Graph Queries](#) for more information.
- Support for loading SQL property graphs into the graph server (PGX).
See [Loading a SQL Property Graph Using the readGraphByName API](#) for more information.
- Support for loading a subgraph from a SQL property graph into the graph server (PGX).
See [Loading a Subgraph Using PGQL Queries](#) for more information.
- Support for dynamically expanding a subgraph in the graph server (PGX).
See [Expanding a Subgraph](#) for more information.
- Support for running PGQL SELECT queries against SQL property graphs.
See [Executing PGQL Queries Against SQL Property Graphs](#) for more information.
- Support for visualizing SQL graph queries on graphs in the database using the Graph Visualization application.
See [Visualizing Graph Queries on SQL Property Graphs](#) for more information.
- Support for visualizing SQL graph queries using the APEX Graph Visualization plug-in in APEX applications.
See [Visualizing SQL Graph Queries Using the APEX Graph Visualization Plug-in](#) for more information.

Deprecated Features

Review the deprecated features in Oracle Graph Server and Client.

- **Deprecated constructors in `oracle.pgx.api`**
 - `EntityProviderMetaData(String name, IdType idType, Set<String> labels, List<PropertyMetaData> properties)` is deprecated. Instead, use `EntityProviderMetaData(String name, List<KeyColumnDescriptor> keyColumns, Set<String> labels, List<PropertyMetaData> properties)`.
 - `VertexProviderMetaData(String name, IdType idType, Set<String> labels, List<PropertyMetaData> properties, Set<String> edgeProviderNamesWhereSource, Set<String> edgeProviderNamesWhereDestination)` is deprecated. Instead, use `VertexProviderMetaData(String name, List<KeyColumnDescriptor> key, Set<String> labels, List<PropertyMetaData> properties, Set<String>`

```
edgeProviderNamesWhereSource, Set<String>
edgeProviderNamesWhereDestination).
```

- **Deprecated constructor in `oracle.pgx.config`**
`GraphResource.describeGraphLegacyFormat(ServletContext context, String sessionId, Request request, UriInfo uriInfo, DescribeGraphRequest describeGraphRequest)` is deprecated. Instead, use
`GraphResource.describeGraph(ServletContext context, String sessionId, Request request, UriInfo uriInfo, DescribeGraphRequest describeGraphRequest)`.
- **Oracle Linux 7**
Oracle Linux 7 is deprecated. Instead, use Oracle Linux 8.
- **Graph Server REST API Version 1**
Graph Server REST API Version 1 is deprecated. It is recommended that you use [Graph Server REST API Version 2](#).
- **formatter parameter in `https://localhost:7007/v2/runQuery` endpoint**
The `formatter` parameter in `https://localhost:7007/v2/runQuery` endpoint is deprecated.
- **PG_VIEW field**
The `PG_VIEW` constant is deprecated from `GraphSource` and `SourceType`. Instead, use `PG_PGQL`.
- **Graph Loading From Files**
The following data formats are deprecated:
 - `Format.EDGE_LIST`
 - `Format.TWO_TABLES`
 - `Format.ADJ_LIST`
 - `Format.FLAT_FILE`
 - `Format.GRAPHML`
 - `Format.RDF`
- **Interfaces, Classes and Methods deprecated for `oracle.pgx.api`**
 - `GraphBuilder.setConfigParameter(GraphBuilderConfig.Field, Object)` is deprecated. Instead, use specific setter methods.
 - `PgxGraphFromFramesCreator.partitioned(boolean)` is deprecated.
 - `AbstractServerConfig.getCaCerts()` is deprecated.
 - The following `PgxGraph` APIs (and their corresponding `async` versions) are deprecated as they are not supported for partitioned graphs:
 - * `PgxGraph.isDirected()`
 - * `PgxGraph.undirect()`
 - * `PgxGraph.undirect(MutationStrategy)`
 - * `PgxGraph.undirect(Collection<VertexProperty<?, ?>>, Collection<EdgeProperty<?>>, MultiEdges, SelfEdges, TrivialVertices, Mode, String)`
 - * `PgxGraph.undirect(MultiEdges, SelfEdges, Mode, String)`
 - * `PgxGraph.undirect(String)`
 - * `PgxGraph.sortByDegree()`

- * `PgxGraph.sortByDegree(SortOrder, Degree, Mode, String)`
- * `PgxGraph.sortByDegree(String)`
- * `PgxGraph.transpose(Collection<VertexProperty<?, ?>>, Collection<EdgeProperty<?>>, Map<String, String>, Mode, String)`
- * `PgxGraph.transpose(Mode, String)`
- * `PgxGraph.transpose(String)`
- * `PgxGraph.transpose(Mode)`
- * `PgxGraph.transpose()`
- * `PgxGraph.transpose(MutationStrategy)`
- The following `PgxSession` APIs (and their corresponding `async` versions) are deprecated as they are not supported for partitioned graphs:
 - * `PgxSession.createGraphFromFrames(String, PgxFrame, PgxFrame)`
 - * `PgxSession.createGraphBuilder(IdGenerationStrategy)`
 - * `PgxSession.createGraphBuilder(IdType)`
 - * `PgxSession.describeGraphFile(String)`
 - * `PgxSession.describeGraphFile(String, Format)`
 - * `PgxSession.describeGraphFiles(List<String>)`
 - * `PgxSession.describeGraphFiles(List<String>, Format)`
 - * `PgxSession.describeGraphFiles(String, String, Format)`
 - * `PgxSession.describeGraphFiles(List<String>, List<String>)`
 - * `PgxSession.readGraphFile(String)`
 - * `PgxSession.readGraphFiles(List<String>)`
 - * `PgxSession.readGraphFiles(List<String>, Format)`
 - * `PgxSession.readGraphFiles(List<String>, String)`
 - * `PgxSession.readGraphFiles(List<String>, Format, String)`
 - * `PgxSession.readGraphFiles(String, String, Format)`
 - * `PgxSession.readGraphFiles(String, String, Format, String)`
 - * `PgxSession.readGraphFiles(List<String>, List<String>, Format)`
 - * `PgxSession.readGraphFiles(List<String>, List<String>, Format, String)`
- `CompiledProgram.destroy(boolean)` is deprecated. Instead, use `CompiledProgram.destroy()`.
- `ComponentCollection.destroy(boolean)` is deprecated. Instead, use `ComponentCollection.destroy()`.
- `Partition.destroy(boolean)` is deprecated. Instead, use `Partition.destroy()`.
- `PgxGraph.destroy(PgxGraph.Retention)` is deprecated. Instead, use `PgxGraph.destroy()`.
- `PgxVertexTableFromFramesCreator` is deprecated. Instead, use `PgxVertexProviderFromFramesCreator`.

- `PgxEdgeTableFromFramesCreator` is deprecated. Instead, use `PgxEdgeProviderFromFramesCreator`.
- `PgxGraphFromFramesCreator.edgeTable(...)` is deprecated. Instead, use `PgxGraphFromFramesCreator.edgeProvider(String, String, String, PgxFrame)`.
- `PgxGraphFromFramesCreator.vertexTable(...)` is deprecated. Instead, use `PgxGraphFromFramesCreator.vertexProvider(String, PgxFrame)`.
- `GraphConfig.getLoading()` is deprecated. Instead, use `GraphConfig.getLoadingOptions()`.
- `AbstractFileGraphConfigBuilder.setStoringConfig(...)` is deprecated. Instead, use `AbstractFileGraphConfigBuilder.setStoringOptions(FileGraphStoringConfig)`.
- `AbstractFileGraphConfig.getStoring()` is deprecated. Instead, use `AbstractFileGraphConfig.getStoringOptions()`.
- `AbstractFileEntityProviderConfig.getStoring()` is deprecated. Instead, use `AbstractFileEntityProviderConfig.getStoringOptions()`.
- `FileEntityProviderConfigBuilder.setStoring(FileGraphStoringConfig)` is deprecated. Instead, use `FileEntityProviderConfigBuilder.setStoringOptions(FileGraphStoringConfig)`.
- `PartitionedGraphConfigBuilder.setPgViewName(String)` is deprecated. Instead, use `PartitionedGraphConfigBuilder.setSourceName(String)` and `PartitionedGraphConfigBuilder.setSourceType(sourceType)`.
- `PickingStrategyBuilder.setPickByProperty(String, PickingStrategyFunction)` is deprecated. Instead, use `PickingStrategyBuilder.setPickByProperty(EdgeProperty, PickingStrategyFunction)`.
- `VertexFilter(String filterExpression)` is deprecated. Instead, use `VertexFilter.fromExpression(String)`.
- `EdgeFilter(String filterExpression)` is deprecated. Instead, use `EdgeFilter.fromExpression(String)`.
- `ServerInstance.getSessionInfo(...)` is deprecated. Instead, use `ServerInstance.getServerState(...)`.
- `ServerInstance.getGraphInfo(...)` is deprecated. Instead, use `ServerInstance.getServerState(...)`.
- `ServerInstance.getMemoryInfo(...)` is deprecated. Instead, use `ServerInstance.getServerState(...)`.
- `ServerInstance.getThreadPoolInfo(...)` is deprecated. Instead, use `ServerInstance.getServerState(...)`.
- `ControlResource.getSessionBoundGraphInfo(String, String, Request, UriInfo)` is deprecated. Instead, use `ControlResource.getServerState(String, Request, UriInfo)`.
- `oracle.pgx.api.filter.ResultSetFilter` is deprecated. Instead, use `oracle.pgx.api.filter.internal.ResultSetFilter`.
- `oracle.pgx.api.filter.ResultSetVertexFilter` is deprecated. Instead, use `oracle.pgx.api.filter.internal.ResultSetVertexFilter`.

- `oracle.pgx.api.filter.ResultSetEdgeFilter` is deprecated. Instead, use `oracle.pgx.api.filter.internal.ResultSetEdgeFilter`.
 - **PgxML**
 - `UnsupervisedGraphWiseModel.getDgiLayerConfigs()` is deprecated. Instead, use `UnsupervisedGraphWiseModel.getEmbeddingConfig()`.
 - `UnsupervisedGraphWiseModelConfig.getDgiLayerConfigs()` is deprecated. Instead, use `UnsupervisedGraphWiseModelConfig.getEmbeddingConfig()`.
 - `UnsupervisedGraphWiseModelConfig.setDgiLayerConfigs(GraphWiseDgiLayerConfig)` is deprecated. Instead, use `UnsupervisedGraphWiseModelConfig.setEmbeddingConfig(GraphWiseEmbeddingConfig)`.
 - The `SupervisedGraphWiseModel.getLossFunction()` method is deprecated. Instead, use `SupervisedGraphWiseModel.getLossFunctionClass()`.
 - **Configuration Fields**
 - `node_id_type` is deprecated. Instead, use `vertex_id_type`.
 - `node_props` is deprecated. Instead, use `vertex_props`.
 - `create_node_id_index` is deprecated. Instead, use `create_vertex_id_index`.
 - `create_node_id_mapping` is deprecated. Instead, use `create_vertex_id_mapping`.
 - `PropertyType.RO_STRING_SET`, `LONG_SET`, `SPARSE` is deprecated.
 - `enable_client_authentication` is deprecated. Instead, use native PGX authentication.
 - **PgxSession.readSubgraph() methods**
 - `session.readSubgraph().fromPgView()` is deprecated. Instead, use `session.readSubgraph().fromPgPsql()`.
 - `graph.expandGraph().withPsql().fromPgView()` is deprecated. Instead, use `graph.expandGraph().withPsql().fromPgPsql()`.
 - **PyPGX**
 - `PgxSession.read_subgraph_from_pg_view()` is deprecated. Instead, use `PgxSession.read_subgraph_from_pg_psql()`.
 - The following function signatures are deprecated for `PgxGraph`:
 - * `get_or_create_edge_property(name, data_type=None, dim=0)`
Instead, use `get_or_create_edge_property(type, /, name)`.
 - * `get_or_create_edge_vector_property(data_type, dim, name=None)`
Instead, use `get_or_create_edge_vector_property(type, dimension, /, name)`.
 - * `get_or_create_vertex_property(name, data_type=None, dim=0)`
Instead, use `get_or_create_vertex_property(type, /, name)`.
 - * `get_or_create_vertex_vector_property(data_type, dim, name=None)`
Instead, use `get_or_create_vertex_vector_property(type, dimension, /, name)`.
- Note the following changes that apply for the new signatures:
- * `name` is no longer optional

- * `type` is the first argument followed by `dimension`, and `name` is the final argument
- * `data_type` and `dim` are deprecated
- `DeepWalkModel.validation_fraction`, `Pg2vecModel.validation_fraction`, and the `validation_fraction` argument of `Analyst.pg2vec_builder()` are deprecated. The loss is computed on all samples.
- The following attributes on `Operation` are now deprecated: `graph_id`, `operation_type`, `cost_estimate`, `total_cost_estimate`, `cardinality_estimate`, `pattern_info`, and `children`. Instead, use the corresponding getter methods, such as `get_graph_id()`, `get_operation_type()`, and so on.
- The `pgx_version` attribute in `ServerInstance` class is deprecated. Instead, use `get_version()`.
- The attribute `pg_view_name` in `PartitionedGraphConfig` is deprecated. Instead, use `source_name` and `source_type`.
- `set_standarize` in `GraphWiseModelConfig` is deprecated. Instead, use `set_standardize`.
- The return value of `PgqlResultSet.get_vertex_labels` may or may not be a list.

Desupported Features

Review the desupported features in Oracle Graph Server and Client.

- The Graph Visualization application which runs on `https://<server_host>:7007/ui/` is desupported. Instead, use the new Graph Visualization application by opening the URL `https://<server_host>:7007/dash/` in your browser (see [Running the Graph Visualization Web Client](#)).
Note that accessing the old URL `https://<server_host>:7007/ui/` will automatically redirect you to the new URL `https://<server_host>:7007/dash/`.
- Oracle Database 12.2 is desupported.
- The graph server configuration fields, `server_cert` and `server_private_key` are desupported. Instead, use `server_keystore`.
- The following `GraphServer#getInstance` APIs are desupported:
 - `GraphServer.getInstance(ClientConfig clientConfig, String username, char[] password, int refreshTimeBeforeTokenExpiry)`
 - `GraphServer.getInstance(String baseUrl, String username, char[] password, int refreshTimeBeforeTokenExpiry)`
 - `GraphServer.getInstance(String baseUrl, String kerberosTicketPath, int refreshTimeBeforeTokenExpiry)`

Instead, configure the `refresh_time_before_token_expiry_seconds` parameter in the `pgx.conf` file.

- Oracle JDK 8 is desupported.
- Oracle Graph HDFS connector is desupported.
- Creating a property graph in the Oracle database using the property graph schema objects is desupported. The related `OPG_APIS` and `OPG_GRAPHOP` PL/SQL packages for working with property graph schema objects are also desupported. Instead, you can create [SQL Property Graphs](#) or [PGQL Property Graphs](#).

- `SupervisedGraphWiseModel.inferAndGetExplanation(...)` is desupported. Instead, use `SupervisedGraphWiseModel.inferAndExplain(...)`.
- `UnsupervisedGraphWiseModel.inferAndGetExplanation(...)` is desupported. Instead, use `UnsupervisedGraphWiseModel.inferAndExplain(PgxGraph, PgxVertex)`.
- `Pg2vecModelBuilder.setUseGraphletSize(java.lang.Boolean useGraphletSize)` method in `oracle.pgx.api.mllib` API is desupported. Instead, use the `Pg2vecModelBuilder.setUseGraphletSize(boolean useGraphletSize)` method.
- `AbstractGraphConfigBuilder.setFilter(final GraphFilter filter)` is desupported. Instead use [Loading a Subgraph from a PGQL Property Graph](#).
- `AbstractGraphConfigBuilder.setFilterStrategy(final FilterStrategy filterStrategy)` is desupported. Instead use [Loading a Subgraph from a PGQL Property Graph](#).
- `GraphConfig.getLoadingFilter()` is desupported. Instead use [Loading a Subgraph from a PGQL Property Graph](#).
- `SupervisedGraphWiseModelBuilder.setLossFunction(SupervisedGraphWiseModelConfig.LossFunction ...)` is desupported. Instead, use `SupervisedGraphWiseModelBuilder.setLossFunction(LossFunction)`.
- `PgqlViewGraphExpander.schema(String)` is desupported. Instead, use `PgqlViewGraphExpander.fromPgPgql(String, String)`.
- `PgqlViewGraphExpander.owner(String)` is desupported. Instead, use `PgqlViewGraphExpander.fromPgPgql(String, String)`.
- The `PgxSession.getGraphs()` method is desupported. Instead, use `PgxSession.getGraphs(Namespace namespace)`.
- The `PgxSession.getGraphsAsync()` method is desupported. Instead, use `PgxSession.getGraphsAsync(Namespace namespace)`.
- The methods `setValidationFraction` and `getValidationFraction` are desupported for DeepWalk and Pg2vec, The loss is now computed on all samples.
- Desupported the edge pattern syntax `--`, `-->`, and `<--` from PGQL 0.9 and PGQL 1.0. Instead, use `-`, `->` and `<-` respectively.
- The `WHERE` clause syntax `WHERE n -> m` in PGQL 0.9 is desupported. Instead, use `WHERE (n) -> (m)`.
- `pypgx.api.FlashbackSynchronizer` is desupported. Instead, use `pypgx.api.Synchronizer`.
- The `connection` parameter in `PgxGraph.create_synchronizer()` is desupported. Instead, use `jdbc_url`, `username`, and `password`. Also, note that the `synchronizer_class` and `invalid_change_policy` parameters are now keyword-only parameters.
- The following classes are desupported in `pypgx` package. Instead, use `pypgx.api.filters` subpackage to access these classes:
 - `EdgeFilter`
 - `GraphFilter`
 - `VertexFilter`
 - `PathFindingFilter`

- `Analyst.deepwalk_builder()`: the parameter `validation_fraction` has been removed. The loss is computed on all samples.
- `set_standarize` in `GraphWiseModelConfig` is desupported. Instead, use `set_standardize`.
- The parameters `redirect_stdout` and `redirect_stderr` in `pypgx.get_session()` are desupported.
- The Java API method `AbstractGraphConfigBuilder#setNodeIdType` in `oracle.pgx.config` is desupported. Instead, use `AbstractGraphConfigBuilder#setVertexIdType()`.

Part I

Getting Started with Oracle Property Graphs

Part I provides the fundamental information to get you started on the property graph feature of Oracle Database.

This part covers the following:

- [Introduction to Property Graphs](#)
Property graphs give you a different way of looking at your data.
- [Running Oracle Graph Quickstart Container Image](#)
You can easily get started with the property graph feature of Oracle Database using the Oracle Graph Quickstart Container Image.
- [Using Oracle Graph with the Autonomous Database](#)
Oracle Graph with the Autonomous Database allows you to create property graphs from data in your Autonomous Database.

1

Introduction to Property Graphs

Property graphs give you a different way of looking at your data.

You can model your data as a graph by making data entities **vertices** in the graph, and relationships between them as **edges** in the graph. For example, in a bank, customer accounts can be vertices, and cash transfer relationships between them can be edges.

When you view your data as a graph, you can analyze your data based on the connections and relationships between them. You can run graph analytics algorithms like PageRank to measure the relative importance of data entities based on the relationships between them (for instance, links between web pages).

- [What Are Property Graphs?](#)
A property graph consists of a set of objects or **vertices**, and a set of arrows or **edges** connecting the objects.
- [About the Property Graph Feature of Oracle Database](#)
The Property Graph feature delivers advanced graph query and analytics capabilities in Oracle Database.
- [Overview of Property Graph Architecture](#)
The property graph feature of Oracle Database supports the following architecture models.
- [Learn About the Graph Server \(PGX\)](#)
The in-memory graph server layer enables you to analyze property graphs using parallel in-memory execution.
- [Security Best Practices with Graph Data](#)
Several security-related best practices apply when working with graph data.
- [About Oracle Graph Server and Client Accessibility](#)
This section provides information on the accessibility features for Oracle Graph Server and Client.

1.1 What Are Property Graphs?

A property graph consists of a set of objects or **vertices**, and a set of arrows or **edges** connecting the objects.

Vertices and edges can have multiple properties, which are represented as key-value pairs.

Each vertex has a unique identifier and can have:

- A set of outgoing edges
- A set of incoming edges
- A collection of properties

Each edge has a unique identifier and can have:

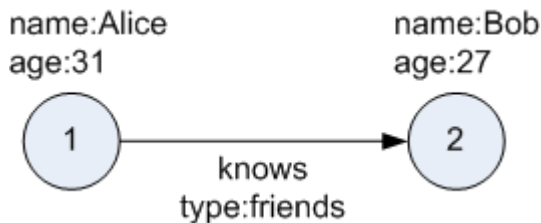

- An outgoing vertex
- An incoming vertex
- A text label that describes the relationship between the two vertices

- A collection of properties

For vertices and edges, each property is identified with a unique name.

The following figure illustrates a very simple property graph with two vertices and one edge. The two vertices have identifiers 1 and 2. Both vertices have properties `name` and `age`. The edge is from the outgoing vertex 1 to the incoming vertex 2. The edge has a text label `knows` and a property `type` identifying the type of relationship between vertices 1 and 2.

Figure 1-1 Simple Property Graph Example

A property graph can have self-edges (that is, an edge whose source and destination vertex are the same), as well as multiple edges between the same source and destination vertices.

A property graph can also have different types of vertices and edges in the same graph. For example a graph can have a set of vertices with label `Person` and a set of vertices with label `Place`, with different properties relevant to these two sets of vertices.

The property graph data model is similar to the W3C standards-based Resource Description Framework (RDF) graph data model; however, the property graph data model is simpler and less precise than RDF.

The property graph data model features and analytic APIs make property graphs a good candidate for use cases such as these:

- Identifying influencers in a social network
- Predicting trends and customer behavior
- Discovering relationships based on pattern matching
- Identifying clusters to customize campaigns

1.2 About the Property Graph Feature of Oracle Database

The Property Graph feature delivers advanced graph query and analytics capabilities in Oracle Database.

This feature supports graph operations, indexing, queries, search, and in-memory analytics.

Graphs manage networks of linked data as vertices, edges, and properties of the vertices and edges. Graphs are commonly used to model, store, and analyze relationships found in social networks, cybersecurity, utilities and telecommunications, life sciences and clinical data, and knowledge networks.

Typical graph analyses encompass graph traversal, recommendations, finding communities and influencers, and pattern matching. Industries including telecommunications, life sciences and healthcare, security, media, and publishing can benefit from graphs.

The property graph features of Oracle Database support those use cases with the following capabilities:

- A scalable graph database
- Developer-based APIs based upon PGQL and Java graph APIs
- A parallel, in-memory graph server (PGX) for running graph queries and graph analytics
- A fast, scalable suite of social network analysis functions that include ranking, centrality, recommender, community detection, and path finding
- Parallel bulk load and export of property graph data in Oracle-defined flat files format
- A powerful Graph Visualization application
- Notebook support through integration with Jupyter

1.3 Overview of Property Graph Architecture

The property graph feature of Oracle Database supports the following architecture models.

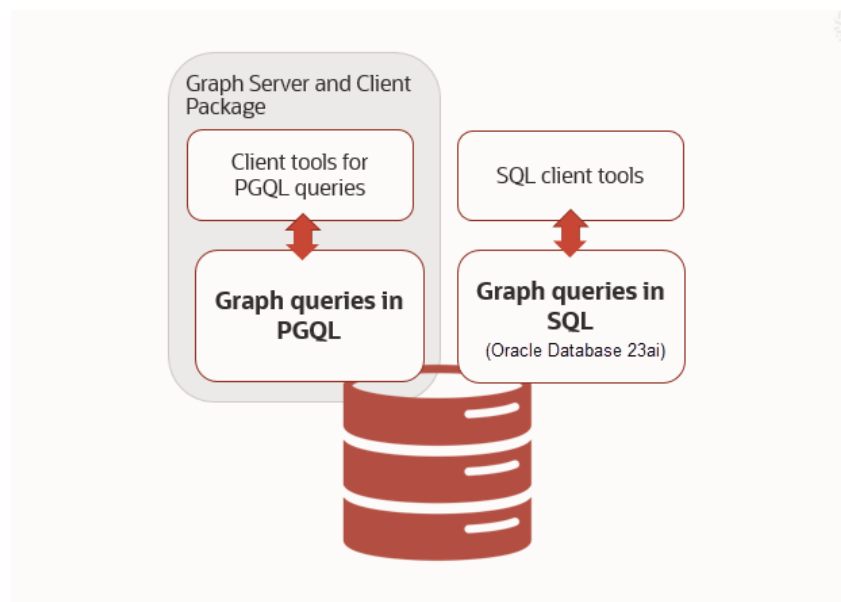

- [Architecture Model for Running Graph Queries in the Database](#)
Using any of the supported client tools, you can directly interact with the graph data stored in the relational tables in the database.
- [Architecture Model for Running Graph Analytics](#)
You can load your property graph into the graph server (PGX) in order to perform specialized graph computations.
- [Developing Applications Using Graph Server Functionality as a Library](#)
The graph functions available with the graph server (PGX) can be used as a library in your application.

1.3.1 Architecture Model for Running Graph Queries in the Database

Using any of the supported client tools, you can directly interact with the graph data stored in the relational tables in the database.

This approach runs graph queries, as shown in the following figure.

Figure 1-2 Property Graph Architecture for Running Graph Queries

This model allows you to create a property graph using any one of the following supported options:

- Create a SQL property graph directly over existing database schema objects using SQL DDL statement. See [SQL Property Graphs](#) for more information.
- Create a PGQL property graph directly over the graph data in the tables. See [PGQL Property Graphs](#) for more information.

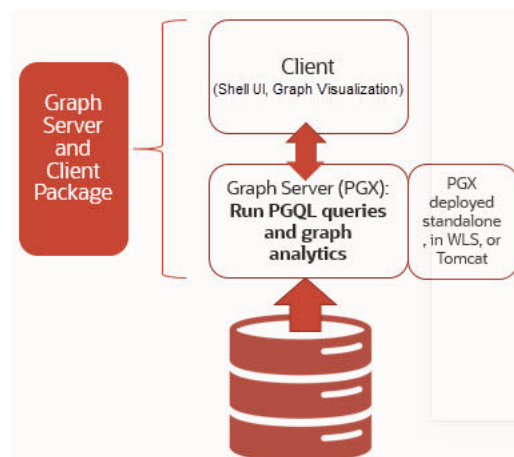

You can directly query the graphs, without loading the graphs into the graph server (PGX), using PGQL. Additionally, you can also run graph pattern matching queries on SQL property graphs using the `GRAPH_TABLE` operator. See [SQL Graph Queries](#) for more information.

However, if you want to run graph analytics algorithms, then you must load this graph into the graph server (PGX). You can configure the graph server to periodically fetch data updates from the database to keep the graph synchronized.

1.3.2 Architecture Model for Running Graph Analytics

You can load your property graph into the graph server (PGX) in order to perform specialized graph computations.

Figure 1-3 Property Graph Architecture for Running Graph Analytics

As seen in the preceding architecture design, the graph server (PGX) is a mid-tier server that can run as a standalone, or in a container like Oracle WebLogic Server or Apache Tomcat. Using this approach, you can load your property graph into the graph server (PGX). This allows you to run graph queries and analytical operations in memory in the graph server.

You can create a graph directly from the relational tables in the graph server (PGX). In addition, you can load a PGQL property graph or a SQL property graph from the database. You can modify the graph in memory (insert, update, and delete vertices and edges, and create new properties for results of executing an algorithm). The graph server does not write the modifications back to the relational tables.

Property Graph Sizing Recommendations

You can compute the memory required by the graph server (PGX) by using this calculator, [Graph Size Estimator](#).

For example, the following table shows the memory estimated by the calculator for the given input:

Table 1-1 Graph Size Estimator

Number of vertices	Number of Edges	Properties per Vertex	Properties per Edge	Estimated graph size
10M	100M	<ul style="list-style-type: none"> 4 - Integer Type 1 - String Type(15 characters) 	<ul style="list-style-type: none"> 4 - Integer Type 1 - String Type(15 characters) 	15 GB
100M	1B	<ul style="list-style-type: none"> 4 - Integer Type 1 - String Type(15 characters) 	<ul style="list-style-type: none"> 4 - Integer Type 1 - String Type(15 characters) 	140 GB

Note

- Reading a graph into memory can take upto twice the amount of memory needed to represent it in memory. So when you calculate the memory required for running PGX it is recommended that you double the amount of memory of the estimated graph size.
- CPU Processors:** The recommended number of CPU processors for a graph with 10M vertices and 100M edges is 2-4 processors, and up to 16 processors for more compute-intensive workloads. Increasing CPU processors will improve performance.

1.3.3 Developing Applications Using Graph Server Functionality as a Library

The graph functions available with the graph server (PGX) can be used as a library in your application.

After the rpm install of the graph server, all the jar files can be found in `/opt/oracle/graph/lib`. In this case, the server installation and the client user application are in the same machine.

For such use cases, development and testing can be done using the interactive Java shell or the Python shell in embedded (local) mode. This means a local PGX instance is created and runs in the same JVM as the client. If you start the shell without any parameters it will start a local PGX instance and run in embedded mode.

See [Using Graph Server \(PGX\) as a Library](#) for more information to obtain reference to a local PGX instance.

1.4 Learn About the Graph Server (PGX)

The in-memory graph server layer enables you to analyze property graphs using parallel in-memory execution.

It provides over 60 analytic functions. Examples of the categories and specific functions include:

- Centrality - Degree Centrality, Eigenvector Centrality, PageRank, Betweenness Centrality, Closedness Centrality

- Component and Community - Strongly Connected Components (Tarjan's and Kosaraju's). Weakly Connected Components
- Twitter's Who-To-Follow, Label Propagation.
- Path Finding - Single source all destination (Bellman-Ford), Dijkstra's shortest path, Hop Distance (Breadth-first search)
- Community Evaluation - Coefficient (Triangle Counting), Conductance, Modularity, Adamic-Adar counter.
- [Overview of the Graph Server \(PGX\)](#)
The Graph Server (PGX) is an in-memory accelerator for fast, parallel graph query and analytics. The server uses light-weight in-memory data structures to enable fast execution of graph algorithms.

Related Topics

- [Installing Oracle Graph Server](#)
- [Getting Started with the Graph Server \(PGX\)](#)
Once you have installed the graph server (PGX), you can start and connect to a graph server instance.

1.4.1 Overview of the Graph Server (PGX)

The Graph Server (PGX) is an in-memory accelerator for fast, parallel graph query and analytics. The server uses light-weight in-memory data structures to enable fast execution of graph algorithms.

There are multiple options to load a graph into the graph server either from Oracle Database or from files.

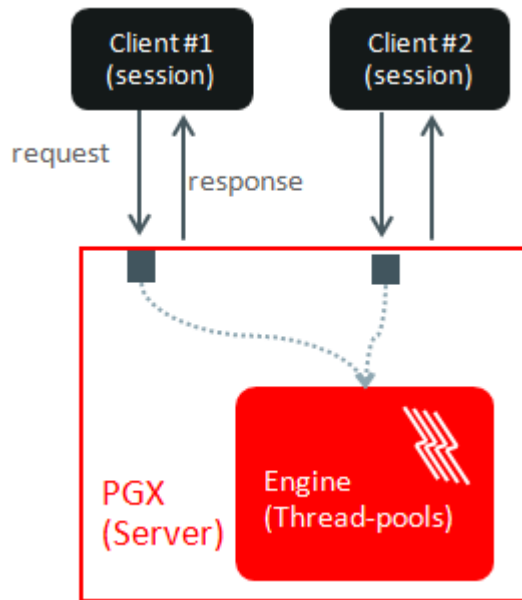

The graph server can be deployed standalone (it includes an embedded Apache Tomcat instance), or deployed in Oracle WebLogic Server or Apache Tomcat.

- [Design of the Graph Server \(PGX\)](#)
- [Usage Modes of the Graph Server \(PGX\)](#)

1.4.1.1 Design of the Graph Server (PGX)

The design of the graph server (PGX) is based on a Server-Client usage model. See [Usage Modes of the Graph Server \(PGX\)](#) for more details on the different graph server (PGX) execution modes.

The following figure shows the graph server (PGX) design:

Figure 1-4 Graph Server (PGX) Design

The core concepts of the graph server (PGX) design are as follows:

- Multiple graph clients can connect to the graph server at the same time.
- Each client request is processed by the graph server asynchronously. The client requests are queued up first and processed later, when resources are available. The client can poll the server to check if a request has been finished.
- Internally, the server maintains its own engine (thread pools) for running parallel graph algorithms and queries. The engine tries to process each analytics request concurrently with as many threads as possible.

Isolation Between Concurrent Clients

The graph server (PGX) supports data isolation between concurrent clients. Each client has its own private workspace, called session. Sessions are isolated from each other. Each client can load a graph instance into its own session, independently from other clients. Therefore, each client can load a graph instance (as well as its properties) into its own session, independently from other clients.

1.4.1.2 Usage Modes of the Graph Server (PGX)

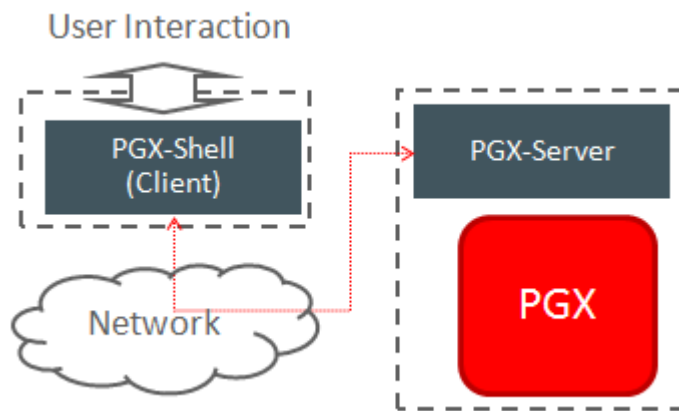

This section presents an overview of the different usage modes of the graph server (PGX). The graph server can be executed in one of the following usage modes.

Remote Server Mode

In the remote server mode, the main PGX execution engine is deployed as a RESTful application on a powerful server machine, and you can connect to it remotely from your machine using graph shell. Also, multiple clients can connect to the same graph server (PGX) at the same time and therefore the graph server is time-shared among these clients.

See [Interactive Graph Shell CLIs](#) for more information on the graph shell.

The following figure shows the graph server (PGX) in a remote execution mode:

Figure 1-5 Remote Server Mode

The remote server mode is useful for the following situations where you want to:

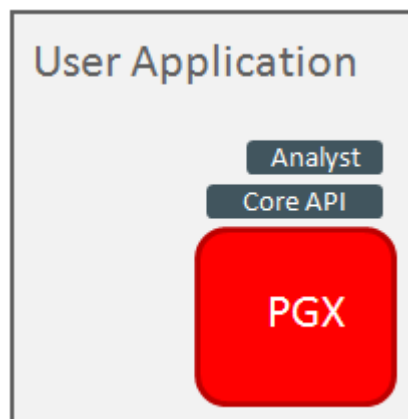

- Perform graph analysis on a large data set with a powerful server-class machine that has many cores and a large memory.
- The server-class machine is shared by multiple clients.

See [Starting the Graph Server \(PGX\)](#) for instructions on how to start the graph server (PGX) in remote server mode.

Using Graph Server (PGX) as a Library

You can also include the graph server (PGX) as a normal Java library in your application.

The following figure shows the graph server (PGX) used as a library in an application:

Figure 1-6 PGX as a Library

The embedded mode is useful when you want to build an application having graph analysis as a part of its functionality.

See [Using Graph Server \(PGX\) as a Library](#) for more information.

Deploying Graph Server (PGX) as Servlet Web Application

You can deploy the graph server (PGX) as a web application using Apache Tomcat or Oracle WebLogic Server.

See [Deploying Oracle Graph Server to a Web Server](#) for instructions to deploy the graph server (PGX) in Apache Tomcat or Oracle WebLogic Server.

1.5 Security Best Practices with Graph Data

Several security-related best practices apply when working with graph data.

Sensitive Information

Graph data can contain sensitive information and should therefore be treated with the same care as any other type of data. Oracle recommends the following considerations when using a graph product:

- Avoid storing sensitive information in your graph if that information is not required for analysis. If you have existing data, only model the relevant subset you need for analysis as a graph, either by applying a preprocessing step or by using subgraph and filtering techniques that are part of graph product.
- Model your graph in a way that vertex and edge identifiers are not considered sensitive information.
- Do not deploy the product into untrusted environments or in a way that gives access to untrusted client connections.
- Make sure all communication channels are encrypted and that authentication is always enabled, even if running within a trusted network.

Least Privilege Accounts

The database user account that is being used by the graph server (PGX) to read data should be a low-privilege, read-only account. PGX is an in-memory accelerator that acts as a read-only cache on top of the database, and it does not write any data back to the database.

If your application requires writing graph data and later analyzing it using PGX, make sure you use two different database user accounts for each component.

Public Health Endpoint Security

Unless you run multiple graph servers behind a load balancer ([Deploying Oracle Graph Server Behind a Load Balancer](#)), it is a good security practice to disable the public endpoint of the graph server, which load balancers need to determine the health of the graph servers.

To disable the endpoint:

1. Locate the WAR file of the graph server. If you installed the graph server via RPM, then the file is located at `/opt/oracle/graph/pgx/server/pgx-webapp-<version>.war`.
2. Unzip the .war file into a location of your choice and then edit the `WEB-INF/web.xml` file inside the unzipped directory with a text editor of your choice.
3. Locate the `pgx.auth.exceptions` parameter in the file. The list of public endpoints can be seen as shown:

```
<init-param>  
  <param-name>pgx.auth.exceptions</param-name>
```

```
<param-value>isReady;isRunning;auth/token</param-value>  
</init-param>
```

4. Remove the `isReady` endpoint from the list of public endpoints as shown:

```
<init-param>  
  <param-name>pgx.auth.exceptions</param-name>  
  <param-value>isRunning;auth/token</param-value>  
</init-param>
```

5. Save your changes, repackage the WAR file and redeploy the file to its original location.
6. Restart the graph server.

1.6 About Oracle Graph Server and Client Accessibility

This section provides information on the accessibility features for Oracle Graph Server and Client.

- For information on addressing accessibility for the Java and Python command line interfaces, which are installed on Oracle Linux, see [Working With Accessibility Features in Oracle Linux 8](#).
- For information on keyboard shortcuts for the Java command line interface, which is built on top of the Java Shell (JShell), see [Keyboard Shortcuts for JShell](#).
- For information on addressing accessibility for the Graph Visualization Application, which is based on Oracle JET, see [About Oracle JET and Accessibility](#).

2

Running Oracle Graph Quickstart Container Image

You can easily get started with the property graph feature of Oracle Database using the Oracle Graph Quickstart Container Image.

The image comprises the following components:

- Oracle Database 23ai Free (based on 23.8.0.0-lite) image
- JDK 21
- Graph Server (RPM file) and Client (25.3 version)

Also, note that the following are preconfigured in the database:

- GRAPHUSER user account.
- A sample SQL property graph called `BANK_GRAPH` based on bank transaction data.

Depending on your Linux version, you can use Docker or Podman to run the Oracle Graph Quickstart Container Image:

- Docker is available on Oracle Linux 7 (x86_64) and Red Hat Enterprise Linux 7. Refer to Oracle Container Runtime for Docker User's Guide for more information.
- Podman is available on Oracle Linux 8 (x86_64) and Red Hat Enterprise Linux 8. Refer to Podman User's Guide for more information.

Note that this image is not available for Oracle Linux 8 64-bit Arm architectures.

Before you get started, perform the following prerequisites:

1. Sign in to Oracle Container Registry and accept the Oracle Standard Terms and Restrictions to download the `graph-quickstart` image.
2. Generate an authentication token to authenticate Docker or Podman with the Oracle Container Registry.
See [Generating an Authentication Token for Use With the Oracle Container Registry](#) for more information.

Perform the following steps to run the Oracle Graph Quickstart Container Image inside a Docker or Podman container.

1. Login from the host system by running the following command:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman login container-registry.oracle.com
```

Linux 7

```
docker login container-registry.oracle.com
```

If your host system is behind a firewall, then ensure that you configure the necessary proxy environment variables to the address of the proxy server.

When prompted, provide your Oracle account username and the authentication token for password.

2. Download the latest **graph-quickstart** image from the Oracle Container Registry by running the following command:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman pull container-registry.oracle.com/database/graph-quickstart:25.2.0
```

Linux 7

```
docker pull container-registry.oracle.com/database/graph-quickstart:25.2.0
```

Alternatively, you can skip this step and run the container directly, which will automatically pull the image as shown in the next step.

3. Run the Oracle Graph Quickstart container as shown:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman run -d --name <container_name> -p <host_port>:7007 -e  
ORACLE_PWD=<database_password> container-registry.oracle.com/database/  
graph-quickstart:25.2.0
```

Linux 7

```
docker run -d --name <container_name> -p <host_port>:7007 -e  
ORACLE_PWD=<database_password> container-registry.oracle.com/database/  
graph-quickstart:25.2.0
```

In the preceding command:

- `--name`: Specifies the name for the container.
- `-d`: Indicates that the container is run at the background.
- `-p`: The port mapping of the host port to the container port.
- `-e`: Sets an environment variable (`ORACLE_PWD`) inside the container that specifies the Oracle Database password for `GRAPHUSER` and `PDBADMIN` user accounts.

See the Oracle Graph Quickstart Container Image [documentation page](#) in Oracle Container Registry for more information.

3

Using Oracle Graph with the Autonomous Database

Oracle Graph with the Autonomous Database allows you to create property graphs from data in your Autonomous Database.

When using Autonomous Database Serverless deployment, you can use Graph Studio, a fully managed service with a powerful user interface for developing applications that use graph analysis. Using Graph Studio, you can automate the modeling of graphs from tables in Autonomous Database. You can interactively analyze and visualize the graph queries using advanced notebooks with multiple visualization options. You can execute over 60 built-in graph algorithms in Graph Studio to gain useful insights on your graph data. See [Using Graph Studio in Oracle Autonomous Database](#) for more information.

You can also access few Graph Studio features using the Autonomous Database Graph Client API using the client shell CLIs or through your Java or Python application. See [Using Autonomous Database Graph Client](#) for more information.

Alternatively, you can use any version of Oracle Graph Server and Client with the family of Oracle Autonomous Database to create and work with property graphs. This includes any version of Oracle Autonomous Database Serverless or Oracle Autonomous Database Dedicated. You can always upgrade to the latest version of Graph Server and Client regardless of the version of your Autonomous Database. Note that the graph server is managed by the application in this case.

You can connect in two-tier mode (connect directly to Autonomous Database) or three-tier mode (connect to PGX on the middle tier, which then connects to Autonomous Database).

The database schema storing the graph must have the `CREATE SESSION` and `CREATE TABLE` privileges.

- [Two-Tier Deployments of Oracle Graph with Autonomous Database](#)
In two-tier deployments, the client graph application connects directly to the Autonomous Database.
- [Three-Tier Deployments of Oracle Graph with Autonomous Database](#)
In three-tier deployments, the client graph application connects to PGX in a middle tier, and PGX connects to the Autonomous Database.

Related Topics

- [Using Autonomous Database Graph Client](#)
Using the `AdbGraphClient` API, you can access Graph Studio features in Autonomous Database programmatically using the Oracle Graph Client or through your Java or Python application.

3.1 Two-Tier Deployments of Oracle Graph with Autonomous Database

In two-tier deployments, the client graph application connects directly to the Autonomous Database.

1. Install Oracle Graph Client, as explained in [Installing the Java Client From the Graph Server and Client Downloads](#).
2. Establish a JDBC connection, as described in the [Oracle Autonomous Warehouse documentation](#).
You must download the wallet and unzip it to a secure location. You can then reference it when establishing the connection as shown in [Example 3-1](#).

3. Start the Java Shell as shown in the code:

```
/bin/opg4j --no_connect
```

4. Connect to your database as shown in [Example 3-1](#).

Note

If you need to use the Graph Visualization Application, you must additionally install the Oracle Graph Server.

- See [Installing Oracle Graph Server](#) for more details.
- See [Running the Graph Visualization Web Client](#) for more details.

Example 3-1 Creating a Database Connection in a Two-Tier Graph Deployment with Autonomous Database

```
opg4j> var jdbcUrl = "jdbc:oracle:thin:@<tns_alias>?  
TNS_ADMIN=<wallet_location>" // jdbc url to the DB  
opg4j> var user = "<user>"  
opg4j> var pass = "<password>"  
opg4j> var conn = DriverManager.getConnection(jdbcUrl, user, pass) //  
connecting to the DB  
conn ==> oracle.jdbc.driver.T4CConnection@57e6cb01
```

In the preceding example:

- **<tns_alias>**: TNS alias used in `tnsnames.ora` file
- **<wallet_location>**: Path to the directory where the wallet is stored
- **<user>**: Name of the database user
- **<password>**: Password for the user

3.2 Three-Tier Deployments of Oracle Graph with Autonomous Database

In three-tier deployments, the client graph application connects to PGX in a middle tier, and PGX connects to the Autonomous Database.

The wallets downloaded from the Oracle Cloud Console are mainly *routing wallets*, meaning they are used to route the connection to the right database and to encrypt the connection. In most cases, they are not auto-login wallets, so they do not contain the password for the actual connection. The password usually needs to be provided separately to the wallet location.

The graph server does not support a wallet stored on the client file system or provided directly by remote users. The high level implications of this are:

- The server administrator provides the wallet and stores the wallet securely on the server's file system.
- Similar to Java EE connection pools, remote users will use that wallet when connecting. This means the server administrator trusts all remote users to use the wallet. As with any production deployments, the PGX server must be configured to enforce authentication and authorization to establish that trust.
- Remote users still need to provide a user name and password when sending a graph read request, just as with non-autonomous databases.
- You can only configure one wallet for each PGX server.

Having the same PGX server connecting to multiple Autonomous Databases is not supported. If you have that use case, start one PGX server for each Autonomous Database.

Pre-loaded graphs

To read a graph from Autonomous Database into PGX at server startup, follow the steps described in [Store the Database Password in a Keystore](#) to:

1. Create a Java Keystore containing the database password
2. Create a PGX graph configuration file describing the location and properties of the graph to be loaded
3. Update the `/opt/oracle/graph/pgx.conf` file to reference the graph configuration file

As root user, edit the service file at `/etc/systemd/system/pgx.service` and specify the environment variable under the [Service] directive:

```
Environment="JAVA_OPTS=-Doracle.net.tns_admin=/etc/oracle/graph/wallets"
```

Make sure that the directory (`/etc/oracle/graph/wallets` in the preceding code) is readable by the Oracle Graph user, which is the user that starts up the PGX server when using `systemd`.

In addition, edit the `ExecStart` command to specify the location of the keystore containing the password:

```
ExecStart=/bin/bash start-server --secret-store /etc/keystore.p12
```

Note

Please note that `/etc/keystore.p12` must not be password protected for this to work. Instead protect the file via file system permission that is only readable by `oraclegraph` user.

After the file is edited, reload the changes using:

```
systemctl daemon-reload
```

Finally start the server:

```
sudo systemctl start pgx
```

On-demand graph loading

To allow remote users of PGX to read from the Autonomous Database on demand, you can choose from two approaches:

- Provide the path to the wallet at server startup time via the `oracle.net.tns_admin` system property. Remote users have to provide the TNS address name, username and keystore alias (password) in their graph configuration files. The wallet is stored securely on the graph server's file system, and the server administrator trusts all remote users to use the wallet to connect to an Autonomous Database.

For example, the server administrator edits the service file at `/etc/systemd/system/pgx.service` and specifies the environment variable under the `[Service]` directive:

```
Environment="JAVA_OPTS=-Doracle.net.tns_admin=/etc/oracle/graph/wallets"
```

and then start the server using

```
systemctl start pgx
```

The `/etc/oracle/graph/wallets/tnsnames.ora` file contains an address as follows:

```
sombrero_medium = (description= (retry_count=20)(retry_delay=3)
(address=(protocol=tcps)(port=1522)(host=adb.us-ashburn-1.oraclecloud.com))
(connect_data=(service_name=l8lgholga0ujxsa_sombrero_medium.adwc.oraclecloud.com))
(security=(ssl_server_cert_dn="CN=adwc.uscom-east-1.oraclecloud.com,OU=Oracle BMCS US,O=Oracle Corporation,L=Redwood City,ST=California,C=US")))
```

Now remote users can read data into the server by sending a graph configuration file with the following connection properties:

```
{
  ...
  "jdbc_url": "jdbc:oracle:thin:@sombrero_medium",
  "username": "hr",
  "keystore_alias": "database1",
  ...
}
```

Note that the keystore still lives on the client side and should contain the password for the `hr` user referenced in the config object, as explained in [Store the Database Password in a Keystore](#). A similar approach works for Tomcat or WebLogic Server deployments.

- Use Java EE connection pools in your web application server. Remote users only have to provide the name of the datasource in their graph configuration files. The wallet and the connection credentials are stored securely in the web application server's file system, and the server administrator trusts all remote users to use a connection from the pool to connect to an Autonomous Database.

You can find instructions how to set up such a data source at the following locations:

- WebLogic Server: [Configuring a WebLogic Data Source to use ATP](#)
- Tomcat: <https://www.oracle.com/technetwork/database/application-development/jdbc/documentation/atp-5073445.html#Tomcat>

If you gave the data source the name *adb_ds*, you can reference them by sending a graph configuration file with the following connection properties:

```
{  
  ...  
  "datasource_id": "adb_ds",  
  ...  
}
```

Part II

SQL Property Graphs

Learn and work with SQL property graphs.

Effective with Oracle Database 23ai, you can create and query SQL property graphs.

The following chapters provide in-depth information on SQL property graphs:

- [Introduction to SQL Property Graphs](#)
You can work with SQL property graphs in any SQL based interface (such as SQL Developer, SQLPLUS, or SQLcl) or from a Java program using JDBC.
- [SQL DDL Statements for Property Graphs](#)
You can create, revalidate, rename, and drop SQL property graphs using SQL data definition language (DDL) statements.
- [SQL Graph Queries](#)
You can query a SQL property graph using the `GRAPH_TABLE` operator to express graph pattern matching queries.
- [Loading a SQL Property Graph into the Graph Server \(PGX\)](#)
You can load a full SQL property graph or a subgraph into memory in the graph server (PGX).
- [Executing PGQL Queries Against SQL Property Graphs](#)
You can directly run PGQL queries against a SQL property graph in the database.
- [Visualizing SQL Graph Queries Using the APEX Graph Visualization Plug-in](#)
You can use the Oracle Application Express (APEX) Graph Visualization plug-in to visualize and interact with SQL property graphs in an APEX application.
- [Getting Started with the Graph Visualization Extension for VS Code](#)
Oracle SQL Developer Graph Visualization for VSCode enables you to visualize the results of SQL graph queries when using Oracle SQL Developer for Visual Studio Code (VS Code).

4

Introduction to SQL Property Graphs

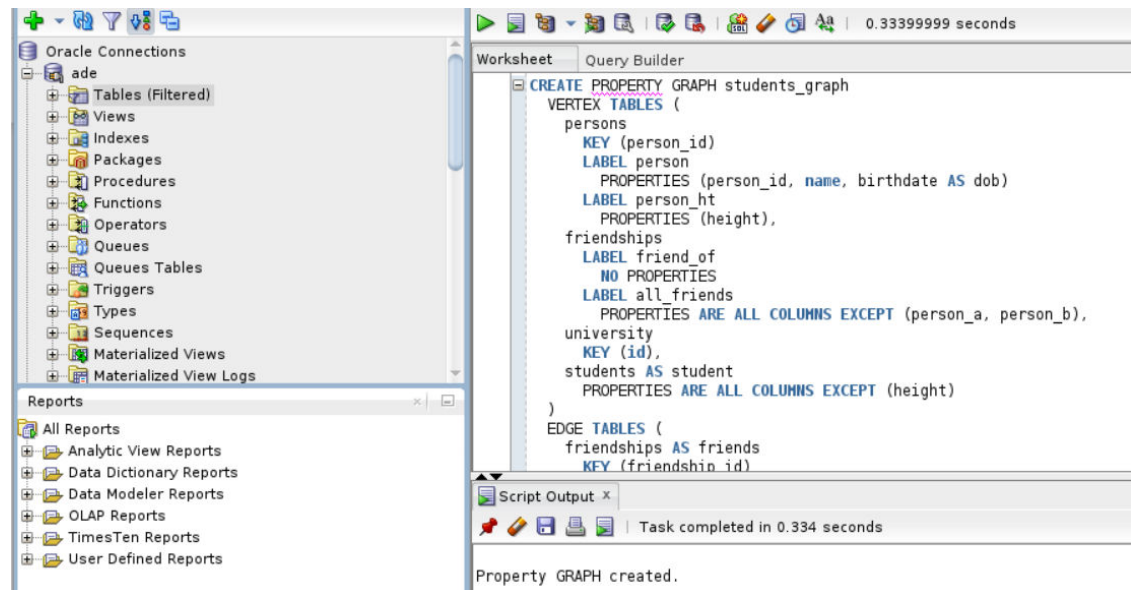

You can work with SQL property graphs in any SQL based interface (such as SQL Developer, SQLPLUS, or SQLcl) or from a Java program using JDBC.

Using SQL statements, you can perform the following:

- Create a SQL property graph from existing database objects in your schema, such as:
 - Tables (with some exceptions as listed in [Limitations of Creating a SQL Property Graph](#))
 - Materialized views
 - External tables
 - Synonyms for any of the preceding database objects
- Create a synonym for a SQL property graph.
- Revalidate a SQL property graph.
- Rename a SQL property graph
- Run graph pattern matching queries on a SQL property graph.
- Drop a SQL property graph.

For example, the following figure shows the creation of a SQL property graph using the SQL Developer tool.

Figure 4-1 Using SQL Developer to Create a SQL Property Graph

- [Quick Start for Working with SQL Property Graphs](#)
This tutorial helps you get started on creating, querying, and running graph algorithms on a SQL property graph.
- [Quick Start: Creating a SQL Property Graph by Importing Graph Data from Neo4j](#)
Oracle Graph provides PL/SQL scripts that allow you to import Neo4j graph data and create a SQL property graph in either your Oracle Autonomous Database instance or an on-premises Oracle Database.

4.1 Quick Start for Working with SQL Property Graphs

This tutorial helps you get started on creating, querying, and running graph algorithms on a SQL property graph.

Before you begin, ensure that you have the required privileges to create and drop a SQL property graph. See [Granting System and Object Privileges for SQL Property Graphs](#) for more information.

The following tutorial uses the SQLcl tool and is based on the sample bank graph data (see [Using Sample Graph Data](#)) provided with the graph server installation in the database tables. However, you can run these examples using any SQL based interface.

1. Create a SQL property graph using the CREATE PROPERTY GRAPH DDL statement.

```
SQL> CREATE PROPERTY GRAPH bank_sql_graph
2   VERTEX TABLES (
3     BANK_ACCOUNTS
4     KEY ( id )
5     LABEL accounts
6     PROPERTIES ( id, name )
7   )
8   EDGE TABLES (
9     BANK_TRANSFERS
10    SOURCE KEY ( src_acct_id ) REFERENCES BANK_ACCOUNTS(id)
11    DESTINATION KEY ( dst_acct_id ) REFERENCES BANK_ACCOUNTS(id)
12    LABEL transfers
13    PROPERTIES ( amount, description, src_acct_id, dst_acct_id,
txn_id )
14* );
```

Property GRAPH created.

On execution, the bank_sql_graph graph is created in the database. The graph is made up of one vertex graph element table (bank_accounts) and one edge graph element table (bank_transfers).

See [Creating a SQL Property Graph](#) to learn the concepts of graph element tables, keys, labels and properties.

2. Run a SQL graph query, on the newly created graph, to list all the transactions from the account with id value 816.

```
SQL> SELECT * FROM GRAPH_TABLE (bank_sql_graph
2   MATCH
3   (a IS accounts WHERE a.id = 816) -[e IS transfers]-> (b IS accounts)
4   COLUMNS (a.id AS acc_a, e.amount AS amount, b.id AS acc_b)
5* );
```

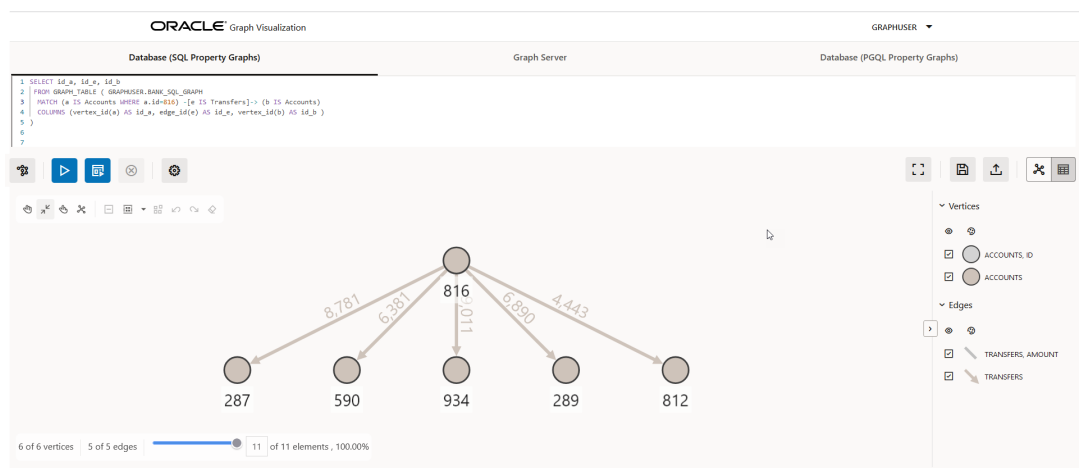

ACC_A	AMOUNT	ACC_B
816	8781	287
816	6381	590
816	9011	934
816	6890	289
816	4443	812

See [SQL Graph Queries](#) for more information.

- Optionally, if you have installed the graph server (PGX), then you can also visualize the preceding SQL graph query, using the graph visualization tool.

The only difference is that you must return the vertex and edge IDs in order to visualize the vertices and edges of the SQL graph query together with their IDs and all their labels and properties. Note that the `COLUMNS` clause in the following example uses the `VERTEX_ID` and `EDGE_ID` functions:

Figure 4-2 Visualizing a SQL Graph Query

- See [Vertex and Edge Identifiers](#) to learn more about the `VERTEX_ID` and `EDGE_ID` functions.
 - See [Visualizing Graph Queries on SQL Property Graphs](#) for more details.
- Load the graph into the graph server (PGX) if you want to run graph algorithms.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_SQL_GRAPH",  
GraphSource.PG_SQL)  
graph ==> PgxGraph[name=BANK_SQL_GRAPH,N=1000,E=5001,created=1752053171422]
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_SQL_GRAPH",  
GraphSource.PG_SQL);
```

Python

```
>>> graph = session.read_graph_by_name("BANK_SQL_GRAPH", "pg_sql")  
>>> graph  
PgxGraph(name: BANK_SQL_GRAPH, v: 1000, e: 5001, directed: True,  
memory(Mb): 0)
```

See [Loading a SQL Property Graph into the Graph Server \(PGX\)](#) for more information.

5. Execute the PageRank algorithm as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var analyst = session.createAnalyst()  
analyst ==> NamedArgumentAnalyst[session=0fb6bea7-  
d467-458d-90c3-803d2932df12]  
opg4j> analyst.pagerank(graph)  
$3 ==> VertexProperty[name=pagerank,type=double,graph=bank_sql_graph]
```

Java

```
Analyst analyst = session.createAnalyst();  
analyst.pagerank(graph);
```

Python

```
>>> analyst = session.create_analyst()  
>>> analyst.pagerank(graph)  
VertexProperty(name: pagerank, type: double, graph: bank_sql_graph)
```

-
6. Query the graph to list the top 10 accounts by pagerank:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> session.queryPgql("SELECT a.id, a.pagerank FROM MATCH (a) ON
bank_sql_graph ORDER BY a.pagerank DESC LIMIT 5").print()
+-----+
| id | pagerank |
+-----+
| 387 | 0.007302836252205924 |
| 406 | 0.006734430614559079 |
| 135 | 0.006725965475577353 |
| 934 | 0.006641340764834484 |
| 397 | 0.0057016075312134595 |
+-----+
$5 ==> PgqlResultSetImpl[graph=bank_sql_graph,numResults=5]
```

Java

```
session.queryPgql("SELECT a.id, a.pagerank FROM MATCH (a) ON
bank_sql_graph ORDER BY a.pagerank DESC LIMIT 5").print();
```

Python

```
>>> session.query_pgql("SELECT a.id, a.pagerank FROM MATCH (a) ON
bank_sql_graph ORDER BY a.pagerank DESC LIMIT 5").print()
+-----+
| id | pagerank |
+-----+
| 387 | 0.007302836252205924 |
| 406 | 0.006734430614559079 |
| 135 | 0.006725965475577353 |
| 934 | 0.006641340764834484 |
| 397 | 0.0057016075312134595 |
+-----+
```

-
7. Drop the SQL property graph after running the graph queries.

```
SQL> DROP PROPERTY GRAPH bank_sql_graph;
```

```
Property dropped.
```

4.2 Quick Start: Creating a SQL Property Graph by Importing Graph Data from Neo4j

Oracle Graph provides PL/SQL scripts that allow you to import Neo4j graph data and create a SQL property graph in either your Oracle Autonomous Database instance or an on-premises Oracle Database.

The scripts are available at [My Oracle Support](#). Refer to [MOS Note 37473555](#) for downloading the scripts. Click open the `README` file and follow the instructions to migrate Neo4j graph data to Oracle Database (either Oracle Autonomous Database or an on-premises database) and create a SQL property graph.

The following outlines the basic steps that you need to perform as explained in the `README` file:

- Ensure that you meet the necessary prerequisites.
- Retrieve and export the graph metadata from Neo4j into CSV files.
- Upload the CSV files to Oracle Database (that is, through Object Storage for an Autonomous Database instance and local directories for an on-premises database).
- Run the migration tool to read the uploaded graph metadata and generate migration scripts in your environment.
- Run the migration scripts to import the Neo4j graph data into Oracle Database and finally create a SQL property graph.

5

SQL DDL Statements for Property Graphs

You can create, revalidate, rename, and drop SQL property graphs using SQL data definition language (DDL) statements.

- [Creating a SQL Property Graph](#)
Using the `CREATE PROPERTY GRAPH` DDL statement, you can create a property graph object directly in an Oracle Database.
- [Revalidating a SQL Property Graph](#)
Using the `ALTER PROPERTY GRAPH COMPILE` DDL statement, you can revalidate an existing property graph object in the database.
- [Renaming a SQL Property Graph](#)
You can rename an existing SQL property graph using the `RENAME` DDL statement.
- [Dropping a SQL Property Graph](#)
Using the `DROP PROPERTY GRAPH` DDL statement, you can remove a property graph object in Oracle Database.
- [JSON Support in SQL Property Graphs](#)
When creating a SQL property graph, you can define a label property over a JSON data type column using simplified dot notation. You can later access this property inside the SQL graph query.

5.1 Creating a SQL Property Graph

Using the `CREATE PROPERTY GRAPH` DDL statement, you can create a property graph object directly in an Oracle Database.

Example 5-1 Creating a SQL Property Graph Using the `CREATE PROPERTY GRAPH` DDL Statement

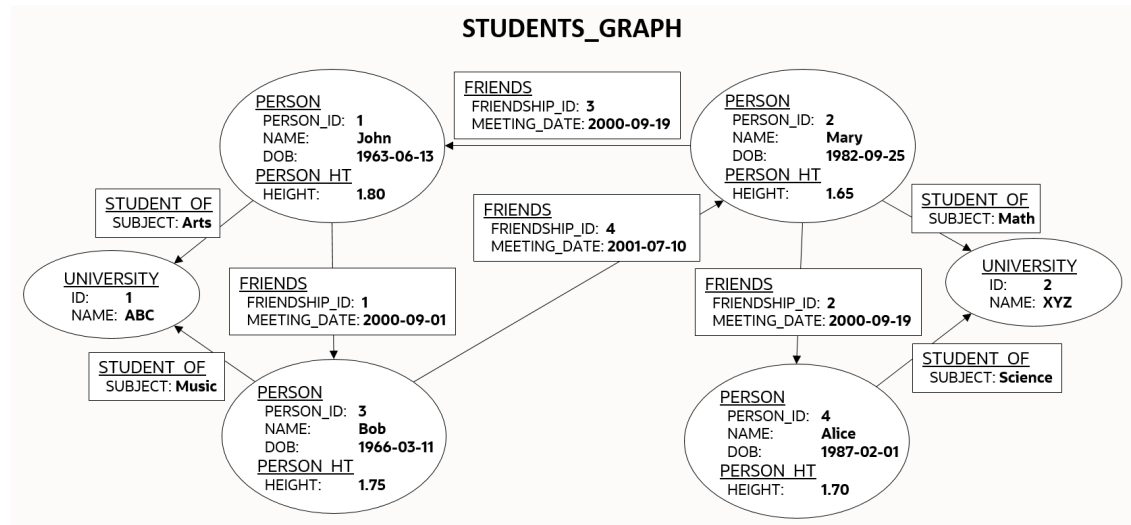

This example creates a SQL property graph, `students_graph`, using `persons`, `university`, `friends`, and `student_of` as the underlying database tables for the graph.

In order to run this example, ensure the following:

1. Set up the sample tables in the database as explained in [Setting Up Sample Data in the Database](#).
2. See [Granting System and Object Privileges for SQL Property Graphs](#) to ensure you have the required privileges to create a SQL property graph.

The following diagram illustrates the `students_graph`:

Figure 5-1 STUDENTS_GRAPH

The corresponding SQL property graph DDL statement is as shown:

```
CREATE PROPERTY GRAPH students_graph
  VERTEX TABLES (
    persons KEY (person_id)
      LABEL person
      PROPERTIES (person_id, name, birthdate AS dob)
    person_ht
      LABEL person_ht
      PROPERTIES (height),
    university KEY (id)
  )
  EDGE TABLES (
    friends
      KEY (friendship_id)
      SOURCE KEY (person_a) REFERENCES persons(person_id)
      DESTINATION KEY (person_b) REFERENCES persons(person_id)
      PROPERTIES (friendship_id, meeting_date),
    student_of
      KEY (s_id)
      SOURCE KEY (s_person_id) REFERENCES persons(person_id)
      DESTINATION KEY (s_univ_id) REFERENCES university(id)
      PROPERTIES (subject)
  );
```

On execution, the preceding example creates a SQL property graph object that uses the tables in your schema to define its graph element tables. Note that the creation of the new SQL property graph object, results only in the storage of the property graph metadata, and there is no copying of data from the underlying database objects into the graph element tables. This implies that when querying a SQL property graph, all the graph queries are performed on the current graph data in the database. You may also specify another schema to contain the SQL property graph provided that you have sufficient privileges.

The graph definition in the example creates a graph that comprises:

- Two vertex graph element tables:

- **persons:** The table has an explicitly defined unique key, `person_id`, and it is associated with two labels:
 - * `person`: This label exposes `person_id`, `name` and `birthdate` as properties.
 - * `person_ht`: This label exposes only the `height` property.
- **university:** The label for the table is implicitly inferred and by default all visible columns of the underlying database table are exposed as properties.
- Two edge graph element tables:
 - **friends:** The edge table references `persons` as the underlying database table for both the source and destination vertex tables. The source and destination keys (`person_a` and `person_b`) for the edge table correspond to the unique key of the source and destination vertex tables respectively. The label for the edge table is automatically inferred from the name of the graph element table (`friends`, in this case) and exposes `friendship_id` and `meeting_date` as properties.
 - **student_of:** The edge table references `persons` and `university` as the underlying database tables for the source and destination vertex tables respectively. The source and destination keys (`s_person_id` and `s_univ_id`) for the edge table correspond to the unique key of the source and destination vertex tables respectively. The label for the edge table is automatically inferred from the name of the graph element table (`student_of`, in this case) and exposes `subject` as the property.

It is important to note that once a SQL property graph is created, you cannot alter the graph definition. However, you can redefine a SQL property graph using the `OR REPLACE` clause in the `CREATE PROPERTY GRAPH` DDL statement. You can use this clause to change the definition of an existing SQL property graph without dropping, re-creating, and regranteeing object privileges that were earlier granted on it.

- [Limitations of Creating a SQL Property Graph](#)
This section lists a few restrictions that apply when creating a SQL property graph.

5.1.1 About Vertex and Edge Graph Element Tables

The vertices and edges of a SQL property graph defined from the underlying database objects are stored in the graph element tables.

A graph element table can either be a vertex table or an edge table.

Refer to the graph definition in [Example 5-1](#) to easily understand the following sections:

Vertex graph element table

- A vertex table is defined using the `VERTEX TABLES` clause.
- Each row in a vertex table corresponds to a vertex of the graph.
- A vertex graph element table has a name that is independent from the name of the underlying database object.
- By default, the name of the vertex graph element table is the same as the name of the underlying database object.
- A vertex table name must be unique for a graph. In case you want to define a SQL property graph with multiple graph element tables from the same database object, then you must specify an alternate graph element table name using the `AS` clause.

Edge graph element table

- An edge table is defined using the `EDGE TABLES` clause.
- It specifies a direct relationship between the source vertex table and the destination vertex table using the `SOURCE` and `DESTINATION` keywords that `REFERENCES` the respective vertex tables.
- Each row in an edge table corresponds to an edge of the graph.
- An edge graph element table has a name that is independent from the name of the underlying database object.
- By default, the name of the edge graph element table is the same as the name of the underlying database object.
- The edge table name must be unique for a graph. An edge table name cannot be shared with a vertex table or another edge table.

5.1.2 About Vertex and Edge Table Keys

Each vertex and edge table used in a SQL property graph definition must have a key in order to identify a unique vertex or an edge in a SQL property graph.

The key is defined from one or more columns of the underlying table. The key may be implicitly inferred based on an existing primary key or a unique constraint defined on the underlying table, or explicitly defined. The key should be unique.

However, note that the uniqueness constraint for the key column is required if you create the graph in `ENFORCED MODE`. Otherwise, you can create the graph in `TRUSTED MODE` using key columns that do not have a uniqueness constraint. See [Using Graph Options to Create SQL Property Graphs](#) for more information on the different modes that can be applied during graph creation.

Vertex or edge table keys can be defined for any of the following built-in data type columns:

- `VARCHAR2`
- `NVARCHAR2`
- `NUMBER`
- `BINARY_FLOAT`
- `BINARY_DOUBLE`
- `CHAR`
- `NCHAR`
- `DATE`
- `INTERVAL` (both `YEAR TO MONTH` and `DAY TO SECOND`)
- `TIMESTAMP`

Note that the `TIMESTAMP WITH TIME ZONE` data type is not supported.

Refer to the SQL property graph definition in [Example 5-1](#) to easily understand the following sections:

Vertex Table Key

- By default, the key for a vertex table is automatically identified from a single `PRIMARY KEY` or `UNIQUE` key constraint on the underlying database object. If both exist, then the `PRIMARY KEY` constraint takes precedence over the `UNIQUE` key constraint.
- If the vertex table key is automatically inferred based on a single `UNIQUE` key, then the set of columns in that `UNIQUE` key must also be `NOT NULL`.
- If the underlying database object does not contain a unique constraint to enforce uniqueness, then you must explicitly define the `KEY` subclause in the `VERTEX TABLES` clause, to identify the columns that define a unique key for the vertex table. Note that the column names must match the column names of the underlying database object.
- Composite vertex table keys are also supported.

Edge Table Key

- By default, the key for an edge table is automatically identified from a single `PRIMARY KEY` or `UNIQUE` key constraint on the underlying database object. If both exist, then the `PRIMARY KEY` constraint takes precedence over the `UNIQUE` key constraint.
- If the edge table key is automatically inferred based on a single `UNIQUE` key, then the set of columns in that `UNIQUE` key must also be `NOT NULL`.
- If the underlying database object does not contain a unique constraint to enforce uniqueness, then you must explicitly define the `KEY` subclause in the `EDGE TABLES` clause, to identify the columns that define a unique key for the edge table. Note that the column names must match the column names of the underlying database object.

- By default, the `SOURCE` and `DESTINATION` table keys are automatically obtained from a single `FOREIGN KEY` constraint between the edge table and the underlying source and destination tables respectively.
- However, you must explicitly specify the `KEY` subclause for the `SOURCE` and `DESTINATION` vertex tables, if any of the following applies:
 - There is no `FOREIGN KEY` constraint between the edge and the referenced vertex tables.
 - There are multiple `FOREIGN KEY` constraints between the edge and the referenced vertex tables.
 - The underlying database objects for the edge table and its source and destination vertex tables are materialized views or external tables.

Note

All restrictions that apply for primary key constraints on a database object also apply on vertex and edge table keys.

5.1.3 About Labels and Properties

Labels can be associated to one or more graph element tables and they enrich the graph definition. A label can be defined with or without properties.

You can optionally define `LABELS` and `PROPERTIES` for the vertex and edge tables in your graph. When not specified, the graph element tables are automatically assigned a label with the name of the graph element table, and all visible columns are exposed as properties, using the column name as property name.

Refer to the SQL property graph definition in [Example 5-1](#) to easily understand the following sections:

Labels

- By default, the vertex and edge tables are automatically assigned a label with the name of the respective graph element tables.
- The `DEFAULT LABEL` subclause can also be used to explicitly apply the preceding rule.
- You can explicitly assign a new label name to a vertex or an edge graph element table using the `LABEL` subclause.
- Multiple labels can be associated with the same graph element table.
- The same label can be **shared** with multiple graph element tables. A label can be associated with more than one graph element table (shared label) provided the following conditions apply:
 - All graph element tables that share this label declare the same set of property names. Note that the property order does not matter in the label definition.
 - Different columns or value expression exposed by the same property name have **union compatible** types.
- Also, refer to [Type Compatibility Rules for Determining Property Types](#) for more information.

Properties

- By default, all the visible columns of a vertex or an edge table are automatically exposed as properties if there is no label declaration or if the `DEFAULT LABEL` subclause is used in the property graph definition. The property names are the same as the column names of the underlying database object.
- Columns of any Oracle built-in data types can be exposed as properties of labels in a SQL property graph. This includes virtual columns, JSON data type columns, `CLOB` and `BLOB` data types.
However, the following are not supported:
 - `XMLType` and `SDO_GEOMETRY` type columns are not supported.
 - SQL/XML value expressions over `XMLType` column stored as binary XML, and `SDO_GEOMETRY` built-in functions over `SDO_GEOMETRY` object datatype column are allowed as long as they return a value of a type supported for properties. Any general object data type and user defined data type and their corresponding SQL operator value expression over them are not supported.
 - Columns of type `ANYTYPE` cannot be exposed as property.
- At the time of the SQL property graph creation, the data type of a vertex or edge property is determined as follows:
 - Distinct properties associated with distinct labels have the same data type as the underlying database columns.
 - Properties with the same name coming from different labels have the same data type as the underlying database columns. However, you must use the `ALLOW MIXED PROPERTY TYPES` option when creating the SQL property graph.
See [Using Graph Options to Create SQL Property Graphs](#) for an example using a shared property name.
 - Properties with the same name coming from the same label will have the `UNION ALL` compatible type of the underlying database columns. In addition, you must use the `ALLOW MIXED PROPERTY TYPES` option when creating the SQL property graph:
 - * See [Using Graph Options to Create SQL Property Graphs](#) for an example using a shared property name in a shared label.
 - * See [Type Compatibility Rules for Determining Property Types](#) for more information on the type rules that determine the property type.
- If you want to explicitly define the vertex or edge properties for a label, then the following property declarations are supported:
 - **PROPERTIES [ARE] ALL COLUMNS:** To expose all the visible columns of the graph element table as label properties. However, if any columns are added or deleted in the source database object, after the creation of the SQL property graph, then these will not be reflected on the graph.
 - **PROPERTIES [ARE] ALL COLUMNS EXCEPT(<column_names_list>):** To expose all the visible columns of the graph element table as label properties except those that are explicitly listed.
 - **PROPERTIES(<list_of_column_names>):** To expose only those columns of the graph element table that are explicitly listed as label properties. The property name defaults to the column name.
 - **PROPERTIES(<column_name AS property_name,...>):** Same as the preceding option. However, if `AS property_name` is appended to the `column_name`, then `property_name` is used as the property name.

- **PROPERTIES(<column_expressions AS property_name,...>)**: To declare a property which is an expression over columns. The **AS** clause is mandatory in this case. A value expression can either be a SQL operator expression defined over scalar data type columns or JSON expression. See [JSON Support in SQL Property Graphs](#) for an example using JSON expressions.
- **NO PROPERTIES**: No columns are exposed for a label.
- Pseudo-columns cannot be exposed as a label property.

5.1.4 Using Graph Options to Create SQL Property Graphs

You can use graph options to control the behavior of a SQL property graph at the time of its creation.

Graph options can be specified at the end of the **CREATE PROPERTY GRAPH** DDL statement using the **OPTIONS** clause. You can use either the **MODE** or **MIXED PROPERTY TYPES** option, or both as required.

Using an Option to Specify the Mode of the Graph

You can specify the **MODE** of the graph by using one of the following option values at the time of creating the SQL property graph:

- **ENFORCED MODE**: This ensures that there is a dependency to the unique key constraint on the underlying database tables. If used when creating a SQL property graph, the **CREATE PROPERTY GRAPH** statement will throw an error if any of the following conditions apply:
 - The specified vertex or edge table **KEY** for the graph element table is neither a **PRIMARY KEY** nor a **UNIQUE** key defined on **NOT NULL** columns.
 - There is no explicit vertex or edge table **KEY** defined for the graph element table and also the system is unable to automatically identify the default vertex or edge key, as there is no single **PRIMARY KEY** or a single **UNIQUE** key constraint on **NOT NULL** columns on the underlying database table.
 - For a specified edge source key and corresponding source vertex key or for a specified edge destination key and corresponding destination vertex key, there does not exist a corresponding **FOREIGN KEY** between the underlying tables.
 - An edge table has no explicit keys for the source or for the destination and the system is unable to implicitly infer the keys, as there is no single **FOREIGN KEY** constraint between the edge table and the referenced source (or destination) vertex table.

For example, consider the following **t1** table in the database that does not have any primary key, unique key or a **NOT NULL** constraint.

```
SQL> CREATE TABLE t1 (id NUMBER, name VARCHAR2(10));

INSERT INTO t1 (id, name) VALUES (1, 'John');
INSERT INTO t1 (id, name) VALUES (2, 'Mary');
```

Create a SQL property graph using **OPTIONS(ENFORCED MODE)** as shown:

```
CREATE PROPERTY GRAPH g
  VERTEX TABLES (
    t1 KEY (id)
```

```

        LABEL t PROPERTIES ARE ALL COLUMNS
    ) OPTIONS(ENFORCED MODE);

```

The graph creation fails with the following error as there are no key constraints to enforce uniqueness:

```

ORA-42434: Columns used to define a graph element table key must be NOT NULL
in ENFORCED MODE

```

If you omit the **KEY** clause in the preceding graph definition, then the following error is thrown:

```

ORA-42402: cannot infer key for graph element table T1

```

- **TRUSTED MODE (default):** There is no dependency to the unique key constraint on the underlying database tables when using the **TRUSTED** mode. Therefore, the preceding example when run in **TRUSTED** mode will not throw any error. This implies that if you choose to use this option, then you must guarantee the uniqueness of primary keys on each of the graph element tables, as well as valid foreign key references between an edge table and its source and destination tables. Otherwise, your graph query results may be incorrect as the expected guarantees are not met.

Using an Option to Allow or Disallow Different Property Types for Shared Property Names

You can specify the **MIXED PROPERTY TYPES** options using one of the following values:

- **ALLOW MIXED PROPERTY TYPES:** This ensures that:
 - If two properties with the same name belong to different labels, then they can have completely different types.
 For example, in addition to the sample tables `persons` and `students` (see [Setting Up Sample Data in the Database](#)), create the following additional table:

```

CREATE TABLE t2 (id NUMBER, height VARCHAR2(4),
CONSTRAINT t2_pk PRIMARY KEY (id));

INSERT INTO t2 (id, height) VALUES (1, '1.80');
INSERT INTO t2 (id, height) VALUES (2, '1.65');

CREATE TABLE t3 (id NUMBER, height BINARY_DOUBLE,
CONSTRAINT t3_pk PRIMARY KEY (id));

INSERT INTO t3 (id, height) VALUES (1, 1.80);
INSERT INTO t3 (id, height) VALUES (2, 1.65);

```

Run the following **CREATE PROPERTY GRAPH** DDL statement which uses three distinct labels for the same property name, `height`.

```

CREATE PROPERTY GRAPH g1
  VERTEX TABLES (
    persons
      LABEL person PROPERTIES (name, height),
    t2
      LABEL t2 PROPERTIES (height),
    t3

```

```

        LABEL t3 PROPERTIES (height)
    )OPTIONS(ALLOW MIXED PROPERTY TYPES);

```

When the graph is created, the property type for `height` in the vertex tables associated with:

```

*   LABEL person IS FLOAT
*   LABEL t2 IS VARCHAR
*   LABEL t3 IS BINARY_DOUBLE

```

However, when querying this graph, the property type for `height` is dependent on the label constraint used in the SQL graph query. See [Accessing Label Properties](#) for more information.

- If you are sharing property names inside shared labels, then they should be all union compatible types.

For example, run the following `CREATE PROPERTY GRAPH` DDL statement where the property name `height` is used inside the shared label `t`:

```

CREATE PROPERTY GRAPH g2
  VERTEX TABLES (
    persons
      LABEL t PROPERTIES (height),
    t2
      LABEL t PROPERTIES (height)
  )OPTIONS(ALLOW MIXED PROPERTY TYPES);

```

The graph creation fails as the column `height` in the tables `persons` and `t2` has the data type `FLOAT` and `VARCHAR` respectively which are union incompatible. Therefore, the following error is thrown:

```
ORA-42414: cannot use mixed type for property HEIGHT of label T
```

However, the following graph will get created successfully as `FLOAT` and `BINARY_DOUBLE` belong to the numeric group and are union compatible.

```

CREATE PROPERTY GRAPH g3
  VERTEX TABLES (
    persons
      LABEL t PROPERTIES (height),
    t3
      LABEL t PROPERTIES (height)
  )OPTIONS(ALLOW MIXED PROPERTY TYPES);

```

See [Type Compatibility Rules for Determining Property Types](#) for more information.

- **DISALLOW MIXED PROPERTY TYPES (default):** This ensures that a property with the same name should strictly be the same data type. This applies to all labels irrespective of whether they are associated with a single or multiple graph element tables. For example, run the following DDL statement using `persons` and `t2` as the underlying database tables:

```

CREATE PROPERTY GRAPH g4
  VERTEX TABLES (
    persons
      LABEL person PROPERTIES (name, height),

```

```

t2
  LABEL t2 PROPERTIES (height)
);

```

The preceding code uses the default `DISALLOW MIXED PROPERTY TYPES` graph option and therefore throws an error as mixed property types are used in the graph definition:

ORA-42414: cannot use mixed type for property HEIGHT of label T2

The following table summarizes compatibility rules with respect to the `MIXED PROPERTY TYPES` options

Description	ALLOW	DISALLOW
Properties with the same name exposed by shared labels ¹	Union-compatible	Types must match
Shared properties ²	Any	Types must match

¹ A label with the same name can be associated with more than one graph element table.

² A property with the same name can be exposed by different labels.

5.1.5 Granting System and Object Privileges for SQL Property Graphs

Learn about the new system and object privileges for performing operations on SQL property graphs.

Table 5-1 System Privileges for SQL Property Graph Objects

System Privileges	Description
CREATE PROPERTY GRAPH	To create a SQL property graph in the grantee's schema
CREATE ANY PROPERTY GRAPH	To create a SQL property graph in any schema except SYS and AUDSYS
ALTER PROPERTY GRAPH	To alter a SQL property graph in the grantee's schema
ALTER ANY PROPERTY GRAPH	To alter a SQL property graph in any schema except SYS and AUDSYS
READ PROPERTY GRAPH	To query a SQL property graph in the grantee's schema
READ ANY PROPERTY GRAPH	To query a SQL property graph in any schema except SYS and AUDSY
SELECT PROPERTY GRAPH	To query a SQL property graph in the grantee's schema
DROP ANY PROPERTY GRAPH	To drop a SQL property graph in any schema except SYS and AUDSYS

Table 5-2 Object Privileges for SQL Property Graphs

Object Privileges	Description
ALTER	To alter a SQL property graph
READ	To query a SQL property graph with a SQL graph query
¹ SELECT	To query a SQL property graph with a SQL graph query

¹ Note that the `SELECT` privilege behaves exactly as the `READ` privilege for the SQL property graph object. It is mainly present for compatibility with the SQL standards for a property graph object.

The following shows the examples for granting and revoking the SQL property graph related privileges. Ensure you have SYSDBA access to grant and revoke these privileges:

```
GRANT CREATE PROPERTY GRAPH, CREATE ANY PROPERTY GRAPH,
      ALTER ANY PROPERTY GRAPH, DROP ANY PROPERTY GRAPH,
      READ ANY PROPERTY GRAPH TO <graphuser>;
```

```
REVOKE CREATE PROPERTY GRAPH, CREATE ANY PROPERTY GRAPH,
      ALTER ANY PROPERTY GRAPH, DROP ANY PROPERTY GRAPH,
      READ ANY PROPERTY GRAPH FROM <graphuser>;
```

You can share your SQL property graph in the database with another user as shown.

```
GRANT SELECT ON PROPERTY GRAPH <graph_name> TO <schema_user>;
```

5.1.6 Retrieving Metadata for SQL Property Graphs

The metadata of SQL property graphs can be accessed through a series of data dictionary views.

The following table provides a complete list of the data dictionary views that you can access to retrieve the metadata for SQL property graphs. Note that the metadata for each category in the table exists across ALL_ , USER_ , and DBA_ view set. Depending upon your level of privilege, you can access the corresponding view.

Table 5-3 List of Data Dictionary Views to Retrieve Metadata for SQL Property Graphs

View Name ¹	Description
<ul style="list-style-type: none"> ALL_PROPERTY_GRAPHS USER_PROPERTY_GRAPHS DBA_PROPERTY_GRAPHS 	To describe all the property graphs in the database.
<ul style="list-style-type: none"> ALL_PG_ELEMENTS USER_PG_ELEMENTS DBA_PG_ELEMENTS 	To describe all the graph element tables of the property graphs in the database.
<ul style="list-style-type: none"> ALL_PG_EDGE_RELATIONS_HIPS USER_PG_EDGE_RELATIONSHIPS DBA_PG_EDGE_RELATIONS_HIPS 	To describe all the columns used to define the edge relationships.
<ul style="list-style-type: none"> ALL_PG_KEYS USER_PG_KEYS DBA_PG_KEYS 	To describe all the columns used as the key for the graph element tables.
<ul style="list-style-type: none"> ALL_PG_LABELS USER_PG_LABELS DBA_PG_LABELS 	To describe labels of property graphs in the database.
<ul style="list-style-type: none"> ALL_PG_LABEL_PROPERTIES USER_PG_LABEL_PROPERTIES DBA_PG_LABEL_PROPERTIES 	To describe the properties of all the labels of the property graphs in the database.

Table 5-3 (Cont.) List of Data Dictionary Views to Retrieve Metadata for SQL Property Graphs

View Name ¹	Description
<ul style="list-style-type: none"> ALL_PG_PROP_DEFINITION_S USER_PG_PROP_DEFINITION_S DBA_PG_PROP_DEFINITION_S 	To describe all the column expressions used to define the properties of labels.
<ul style="list-style-type: none"> ALL_PG_ELEMENT_LABELS_S USER_PG_ELEMENT_LABELS_S DBA_PG_ELEMENT_LABELS_S 	To describe all the labels of all the graph element tables of the property graphs in the database.

¹ See *Oracle Database Reference* for more information on the views.

The following example retrieves the graph element tables that were defined for the SQL property graph (`students_graph`) created in [Creating a SQL Property Graph](#).

```
SQL> SELECT * FROM USER_PG_ELEMENTS;
```

GRAPH_NAME OBJECT_NAME	ELEMENT_NAME	ELEMENT_KIND	OBJECT_OWNER
-----	-----	-----	-----
STUDENTS_GRAPH	PERSONS	VERTEX	GRAPHUSER
STUDENTS_GRAPH	UNIVERSITY	VERTEX	GRAPHUSER
UNIVERSITY			
STUDENTS_GRAPH	FRIENDS	EDGE	GRAPHUSER
STUDENTS_GRAPH	STUDENT_OF	EDGE	GRAPHUSER
STUDENT_OF			

5.1.7 Retrieving SQL Creation DDL Using the DBMS_METADATA Package

You can retrieve the creation DDL for a SQL property graph using the `DBMS_METADATA` package.

The following example displays the DDL for the graph created in [Creating a SQL Property Graph](#) using the `DBMS_METADATA` package.

```
SQL> SELECT DBMS_METADATA.GET_DDL('PROPERTY_GRAPH', 'STUDENTS_GRAPH') FROM  
DUAL;
```

```
CREATE PROPERTY GRAPH "GRAPHUSER"."STUDENTS_GRAPH"  
VERTEX TABLES (  
  "GRAPHUSER"."PERSONS" AS "PERSONS" KEY ("PERSON_ID")  
    LABEL PERSON PROPERTIES ("PERSON_ID", "NAME", "BIRTHDATE" AS "DOB")  
    LABEL PERSON_HT PROPERTIES ("HEIGHT"),  
  "GRAPHUSER"."UNIVERSITY" AS "UNIVERSITY" KEY ("ID")  
    PROPERTIES ("ID", "NAME") )  
EDGE TABLES (  
  "GRAPHUSER"."FRIENDS" AS "FRIENDS" KEY ("FRIENDSHIP_ID")  
    SOURCE KEY("PERSON_A") REFERENCES PERSONS ("PERSON_ID")
```

```

        DESTINATION KEY("PERSON_B") REFERENCES PERSONS ("PERSON_ID")
        PROPERTIES ("FRIENDSHIP_ID", "MEETING_DATE"),
"GRAPHUSER"."STUDENT_OF" AS "STUDENT_OF" KEY ("S_ID")
        SOURCE KEY("S_PERSON_ID") REFERENCES PERSONS ("PERSON_ID")
        DESTINATION KEY("S_UNIV_ID") REFERENCES PERSONS ("ID")
        PROPERTIES ("SUBJECT" )
    OPTIONS (TRUSTED MODE, DISALLOW MIXED PROPERTY TYPES)

```

5.1.8 Limitations of Creating a SQL Property Graph

This section lists a few restrictions that apply when creating a SQL property graph.

- Views cannot be used as graph element tables in a SQL property graph.
- Hybrid partitioned tables, as well as views derived from these tables, cannot be used as graph element tables in a SQL property graph.
- Database links, as well as views defined using these links, cannot be used as graph element tables in a SQL property graph.
- Object tables (that is, table created with `CREATE TABLE x OF myObjectType`) and object views cannot be used as graph element tables in a SQL property graph.
- XMLType table (that is, table created with `CREATE TABLE x OF XMLTYPE ...`) cannot be used as graph element tables in a SQL property graph. However SQL/XML operators, `XMLExists()`, `XMLCast(XMLQuery())` over XMLType column stored as binary XML to define property as SQL value expression is supported.
- Columns of type ANYTYPE cannot be exposed as properties or as keys for graph element tables.
- Pseudo-columns cannot be exposed as properties or as keys for graph element tables.
- Column expressions that comprise invocations to PL/SQL functions cannot be exposed as properties. Similarly, virtual columns defined over column expressions that comprise invocations to PL/SQL functions cannot be exposed as properties.
- SQL property graph are not editable.
- A SQL property graph definition cannot be modified once the graph is created. However, you can redefine a SQL property graph using the `OR REPLACE` clause in the `CREATE PROPERTY GRAPH` DDL statement.
- SQL property graph creation is not supported in a shard catalog. However, you can create a property graph over sharded tables in the local shards.

5.2 Revalidating a SQL Property Graph

Using the `ALTER PROPERTY GRAPH COMPILE` DDL statement, you can revalidate an existing property graph object in the database.

A SQL property graph schema may become invalid due to the alteration of the underlying database objects. For instance, adding or dropping a column from the underlying database tables, used in the graph definition, can cause the graph to become invalid. Any invalidation of the graph will also invalidate cursors depending on the graph object. In such a case, you can recover your property graph from an **invalid** state as shown in the following example. Also, refer to [Granting System and Object Privileges for SQL Property Graphs](#) to ensure you have the required privilege to perform the `ALTER PROPERTY GRAPH` operation.

Example 5-2 Revalidating a SQL Property Graph

```
ALTER PROPERTY GRAPH students_graph COMPILE;
```

① See Also

ALTER PROPERTY GRAPH in *Oracle Database SQL Language Reference*

5.3 Renaming a SQL Property Graph

You can rename an existing SQL property graph using the `RENAME` DDL statement.

The following example renames the property graph `students_graph` to a new name `students`.

Example 5-3 Renaming a SQL Property Graph

```
RENAME students_graph TO students;
```

5.4 Dropping a SQL Property Graph

Using the `DROP PROPERTY GRAPH` DDL statement, you can remove a property graph object in Oracle Database.

See [Granting System and Object Privileges for SQL Property Graphs](#) to ensure you have the required privilege to drop a SQL property graph.

Example 5-4 Dropping a SQL Property Graph

The following example removes the SQL property graph, `students_graph`, in the database.

```
DROP PROPERTY GRAPH students_graph;
```

Similar to database views, dropping a property graph object does not remove the underlying database tables.

DROP PROPERTY GRAPH in *Oracle Database SQL Language Reference*

5.5 JSON Support in SQL Property Graphs

When creating a SQL property graph, you can define a label property over a JSON data type column using simplified dot notation. You can later access this property inside the SQL graph query.

The label property defined over a JSON data type column can be of common SQL scalar data types, such as:

- VARCHAR

- NUMBER
- BINARY_FLOAT
- BINARY_DOUBLE
- DATE
- TIMESTAMP
- raw JSON data converted to a SQL data type
via `.string()`, `.number()`, `.float()`, `.double()`, `.date()`, `.timestamp()`, `.binary()` or
their equivalent using the `JSON_VALUE` operator

Therefore, you can use either a JSON dot notation or the `JSON_VALUE` operator to select a scalar value in the JSON data to define a SQL property graph label property. This also applies when accessing a label property defined over the JSON data type column inside a SQL graph query.

Example 5-5 Defining a SQL Property Graph Using JSON Dot Notation and JSON Expressions for Label Properties

The following example creates a SQL property graph that contains label properties defined over a JSON data type column. The graph is created using the sample database tables (`persons` and `friendships`) defined in [Setting Up Sample Data in the Database](#). The example uses both the JSON dot notation and the `JSON_VALUE` expression to define the label property.

```
CREATE PROPERTY GRAPH friends_graph
  VERTEX TABLES (
    persons AS p KEY (person_id)
    LABEL person
    PROPERTIES (name, birthdate AS dob,
      p.hr_data.department.string() AS "works_in",
      JSON_VALUE(person_data, '$.role') AS "works_as")
  )
  EDGE TABLES (
    friends
    KEY (friendship_id)
    SOURCE KEY (person_a) REFERENCES p(person_id)
    DESTINATION KEY (person_b) REFERENCES p(person_id)
    PROPERTIES (meeting_date)
  );
```

The graph gets created successfully and you can query the graph as shown in the following example:

Example 5-6 Querying a SQL Property Graph and Accessing Label Properties Defined As SQL/JSON Expressions

The following example queries the SQL property graph created in the preceding example to access the label properties created over a JSON data type column.

```
SELECT * FROM GRAPH_TABLE (friends_graph
  MATCH
    (a IS person) -[e IS friends]-> (b IS person)
  COLUMNS (a.name AS a,
    a."works_in" AS "a_works_in",
    e.meeting_date,
```

```

        b.name AS b)
    );

```

The query produces the following output:

```

A      a_works_in MEETING_D B
-----
John  IT          01-SEP-00 Bob
Mary  HR          19-SEP-00 Alice
Mary  HR          19-SEP-00 John
Bob   IT          10-JUL-01 Mary

```

Example 5-7 Creating and Querying a SQL Property Graph with JSON Data Type Label Property

The following example creates a SQL property graph with JSON data type label property:

```

CREATE PROPERTY GRAPH friends_graph_new
  VERTEX TABLES (
    persons AS p KEY (person_id)
    LABEL person
    PROPERTIES (name, birthdate AS dob, p.hr_data AS "p_data")
  )
  EDGE TABLES (
    friends
    KEY (friendship_id)
    SOURCE KEY (person_a) REFERENCES p(person_id)
    DESTINATION KEY (person_b) REFERENCES p(person_id)
    PROPERTIES (meeting_date)
  );

```

You can then query the graph using a `JSON_VALUE` expression as shown:

```

SELECT * FROM GRAPH_TABLE (friends_graph_new
  MATCH
    (a IS person WHERE JSON_VALUE(a."p_data", '$.department') = 'IT') -[e]->
  (b)
  COLUMNS (a.name AS a,
    a."p_data".department.string() AS "a_works_in",
    a."p_data".role.string() AS "a_works_as",
    e.meeting_date,
    b.name AS b)
);

```

```

A      a_works_in a_works_as      MEETING_D B
-----
John  IT          Software Developer  01-SEP-00 Bob
Bob   IT          Technical Consultant 10-JUL-01 Mary

```

6

SQL Graph Queries

You can query a SQL property graph using the `GRAPH_TABLE` operator to express graph pattern matching queries.

Graph pattern matching allows you to define a set of path patterns and match it against a graph to obtain a set of solutions. You must provide the graph to be queried as an input to the `GRAPH_TABLE` operator along with the `MATCH` clause containing the graph patterns to be searched as shown:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person) -[e IS friends]-> (b IS person WHERE b.name = 'Mary')
WHERE a.name='John'
COLUMNS (a.name AS person_a, b.name AS person_b)
);
```

A basic SQL graph query is made up of the following components:

- **FROM clause:** It includes the `GRAPH_TABLE` operator which takes the input graph name as the first parameter.
- **MATCH clause:** It expresses the graph element patterns (vertex or edge pattern) to be searched on the SQL property graph. It can optionally include an element pattern `WHERE` clause as seen in the preceding example ((`b IS person WHERE b.name = 'Mary'`)) query. This in-line `WHERE` clause can access any matched variable.
- **WHERE clause:** This is an optional out-of-line `WHERE` clause. Similar to the element pattern `WHERE` clause, it has access to all the graph pattern variables and expresses a predicate that applies to the entire pattern in the `MATCH` clause.
- **ONE ROW PER clause:** An optional clause to limit the number of output rows. See [Using ONE ROW PER Clause in a SQL Graph Query](#) for more information.
- **COLUMNS clause:** This contains the query output columns.

① Note

It is recommended that you create indexes on the underlying database tables for better SQL property graph query performance.

Using SQL Developer 23.1, you can view all the SQL property graphs existing in your database schema by expanding **SQL Property Graphs** under the **Property Graph** node in the **Connections** navigator.

6.1 About Graph Pattern

The `GRAPH_TABLE` operator in a SQL graph query contains a graph pattern.

A graph pattern is expressed between the input graph name and the `COLUMNS` clause inside the `GRAPH_TABLE` operator.

A graph pattern contains one or more comma-separated path patterns, which are composed of vertex and edge patterns. For example, the following path pattern has two vertex patterns and one edge pattern:

```
(v1) -[e]-> (v2)
```

A vertex pattern is enclosed in parentheses and specifies how to match a single vertex. An edge pattern is enclosed by a square bracket with delimiters on the left and right side of the edge pattern and specifies how to match a single edge.

Also, the available arrow tokens for edge patterns are summarized in the following table:

Table 6-1 Arrow Tokens for Edge Patterns

Directionality	Bracketed Syntax	Abbreviated Syntax ¹
Directed to the right	-[]->	->
Directed to the left	<-[]-	->
Any directed edge (right or left)	<-[]-> or -[]-	-

- ¹
- There are no brackets for the arrows in the “abbreviated syntax” column.
 - All edge labels will be considered as no edge label is specified. Hence, filtering on a specific edge is not supported.

A graph element pattern (which can either be a vertex or an edge pattern) may in turn optionally include:

- An element variable.
- A label expression which is that part in an element pattern that starts with the keyword `IS` and is followed by a list of one or more label names. If there is more than one label name, then these are separated by vertical bars.
- An element pattern `WHERE` clause which expresses a search condition on the element variable declared by the element pattern.

See Also

Graph Pattern in *Oracle Database SQL Language Reference*

The following sections explain the graph pattern concepts more in detail:

- [Graph Element Variables](#)
Vertex and edge pattern variables ranges over vertices and edges respectively.
- [Path Variables](#)
A graph path pattern in a SQL graph query can have an optional path variable declaration.
- [Label Expressions](#)
A label expression in a vertex or an edge element pattern is introduced by the keyword `IS`.
- [Accessing Label Properties](#)
You can access a property inside a graph element pattern, in the out-of-line `WHERE` clause or in the `COLUMNS` clause.
- [Using the IS LABELED Predicate](#)
You can use the `IS [NOT] LABELED` predicate to determine whether a graph element satisfies a label expression.

- [Using the PROPERTY_EXISTS Predicate](#)
You can use the `PROPERTY_EXISTS` predicate to determine if the graph element bound to a singleton element reference has a specific property.

6.1.1 Graph Element Variables

Vertex and edge pattern variables ranges over vertices and edges respectively.

For example, consider the following graph pattern which contains three graph element variables.

```
(v1)-[e]->(v2)
```

In the preceding graph pattern, `v1` and `v2` are two vertex pattern variables and `e` is an edge pattern variable.

Ensure that you apply the following rules for the graph pattern variables:

- You cannot use the same variable name for both a vertex and an edge.
- You can use the same variable name in two different vertex patterns as shown:

```
MATCH (a IS person) -> (a IS person)
```

In the preceding example, the vertex variable `a` is used in two vertex patterns - `(a IS person)` and `(a IS person)`. This implies that the two vertex patterns that declare the same vertex variable must bind to the same vertex. Thus the vertex variable binds to a unique vertex but the vertex pattern can appear multiple times in the same graph pattern.
- You can use the same variable name in two different edge patterns.
- Anonymous (that is, omitted) vertex and edge variables are supported. See [Example 6-8](#).

6.1.2 Path Variables

A graph path pattern in a SQL graph query can have an optional path variable declaration.

For instance, consider the following example which shows comma-separated path patterns in a `MATCH` clause:

```
MATCH p1 = (a is Person), (b is Person)
```

The first path pattern `(a is Person)` starts with a path variable declaration named `p1`, whereas the second path pattern `(b is Person)` is unnamed.

Note the following about path variables:

- Path variable declarations are optional in a path pattern.
- A path variable, when used, is declared at the beginning of a path pattern.
- A `MATCH` clause can contain both named and unnamed path patterns.
- All path variables have to be unique and cannot be multiply declared. This means that a path variable may not be declared with the same name as an element variable, an iterator variable, or another path variable.
- Adding a path variable to SQL graph query does not impact the query output unless the query contains the `ONE ROW PER STEP/VERTEX` clause or `PATH_NAME` function.

See [Example 6-21](#) for an example using path variables.

6.1.3 Label Expressions

A label expression in a vertex or an edge element pattern is introduced by the keyword `IS`.

For example, in the following graph pattern, the vertex pattern associated with the graph element variable `v1` has the label `person`. Also, the edge pattern associated with the graph element variable `e` contains the label `friendOf`:

```
(v1 IS person) -[e IS friendOf]-> (v2)
```

If the label is omitted in a graph element pattern, then depending on the type of the element variable, either all vertex properties or all edge properties in the graph can be referenced. Otherwise, if a label expression is specified, then the set of properties that can be referenced is the union of the properties of labels belonging to vertex (or edge) tables that have at least one label that satisfies the label expression.

A label expression can also include an optional in-line SQL search condition that can access any matched variable. When accessing a property, you must specify a graph pattern variable.

The supported vertex and edge label expressions are described in the following table:

Table 6-2 Supported Vertex and Edge Label Expressions

Vertex Label Expression	Edge Label Expression	Description
(a)	[e]	<ul style="list-style-type: none"> The vertex graph pattern variable <code>a</code> may match a vertex with any label. The edge graph pattern variable <code>e</code> may match an edge with any label.
()	[]	<ul style="list-style-type: none"> The vertex pattern has no label and can match any vertex. The edge pattern has no label and can match any edge. <p>When a graph pattern variable is not specified, a unique vertex or edge variable name is internally generated by the system. Therefore, you cannot reference the vertex or edge elsewhere in the query, as it is unknown.</p>
(IS person)	[IS friend_of]	<ul style="list-style-type: none"> The vertex pattern has only the <code>person</code> label. The edge pattern has only the <code>friend_of</code> label. <p>When a graph pattern variable is not specified, a unique vertex or edge variable name is internally generated by the system. Therefore, you cannot reference the vertex or edge elsewhere in the query, as it is unknown.</p>

Table 6-2 (Cont.) Supported Vertex and Edge Label Expressions

Vertex Label Expression	Edge Label Expression	Description
(IS person place thing)	[IS friend_of student_of]	<ul style="list-style-type: none"> The vertex pattern has an alternation of three labels, person, place and thing. This implies that the vertex pattern can match any vertex having those labels. The edge pattern has an alternation of two labels, friend_of and student_of. This implies that the edge pattern can match any edge having those labels. <p>As there is no explicit graph pattern variable in the vertex or edge pattern, you cannot reference this vertex or edge elsewhere in the query.</p>
(a IS person place thing)	[e IS friend_of student_of]	<p>Same as the preceding table entry. However, the vertex and edge patterns contain a and e as vertex and edge graph pattern variables respectively. Therefore, you can reference the vertex or edge using the respective graph pattern variables elsewhere in the query. See Example 6-12.</p>
(a IS person), (a IS car)	(a)-[e IS L1]->(b), (a)-[e IS L2]->(b)	<ul style="list-style-type: none"> The vertex pattern a IS person implies that a must match vertices having the label person, and the vertex pattern a IS car implies that a must match vertices having the label car. Therefore, this represents that a must match vertices having both person and car as labels, effectively an AND of these two conditions. Also, you can reference a vertex as a elsewhere in the query. The edge pattern e IS L1 implies that e must match edges having the label L1, and the edge pattern e IS L2 implies that e must match edges having the label L2. Therefore, this represents that e must match edges having both L1 and L2 as labels, effectively an AND of these two conditions. Also, you can reference an edge as e elsewhere in the query. <p>See Example 6-13.</p>

Table 6-2 (Cont.) Supported Vertex and Edge Label Expressions

Vertex Label Expression	Edge Label Expression	Description
(a IS person WHERE a.name = 'Fred')	[e IS student_of WHERE e.subject = 'Arts']	<ul style="list-style-type: none"> The vertex pattern has a label <code>person</code> and a vertex graph pattern variable <code>a</code>, which is qualified in the element pattern <code>WHERE</code> clause. The edge pattern has a label <code>student_of</code> and an edge graph pattern variable <code>e</code>, which is qualified in the element pattern <code>WHERE</code> clause. <p>The only graph pattern variable that is visible within an element pattern is the graph pattern variable defined locally by the element pattern. Graph pattern variables from another element patterns cannot be accessed. See Example 6-5.</p>

6.1.4 Accessing Label Properties

You can access a property inside a graph element pattern, in the out-of-line `WHERE` clause or in the `COLUMNS` clause.

Consider the following graph element pattern where `a` is a graph element variable and `name` is a property name:

```
(a IS person WHERE a.name='John')
```

You can then reference the property in the `WHERE` clause inside the graph element pattern as `a.name`. This means `a.name` references the property `name` of the graph element bound to the graph pattern variable `a`.

Also, the following conditions apply when accessing a property:

- The property `name` is part of at least one table that satisfies the label expression.
- A graph variable name must always be used to access a property.
- At the time of query compilation, certain type checking rules apply for the vertex or edge table properties. See [Type Compatibility Rules for Determining Property Types](#) for more information.
- If an element variable is not bound to a graph element, then the result is a null value. This can happen only when an element variable is optionally bound, such as when the element variable is an iterator variable declared in `ONE ROW PER STEP`. Specifically, the edge variable and the second vertex variable declared in `ONE ROW PER STEP` will not be bound to a graph element when the path pattern matches an empty path (that is, when a quantifier iterated zero times). See [Using ONE ROW PER Clause in a SQL Graph Query](#) for more information on `ONE ROW PER STEP`.

The following examples describe a few scenarios for determining property types when querying SQL property graphs. Note that [Example 6-1](#) to [Example 6-3](#) refer to the SQL property [graph definition for q1](#) which contains `height` as a shared property across different labels.

Example 6-1 Determining the Property Type for a Single Label

The data type for `a.height` in the following query is `FLOAT`:

```
SELECT * FROM GRAPH_TABLE (g1
MATCH
(a IS person)
COLUMNS (a.height)
);
```

The query output is as shown:

```
HEIGHT
-----
      1.8
      1.65
      1.75
      1.7
```

Example 6-2 Determining Union Compatible Property Type for Two Different Labels

The data type for `a.height` in the following query is the union compatible type between `FLOAT` and `BINARY_DOUBLE`:

```
SELECT * FROM GRAPH_TABLE (g1
MATCH
(a IS person|t3)
COLUMNS (a.height)
);
```

The query output is as shown:

```
HEIGHT
-----
1.8E+000
1.65E+000
1.75E+000
1.7E+000
1.8E+000
1.65E+000
```

In the SQL property graph `g1`, the property type for `height` associated with the labels `person` and `t3` is `FLOAT` and `BINARY_DOUBLE` respectively. `BINARY_DOUBLE` takes precedence over `FLOAT` and hence the resulting output property type for `a.height` is `BINARY_DOUBLE`.

Example 6-3 No Union Compatible Property Type for Two Different Labels

Error is thrown for the following query as the data type for `a.height` is not union compatible across the tables, `person` (`FLOAT`) and `t2` (`VARCHAR`):

```
SELECT * FROM GRAPH_TABLE (g1
MATCH
(a IS person|t2)
```

```
COLUMNS (a.height)
);
```

On execution, the preceding query throws the error - ORA-01790: expression must have same datatype as corresponding expression

Example 6-4 Determining Union Compatible Property Type for Shared Labels

Consider the [SQL property graph definition for g3](#) which uses a shared label (t) that is associated with a shared property name (height).

When querying g3, the data type for a.height in the following SQL graph query is BINARY_DOUBLE:

```
SELECT * FROM GRAPH_TABLE (g3
MATCH
(a IS t)
COLUMNS (a.height)
);
```

The query output is a union of the property columns across all the graph element tables sharing the label. Also, the property type is BINARY_DOUBLE as per the [Type Compatibility Rules for Determining Property Types](#):

```
      HEIGHT
-----
1.8E+000
1.65E+000
1.75E+000
1.7E+000
1.8E+000
1.65E+000
```

6.1.5 Using the IS LABELED Predicate

You can use the IS [NOT] LABELED predicate to determine whether a graph element satisfies a label expression.

The function returns a BOOLEAN data type as specified in the following scenarios:

- TRUE: A vertex or an edge is bound to the specified label.
- FALSE: A vertex or an edge is bound, but not to the specified label.
- NULL: A vertex or an edge is not bound.

The IS [NOT] LABELED predicate can be used in the COLUMNS or WHERE clause of a SQL graph query as shown:

```
SELECT * FROM GRAPH_TABLE ( g1
MATCH (n)
COLUMNS (n.name, n IS LABELED Person AS labeledPerson)
);
```

Note that you can only specify a simple label name; label disjunction is not supported.

See [Example 6-14](#) for more information.

6.1.6 Using the PROPERTY_EXISTS Predicate

You can use the `PROPERTY_EXISTS` predicate to determine if the graph element bound to a singleton element reference has a specific property.

The function returns a `BOOLEAN` data type as specified in the following scenarios:

- **TRUE:** A vertex or an edge is bound and at least one of the labels have the specified property.
- **FALSE:** A vertex or an edge is bound, but the specified property does not exist in any of the labels.
- **NULL:** A vertex or an edge is not bound.

The `PROPERTY_EXISTS` predicate can be used in the `COLUMNS` or `WHERE` clause of a SQL graph query as shown:

```
SELECT * FROM GRAPH_TABLE ( g1
MATCH (n)
COLUMNS (n.name, PROPERTY_EXISTS(n, name) AS nameExists)
);
```

See [Example 6-15](#) for more information.

6.2 Variable Length Path Patterns

Variable length graph patterns provide advanced querying support for SQL property graphs.

Variable length graph patterns require recursion such that there is a variable number of joins when translated into a relational query.

Bounded recursive path patterns that include one or more of the following quantifiers are supported:

Table 6-3 Quantifier Support for Variable Length Graph Patterns

Quantifier	Description
{n}	Exactly n
{n, m}	Between n and m (inclusive)
{, m}	Between 0 and m (inclusive)

Note that the lower bound should be 0 or greater, while the upper bound should be 1 or greater and should also be greater than or equal to the lower bound.

See [Example 6-16](#) for example queries using recursive path patterns with bounded quantifiers.

6.3 Complex Path Patterns

You can query a SQL property graph using complex path patterns.

Cyclic Path Patterns

Vertex and edge path patterns can form cycles. For instance, consider the following graph pattern:

```
MATCH (a IS person) -[IS friends]-> (a IS person)
```

The preceding graph pattern describes a single path pattern, and it contains the vertex variable `a` twice. Thus, this finds cycles in the graph such that `a` binds to a `person` that has a `friends` edge to itself.

Also, note the following:

- The label `person` for the vertex variable `a` need not be repeated twice. The result is the same with or without repeating the label expression.
- You can use multiple in-line `WHERE` clauses to add conditions on the same pattern variable.
- Using the same edge variable twice in a path pattern also has the semantics that the edges must be the same.

Cycles can be longer than a single edge. See [Example 6-11](#).

Multiple Path Patterns

A `MATCH` clause may have more than one path pattern, in a comma-separated list. For instance, the following example shows two path patterns:

```
MATCH (a IS person WHERE a.name='John') -[IS student_of]-> (b IS university),  
(a IS person WHERE a.name='John') -[IS friends]-> (c IS person)
```

Any graph pattern variables in common between two path patterns denotes an overlap between the path patterns. In the preceding example, the vertex variable `a` is shared. Note that the variable `a` must bind to the same graph element table in each element pattern of the graph pattern, and thus there is an implicit natural inner join on such repeated graph pattern variables.

If there are no shared variables between the two path patterns, then the resulting output set is a cross product of the outputs of the individual path patterns. See [Example 6-9](#) and [Example 6-10](#).

6.4 Vertex and Edge Identifiers

You can uniquely identify each vertex and edge in a SQL property graph with the `VERTEX_ID` and `EDGE_ID` functions, respectively, in a SQL graph query.

Graph element identifiers are based on the key value defined for the graph element tables. Therefore, it is important to note the following:

- Graphs in `TRUSTED` mode may produce duplicate identifiers for different vertices if some key columns do not have a `UNIQUE` constraint.
- Graphs in `ENFORCED` mode are guaranteed to always produce unique identifiers.

The `VERTEX_ID` and `EDGE_ID` functions can be used in any expression appearing in the `COLUMNS` or `WHERE` clause in a SQL graph query.

Note

In order to use the `VERTEX_ID` and `EDGE_ID` functions, you must have `READ` or `SELECT` privilege on the property graph. In addition, for each vertex or edge table from which the vertex or edge IDs are requested, ensure at least one of the following:

- Each of its key columns is directly exposed as a property.
- You have `READ` or `SELECT` privilege on its underlying database table.

The input to the `VERTEX_ID` function is a single vertex graph pattern variable coming from a matched vertex pattern as shown:

```
MATCH (v) COLUMNS(VERTEX_ID(v) AS v_id)
```

Similarly, the `EDGE_ID` function takes as input a single edge graph pattern variable coming from a matched edge pattern as shown:

```
MATCH (v1)-[e]->(v2) COLUMNS(EDGE_ID(e) AS e_id)
```

The output of these functions is a vertex or an edge identifier of JSON data type. The following shows an example of a JSON output describing the vertex identifier:

```
{
  "GRAPH_OWNER": "GRAPHUSER",
  "GRAPH_NAME": "STUDENTS_GRAPH",
  "ELEM_TABLE": "PERSONS",
  "KEY_VALUE": {
    "PERSON_ID": 1
  }
}
```

In the preceding JSON output:

- **GRAPH_OWNER:** Owner of the property graph object
- **GRAPH_NAME:** Name of the property graph object
- **ELEM_TABLE:** Name of the vertex table
- **KEY_VALUE:** Name and value of the key column

The same list of JSON output fields apply to an edge identifier also. However, the `ELEM_TABLE` field represents the name of an edge table. Also, all operations that can be performed on a JSON data type can be performed on the vertex and edge identifiers.

If the referenced element variable is not bound to a graph element, then the `VERTEX_ID` and `EDGE_ID` functions return the null value.

See [Example 6-29](#) for more information.

`VERTEX_EQUAL` and `EDGE_EQUAL` Predicates

The `VERTEX_EQUAL` and `EDGE_EQUAL` predicates can be used to, respectively, compare two vertex and edge identifiers and return `TRUE` if they are equal.

The inputs to the `VERTEX_EQUAL` predicate are two vertex graph pattern variables. Similarly for `EDGE_EQUAL`, both inputs must be edge graph pattern variables. These predicates can be used in the `WHERE` clause in a SQL graph query.

If at least one of the referenced element variables is not bound to a graph element, then the predicates evaluate to the null value. Otherwise, they evaluate to `TRUE` or `FALSE`.

See [Example 6-30](#) for more information.

6.5 Using ONE ROW PER Clause in a SQL Graph Query

You can use the `ONE ROW PER` optional clause in a SQL graph query to determine the number of rows to be returned by the query.

The `ONE ROW PER` clause can be placed after the `MATCH` clause (or if present, after a `WHERE` clause) and before the `COLUMNS` clause in a SQL graph query.

The `ONE ROW PER` clause supports the following options which determine the number of rows to be returned by the query:

- `ONE ROW PER MATCH` (default): This specifies that one row is returned per match to the graph pattern. See [Example 6-18](#) for more information.
- `ONE ROW PER VERTEX`: This creates one row for each vertex along a path. It declares a single iterator vertex variable and iterates through the vertices in paths, binding the iterator variable to different vertices in different iterations. For each path, it creates as many rows as there are vertices in the path.

For example, consider the following path with three vertices - $(v1) \rightarrow (v2) \rightarrow (v3)$. In this case `ONE ROW PER VERTEX (v)` creates three rows, one for each of `v1`, `v2`, and `v3`.

For zero hop paths, `ONE ROW PER VERTEX (v)` creates one row, where `v` binds to the only vertex (which is the source and destination of the path).

See [Example 6-19](#) for more information.

- `ONE ROW PER STEP`: This declares an iterator vertex variable, an iterator edge variable, and another iterator vertex variable. It creates one row for every hop, where the first vertex variable binds to the source of this hop, the edge variable is the edge of the hop and the second vertex variable is the destination of the hop. It iterates through the steps of the different paths. A step is a vertex-edge-vertex triple. If a path is non-empty and thus contains at least one edge and two vertices, then there are as many steps as there are edges and each iteration binds the iterator variables to the next edge and its source and destination in the path.

For example, consider the following path - $v1 -[e1] \rightarrow v2 -[e2] \rightarrow v3$. In this case `ONE ROW PER STEP (v1,e,v2)` returns the following two rows:

```
v1, e1, v2
v2, e2, v3
```

However, if a path is empty and consists of a single vertex only, then the path has a single step and the first iterator vertex variable binds to that vertex, while the iterator edge variable and the second iterator vertex variable are not bound to any graph element.

See [Example 6-20](#) for more information.

The following describes a few restrictions for the iterator variables:

- All iterator variables have to be unique. This implies that these variables need to be different from the graph element variables and path variables used in the `MATCH` clause. In case of `ONE ROW PER STEP`, all the three iterator variables need to be different.
- Iterator variables cannot be referenced in the graph pattern or graph pattern `WHERE` clause of the SQL graph query. They can only be used in the `COLUMNS` clause of the query.

① Note

If you use `ONE ROW PER` clause in a SQL graph query in the Graph Visualization application or APEX plug-in for graph visualization, then ensure that the underlying SQL property graph definition does not contain any vertex or edge table alias (`AS` clause).

Using IN Path Clause

If a SQL graph query contains multiple named path patterns, then an `IN` path clause must be specified when using the `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in the query. The `IN` path clause specifies one or more path variables referencing the paths that should be iterated through. If no `IN` path clause is specified, then all paths are iterated through.

Also, note the following:

- The `IN` clause may reference a path variable at most once.
- If the `IN` clause is omitted, then either a single path pattern must be specified, or all the path patterns must have a path variable declaration.

See [Example 6-21](#) for more information.

- [Using the MATCHNUM Function](#)
The `MATCHNUM` function returns a number that uniquely identifies a match in a set of matches.
- [Using the PATH_NAME Function](#)
The `PATH_NAME` function can only be used in combination with the `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in a SQL graph query and returns the name of the path that the iterator variables are currently iterating over.
- [Using the ELEMENT_NUMBER Function](#)
The `ELEMENT_NUMBER` function can only be used for iterator variables that are defined in the `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in a SQL graph query. It returns the sequential element number of the vertex or edge that the referenced iterator variable currently binds to.

6.5.1 Using the MATCHNUM Function

The `MATCHNUM` function returns a number that uniquely identifies a match in a set of matches.

The numbers are not necessarily consecutive, and gaps may appear (for instance, when matches are filtered out). Rows returned from `GRAPH_TABLE` have unique match numbers unless `ONE ROW PER VERTEX` or `ONE ROW PER STEP` is specified, in which case the same match number is returned for different iterations within a match.

`MATCHNUM` can be used only in the `COLUMNS` clause of the SQL graph query as shown.

```
SELECT *
FROM GRAPH_TABLE ( g
```

```

MATCH (p IS person)
COLUMNS (MATCHNUM() AS matchnum,
          p.name)
)ORDER BY matchnum;

```

The preceding graph query matches all person vertices and for each match returns a unique match number as well as the name of the `person`.

See [Example 6-22](#) for more information.

6.5.2 Using the PATH_NAME Function

The `PATH_NAME` function can only be used in combination with the `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in a SQL graph query and returns the name of the path that the iterator variables are currently iterating over.

The function can be specified only in the `COLUMNS` clause of the graph query and the return type is `CHAR`. For example, consider the following query:

```

SELECT *
FROM GRAPH_TABLE ( g1
  MATCH p1 = (x)->(y), p2 = (y) -> (z)
  ONE ROW PER VERTEX (v)
  COLUMNS (PATH_NAME() AS pathnames)
);

```

The preceding query returns `P1` and `P2` as the values of `PATH_NAME`.

`PATH_NAME` returns `NULL` when there is a single path pattern without a path variable declaration.

See [Example 6-24](#) for more information.

6.5.3 Using the ELEMENT_NUMBER Function

The `ELEMENT_NUMBER` function can only be used for iterator variables that are defined in the `ONE ROW PER VERTEX` or `ONE ROW PER STEP` clause in a SQL graph query. It returns the sequential element number of the vertex or edge that the referenced iterator variable currently binds to.

Since paths always start with a vertex and alternate between vertices and edges, the first element is a vertex with element number 1, the second element is an edge with element number 2, the third element is a vertex with element number 3, and so on. For example, consider the following path: `v1 -[e1]-> v2 -[e2]-> v3`. Then the element numbers are generated from left to right as shown:

```
v1:1, e1:2, v2:3, e2:4, v3:5
```

Therefore, vertices always have odd element numbers while edges have even element numbers.

If `ONE ROW PER STEP` is specified and the path is empty (that is, only has a single vertex and no edges), then `ELEMENT_NUMBER` returns `NULL` when the iterator edge variable or the second iterator vertex variable is referenced. Note that empty paths result in single steps in which only the first iterator (vertex) variable is bound.

Also, note the following:

- `ELEMENT_NUMBER` can be used only in the `COLUMNS` clause.

- `ELEMENT_NUMBER` function can only be used if `ONE ROW PER VERTEX` or `ONE ROW PER STEP` is specified in the SQL graph query.
- `ELEMENT_NUMBER` cannot reference any type of variable other than an iterator variable.

For instance, consider the following sample query. The query uses `ONE ROW PER STEP` and the `ELEMENT_NUMBER` function returns the element number of the graph element that is bound by the iterator variable `v`.

```
SELECT *
FROM GRAPH_TABLE ( g
    MATCH (a) ->{0,2} ONE ROW PER STEP (v,e,v2)
    COLUMNS (ELEMENT_NUMBER(v) AS elementNumber)
)
```

See [Example 6-23](#) for more information.

6.6 Using Aggregate Functions in SQL Graph Queries

You can use aggregate functions in a SQL graph query to obtain an aggregated output.

Both SQL built-in [Aggregate Functions](#) and user-defined aggregates are supported. These functions can be included in both fixed length and variable length path patterns in a SQL graph query.

The aggregate functions can be applied in the `COLUMNS` clause or in the graph pattern `WHERE` clause of the SQL graph query. For instance, consider the following sample query:

```
SELECT *
FROM GRAPH_TABLE ( g
    MATCH (v1) (-[e]->(v2)){1,2}
    COLUMNS (LISTAGG(v2.id, ',' ) AS id_list)
)
```

The preceding graph query describes a variable length path pattern having `{1,2}` as the quantifier. The `LISTAGG` aggregate function is used in the `COLUMNS` clause to list all the `ids` along a path.

Similarly, you can also apply aggregations in a fixed length path pattern as shown:

```
SELECT *
FROM GRAPH_TABLE ( g
    MATCH (v1) (-[e]->(v2)){2}
    WHERE AVG(v2.age) >= 30
    COLUMNS (LISTAGG(v2.id, ',' ) AS id_list)
)
```

The preceding graph query describes a fixed length path pattern. The `AVG` aggregate used in the `WHERE` clause determines only those paths where the average `age >= 30` condition is met. The resulting query output is a list of `ids` along a path.

See [Example 6-17](#) for example queries using aggregations.

Using `binding_count()` in SQL Graph Queries

You can use the `binding_count()` aggregate to count the number of bindings to an element variable. This aggregate can only be used inside the `COLUMNS` clause or in the graph pattern `WHERE` clause of the SQL graph query. Also, note that you cannot specify `UNIQUE` or `DISTINCT` on the `binding_count()` element variable.

For instance, consider the following sample query:

```
SELECT *
FROM GRAPH_TABLE ( g
    MATCH (v1) (-[e]->(v2)){1,2}
    COLUMNS (binding_count(v2) AS cnt, LISTAGG(v2.id, ',') AS id_list)
)
```

The preceding graph query outputs a list of `ids` along a path together with the count of bindings to `v2`.

Also, see the [Using binding_count\(\) Aggregate](#) example in [Example 6-17](#).

① See Also

[Graph Pattern](#) in *Oracle Database SQL Language Reference* for more examples on aggregations

6.7 Selecting All Properties in the COLUMNS Clause

You can select all the vertex or edge properties based on the element type (vertex or edge) and any label expression specified for the element in the `COLUMNS` clause of a SQL graph query.

The set of properties is the union of properties of the vertex (or edge) labels belonging to tables that have at least one label that satisfies the label expression. In case some of these matching tables define a property while other tables do not, then `NULL` values will be returned for those tables that do not define the property.

For instance, the following example matches all the vertices in the graph `g` and retrieves all the valid properties through `n.*` in the `COLUMNS` clause.

```
SELECT *
FROM GRAPH_TABLE ( g
    MATCH (n IS person)
    COLUMNS ( n.* )
)
```

See [Example 6-32](#) for more information.

6.8 Using the SOURCE and DESTINATION Predicates

You can determine if a vertex is a source or destination using the `IS [NOT] SOURCE OF` or `IS [NOT] DESTINATION OF` predicate in a value expression inside a `WHERE` or `COLUMNS` clause.

These predicates are mainly useful for determining the direction of edges that are matched through any-directed edge patterns (`<-[]->` or `-[]->`).

The `IS [NOT] SOURCE OF` predicate takes a vertex and an edge as input and returns `TRUE` or `FALSE` depending on whether the vertex is (or not) the source of the edge.

The `IS [NOT] DESTINATION OF` predicate also takes a vertex and an edge as input and returns `TRUE` or `FALSE` depending on whether the vertex is (or not) the destination of the edge.

If at least one of the referenced element variables is not bound to a graph element, then the source and destination predicates evaluate to the null value. Otherwise, they evaluate to `TRUE` or `FALSE`.

See [Example 6-33](#) for more information.

6.9 Running SQL Graph Queries at a Specific SCN

You can run a SQL graph query at a given System Change Number (SCN) or timestamp value.

The graph name, which is the first operand of the `GRAPH_TABLE` operator, can be associated with either of the following clauses:

- `AS OF SCN`: See [Example 6-27](#)
- `AS OF TIMESTAMP`: See [Example 6-28](#)

6.10 Privileges to Query a SQL Property Graph

You must have the `READ` or `SELECT` object privilege to query a SQL property graph.

If you are the graph creator, then you can allow other graph users to query your graph by granting any one of the following privileges:

```
GRANT READ ON PROPERTY GRAPH <graph_name> TO <schema_user>;
GRANT SELECT ON PROPERTY GRAPH <graph_name> TO <schema_user>;
```

It is important to note that granting the preceding privileges allows access only to the property graph object and not to its underlying database tables.

This allows the graph user to successfully run SQL graph queries on your graph without having access to the underlying tables. For example:

```
GRANT READ ON PROPERTY GRAPH students_graph TO hr;

SQL> conn hr/<password_for_hr>;
Connected.
SQL> SELECT * FROM GRAPH_TABLE (graphuser.students_graph MATCH (a IS person)
COLUMNS (a.name AS person_a));

PERSON_A
-----
John
Mary
Bob
Alice
```

However, to perform SQL graph queries with `VERTEX_ID` and `EDGE_ID` functions, the graph user must additionally have `READ` or `SELECT` privilege on the underlying database tables.

6.11 Examples for SQL Graph Queries

This section contains a few examples for querying a SQL property graph with fixed-length and variable-length graph pattern matching queries.

All the queries shown in the examples are run on the SQL property graph, `students_graph`, created in [Example 5-1](#):

Example 6-5 Query Using An Edge Pattern Directed Left-To-Right

The following example shows a `GRAPH_TABLE` query containing an edge pattern (`-[e IS friends]->`) which is directed from left-to-right:

```
SELECT * FROM GRAPH_TABLE (students_graph
    MATCH
    (a IS person) -[e IS friends]-> (b IS person WHERE b.name='Alice')
    WHERE a.name='Mary'
    COLUMNS (a.name AS person_a, b.name AS person_b)
);
```

The code produces the following output:

```
PERSON_A  PERSON_B
-----
Mary      Alice
```

Example 6-6 Query Using An Edge Pattern Directed Right-To-Left

The following example shows a query containing an edge pattern (`<-[e IS friends]-`) which is directed from right-to-left:

```
SELECT * FROM GRAPH_TABLE (students_graph
    MATCH
    (a IS person) <-[e IS friends]- (b IS person WHERE b.name='Mary')
    WHERE a.name='Alice'
    COLUMNS (a.name AS person_a, b.name AS person_b)
);
```

The code produces the following output:

```
PERSON_A  PERSON_B
-----
Alice     Mary
```

Example 6-7 Query Using Any-Directed Edge Pattern

The following example shows a query which contains any-directed edge pattern (`-[e IS friends]-`):

```
SELECT * FROM GRAPH_TABLE (students_graph
    MATCH
    (a IS person) -[e IS friends] - (b IS person WHERE b.name='Alice' OR
    b.name='Mary')
```

```

WHERE (a.name='Alice' OR a.name='Mary')
COLUMNS (a.name AS person_a, b.name AS person_b)
);

```

The code produces the following output:

PERSON_A	PERSON_B
Mary	Alice
Alice	Mary

Example 6-8 Query Using an Anonymous Edge Variable

The following example shows a query where the edge element variable is omitted:

```

SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person) -[]-> (b IS person)
COLUMNS (a.name AS person_a, b.name AS person_b)
);

```

Alternatively, you can replace the bracketed syntax for the edge pattern (-[]->) in the preceding query with an abbreviated syntax ->.

The code produces the following output:

PERSON_A	PERSON_B
Mary	John
Bob	Mary
John	Bob
Mary	Alice

Example 6-9 Query Using Multiple Path Patterns

The following example shows a query containing two path patterns (a->(b), (a->(c)) which have a common vertex as shown:

```

SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person WHERE a.name = 'John') -> (b IS person),(a IS person WHERE
a.name = 'John') -> (c IS university)
COLUMNS (a.name AS person_a, b.name AS person_b,c.name as university)
);

```

The preceding code produces the following output:

PERSON_A	PERSON_B	UNIVERSITY
John	Bob	ABC

Example 6-10 Query Using Disjoint Path Patterns

The following example shows a query containing two disjoint path patterns:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH (a IS person WHERE a.name='John') -[IS student_of]-> (b IS university),
(x IS person) -[IS friends]-> (y IS person)
COLUMNS (a.name AS a, b.name as university, x.name AS x, y.name as y)
);
```

The resulting output is as shown:

A	UNIVERSITY	X	Y
John	ABC	Mary	John
John	ABC	Bob	Mary
John	ABC	John	Bob
John	ABC	Mary	Alice

Example 6-11 Query Using Cyclic Path Patterns

The following example uses a cyclic path pattern (`MATCH (a)-[]->(b)-[]->(c)-[]->(a)`) as shown. Note that the example uses the same vertex pattern variable name `a` (which is bound to `person`) twice. Thus, this finds cycles in the graph containing three edges that finally bind to `a` itself.

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person) -[IS friends]-> (b IS person) -[IS friends]->
(c IS person) -[IS friends]-> (a)
COLUMNS (a.name AS person_a, b.name AS person_b, c.name AS person_c)
);
```

The preceding code produces the following output:

PERSON_A	PERSON_B	PERSON_C
Bob	Mary	John
John	Bob	Mary
Mary	John	Bob

Example 6-12 Query Using Label Disjunction

The following example uses label disjunction in the vertex label expression:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a is person|university)
COLUMNS (a.name, a.dob)
);
```

The code produces the following output:

NAME	DOB
John	13-JUN-63
Mary	25-SEP-82
Bob	11-MAR-66
Alice	01-FEB-87
ABC	NULL
XYZ	NULL

6 rows selected.

Example 6-13 Query Using Label Conjunction

The following example uses label conjunction in the vertex label expression:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person), (a IS person_ht)
COLUMNS (a.name as name, a.dob as dob, a.height as height )
);
```

The code produces the following output:

NAME	DOB	HEIGHT
John	13-JUN-63	1.8
Mary	25-SEP-82	1.65
Bob	11-MAR-66	1.75
Alice	01-FEB-87	1.7

Example 6-14 Query Using IS LABELED Predicate

```
FRIENDSSTUDENT_OFBobIDNAMEpersonuniversityIS LABELEDPERSON_IDID
```

```
SELECT *
FROM GRAPH_TABLE ( students_graph
MATCH (p1 IS person) -[IS friends|student_of]-> (x IS person|
university)
WHERE p1.name = 'Bob'
COLUMNS (CASE
WHEN x IS LABELED person THEN 'PERSON'
ELSE 'UNIVERSITY'
END AS label,
CASE
WHEN x IS LABELED person THEN x.person_id
ELSE x.id
END AS id,
x.name))
ORDER BY label, id;
```

The query returns the following output:

LABEL	ID	NAME
PERSON	2	Mary
UNIVERSITY	1	ABC

Example 6-15 Query Using PROPERTY_EXISTS Predicate

```
PERSONUNIVERSITYDOBHEIGHTNAMEID
```

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (x IS person|university)
    COLUMNS (CASE
        WHEN x IS LABELED person THEN 'PERSON'
        ELSE 'UNIVERSITY'
    END AS label,
    PROPERTY_EXISTS(x, dob) AS has_dob,
    PROPERTY_EXISTS(x, height) AS has_height,
    PROPERTY_EXISTS(x, name) AS has_name,
    PROPERTY_EXISTS(x, id) AS has_id))
GROUP BY label, has_dob, has_height, has_name, has_id
ORDER BY label;
```

The query returns the following output:

LABEL	HAS_DOB	HAS_HEIGHT	HAS_NAME	HAS_ID
PERSON	TRUE	TRUE	TRUE	FALSE
UNIVERSITY	FALSE	FALSE	TRUE	TRUE

Example 6-16 Queries Using Recursive Path Patterns with Bounded Quantifiers

The following example uses a recursive path pattern to retrieve all friends within two hops:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH (a is person WHERE a.name='Mary') -[is friends]->{2} (b is person)
COLUMNS (a.name AS a , b.name AS b)
);
```

The preceding code produces the following output:

A	B
Mary	Bob

The following example uses a recursive path pattern to retrieve all friends between one and two hops (inclusive):

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH (a is person WHERE a.name='Mary') -[is friends]->{1, 2} (b is person)
```

```
COLUMNS (a.name AS a , b.name AS b)
);
```

The preceding code produces the following output:

A	B
Mary	Alice
Mary	John
Mary	Bob

The following example uses a recursive path pattern to retrieve all friends by performing from zero to two iterations:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH (a IS person WHERE a.name='Mary') -[is friends]->{,2} (b IS person)
COLUMNS (a.name AS a , b.name AS b)
);
```

The preceding code produces the following output:

A	B
Mary	Mary
Mary	Alice
Mary	John
Mary	Bob

Note that in the first line of the preceding output, `Mary` is bound to both the element pattern variables, `a` and `b`. This is because the query includes a zero hop iteration and therefore, the vertex pattern to the left and the vertex pattern to the right must bind to the same graph element.

Example 6-17 Queries Using Aggregations

The following example finds all paths that have a length between two and three edges (`{2,3}`), starting from a person named `John` and following only outgoing edges labeled `friends` and vertices labeled `person`. Vertices along paths should not have the same `person_id` as `John` (`WHERE p.person_id <> friend.person_id`). The example uses the following four aggregates in the `COLUMNS` clause:

- **LISTAGG**: The first one creates a comma-separated list of the person names along the path and the second one creates a comma-separated list of the person ages along the path.
- **AVG**: This computes the average age of the person group in a path.
- **COUNT**: This computes the length of each path.

```
SQL> SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (p IS person) (-[e IS friends]-> (friend IS person)
WHERE p.person_id <> friend.person_id){2,3}
WHERE p.name = 'John'
COLUMNS (LISTAGG(friend.name, ',') as fnames,
LISTAGG(EXTRACT(YEAR from SYSDATE) - EXTRACT(YEAR from friend.dob),
',') AS age_list,
```

```

        AVG(EXTRACT(YEAR from SYSDATE) - EXTRACT(YEAR from friend.dob)) AS
avg_age_group,
        COUNT(e.friendship_id) AS path));

```

The preceding code produces the following output:

FNAMES	AGE_LIST	AVG_AGE_GROUP	PATH
Bob,Mary	57,41	49.00	2
Bob,Mary,Alice	57,41,36	44.67	3

The following example finds all paths between university ABC and university XYZ such that paths have a length of up to three edges ($\{,3\}$). For each path, a JSON array is returned such that the array contains the `friendship_id` value for edges labeled `friends`, and the `subject` value for edges labeled `student_of`. Note that the `friendship_id` property is casted to `VARCHAR(100)` to make it type-compatible with the `subject` property.

```

SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (u1 IS university) -[e]-{,3} (u2 IS university)
WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
COLUMNS (JSON_ARRAYAGG(CASE WHEN e.subject IS NOT NULL THEN
e.subject
                        ELSE CAST(e.friendship_id AS VARCHAR(100)) END) AS
path));

```

The preceding code produces the following output:

```

PATH
-----
["Arts","3","Math"]
["Music","4","Math"]

```

Using `binding_count()` Aggregate:

The following example finds all paths that have a length between two and three edges ($\{2,3\}$), starting from a person named John and following only outgoing edges labeled `friends` and vertices labeled `person`. The example uses the `binding_count` aggregate to count the number of bindings on the `friend` element variable in the `COLUMNS` clause:

```

SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (p IS person) (-[e IS friends]-> (friend IS person)
WHERE p.person_id <> friend.person_id){2,3}
WHERE p.name = 'John'
COLUMNS (LISTAGG(friend.name, ',') AS friends,
binding_count(friend) AS cnt,
LISTAGG(EXTRACT(YEAR from SYSDATE) - EXTRACT(YEAR from friend.dob),
',') AS age_list,
COUNT(e.friendship_id) AS path));

```

The preceding code produces the following output:

FRIENDS	CNT	AGE_LIST	PATH
-----	----	-----	----

Bob,Mary	2 58,42	2
Bob,Mary,Alice	3 58,42,37	3

Example 6-18 Query Using ONE ROW PER MATCH Clause

The following example query uses `ONE ROW PER MATCH` and finds all friends path with length between 0 and 3 starting from a person named *John*.

```
SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (n1 IS person) -[e1 IS friends]->{0,3} (n2 IS person)
WHERE n1.name = 'John'
ONE ROW PER MATCH
COLUMNS (LISTAGG(e1.friendship_id, ', ') AS friendship_ids, n2.name)
);
```

The example shows the following output from five paths that were matched, and the corresponding name of the person in that specific path. Note that the empty path (zero friendship_ids) is bound to a single person named *John*.

FRIENDSHIP_IDS	NAME
-----	-----
	John
1	Bob
1, 4	Mary
1, 4, 2	Alice
1, 4, 3	John

Example 6-19 Query Using ONE ROW PER VERTEX Clause

The following example query uses `ONE ROW PER VERTEX` and finds all friends path with length between 0 and 3 starting from a person named *John*. The query outputs one row per vertex.

```
SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (n IS person) -[e1 IS friends]->{0,3} (IS person)
WHERE n.name = 'John'
ONE ROW PER VERTEX (v)
COLUMNS (LISTAGG(e1.friendship_id, ', ') AS friendship_ids,
           v.name)
);
```

The example produces the following output:

FRIENDSHIP_IDS	NAME
-----	-----
	John
1	John
1	Bob
1, 4	John
1, 4	Bob
1, 4	Mary
1, 4, 2	John
1, 4, 2	Bob
1, 4, 2	Mary
1, 4, 2	Alice

```

1, 4, 3      John
1, 4, 3      Bob
1, 4, 3      Mary
1, 4, 3      John

```

14 rows selected.

The preceding output shows data from five paths that were matched:

- The empty path (zero `friendship_ids`) contains a single person (*John*).
- The path with `friendship_ids 1` contains two persons (*John* and *Bob*).
- The path with `friendship_ids 1, 4` contains three persons (*John*, *Bob*, and *Mary*).
- The path with `friendship_ids 1, 4, 2` contains four persons (*John*, *Bob*, *Mary*, and *Alice*).
- The path with `friendship_ids 1, 4, 3` contains four persons and this forms a cycle (*John*, *Bob*, *Mary*, and *John*).

The following example query matches paths between universities ABC and XYZ such that the paths consist of an incoming `student_of` edge, followed by one or two `friends` edges, and finally followed by an outgoing `student_of` edge. The query returns one row per vertex and for each row it returns the match number, the element number, the type of the vertex (either person or university), as well as the name of the university or the person.

```

SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (u1 IS university)
        <-[IS student_of]- (p1 IS person)
        -[IS friends]-{1,2} (p2 IS person)
        -[IS student_of]-> (u2 IS university)
    WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
    ONE ROW PER VERTEX (v)
    COLUMNS (MATCHNUM() AS matchnum,
        ELEMENT_NUMBER(v) AS element_number,
        CASE WHEN v.person_id IS NOT NULL
            THEN 'person'
            ELSE 'university'
        END AS label,
        v.name))
ORDER BY matchnum, element_number;

```

The example produces the following output. Note that a total of 6 paths were matched with match numbers 1, 2, 3, 4, 6 and 8. Each path has university ABC as the first vertex and university XYZ as the last vertex. Furthermore, paths with match numbers 1 and 3 contain two person vertices while the other paths (match numbers 2, 4, 6 and 8) contain three person vertices.

MATCHNUM	ELEMENT_NUMBER	LABEL	NAME
1	1	university	ABC
1	3	person	John
1	5	person	Mary
1	7	university	XYZ
2	1	university	ABC
2	3	person	Bob

2	5 person	John
2	7 person	Mary
2	9 university	XYZ
3	1 university	ABC
3	3 person	Bob
3	5 person	Mary
3	7 university	XYZ
4	1 university	ABC
4	3 person	John
4	5 person	Mary
4	7 person	Alice
4	9 university	XYZ
6	1 university	ABC
6	3 person	John
6	5 person	Bob
6	7 person	Mary
6	9 university	XYZ
8	1 university	ABC
8	3 person	Bob
8	5 person	Mary
8	7 person	Alice
8	9 university	XYZ

28 rows selected.

Example 6-20 Query Using ONE ROW PER STEP Clause

The following example query uses `ONE ROW PER STEP` and finds all friends path with length between 0 and 3 starting from a person named *John*. The query outputs one row per step.

```
SELECT * FROM GRAPH_TABLE ( students_graph
MATCH (n IS person) -[e1 IS friends]->{0,3} (IS person)
WHERE n.name = 'John'
ONE ROW PER STEP (src, e2, dst)
COLUMNS (LISTAGG(e1.friendship_id, ', ') AS friendship_ids,
           src.name AS src_name,
           e2.friendship_id,
           dst.name AS dst_name)
);
```

The example produced the following output:

FRIENDSHIP_IDS	SRC_NAME	FRIENDSHIP_ID	DST_NAME
	John		
1	John	1	Bob
1, 4	John	1	Bob
1, 4	Bob	4	Mary
1, 4, 2	John	1	Bob
1, 4, 2	Bob	4	Mary
1, 4, 2	Mary	2	Alice
1, 4, 3	John	1	Bob
1, 4, 3	Bob	4	Mary
1, 4, 3	Mary	3	John

10 rows selected.

The preceding output shows data from five paths that were matched:

- The empty path (zero `friendship_ids`) has a single step in which iterator vertex variable `src` is bound to the vertex corresponding to the person named *John*, while iterator edge variable `e2` and iterator vertex variable `dst` are not bound, resulting in NULL values for `FRIENDSHIP_IDS` and `DST_NAME`.
- The path with `friendship_ids 1` has a single step since it has a single edge. In this step, iterator vertex variable `src` is bound to the vertex corresponding to *John*, iterator edge variable `e2` is bound to the edge with `friendship_id 1`, and iterator vertex variable `dst` is bound to the vertex corresponding to *Bob*.
- The path with `friendship_ids 1, 4` has two steps since it has two edges.
- The path with `friendship_ids 1, 4, 3` has three steps since it has three edges.
- The path with `friendship_ids 1, 4, 2` again has three steps since it has three edges.

Example 6-21 Query Using `IN` Path Clause within `ONE ROW PER VERTEX`

The following query matches paths between universities ABC and XYZ, and contains three path patterns. The first path pattern matches an incoming `student_of` edge, the second path pattern match one or two `friends` edges, and the third path pattern matches again a `student_of` edge. The query returns one row per vertex in the second path. This path contains only person vertices. For each vertex, the query returns the match number, the path name, the element number, and all the vertex properties.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH path1 = (u1 IS university) <-[IS student_of]- (p1 IS person),
        path2 = (p1) -[IS friends]-{1,2} (p2 IS person),
        path3 = (p2) -[IS student_of]-> (u2 IS university)
    WHERE u1.name = 'ABC' AND u2.name = 'XYZ'
    ONE ROW PER VERTEX (v) IN (path2)
    COLUMNS (MATCHNUM() AS matchnum,
        PATH_NAME() AS path_name,
        ELEMENT_NUMBER(v) AS element_number,
        v.*))
ORDER BY matchnum, element_number
```

The preceding query output is as follows:

MATCHNUM	PATH_NAME	ELEMENT_NUMBER	PERSON_ID	NAME	DOB	HEIGHT	ID
1	PATH2	1	1	John	13-JUN-63	1.8	
1	PATH2	3	2	Mary	25-SEP-82	1.65	
2	PATH2	1	3	Bob	11-MAR-66	1.75	
2	PATH2	3	1	John	13-JUN-63	1.8	
2	PATH2	5	2	Mary	25-SEP-82	1.65	
3	PATH2	1	3	Bob	11-MAR-66	1.75	
3	PATH2	3	2	Mary	25-SEP-82	1.65	
4	PATH2	1	1	John	13-JUN-63	1.8	
4	PATH2	3	2	Mary	25-SEP-82	1.65	
4	PATH2	5	4	Alice	01-FEB-87	1.7	

6 PATH2	1	1 John	13-JUN-63	1.8
6 PATH2	3	3 Bob	11-MAR-66	1.75
6 PATH2	5	2 Mary	25-SEP-82	1.65
8 PATH2	1	3 Bob	11-MAR-66	1.75
8 PATH2	3	2 Mary	25-SEP-82	1.65
8 PATH2	5	4 Alice	01-FEB-87	1.7

As seen in the preceding output, a total of 6 paths are matched with match numbers 1, 2, 3, 4, 6 and 8. Paths with match numbers 1 and 3 contain two `person` vertices while the other paths (match numbers 2, 4, 6 and 8) contain three `person` vertices. The all properties reference `v.*` expands to properties `PERSON_ID`, `NAME`, `DOB`, `HEIGHT` and `ID`. Thus, even though `person` vertices do not have property `ID` (only `university` vertices do), the expansion still includes property `ID` because an all properties reference with an iterator variable always expands to either all vertex properties or all edge properties in the graph based on the iterator variable type.

Example 6-22 Query Using MATCHNUM Function

The following query finds paths connecting John and Mary either directly or indirectly through a common friend. For each match, the query returns one row per vertex, which means one row per person along the friendship path. Each result contains a match number, the element number of the `person` vertex, and the name of the `person`.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[IS friends]-{1,2} (p2 IS person)
    WHERE p1.name = 'John' AND p2.name = 'Mary'
    ONE ROW PER VERTEX (v)
    COLUMNS (MATCHNUM() AS matchnum,
        ELEMENT_NUMBER(v) AS element_number,
        v.name))
ORDER BY matchnum, element_number
```

The output for the preceding query is as shown:

MATCHNUM	ELEMENT_NUMBER	NAME
1	1	John
1	3	Mary
2	1	John
2	3	Bob
2	5	Mary

Example 6-23 Query Using ELEMENT_NUMBER Function

The following query finds paths connecting John and Mary either directly or indirectly through a common friend. For each match, the query returns one row per step. Each result contains a match number, the element number of the `friends` edge in the step, the `friendship_id`, and the names of the two persons in the step.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[IS friends]-{1,2} (p2 IS person)
    WHERE p1.name = 'John' AND p2.name = 'Mary'
    ONE ROW PER STEP (v1, e, v2)
```

```

        COLUMNS (MATCHNUM() AS matchnum,
                  ELEMENT_NUMBER(e) AS element_number,
                  v1.name AS name1,
                  e.friendship_id,
                  v2.name AS name2))
ORDER BY matchnum, element_number;

```

The output for the preceding query is as shown:

MATCHNUM	ELEMENT_NUMBER	NAME1	FRIENDSHIP_ID	NAME2
1		John		
2	2	John	1	Bob
2	4	Bob	3	Mary

The following query finds all people connected to John through 0 or 1 `friends` edges. For each match, the query returns one row per step. Each result contains a match number, the element number of the `friends` edge in the step, the `friendship_id`, and the names of the two persons in the step.

```

SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[IS friends]-{0,1} (p2 IS person)
    WHERE p1.name = 'John'
    ONE ROW PER STEP (v1, e, v2)
    COLUMNS (MATCHNUM() AS matchnum,
              ELEMENT_NUMBER(e) AS element_number,
              v1.name AS name1,
              e.friendship_id,
              v2.name AS name2))
ORDER BY matchnum, element_number;

```

The query produced the following output:

MATCHNUM	ELEMENT_NUMBER	NAME1	FRIENDSHIP_ID	NAME2
1		John		
2	2	John	3	Mary
4	2	John	1	Bob

As seen in the preceding output, three paths were matched. The path with match number 1 has one vertex and zero edges. Thus, there is a single step in which the iterator vertex variable `v1` is bound but the iterator edge variable `e` and iterator vertex variable `v2` are not bound, leading to the `NULL` values in the `ELEMENT_NUMBER`, `FRIENDSHIP_ID`, and `NAME2` columns. The other two paths (with match numbers 2 and 4) also have a single step, but since these paths do contain an edge as well as a second vertex, all three iterator variables are bound, and no `NULL` values are returned.

Example 6-24 Query Using `PATH_NAME` Function

The following query finds `friends` of `friends` of *Bob* and the universities they attend. The graph pattern is split into two path patterns named `PATH1` and `PATH2`. For each match, `PATH1` always matches 3 vertices while `PATH2` always matches 2 vertices. Therefore, since the query specifies `ONE ROW PER VERTEX`, a total of 5 rows are returned for each match. Each row

includes the match number, the path name, the element number and the `NAME` property of the vertices.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH path1 = (p1 IS person) -[IS friends]-{2} (p2 IS person),
        path2 = (p2) -[IS student_of]-> (u2 IS university)
    WHERE p1.name = 'Bob'
    ONE ROW PER VERTEX (v)
    COLUMNS (MATCHNUM() AS matchnum,
        PATH_NAME() AS path_name,
        ELEMENT_NUMBER(v) AS element_number,
        v.name))
ORDER BY matchnum, path_name, element_number;
```

The preceding query output is as follows:

MATCHNUM	PATH_NAME	ELEMENT_NUMBER	NAME
1	PATH1	1	Bob
1	PATH1	3	John
1	PATH1	5	Mary
1	PATH2	1	Mary
1	PATH2	3	XYZ
2	PATH1	1	Bob
2	PATH1	3	John
2	PATH1	5	Bob
2	PATH2	1	Bob
2	PATH2	3	ABC
3	PATH1	1	Bob
3	PATH1	3	Mary
3	PATH1	5	Bob
3	PATH2	1	Bob
3	PATH2	3	ABC
4	PATH1	1	Bob
4	PATH1	3	Mary
4	PATH1	5	John
4	PATH2	1	John
4	PATH2	3	ABC
5	PATH1	1	Bob
5	PATH1	3	Mary
5	PATH1	5	Alice
5	PATH2	1	Alice
5	PATH2	3	XYZ

Example 6-25 Query Using Bind Variables

The example declares a bind variable, `name` and assigns a value as shown:

```
SQL> variable name VARCHAR2(10);
SQL> BEGIN
  2  :name := 'Bob';
  3  END;
  4  /
```

PL/SQL procedure successfully completed.

Using this bind variable, the following query is performed:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person) -[e IS friends]-> (b IS person WHERE b.name=:name)
WHERE a.name='John'
COLUMNS (a.name AS person_a,
          b.name AS person_b,
          e.meeting_date AS met_on)
);
```

The code produces the following output:

A	B	MET_ON
John	Bob	01-SEP-00

Example 6-26 Query Invoking a PL/SQL function Inside an Expression and in the COLUMNS Clause

The example declares a user defined function(UDF) as shown:

```
CREATE OR REPLACE FUNCTION get_age(
    id NUMBER
)
RETURN NUMBER
AS
    age NUMBER := 0;
BEGIN
    -- get age
    SELECT (EXTRACT(YEAR from SYSDATE) - EXTRACT(YEAR from birthdate))
    INTO age
    FROM persons
    WHERE person_id=id;
    -- return age
    RETURN age;
END;
/
```

Function created.

The following query invokes the UDF inside an expression in the WHERE clause and again in the COLUMNS clause:

```
SELECT * FROM GRAPH_TABLE (students_graph
MATCH
(a IS person) -[e IS friends]-> (b IS person)
WHERE (get_age(a.person_id) > 50)
COLUMNS (a.name AS a,
          get_age(a.person_id) AS age,
          b.name AS b,
```

```

        e.meeting_date AS met_on)
    );

```

The code produces the following output:

A	AGE	B	MET_ON
John	60	Bob	01-SEP-00
Bob	57	Mary	10-JUL-01

Example 6-27 Query Using SCN

Determine the current SCN value of the database as shown:

```

SQL> SELECT TIMESTAMP_TO_SCN(SYSDATE) FROM DUAL;

TIMESTAMP_TO_SCN(SYSDATE)
-----
                2117789

```

The following query using the preceding SCN value as shown:

```

SELECT * FROM GRAPH_TABLE (students_graph AS OF SCN 2117789
MATCH
    (a IS person) -[e]-> (b IS person)
    COLUMNS (a.name AS a, b.name AS b, e.meeting_date AS met_on)
);

```

The query produces the following output:

A	B	MET_ON
Mary	John	19-SEP-00
Bob	Mary	10-JUL-01
John	Bob	01-SEP-00
Mary	Alice	19-SEP-00

Example 6-28 Query Using TIMESTAMP

The following query uses a TIMESTAMP value as shown:

```

SQL> SELECT * FROM GRAPH_TABLE (students_graph AS OF TIMESTAMP SYSTIMESTAMP
MATCH
    (a IS person WHERE a.name='John') -[e]-> (b IS person)
    COLUMNS (a.name AS a, b.name AS b, e.meeting_date AS met_on)
);

```

The query produces the following output:

A	B	MET_ON
John	Bob	01-SEP-00

Example 6-29 Query Using the VERTEX_ID and EDGE_ID Identifiers

```

SELECT * FROM GRAPH_TABLE (students_graph
MATCH
  (a IS person ) -[e IS friends]-> (b IS person)
COLUMNS (JSON_SERIALIZE(VERTEX_ID(a)) AS id_a , JSON_SERIALIZE(EDGE_ID(e)) AS
id_e)
);

```

The query produces a JSON data type output that includes the graph owner, graph name and graph element table name and the key value as shown:

ID_A	ID_E
{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 1 } }	{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "FRIENDS", "KEY_VALUE": { "FRIENDSHIP_ID": 1 } }
{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 2 } }	{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "FRIENDS", "KEY_VALUE": { "FRIENDSHIP_ID": 2 } }
{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 2 } }	{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "FRIENDS", "KEY_VALUE": { "FRIENDSHIP_ID": 3 } }
{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 3 } }	{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "FRIENDS", "KEY_VALUE": { "FRIENDSHIP_ID": 4 } }

Example 6-30 Query Using the VERTEX_EQUAL Predicate

```

SELECT * FROM GRAPH_TABLE (students_graph
MATCH
  (a IS person WHERE a.name='John') -[e IS friends]->{,1} (b IS person)
WHERE VERTEX_EQUAL(a,b)
COLUMNS (JSON_SERIALIZE(VERTEX_ID(a)) AS id_a , JSON_SERIALIZE(VERTEX_ID(b))
AS id_b)
);

```

The query produces a JSON data type output that includes the graph owner, graph name and graph element table name and the key value as shown:

ID_A	ID_B
{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 1 } }	{ "GRAPH_OWNER": "GRAPHUSER", "GRAPH_NAME": "STUDENTS_GRAPH", "ELEM_TABLE": "PERSONS", "KEY_VALUE": { "PERSON_ID": 1 } }

Example 6-31 Query Using the IS SOURCE OF and IS DESTINATION OF Predicates

The following query matches `FRIENDS` edges that are either incoming or outgoing from **Mary**. For each edge, it return the `NAME` property for the source of the edge as well as the `NAME` property for the destination of the edge.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[e IS friends]- (p2 IS person)
    WHERE p1.name = 'Mary'
    COLUMNS (e.friendship_id,
              e.meeting_date,
              CASE WHEN p1 IS SOURCE OF e THEN p1.name ELSE p2.name END AS
from_person,
              CASE WHEN p1 IS DESTINATION OF e THEN p1.name ELSE p2.name
END AS to_person))
ORDER BY friendship_id;
```

FRIENDSHIP_ID	MEETING_DATE	FROM_PERSON	TO_PERSON
2	19-SEP-00	Mary	Alice
3	19-SEP-00	Mary	John
4	10-JUL-01	Bob	Mary

Example 6-32 Queries Fetching All the Vertex and Edge Properties

The following query matches all `FRIENDS` edges between two persons `P1` and `P2` and uses *all properties references* `P1.*` and `E.*` to retrieve all the properties of vertex `P1` as well as all properties of edge `E`.

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[e IS friends]-> (p2 IS person)
    COLUMNS ( p1.*, p2.name AS p2_name, e.* )
)
ORDER BY 1, 2, 3, 4, 5;
```

Note that the following result for `P1.*` includes properties `PERSON_ID`, `NAME` and `DOB` of label `PERSON` as well as property `HEIGHT` of label `PERSON_HT`. Furthermore, the result for `E.*` includes properties `FRIENDSHIP_ID` and `MEETING_DATE` of label `FRIENDS`.

PERSON_ID	NAME	DOB	HEIGHT	P2_NAME	FRIENDSHIP_ID	MEETING_D
1	John	13-JUN-63	1.8	Bob	1	01-SEP-00
2	Mary	25-SEP-82	1.65	Alice	2	19-SEP-00
2	Mary	25-SEP-82	1.65	John	3	19-SEP-00
3	Bob	11-MAR-66	1.75	Mary	4	10-JUL-01

The following query matches all vertices in the graph and retrieves all their properties:

```
SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (v)
```

```

    COLUMNS ( v.* )
)
ORDER BY 1, 2, 3, 4, 5;

```

The query produces the following result. Note that since the `PERSON` vertices do not have an `ID` property, the query returns `NULL` values (empty strings). Similarly, `UNIVERSITY` vertices do not have `PERSON_ID`, `DOB` and `HEIGHT` properties, and so again the query returns `NULL` values (empty strings).

PERSON_ID	NAME	DOB	HEIGHT	ID
1	John	13-JUN-63	1.8	
2	Mary	25-SEP-82	1.65	
3	Bob	11-MAR-66	1.75	
4	Alice	01-FEB-87	1.7	
	ABC			1
	XYZ			2

6 rows selected.

Example 6-33 Query Using the `IS SOURCE OF` and `IS DESTINATION OF` Predicates

The following query matches `FRIENDS` edges that are either incoming or outgoing from *Mary*. For each edge, it returns the *NAME* property for the source of the edge as well as the *NAME* property for the destination of the edge.

```

SELECT *
FROM GRAPH_TABLE ( students_graph
    MATCH (p1 IS person) -[e IS friends]- (p2 IS person)
    WHERE p1.name = 'Mary'
    COLUMNS (e.friendship_id,
              e.meeting_date,
              CASE WHEN p1 IS SOURCE OF e THEN p1.name ELSE p2.name END AS
from_person,
              CASE WHEN p1 IS DESTINATION OF e THEN p1.name ELSE p2.name
END AS to_person))
ORDER BY friendship_id;

```

FRIENDSHIP_ID	MEETING_DATE	FROM_PERSON	TO_PERSON
2	19-SEP-00	Mary	Alice
3	19-SEP-00	Mary	John
4	10-JUL-01	Bob	Mary

- [Setting Up Sample Data in the Database](#)

6.11.1 Setting Up Sample Data in the Database

In order to create the SQL property graph, `students_graph`, shown in [Creating a SQL Property Graph](#), the following sample tables with data need to be set up in the database.

1. Connect to the database as the schema user.

2. Run the following SQL script to create the university, persons, students, and friendships tables with sample data in the database.

```

CREATE TABLE university (
    id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT BY 1),
    name VARCHAR2(10),
    CONSTRAINT u_pk PRIMARY KEY (id));

INSERT INTO university (name) VALUES ('ABC');
INSERT INTO university (name) VALUES ('XYZ');

CREATE TABLE persons (
    person_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT
    BY 1),
    name VARCHAR2(10),
    birthdate DATE,
    height FLOAT DEFAULT ON NULL 0,
    hr_data JSON,
    CONSTRAINT person_pk PRIMARY KEY (person_id)
);

INSERT INTO persons (name, height, birthdate, hr_data)
VALUES ('John', 1.80, to_date('13/06/1963', 'DD/MM/YYYY'),
'{"department":"IT","role":"Software Developer"}');

INSERT INTO persons (name, height, birthdate, hr_data)
VALUES ('Mary', 1.65, to_date('25/09/1982', 'DD/MM/YYYY'),
'{"department":"HR","role":"HR Manager"}');

INSERT INTO persons (name, height, birthdate, hr_data)
VALUES ('Bob', 1.75, to_date('11/03/1966', 'DD/MM/YYYY'),
'{"department":"IT","role":"Technical Consultant"}');

INSERT INTO persons (name, height, birthdate, hr_data)
VALUES ('Alice', 1.70, to_date('01/02/1987', 'DD/MM/YYYY'),
'{"department":"HR","role":"HR Assistant"}');

CREATE TABLE student_of (
    s_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT BY
    1),
    s_univ_id NUMBER,
    s_person_id NUMBER,
    subject VARCHAR2(10),
    CONSTRAINT stud_pk PRIMARY KEY (s_id),
    CONSTRAINT stud_fk_person FOREIGN KEY (s_person_id) REFERENCES
persons(person_id),
    CONSTRAINT stud_fk_univ FOREIGN KEY (s_univ_id) REFERENCES
university(id)
);

INSERT INTO student_of(s_univ_id, s_person_id,subject) VALUES (1,1,'Arts');
INSERT INTO student_of(s_univ_id, s_person_id,subject) VALUES
(1,3,'Music');
INSERT INTO student_of(s_univ_id, s_person_id,subject) VALUES (2,2,'Math');
INSERT INTO student_of(s_univ_id, s_person_id,subject) VALUES
(2,4,'Science');

```

```

CREATE TABLE friends (
    friendship_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1
INCREMENT BY 1),
    person_a NUMBER,
    person_b NUMBER,
    meeting_date DATE,
    CONSTRAINT fk_person_a_id FOREIGN KEY (person_a) REFERENCES
persons(person_id),
    CONSTRAINT fk_person_b_id FOREIGN KEY (person_b) REFERENCES
persons(person_id),
    CONSTRAINT fs_pk PRIMARY KEY (friendship_id)
);

INSERT INTO friends (person_a, person_b, meeting_date) VALUES (1, 3,
to_date('01/09/2000', 'DD/MM/YYYY'));
INSERT INTO friends (person_a, person_b, meeting_date) VALUES (2, 4,
to_date('19/09/2000', 'DD/MM/YYYY'));
INSERT INTO friends (person_a, person_b, meeting_date) VALUES (2, 1,
to_date('19/09/2000', 'DD/MM/YYYY'));
INSERT INTO friends (person_a, person_b, meeting_date) VALUES (3, 2,
to_date('10/07/2001', 'DD/MM/YYYY'));

```

6.12 Supported Features and Limitations for Querying a SQL Property Graph

This section provides the list of supported and unsupported features for querying a SQL Property Graph.

Supported Features

- Single label, no label, label disjunction and label conjunction are supported in label expressions inside a graph pattern. For more information, see:
 - [Table 6-2](#) in [Label Expressions](#)
 - [Examples for SQL Graph Queries](#)
- Any directed edge patterns (`MATCH (a)-[e]-(b)`) are supported. See [Example 6-7](#).
- Anonymous vertex (`MATCH ()-[e]->()`) and edge (`MATCH (a)-[]->(b)`) variables are supported. See [Example 6-8](#).
- Complex path pattern queries are supported. See [Example 6-9](#), [Example 6-10](#) and [Example 6-11](#).
- Bounded recursive path pattern queries are supported. See [Example 6-16](#).
- Bind variables are supported inside a `WHERE` clause. See [Example 6-25](#).
- `VERTEX_ID` and `EDGE_ID` functions that uniquely identify a vertex and an edge respectively can be used within a SQL graph query.
 - See [Vertex and Edge Identifiers](#).

- See [Example 6-29](#).
- VERTEX_EQUAL and EDGE_EQUAL predicates for matching vertex and edge identifiers are supported.
 - See [Vertex and Edge Identifiers](#).
 - See [Example 6-30](#).
- SQL and JSON expressions are supported inside WHERE and COLUMNS clauses. See [Example 5-7](#).
- JSON simplified syntax is supported to access properties of type JSON. See [Example 5-7](#).
- PL/SQL functions are supported inside a WHERE or COLUMNS clause. See [Example 6-26](#).
- Single line and multi-line comments are supported within a graph query.
- All identifiers within the GRAPH_TABLE operator in a SQL graph query, such as graph names, alias names, graph element pattern variable names, labels and property names follow the standard SQL rules about case sensitivity:
 - Identifiers within double quotes are case sensitive.
 - Identifiers not enclosed in double quotes are implicitly converted to uppercase and enclosed in double quotes.
- SQL hints are supported inside and outside the SQL graph query for tuning. See [Tuning SQL Property Graph Queries](#) for more information.
- You can query a graph defined in another schema if you have the required privileges. See [Granting System and Object Privileges for SQL Property Graphs](#) for more information.

Limitations

- Variable-length pattern matching goals (such as ANY, ALL, ALL SHORTEST, ANY CHEAPEST, and so on) are not supported.
- Path pattern variables (MATCH p = (n)-[e]->(m)) are not supported.
- Clauses such as COST and TOTAL_COST are not supported.
- Inline subqueries and LATERAL inline views are not supported.
- SQL Macros are not supported.

6.13 Tuning SQL Property Graph Queries

You can tune a SQL graph query using the EXPLAIN PLAN statement.

The GRAPH_TABLE operator with the property graph is internally translated into equivalent SQL. You can therefore generate the EXPLAIN PLAN for the property graph query as shown:

```
SQL> EXPLAIN PLAN FOR SELECT * FROM GRAPH_TABLE (students_graph
MATCH (a is person)-[e is friends]-> (b is person)
COLUMNS (a.name AS a , b.name AS b)
);
Explained.
```

The EXPLAIN PLAN can be viewed as shown:

```
SQL> SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY(format=>'ALL'));
```

Plan hash value: 1420380663

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	
Time						

0	SELECT STATEMENT		4	264	10	(10)
00:00:01						
* 1	HASH JOIN		4	264	10	(10)
00:00:01						
* 2	HASH JOIN		4	184	7	(15)
00:00:01						
3	TABLE ACCESS FULL	PERSONS	4	80	3	(0)
00:00:01						
4	TABLE ACCESS FULL	FRIENDSHIPS	4	104	3	(0)
00:00:01						
5	TABLE ACCESS FULL	PERSONS	4	80	3	(0)
00:00:01						

Query Block Name / Object Alias (identified by operation id):

```
-----
1 - SEL$B92C7F25
3 - SEL$B92C7F25 / "A"@SEL$213F43E5"
4 - SEL$B92C7F25 / "E"@SEL$213F43E5"
5 - SEL$B92C7F25 / "B"@SEL$213F43E5"
```

You can tune the preceding query by using optimizer hints. For instance, the following example uses the `PARALLEL` hint and the hint usage can be seen in the following execution plan:

```
SQL> EXPLAIN PLAN FOR SELECT /*+ PARALLEL(4) */ * FROM GRAPH_TABLE
(students_graph
MATCH (a is person)-[e is friends]-> (b is person)
COLUMNS (a.name AS a , b.name AS b)
);
Explained.
```

```
SQL> SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY(format=>'ALL'));
```

Plan hash value: 1486901074

Id	Operation	Name	Rows	Bytes	Cost	
(%CPU)	Time	TQ	IN-OUT	PQ Distrib		

0	SELECT STATEMENT		4	264		
4 (0)	00:00:01					
1	PX COORDINATOR					

```

|      |      |      |      |      |      |      |
| 2 | PX SEND QC (RANDOM) | :TQ10000 | 4 | 264 |

```

-----
- PARALLEL(4)

```

Note

```

-----
- dynamic statistics used: dynamic sampling (level=2)
- Degree of Parallelism is 4 because of hint

```

6.14 Type Compatibility Rules for Determining Property Types

When using shared property names that are union compatible, the property type is determined by certain type compatibility rules.

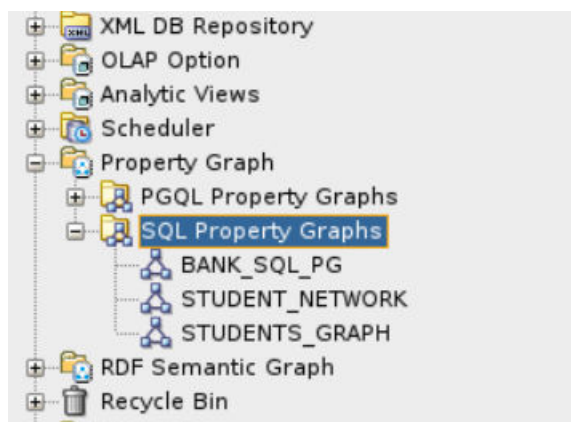

The following summarizes the rules for determining the type of a property for union compatible properties at the time of DDL creation and also during query compilation:

- If expressions exposed by a same property of a shared label are character data, then the data type of the property is determined as follows:
 - If all expressions are of data type `CHAR` of equal length, then the property has a data type `CHAR` of that length. If the expression are all of data type `CHAR`, but with different lengths, then the property type is `VARCHAR2` with the length of the larger `CHAR` type.
 - If any, or all of the expressions are of data type `VARCHAR2`, then the property has data type `VARCHAR2`. The length of the `VARCHAR2` is the maximum length size of the input columns.
- If expressions exposed by a same property of a shared label are numeric data, then the data type of the property is determined by numeric precedence:
 - If any expression exposed by a property is of data type `BINARY DOUBLE`, then the property has the data type `BINARY DOUBLE`.
 - If no expression defining the property are of data type `BINARY DOUBLE`, but any expression is of type `BINARY FLOAT`, then the property has data type `BINARY FLOAT`.
 - If all expressions defining the property are of data type `NUMBER`, then the property has data type `NUMBER`.
- If expressions exposed by a same property of a shared label are date and timestamp data, then the data type of the property is determined as follows:
 - If all expressions are of data type `DATE`, then property has data type `DATE`.
 - If any, or all of the expressions are of data type `TIMESTAMP`, then the property has data type `TIMESTAMP`.

6.15 Viewing and Querying SQL Property Graphs Using SQL Developer

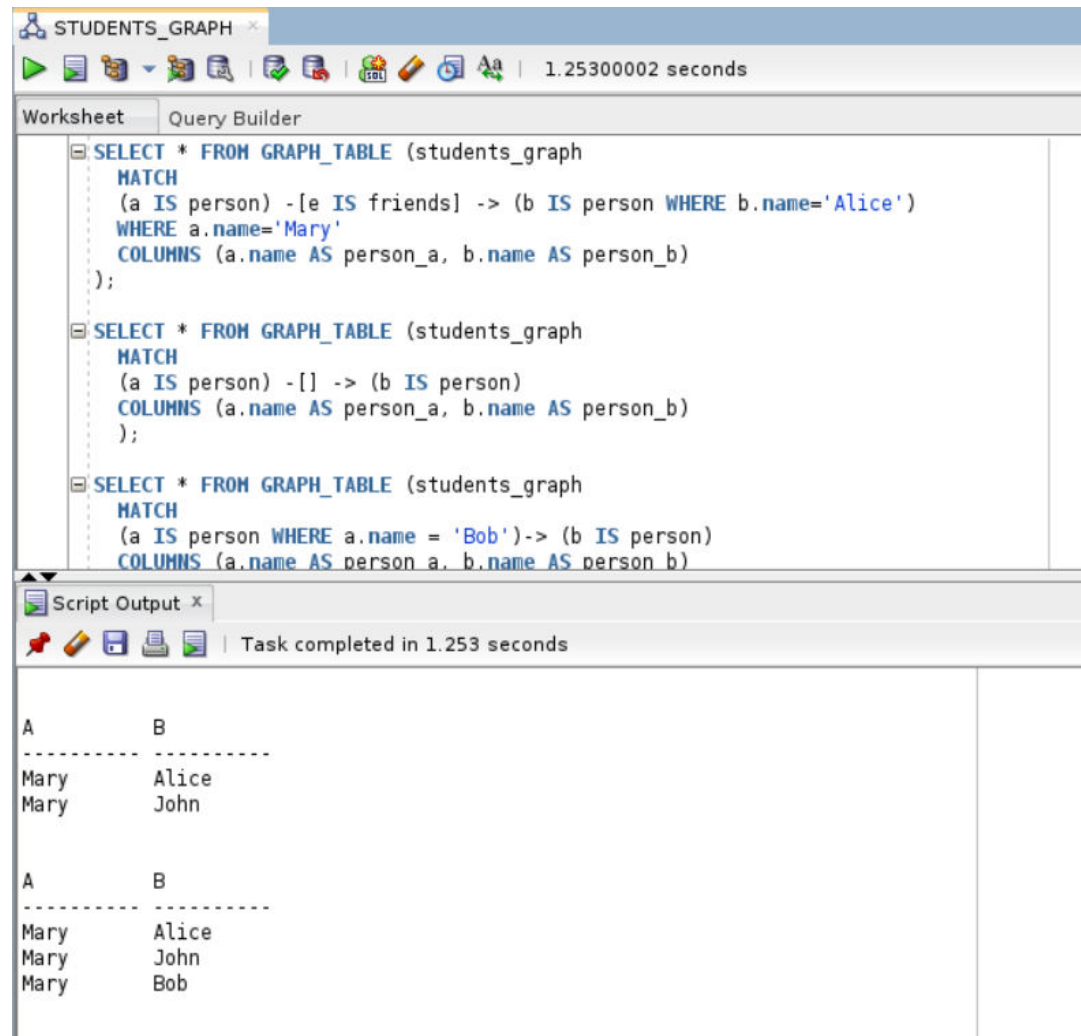

Using SQL Developer 23.1, you can view all the SQL property graphs existing in your database schema by expanding **SQL Property Graphs** under the **Property Graph** node in the **Connections** navigator.

Figure 6-1 SQL Property Graphs in SQL Developer

The following steps show an example for running graph queries on a SQL property graph:

1. Click on any SQL property graph.
This opens a SQL worksheet in another tab.
2. Run one or more queries in the SQL worksheet.
For example:

Figure 6-2 Running SQL Graph queries in SQL Developer

7

Loading a SQL Property Graph into the Graph Server (PGX)

You can load a full SQL property graph or a subgraph into memory in the graph server (PGX).

Note

Ensure that you drop the graph when it is no longer in use to release the graph server (PGX) memory. See [Deleting a Graph](#) for more information.

The following topics describe the various ways to load a SQL property graph into the graph server (PGX).

- [Loading a SQL Property Graph Using the readGraphByName API](#)
You can load a SQL property graph into the graph server (PGX) by calling the `readGraphByName` API on a `PgxSession` object.
- [Loading a Subgraph Using PGQL Queries](#)
You can create an in-memory subgraph from a SQL property graph using the `PgSqlSubgraphReader` API.
- [Expanding a Subgraph](#)
You can expand an in-memory subgraph by loading graph data from a SQL property graph into memory, and merging it with the current subgraph.
- [Handling Vertex and Edge Identifiers in the Graph Server \(PGX\)](#)
The Oracle Database maintains globally unique identifiers in JSON format.
- [Mapping Oracle Database Types to PGX Types](#)
Learn how the input Oracle database types are mapped to its corresponding PGX types, when a graph from the database is loaded into the graph server (PGX).
- [Privileges to Load a SQL Property Graph](#)
Learn about the privileges required to load a SQL property graph into the graph server (PGX).
- [Loading Graphs with Unsupported Key Types](#)
Starting from Graph Server and Client Release 25.2 onwards, you can load a SQL property graph (or a subgraph) containing unsupported key types for vertices or edges, into the graph server (PGX) memory.
- [Loading SQL Property Graphs with Composite Keys](#)
You can load a full SQL property graph or a sub-graph with composite keys into the graph server (PGX) memory using server-generated IDs.

7.1 Loading a SQL Property Graph Using the readGraphByName API

You can load a SQL property graph into the graph server (PGX) by calling the `readGraphByName` API on a `PgxSession` object.

When loading a SQL property graph into the graph server (PGX), the full graph schema will be determined and mapped to a graph configuration. The graphs will be loaded as partitioned graphs where each vertex or edge table will be mapped to the respective vertex or edge provider of the same name. Labels and properties will also be loaded as defined.

However, note that only one label per vertex or edge table is supported in order to load a SQL graph into the graph server (PGX).

For example, consider the following SQL property graph:

```
CREATE PROPERTY GRAPH student_network
  VERTEX TABLES (
    persons KEY (person_id)
      LABEL person
      PROPERTIES (person_id, name, birthdate AS dob)
  )
  EDGE TABLES (
    friendships AS friends
      KEY (friendship_id)
      SOURCE KEY (person_a) REFERENCES persons(person_id)
      DESTINATION KEY (person_b) REFERENCES persons(person_id)
      PROPERTIES (friendship_id, meeting_date)
  );
```

You can load this SQL graph into memory as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName
("STUDENT_NETWORK", GraphSource.PG_SQL)
graph ==> PgxGraph[name=STUDENTS_NETWORK, N=4, E=4, created=1681007796946]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL);
```

Python

```
>>> graph = session.read_graph_by_name("STUDENT_NETWORK", "pg_sql")
>>> graph
PgxGraph(name: STUDENTS_NETWORK, v: 4, e: 4, directed: True, memory(Mb): 0)
```

- [Loading a SQL Property Graph from a Different Schema](#)
You can specify the schema name when using the `readGraphByName` API for loading a SQL property graph.
- [Loading a SQL Property Graph Using PropertyLoadingMode Options](#)
By default, the `readGraphByName` API loads a SQL property graph into the graph server (PGX) with the complete set of properties. However, you can choose to include or exclude selected properties using the `PropertyLoadingMode` option while loading the graph.
- [Loading a SQL Property Graph Using Graph Optimization Options](#)
You can optimize the read or update performance, when loading a SQL property graph using the graph optimization options.
- [Loading a SQL Property Graph Using OnMissingVertex Options](#)
If either the source or destination vertex or both are missing for an edge, then you can use the `OnMissingVertexOption` to specify the behavior for handling the edge with the missing vertex.
- [Loading a SQL Property Graph with Properties Mapped to CLOB Data Type Columns](#)
You can load a SQL property graph from a database table having a CLOB data type column into the graph server (PGX).

7.1.1 Loading a SQL Property Graph from a Different Schema

You can specify the schema name when using the `readGraphByName` API for loading a SQL property graph.

If you only provide the graph name when calling the `readGraphByName` API, it is assumed that the graph is owned by current user. But if you want to load a graph owned by another user, then you must provide the schema name as well. Also, ensure that you have `SELECT` permission on the SQL graph and all its underlying data tables.

The following example loads a SQL property graph from the `GRAPHUSER` schema:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("GRAPHUSER", "STUDENT_NETWORK",
GraphSource.PG_SQL)
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1680769031393]
```

Java

```
PgxGraph graph = session.readGraphByName("GRAPHUSER", "STUDENT_NETWORK",
GraphSource.PG_SQL);
```

Python

```
>>> graph = session.read_graph_by_name("STUDENT_NETWORK", "pg_sql",
"GRAPHUSER")
>>> graph
PgxGraph(name: STUDENT_NETWORK_2, v: 4, e: 4, directed: True, memory(Mb): 0)
```

① See Also

[Privileges to Load a SQL Property Graph](#)

7.1.2 Loading a SQL Property Graph Using PropertyLoadingMode Options

By default, the `readGraphByName` API loads a SQL property graph into the graph server (PGX) with the complete set of properties. However, you can choose to include or exclude selected properties using the `PropertyLoadingMode` option while loading the graph.

The supported `PropertyLoadingMode` options are:

- `ReadGraphOption.includeProperties()`: You can provide a list of properties to be loaded for each provider while loading the graph.
- `ReadGraphOption.excludeProperties()`: You can provide a list of properties to be skipped for each provider while loading the graph.
- `ReadGraphOption.topologyOnly()`: You can choose this mode if you wish to load only the graph topology and skip all the properties.

The following example shows loading a SQL property graph with the `ReadGraphOption.includeProperties()` option.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var propertyFilterBuilder = new PropertyFilterBuilder()
propertyFilterBuilder ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> propertyFilterBuilder.addProperty("PERSONS", "NAME")
$2 ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> propertyFilterBuilder.addProperties("FRIENDS", "MEETING_DATE")
$3 ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
ReadGraphOption.includeProperties(propertyFilterBuilder.build()))
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1751014147184]
```

Java

```
PropertyFilterBuilder propertyFilterBuilder = new PropertyFilterBuilder();
propertyFilterBuilder.addProperty("PERSONS", "NAME");
propertyFilterBuilder.addProperties("FRIENDS", "MEETING_DATE");
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
ReadGraphOption.includeProperties(propertyFilterBuilder.build()));
```

Python

```
>>> from pypgx._utils.pgx_types import include_properties
>>> graph = session.read_graph_by_name("STUDENT_NETWORK", "pg_sql",
options=(include_properties({"PERSONS": ["NAME"], "FRIENDS" :
["MEETING_DATE"] })),)
```

The following example shows loading a SQL property graph with the `ReadGraphOption.excludeProperties()` option

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var propertyFilterBuilder = new PropertyFilterBuilder()
propertyFilterBuilder ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> propertyFilterBuilder.addProperty("PERSONS", "DOB")
$2 ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> propertyFilterBuilder.addProperties("FRIENDS", "MEETING_DATE")
$3 ==> oracle.pgx.config.PropertyFilterBuilder@6f68756d
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
ReadGraphOption.excludeProperties(propertyFilterBuilder.build()))
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1751203787443]
```

Java

```
PropertyFilterBuilder propertyFilterBuilder = new PropertyFilterBuilder();
propertyFilterBuilder.addProperty("PERSONS", "DOB");
propertyFilterBuilder.addProperties("FRIENDS", "MEETING_DATE");
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
ReadGraphOption.excludeProperties(propertyFilterBuilder.build()));
```

Python

```
>>> from pypgx._utils.pgx_types import exclude_properties
>>> graph = session.read_graph_by_name("STUDENT_NETWORK", "pg_sql",
options=(exclude_properties({"PERSONS": ["DOB"], "FRIENDS" :
["MEETING_DATE"] })), )
```

The following example shows loading a SQL property graph with the `ReadGraphOption.topologyOnly()` option

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL, ReadGraphOption.topologyOnly())
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1751014147184]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL, ReadGraphOption.topologyOnly());
```

Python

```
>>> from pypgx._utils.pgx_types import topology_only
>>> graph = session.read_graph_by_name("STUDENT_NETWORK", "pg_sql",
options=(topology_only(),))
```

7.1.3 Loading a SQL Property Graph Using Graph Optimization Options

You can optimize the read or update performance, when loading a SQL property graph using the graph optimization options.

The following example shows loading a SQL property graph optimized for READ operation:

- [JShell](#)
- [Java](#)

- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
...>     ReadGraphOption.optimizeFor(GraphOptimizedFor.READ))
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1681008951415]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
    ReadGraphOption.optimizeFor(GraphOptimizedFor.READ));
```

Python

```
>>> session.read_graph_by_name('STUDENT_NETWORK', 'pg_sql',
options=['optimized_for_read'])
PgxGraph(name: STUDENT_NETWORK, v: 4, e: 4, directed: True, memory(Mb): 0)
```

The following example shows loading a SQL property graph optimized for UPDATE operation. Also, note that the READ and UPDATE options cannot be used at the same time.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
...>     ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES))
graph ==> PgxGraph[name=STUDENT_NETWORK_2,N=4,E=4,created=1681009073501]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
    ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES));
```

Python

```
>>> session.read_graph_by_name('STUDENT_NETWORK', 'pg_sql',  
options=['optimized_for_updates'])  
PgxGraph(name: STUDENT_NETWORK, v: 4, e: 4, directed: True, memory(Mb): 0)
```

The following example shows loading a SQL property graph with the `SYNCHRONIZABLE` optimization option. This option can be used in combination with the `READ` and `UPDATE` options.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("STUDENT_NETWORK",  
GraphSource.PG_SQL,  
...> ReadGraphOption.SYNCHRONIZABLE)  
graph ==> PgxGraph[name=STUDENT_NETWORK,N=4,E=4,created=1696341305374]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",  
GraphSource.PG_SQL,  
ReadGraphOption.SYNCHRONIZABLE);
```

Python

```
>>> session.read_graph_by_name('STUDENT_NETWORK', 'pg_sql',  
options=['synchronizable'])  
PgxGraph(name: STUDENT_NETWORK_2, v: 4, e: 4, directed: True, memory(Mb): 0)
```

① See Also

[Using the Graph Optimization Options](#) for more information.

7.1.4 Loading a SQL Property Graph Using `OnMissingVertex` Options

If either the source or destination vertex or both are missing for an edge, then you can use the `OnMissingVertexOption` to specify the behavior for handling the edge with the missing vertex.

The supported values are:

- **`OnMissingVertex.ERROR (default)`:** Specifies that an error must be thrown for edges with missing source or destination vertex.
- **`OnMissingVertex.IGNORE_EDGE`:** Specifies that the edge for a missing source or destination vertex must be ignored.
- **`OnMissingVertex.IGNORE_EDGE_LOG`:** Specifies that the edge for a missing source or destination vertex must be ignored and all ignored edges must be logged.
- **`OnMissingVertex.IGNORE_EDGE_LOG_ONCE`:** Specifies that the edge for a missing source or destination vertex must be ignored and only the first ignored edge must be logged.

The following example loads a SQL property graph by ignoring the edges with missing vertices and logging only the first ignored edge.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.readGraphByName("STUDENT_NETWORK", GraphSource.PG_SQL,
...>
ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG_ONCE))
$2 ==> PgxGraph[name=STUDENT_NETWORK_2,N=4,E=4,created=1697264084059]
```

Java

```
PgxGraph graph = session.readGraphByName("STUDENT_NETWORK",
GraphSource.PG_SQL,
    ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG_ONCE));
```

Python

```
>>> session.read_graph_by_name('STUDENT_NETWORK', 'pg_sql',
    options=['on_missing_vertex_ignore_edge_log_once'])
PgxGraph(name: STUDENT_NETWORK, v: 4, e: 4, directed: True, memory(Mb): 0)
```

7.1.5 Loading a SQL Property Graph with Properties Mapped to CLOB Data Type Columns

You can load a SQL property graph from a database table having a CLOB data type column into the graph server (PGX).

The CLOB data type columns are processed as `String` properties in the graph server (PGX).

For example, consider the following sample data in the database:

```
CREATE TABLE depts (  
    dept_id          NUMBER,  
    dept_name        VARCHAR2 (10),  
    emp_details      CLOB,  
    CONSTRAINT employees_pk PRIMARY KEY (dept_id)  
);  
  
INSERT INTO depts  
VALUES (1, 'HR', '  
<employees>  
  <employee empNo="1234" eName="SMITH" hireDate="17-DEC-1990"></employee>  
  <employee empNo="5678" eName="ALLEN" hireDate="02-JAN-1981"></employee>  
</employees>  
' );  
  
INSERT INTO depts  
VALUES (2, 'IT', '  
<employees>  
  <employee empNo="5628" eName="JONES" hireDate="13-MAR-1986"></employee>>  
  <employee empNo="5628" eName="TOM" hireDate="13-MAR-1986"></employee>>  
</employees>  
' );
```

Create a SQL property graph created using the `CREATE PROPERTY GRAPH` DDL statement.

```
CREATE PROPERTY GRAPH dept  
VERTEX TABLES (  
    DEPTS KEY (dept_id)  
    LABEL dept  
    PROPERTIES (dept_id, dept_name, emp_details)  
)
```

Load the graph into the graph server (PGX) as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var g = session.readGraphByName("DEPT", GraphSource.PG_SQL)
g ==> PgxGraph[name=DEPT,N=2,E=0,created=1727242485228]
opg4j> g.queryPsql("SELECT n.* FROM MATCH (n:dept)").print()
+-----+
+-----+
| DEPT_ID | DEPT_NAME | EMP_DETAILS
| 2.0     | IT        | <employees>

- [Mapping Oracle Database Types to PGX Types](#)
Learn how the input Oracle database types are mapped to its corresponding PGX types, when a graph from the database is loaded into the graph server (PGX).

7.2 Loading a Subgraph Using PGQL Queries

You can create an in-memory subgraph from a SQL property graph using the `PgSqlSubgraphReader` API.

You can specify the subgraph to be loaded in one or more PGQL queries. Each of these PGQL queries will be executed on the database and all the matched vertices and edges will be loaded as part of the subgraph. Therefore, vertices and edges will be loaded only if they match at least one of the queries.

Also, note the following:

- You can only create subgraphs from SQL property graphs that exist in the current database user schema.
- CLOB data type columns are supported when creating a subgraph from a SQL property graph.

The following example creates a subgraph from a SQL property graph using multiple PGQL queries:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> var graph = session.readSubgraph().
...>   fromPgSql("STUDENT_NETWORK").
...>   queryPgql("MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE
id(v1) = 'PERSONS(1)')").
...>   queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')").
...>   load()
graph ==> PgxGraph[name=STUDENT_NETWORK_4,N=3,E=1,created=1681009569883]

```

Java

```

PgxGraph graph = session.readSubgraph()
    .fromPgSql("STUDENT_NETWORK")
    .queryPgql("MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE

```

```
id(v1) = 'PERSONS(1)')
    .queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')")
    .load();
```

Python

```
>>> graph = session.read_subgraph_from_pg_sql("STUDENT_NETWORK",
...     ["MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE id(v1) =
'PERSONS(1)'",
...     "MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')"])
>>> graph
PgxGraph(name: STUDENT_NETWORK, v: 3, e: 1, directed: True, memory(Mb): 0)
```

Loading Subgraphs with Custom Names

By default, the new subgraph gets created with the same name as the SQL property graph. Alternatively, if you want to load a subgraph with a custom name, then you can configure the subgraph name as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readSubgraph().
...>     fromPgSql("STUDENT_NETWORK").
...>     queryPgql("MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE
id(v1) = 'PERSONS(1)')").
...>     queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')").
...>     load("student_subgraph")
graph ==> PgxGraph[name=student_subgraph,N=3,E=1,created=1681010160515]
```

Java

```
PgxGraph graph = session.readSubgraph()
    .fromPgSql("STUDENT_NETWORK")
    .queryPgql("MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE
id(v1) = 'PERSONS(1)')")
    .queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')")
    .load("student_subgraph");
```

Python

```
>>> graph = session.read_subgraph_from_pg_sql("STUDENT_NETWORK",
...     ["MATCH (v1 IS Person)-[e IS friends]->(v2 IS Person) WHERE id(v1) =
'PERSONS(1)'",
```

```
...      "MATCH (v:Person) WHERE id(v) = 'PERSONS(2)']",
...      graph_name="student_subgraph")
>>> graph
PgxGraph(name: student_subgraph, v: 3, e: 1, directed: True, memory(Mb): 0)
```

7.3 Expanding a Subgraph

You can expand an in-memory subgraph by loading graph data from a SQL property graph into memory, and merging it with the current subgraph.

The following applies when merging two subgraphs:

- Expanding a subgraph with data from another SQL graph is only possible if the graph schemas are compatible.
- The initial subgraph for expanding can also be loaded from a PGQL property graph and need not necessarily originate from a SQL property graph.
- You can only expand a subgraph by loading graph data from a property graph that exists in the current database schema.
- Also, see [Dynamically Expanding a Subgraph](#) for additional information.

The following example shows the expansion of the subgraph created in [Loading a Subgraph Using PGQL Queries](#):

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph = graph.expandGraph().
...>   withPgql().
...>   fromPgSql("STUDENT_NETWORK").
...>   queryPgql("MATCH (v1 IS Person) WHERE id(v1) = 'PERSONS(4)']").
...>   expand()
graph ==> PgxGraph[name=anonymous_graph_31,N=4,E=1,created=1681011908378]
```

Java

```
PgxGraph graph = graph.expandGraph()
    .withPgql()
    .fromPgSql("STUDENT_NETWORK")
    .queryPgql("MATCH (v1 IS Person) WHERE id(v1) = 'PERSONS(4)')")
    .expand();
```

Python

```
>>> graph = graph.expand_with_pgql("MATCH (v1 IS Person) WHERE id(v1) =  
'PERSONS(4)'", pg_sql_name="STUDENT_NETWORK")  
>>> graph  
PgxGraph(name: anonymous_graph_34, v: 4, e: 1, directed: True, memory(Mb): 0)
```

7.4 Handling Vertex and Edge Identifiers in the Graph Server (PGX)

The Oracle Database maintains globally unique identifiers in JSON format.

The following shows an example of a JSON output describing the vertex identifier:

```
{  
  "GRAPH_OWNER": "GRAPHUSER",  
  "GRAPH_NAME": "STUDENTS_GRAPH",  
  "ELEM_TABLE": "PERSONS",  
  "KEY_VALUE": {  
    "PERSON_ID": 1  
  }  
}
```

See [Vertex and Edge Identifiers](#) for more information.

However, the graph server (PGX) will not load the full identifiers, but only the `KEY_VALUE` column. This ID will then be maintained as a partitioned ID. For instance, the partitioned ID constructed from the preceding JSON output is: `PERSONS(1)`

Note that when working with graphs loaded from SQL property graphs, always use the partitioned ID format to refer to the elements by ID.

7.5 Mapping Oracle Database Types to PGX Types

Learn how the input Oracle database types are mapped to its corresponding PGX types, when a graph from the database is loaded into the graph server (PGX).

The following table applies for both SQL property graphs and PGQL property graphs.

Table 7-1 Mapping Oracle Database Types to PGX Types

Oracle Database Type ¹	PGX Type
NUMBER	<p>The following implicit type conversion rules apply:</p> <ul style="list-style-type: none"> NUMBER => LONG (for key columns) NUMBER => DOUBLE (for non-key columns) NUMBER(<i>m</i>) (number having precision <i>m</i>) with $m \leq 9$ => INTEGER NUMBER(<i>m</i>) (number having precision <i>m</i>) with $9 < m \leq 18$ => LONG NUMBER(<i>m</i>, <i>n</i>) (number having precision <i>m</i> and scale <i>n</i>) => DOUBLE <p>Note that this applies if $n > 0$. Otherwise, it follows the same mapping as NUMBER(<i>x</i>), where $x = m - n$ (that is, subtracting the scale from the precision). The PGX type can then vary, depending on the <i>x</i> value as shown:</p> <ul style="list-style-type: none"> $x \leq 9$ => INTEGER $9 < x \leq 18$ => LONG $x > 18$ => DOUBLE <p>For instance, consider a scenario where $n = -100$ and $m = 1$. In this case, $x = 101$ ($m - n$), which is greater than 18. Extremely large numbers cannot be encoded to fit in INTEGER or LONG and therefore require the DOUBLE data type.</p>
CHAR or NCHAR	STRING
VARCHAR, VARCHAR2, or NVARCHAR2	STRING
BINARY_FLOAT	FLOAT
BINARY_DOUBLE	DOUBLE
FLOAT	<p>The following implicit type conversion rules apply:</p> <ul style="list-style-type: none"> FLOAT(<i>m</i>) with $m \leq 23$ => FLOAT FLOAT(<i>m</i>) with $23 < m$ => DOUBLE <p>In the preceding entries, <i>m</i> is the variable for precision.</p>
CLOB	STRING
DATE or TIMESTAMP	TIMESTAMP
TIMESTAMP WITH LOCAL TIME ZONE	TIMESTAMP
TIMESTAMP WITH TIME ZONE	TIMESTAMP WITH TIME ZONE

¹ Data types for **PGQL property graphs** and **SQL Property Graphs** share a one-to-one mapping with Oracle Database data types.

7.6 Privileges to Load a SQL Property Graph

Learn about the privileges required to load a SQL property graph into the graph server(PGX).

Ensure that you have the following set of permissions:

- SELECT permission is required for the SQL property graph.
 - If you are the graph owner, you will automatically get this permission.
 - Otherwise, you can grant the permission as shown:

```
GRANT SELECT ON PROPERTY GRAPH <graph_name> TO <user_name>;
```
- SELECT permission is required for all the underlying data tables of the SQL property graph

- This permission is required to access entity keys.
- Note that these permissions are handled separately from the graph permissions.
- You can grant the permission as shown:
`GRANT SELECT ON <table_name> TO <user_name>;`

7.7 Loading Graphs with Unsupported Key Types

Starting from Graph Server and Client Release 25.2 onwards, you can load a SQL property graph (or a subgraph) containing unsupported key types for vertices or edges, into the graph server (PGX) memory.

When loading an entire SQL property graph or a subgraph into memory, the supported key types for the graph elements are as follows:

- For vertices, keys need to be one of these (PGX) types: `INTEGER`, `LONG`, or `STRING`.
- For edges, keys can only be numeric and the only supported type is `LONG`.

However, if the graph contains unsupported key types or composite keys for a vertex or an edge, the full graph or subgraph can still be loaded using the `readGraphByName` API. In such cases, the graph server (PGX) will automatically generate unique keys to serve as identifiers for edge or vertex tables. See [Loading SQL Property Graphs with Composite Keys](#) for more information.

① See Also

[Mapping Oracle Database Types to PGX Types](#)

7.8 Loading SQL Property Graphs with Composite Keys

You can load a full SQL property graph or a sub-graph with composite keys into the graph server (PGX) memory using server-generated IDs.

Consider the following SQL property graph which is defined with composite vertex (`FIRST_NAME`, `LAST_NAME`) and edge (`USER1_FIRST_NAME`, `USER1_LAST_NAME`, `USER2_FIRST_NAME`, `USER2_LAST_NAME`) keys:

```
CREATE PROPERTY GRAPH SOCIAL_NETWORK
  VERTEX TABLES (
    USERS
      KEY (FIRST_NAME, LAST_NAME)
      PROPERTIES (FULL_NAME, USERNAME)
  )
  EDGE TABLES (
    FRIENDS_WITH
      KEY (USER1_FIRST_NAME, USER1_LAST_NAME, USER2_FIRST_NAME,
USER2_LAST_NAME)
      SOURCE KEY (USER1_FIRST_NAME, USER1_LAST_NAME) REFERENCES USERS
(FIRST_NAME, LAST_NAME)
      DESTINATION KEY (USER2_FIRST_NAME, USER2_LAST_NAME) REFERENCES USERS
(FIRST_NAME, LAST_NAME)
```

```
NO PROPERTIES
) OPTIONS (ENFORCED MODE);
```

1. Load the complete graph into the graph server (PGX) memory using the `readGraphByName` API as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("SOCIAL_NETWORK",
GraphSource.PG_SQL)
graph ==> PgxGraph[name=SOCIAL_NETWORK,N=3,E=3,created=1742566083153]
```

Java

```
PgxGraph graph = session.readGraphByName("SOCIAL_NETWORK",
GraphSource.PG_SQL);
```

Python

```
>>> graph = session.read_graph_by_name("SOCIAL_NETWORK", "pg_sql")
>>> graph
PgxGraph(name: SOCIAL_NETWORK, v: 3, e: 3, directed: True, memory(Mb): 0)
```

Also, it is important to note the following when creating graphs using composite keys:

- It is recommended that you enable `ENFORCED MODE` when creating the graph. This is to ensure the uniqueness for the specified composite keys, and avoid having the same vertex or edge being loaded multiple times with duplicate keys.
- As these IDs are automatically generated, there is no key mapping between the graph entities and the database elements. Therefore, these graphs are not synchronizable.
- The data dictionary views which store the metadata related to the key columns of the SQL property graph gets updated on the composite keys as shown:

```
SQL> SELECT ELEMENT_NAME, COLUMN_NAME from ALL_PG_KEYS WHERE GRAPH_NAME
= 'SOCIAL_NETWORK';
```

ELEMENT_NAME	COLUMN_NAME
USERS	FIRST_NAME
USERS	LAST_NAME
FRIENDS_WITH	USER1_FIRST_NAME
FRIENDS_WITH	USER1_LAST_NAME

```
FRIENDS_WITH      USER2_FIRST_NAME
FRIENDS_WITH      USER2_LAST_NAME
```

6 rows selected.

- Optionally, query the graph in the graph server (PGX) to view the auto-generated vertex and edge keys.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var pgql =
...> "SELECT * "+
...> "FROM GRAPH_TABLE ( social_network "+
...> "MATCH (a IS users) -[e IS friends_with]-> (b IS users) "+
...> "COLUMNS (vertex_id(a), a.full_name, edge_id(e), b.full_name AS
friend) "+
...> ")"
pgql ==> "SELECT * FROM GRAPH_TABLE ( social_network MATCH (a IS users) -
[e IS friends_with]-> (b IS users) COLUMNS (vertex_id(a), a.full_name,
edge_id(e), b.full_name AS friend) )"
opg4j> g.queryPgql(pgql).print()
+-----+
| vertex_id(a) | full_name   | edge_id(e)   | friend      |
+-----+
| USERS(0)     | Steven King | FRIENDS_WITH(0) | Tom Rogers  |
| USERS(1)     | Tom Rogers  | FRIENDS_WITH(1) | Peter Hall  |
| USERS(2)     | Peter Hall  | FRIENDS_WITH(2) | Steven King |
+-----+
$27 ==> PgqlResultSetImpl[graph=SOCIAL_NETWORK,numResults=3]
```

Java

```
String pgql = "SELECT * "+
    "FROM GRAPH_TABLE ( social_network "+
    "MATCH (a IS users) -[e IS friends_with]-> (b IS users) "+
    "COLUMNS (vertex_id(a), a.full_name, edge_id(e), b.full_name) "+
    ")";
PgqlResultSet rs = g.queryPgql(pgql);
rs.print();
```

Python

```
>>> pgql = """
... SELECT *
... FROM GRAPH_TABLE ( social_network
... MATCH (a IS users) -[e IS friends_with]-> (b IS users)
```

```
... COLUMNS (vertex_id(a), a.full_name, edge_id(e), b.full_name as
name_of_friend)
... )
... """
>>> graph.query_pgql(pgql).print()
```

vertex_id(a)	full_name	edge_id(e)	name_of_friend
USERS(0)	Steven King	FRIENDS_WITH(0)	Tom Rogers
USERS(1)	Tom Rogers	FRIENDS_WITH(1)	Peter Hall
USERS(2)	Peter Hall	FRIENDS_WITH(2)	Steven King

3. Optionally, load and query only a subgraph of the SOCIAL_NETWORK graph which uses composite keys.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var subGraph = session.readSubgraph().
...>     fromPgSql("SOCIAL_NETWORK").
...>     queryPgql("MATCH (v1 IS users)-[e IS friends_with]->(v2 IS users)
WHERE v1.full_name = 'Peter Hall'").
...>     load()
graph ==> PgxGraph[name=SOCIAL_NETWORK_2,N=2,E=1,created=1743066245310]

opg4j> subGraph.queryPgql("SELECT v1.full_name as name, v2.full_name as
name_of_friend from MATCH (v1 IS users)-[e IS friends_with]->(v2 IS
users)").print()
```

name	name_of_friend
Peter Hall	Steven King

```
$11 ==> PgqlResultSetImpl[graph=SOCIAL_NETWORK_3,numResults=1]
```

Java

```
PgxGraph subGraph = session.readSubgraph()
    .fromPgSql("SOCIAL_NETWORK")
    .queryPgql("MATCH (v1 IS users)-[e IS friends_with]->(v2 IS users) WHERE
v1.full_name = 'Peter Hall'")
    .load();

PgqlResultSet rs = subGraph.queryPgql("SELECT v1.full_name as name,
v2.full_name as name_of_friend from MATCH (v1 IS users)-[e IS
```

```
friends_with]->(v2 IS users)");  
rs.print();
```

Python

```
>>> sub_graph = session.read_subgraph_from_pg_sql("SOCIAL_NETWORK",  
...      "MATCH (v1 IS users)-[e IS friends_with]->(v2 IS users) WHERE  
v1.full_name = 'Peter Hall'",  
...      graph_name = "nw_sub_graph")  
  
>>> sub_graph.query_pgql("SELECT v1.full_name as name, v2.full_name as  
name_of_friend from MATCH (v1 IS users)-[e IS friends_with]->(v2 IS  
users)").print()  
+-----+  
| name      | name_of_friend |  
+-----+  
| Peter Hall | Steven King    |  
+-----+
```

Also, note the following limitations when loading a subgraph from a graph that uses composite keys:

- Loading a subgraph based on a condition that depends on the auto-generated key IDs is not supported. For instance: *MATCH (V) WHERE ID(V) = 'Person(0)'*
- Subgraphs with auto-generated IDs cannot be expanded.

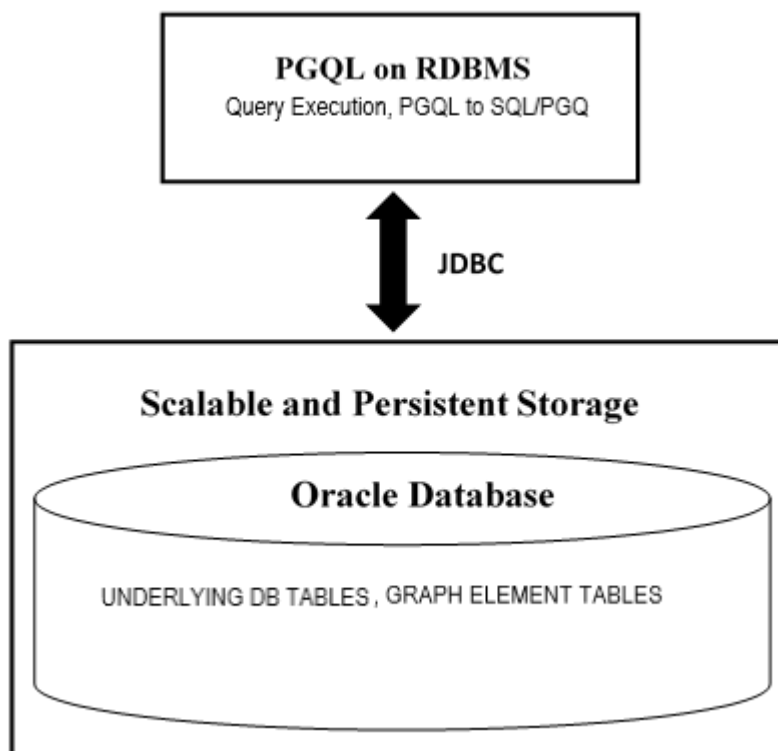

8

Executing PGQL Queries Against SQL Property Graphs

You can directly run PGQL queries against a SQL property graph in the database.

The PGQL query execution flow is shown in the following figure:

Figure 8-1 PGQL on SQL Property Graphs in Oracle Database

The basic execution flow is:

1. The PGQL query is performed on a SQL property graph through a Java API.
2. The PGQL query is translated to SQL/PGQ (SQL graph query).
3. The translated SQL/PGQ is submitted to Oracle Database by JDBC.
4. The SQL/PGQ result set is wrapped as a PGQL result set and returned to the caller.

See [Supported PGQL Features and Limitations for SQL Property Graphs](#) for a complete list of supported and unsupported features.

- [Creating a SQL Property Graph Using PGQL](#)
You can create a SQL property graph from the database tables using the `CREATE PROPERTY GRAPH PGQL` DDL statement.

- [Executing PGQL SELECT Queries on a SQL Property Graph](#)
You can execute PGQL `SELECT` queries, on a SQL property graph, using the Java API in the `oracle.pg.rdbms.pgql` package.
- [Migrating PGQL Property Graphs to SQL Property Graphs](#)
- [Supported PGQL Features and Limitations for SQL Property Graphs](#)
Learn about the supported PGQL features and limitations for SQL property graphs.

8.1 Creating a SQL Property Graph Using PGQL

You can create a SQL property graph from the database tables using the `CREATE PROPERTY GRAPH PGQL` DDL statement.

The following example uses the dataset tables that are created in [Using Sample Graph Data](#):

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<service>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>");
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
opg4j> var pgqlStmt = pgqlConn.createStatement()
opg4j> var pgql =
...> "CREATE PROPERTY GRAPH bank_sql_pg "
...> + "VERTEX TABLES ( BANK_ACCOUNTS "
...> + "KEY (ID) "
...> + "LABEL Accounts "
...> + "PROPERTIES (ID, NAME) "
...> + ") "
...> + "EDGE TABLES ( BANK_TRANSFERS "
...> + "KEY (TXN_ID) "
...> + "SOURCE KEY (SRC_ACCT_ID) REFERENCES BANK_ACCOUNTS (ID) "
...> + "DESTINATION KEY (DST_ACCT_ID) REFERENCES BANK_ACCOUNTS (ID) "
...> + "LABEL Transfers "
...> + "PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION) "
...> + ") OPTIONS (PG_SQL) "
opg4j> pgqlStmt.execute(pgql)
```

Java

```
import java.sql.Connection;
import java.sql.Statement;
import java.sql.DriverManager;
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlStatement;
```

```

/*
 * This example creates a SQL property graph.
 */
public class CreateSQLGraph
{

    public static void main(String[] args) throws Exception
    {
        int idx=0;
        String jdbcUrl          = args[idx++];
        String username          = args[idx++];
        String password          = args[idx++];
        String graph             = args[idx++];

        Connection conn = null;
        PgqlStatement pgqlStmt = null;

        try {
            //Get a jdbc connection
            conn = DriverManager.getConnection(jdbcUrl, username, password);
            conn.setAutoCommit(false);

            // Get a PGQL connection
            PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);

            // Create a PGQL Statement
            pgqlStmt = pgqlConn.createStatement();
            // Execute PGQL Query
            String pgql =
                "CREATE PROPERTY GRAPH " + graph + " " +
                "VERTEX TABLES ( bank_accounts " +
                "KEY (id) " +
                "LABEL Accounts " +
                "PROPERTIES (id, name)" +
                ") " +
                "EDGE TABLES ( bank_transfers " +

... ) OPTIONS (PG_SQL)
... """
>>> pgql_statement.execute(pgql)
False

```

See [Creating a Property Graph Using PGQL](#) to understand the PGQL concepts.

8.2 Executing PGQL SELECT Queries on a SQL Property Graph

You can execute PGQL `SELECT` queries, on a SQL property graph, using the Java API in the `oracle.pg.rdbms.pgql` package.

The following example shows a PGQL `SELECT` query execution:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<db_service>"
opg4j> var conn =

```

```

DriverManager.getConnection(jdbcUrl, "<username>", "<password>")
opg4j> conn.setAutoCommit(false)
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
opg4j> var pgqlStmt = pgqlConn.createStatement()
opg4j> String query = "SELECT n.name FROM MATCH (n:person) ON STUDENTS_GRAPH"
opg4j> var rs = pgqlStmt.executeQuery(query)
opg4j> rs.print()
+-----+
| NAME |
+-----+
| John |
| Mary |
| Bob  |
| Alice|
+-----+

```

Java

```

Connection conn =
    DriverManager.getConnection("<jdbcUrl>", "<username>", "<password>");
    conn.setAutoCommit(false);
    PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);
    PgqlStatement pgqlStmt = pgqlConn.createStatement();
    String query = "SELECT n.name FROM MATCH (n:person) ON
STUDENTS_GRAPH";
    PgqlResultSet rs = pgqlStmt.executeQuery(query);
    rs.print();

```

Python

```

>>> pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"<jdbcUrl>")
>>> pgql_statement = pgql_conn.create_statement()
>>> query = "SELECT n.name FROM MATCH (n:person) ON STUDENTS_GRAPH"
>>> rs = pgql_statement.execute_query(query)
>>> rs.print()
+-----+
| NAME |
+-----+
| John |
| Mary |
| Bob  |
| Alice|
+-----+

```

8.3 Migrating PGQL Property Graphs to SQL Property Graphs

You can call the `migrate_pgql_to_sql` function to migrate a PGQL property graph to SQL property graph.

The `migrate_pgql_to_sql` function accepts the following parameters:

- **source_schema**: Underlying schema of the original PGQL property graph.
- **source_graph_name**: Name of the original PGQL property graph.
- **destination_schema (optional)**: Underlying schema of the SQL property graph. If not specified, then the graph is created in the source PGQL property graph schema.
- **destination_graph (optional)**: Name of the new SQL property graph. If not specified, then the new graph is created with the original name of the PGQL property graph and the original graph will be renamed by appending **_PGQL** at the end of the name.

Note

PGQL property graphs based on database views cannot be migrated.

Example 8-1 Migrating a PGQL Property Graph to SQL Property Graph

The following example assumes that the PGQL property graph **FRIENDS** exists in Oracle Database 23ai.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<db_service>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>")
opg4j> PgqlConnection pgqlConn = PgqlConnection.getConnection(conn)
opg4j> PgqlStatement pgqlStmt = pgqlConn.createStatement()
opg4j> pgqlStmt.execute("CALL pg.migrate_pgql_to_sql('GRAPHUSER', 'FRIENDS',
'GRAPHUSER', 'FRIENDS_SQL_GRAPH')")
$9 ==> false
```

Java

```
Connection conn = DriverManager.getConnection(<jdbcUrl>, <username>,
<password>);
PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);
PgqlStatement pgqlStmt = pgqlConn.createStatement();
pgqlStmt.execute("CALL pg.migrate_pgql_to_sql('GRAPHUSER', 'FRIENDS',
'GRAPHUSER', 'FRIENDS_SQL_GRAPH')");
```

Python

```
>>> pgql_conn = opg4py.pgql.get_connection("<username>","<password>",
"jdbc:oracle:thin:@<host_name>:<port>/<db_service>")
>>> pgql_statement = pgql_conn.create_statement()
>>> pgql_statement.execute("CALL pg.migrate_pgql_to_sql('GRAPHUSER',
```

```
'FRIENDS', 'GRAPHUSER', 'FRIENDS_SQL_GRAPH')")
$4 ==> false
```

8.4 Supported PGQL Features and Limitations for SQL Property Graphs

Learn about the supported PGQL features and limitations for SQL property graphs.

The following table provides the complete list of supported and unsupported PGQL functionalities for SQL property graphs:

Table 8-1 Supported PGQL Functionalities and Limitations for SQL Property Graphs

Features	PGQL on SQL Property Graphs
CREATE PROPERTY GRAPH	Supported
DROP PROPERTY GRAPH	Supported
Fixed-length pattern matching	Supported
Variable-length pattern matching goals	Not supported
Variable-length pattern matching quantifiers	Not supported
Variable-length path unnesting	Not supported
OPTIONAL MATCH	Not supported
GROUP BY	Supported
HAVING	Supported
Aggregations	Supported: <ul style="list-style-type: none"> COUNT MIN, MAX, AVG, SUM LISTAGG Not supported: <ul style="list-style-type: none"> ARRAY_AGG JSON_ARRAYAGG
DISTINCT <ul style="list-style-type: none"> SELECT DISTINCT Aggregation with DISTINCT (such as, COUNT(DISTINCT e.prop)) 	Supported
SELECT v.*	Not supported
ORDER BY (+ASC/DESC), LIMIT, OFFSET	Supported
Data Types	All available Oracle RDBMS data types supported

Table 8-1 (Cont.) Supported PGQL Functionalities and Limitations for SQL Property Graphs

Features	PGQL on SQL Property Graphs
JSON	<p>Supported:</p> <ul style="list-style-type: none"> JSON storage: <ul style="list-style-type: none"> JSON strings (VARCHAR2) JSON objects JSON functions: Any JSON function call that follows the syntax, <code>json_function_name(arg1, arg2,...)</code>. For example: <code>json_value(department_data, '\$.department')</code> <p>Limitations:</p> <ul style="list-style-type: none"> Simple Dot Notation Any optional clause in a JSON function call (such as RETURNING, ERROR, and so on) is Not supported. For example: <code>json_value(department_data, '\$.employees[1].hireDate' RETURNING DATE)</code>
Operators	<p>Supported:</p> <ul style="list-style-type: none"> Relational: +, -, *, /, %, - (unary minus) Arithmetic: =, <>, <, >, <=, >= Logical: AND, OR, NOT String: (concat)
Functions and predicates	<p>Supported are all available functions in the Oracle RDBMS that take the form <code>function_name(arg1, arg2, ...)</code> with optional schema and package qualifiers.</p> <p>Supported PGQL functions/predicates:</p> <ul style="list-style-type: none"> IS NULL, IS NOT NULL LOWER, UPPER SUBSTRING ABS, CEIL/CEILING, FLOOR, ROUND EXTRACT CAST CASE IN and NOT IN <p>Unsupported PGQL functions/predicates are all vertex/edge functions</p>
User-defined functions	<p>Supported:</p> <ul style="list-style-type: none"> PL/SQL functions Functions created via the Oracle Database Multilingual Engine (MLE)
<p>Subqueries:</p> <ul style="list-style-type: none"> Scalar subqueries EXISTS and NOT EXISTS subqueries LATERAL subquery 	<p>Supported subqueries:</p> <ul style="list-style-type: none"> EXISTS NOT EXISTS <p>Not supported:</p> <ul style="list-style-type: none"> Scalar subqueries LATERAL subquery
GRAPH_TABLE operator	Not supported
INSERT/UPDATE/DELETE	Not supported
INTERVAL literals and operations	Not supported

Visualizing SQL Graph Queries Using the APEX Graph Visualization Plug-in

You can use the Oracle Application Express (APEX) Graph Visualization plug-in to visualize and interact with SQL property graphs in an APEX application.

The following topics explain more about the plug-in:

- [About the APEX Graph Visualization Plug-in](#)
The APEX Graph Visualization plug-in integrates a Java Script Library that supports graph visualization in APEX applications.
- [Getting Started with the APEX Graph Visualization Plug-in](#)
This section helps you get started with the Graph Visualization plug-in in your APEX application.
- [Configuring Attributes for the APEX Graph Visualization Plug-in](#)
Learn how to customize your graph visualization using the Graph Visualization plug-in attributes in your APEX application.

9.1 About the APEX Graph Visualization Plug-in

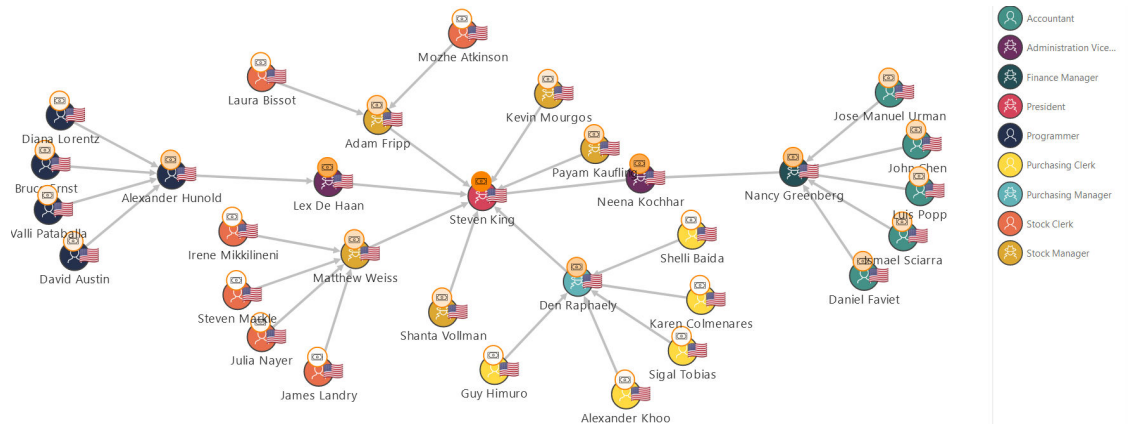

The APEX Graph Visualization plug-in integrates a Java Script Library that supports graph visualization in APEX applications.

See [Property Graph Visualization Developer's Guide and Reference](#) for more information.

The plug-in mainly allows you to:

- Visualize SQL property graph queries from the graph data in your database.
- Explore the graph vertices and edges. You can also select and visualize these graph elements individually or in groups.
- Interact with the graph visualization by performing various actions such as changing the graph layouts, grouping or ungrouping selected vertices, removing selected vertices or edges, and so on.
- Style the vertices and edges in the graph by configuring the style settings such as size, color, icon, label values, and so on.
- Visualize and study the evolution of the graph over time.

The following figure shows an example of graph visualization in an APEX application using the plug-in:

Note that the plug-in supports icons in the [Font APEX](#) library.

9.2 Getting Started with the APEX Graph Visualization Plug-in

This section helps you get started with the Graph Visualization plug-in in your APEX application.

Before you get started, ensure that your APEX workspace meets the following requirements:

- The target application into which you want to import the plug-in exists.
 - The target application is connected to Oracle Database 23ai.
 - The SQL property graph to be used for visualization exists in the default database schema. Using the command editor in the **SQL Workshop** component, you can create a SQL property graph using the CREATE PROPERTY GRAPH DDL statement (see [Using the Command Editor](#)).
 - The Graph Visualization plug-in version in the [Oracle APEX 24.2 GitHub](#) repository is supported only on APEX 24.2 version.
1. Download the **Graph Visualization (Preview)** plug-in (`region_type_plugin_graphviz.sql`) from the [Oracle APEX GitHub](#) repository.
 2. Sign in to your APEX workspace (see [Signing In to Your Workspace](#)).
 3. Create the DBMS_GVT package and the APEX_SQLGRAPH_JSON function in your APEX workspace.
 - a. Download the `optional-23ai-only/gvt_sqlgraph_to_json.sql` file from the [Oracle APEX GitHub](#) repository.
 - b. Upload and run the `gvt_sqlgraph_to_json.sql` script in your APEX workspace (see [Uploading a SQL Script](#)).
 - c. Upload and run the `apex_sqlgraph_to_json.sql` script in your APEX workspace.
 4. Import the downloaded plug-in script (`region_type_plugin_graphviz.sql`) file into your target APEX application (see [Importing Plug-ins](#)).
 5. Implement the plug-in in an application page to perform various graph visualizations.

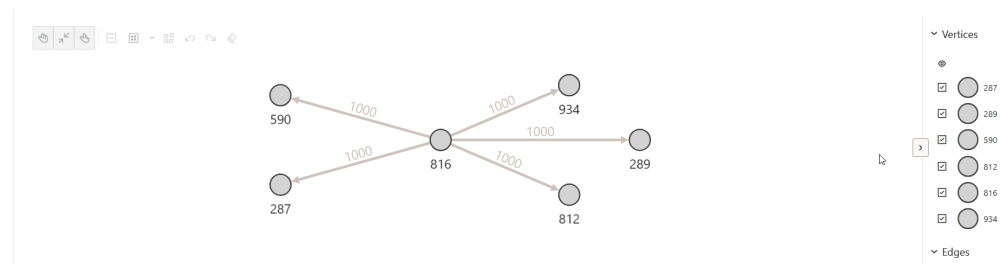

The following basic example describes the steps to visualize a graph existing in your database using the Graph Visualization plug-in.

- a. Open the application page in **Page Designer**.
- b. Select the **Rendering** tab on the left pane of the Page Designer.
- c. Right-click an existing component and add a new region component.

- d. Select the new region and configure the following attributes in the **Region** tab of the **Property Editor** on the right pane of the Page Designer:
 - i. Enter the Identification **Title**.
 - ii. Select **Graph Visualization (Preview)** as Identification **Type**.
 - iii. Select the source **Location** as **Local Database**.
 - iv. Select the **Type** value.
You can choose either **SQL Query** or **PropertyGraph** as the Type value.
 - v. Embed the SQL graph query to retrieve the graph data.
Depending on the type selected in the previous step, you can provide the query as shown in the following examples:
 - **SQL Query:** Enter the SQL graph query input as shown:

```
SELECT *
  FROM GRAPH_TABLE (
    BANK_SQL_PG
    MATCH (a IS accounts) -[e IS transfers]-> (b IS
accounts)
    WHERE a.id = 816
    COLUMNS(vertex_id(a) AS id_a, edge_id(e) AS id_e,
vertex_id(b) AS id_b)
  )
```
 - **PropertyGraph :** Provide the SQL graph query as shown:
 - **Graph Name:** Select the SQL property graph name.
 - **Match Clause:** Enter the MATCH clause of the graph query. For example:
(a IS accounts) -[e IS transfers]-> (b IS accounts)
 - **Columns Clause:** Enter the COLUMNS clause of the graph query. For example:
(vertex_id(a) AS id_a, edge_id(e) AS id_e, vertex_id(b) AS id_b)
 - **Where Clause:** Optionally, enter the WHERE clause of the query. For example, a.id = 816.
- e. Run the application page to visualize the graph rendered by the plugin.

Figure 9-1 Visualizing a SQL Graph Query in an APEX Application

Note

The APEX Graph Visualization plug-in on Oracle Database 23ai does not support graphs that use vertex or edge keys with `DATE` or `TIMESTAMP` data types. Visualizing graph query results on graphs with `DATE` or `TIMESTAMP` keys may result in only a subset of graph data being shown.

6. Optionally, you can visualize the underlying database schema for the property graph that is used in the SQL graph query.

- a. Go to the **Schema** panel in the **Attributes** tab of the Property Editor.
- b. Enable **Schema Visualization**.
- c. Enter **Graph Owner** and **Graph Name**.

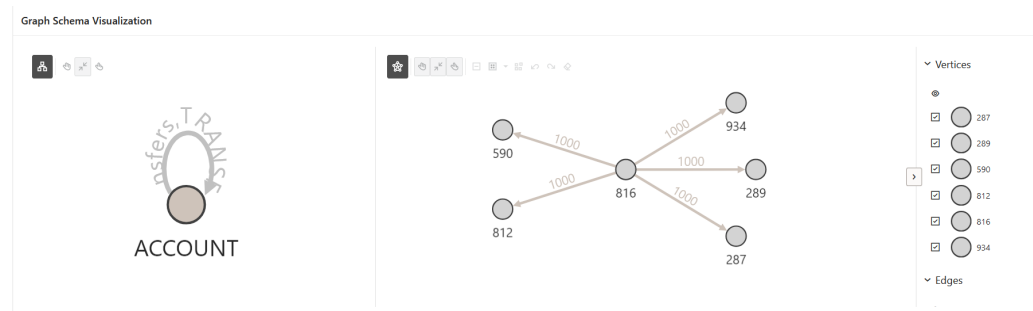

The owner and name of the graph must match those used in the SQL graph query.

If the graph is not qualified with the schema name in the SQL graph query, then the graph owner is the current schema that is associated with the APEX application workspace.

- d. Save and rerun the application page.
- e. Click **Schema View** in the graph visualization toolbar.

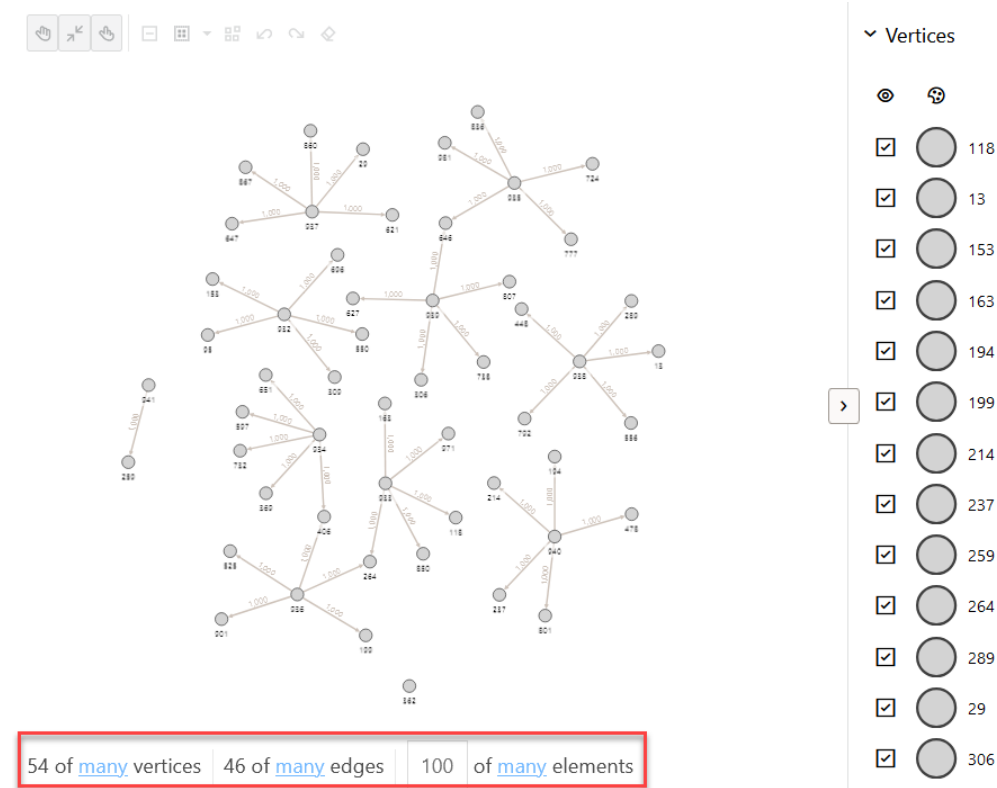

The schema visualization is shown alongside the SQL property graph query visualization. as shown:

Figure 9-2 Graph Schema Visualization

7. Optionally, you can control the display size of the graph by dynamically changing the number of elements to be displayed in the graph.

If the **Show Display Size Control** is switched ON in the [Appearance](#) panel, then the graph display size is rendered at the bottom of the graph visualization as shown:

Figure 9-3 Customizing the Graph Display Size

In the preceding figure:

- **54 of many vertices:** This indicates 54 vertices are displayed and **many** indicates the total number of vertices in the graph.
- **46 of many edges:** This indicates 46 edges are displayed and **many** indicates the total number of edges in the graph.
- **100 of many elements:** This indicates 100 elements are displayed and **many** indicates the total number of graph elements. The initial value depends on the **Display Size** configuration in the [Settings](#) panel.

See [Managing the Display Size of the Graph](#) on the various actions supported for customizing the graph display size.

- Optionally, you can import and run the **Sample Graph Visualizations** application from [Oracle APEX GitHub](#) repository.
- [Importing the Sample Graph Visualizations Application in APEX](#)
The **Sample Graph Visualizations** application demonstrates the use of the Graph Visualization plug-in.

9.2.1 Importing the Sample Graph Visualizations Application in APEX

The **Sample Graph Visualizations** application demonstrates the use of the Graph Visualization plug-in.

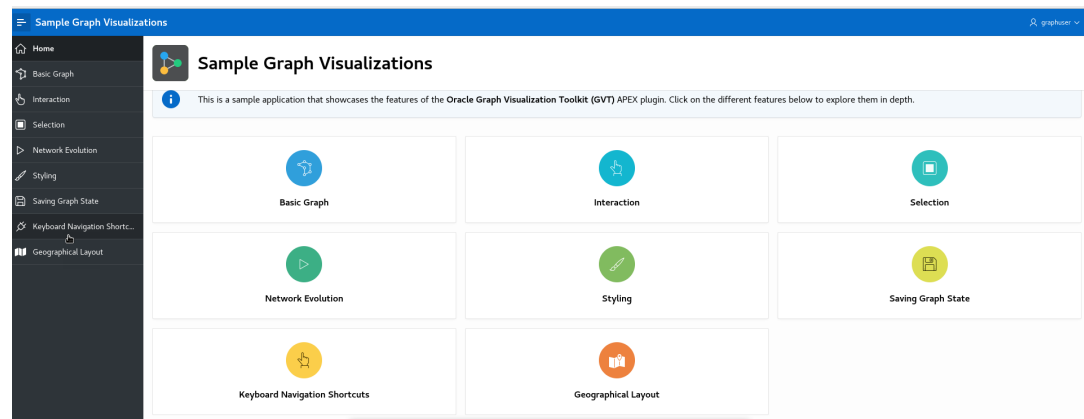

Perform the following steps to import the **Sample Graph Visualizations** application:

1. Download the **Sample Graph Visualizations** application from [Oracle APEX GitHub repository](#).
2. Create the `DBMS_GVT` package if it is not already added in your APEX workspace.
 - a. Download the `optional-23ai-only/gvt_sqlgraph_to_json.sql` file from the [Oracle APEX GitHub repository](#).
 - b. Upload and run the `gvt_sqlgraph_to_json.sql` script in your APEX workspace (see [Uploading a SQL Script](#)).
3. Import the `sample-apps/sample-graph-visualizations/sample-graph-visualizations_23ai.sql` into your APEX instance and install the application by following the steps in [Importing an Application](#).

When installing the sample application, ensure that you have the `CREATE VIEW`, `CREATE MATERIALIZED VIEW`, and `CREATE TRIGGER` privilege for installing the supporting objects.

You can directly run the sample application once it is installed.

Figure 9-4 Sample Graph Visualization Home Page

Also, note that the sample application requires a secure `HTTPS` connection. If you want to disable secure connection, then perform the following steps:

Caution

It is **not** recommended to disable secure connections in production deployment.

- a. Navigate to the sample application home page in **App Builder**.
- b. Click **Shared Components**.
- c. Click **Authentication Schemes** under **Security**.
- d. Click the **Current** authentication scheme.
- e. Click the **Session Sharing** tab and turn off the **Secure** switch.
- f. Click **Apply Changes** and then run the application.

9.3 Configuring Attributes for the APEX Graph Visualization Plug-in

Learn how to customize your graph visualization using the Graph Visualization plug-in attributes in your APEX application.

You can configure the attributes for the plug-in component in the **Attributes tab** (Property Editor) on the right pane of the Page Designer.

The attributes are grouped as per their scope in the following panels:

- [Settings](#)
- [Appearance](#)
- [Layout](#)
- [Captions](#)
- [Evolution](#)
- [Schema](#)
- [Advanced Options](#)
- [Callbacks Options](#)

9.3.1 Settings

The **Settings** panel appears as shown:

Figure 9-5 Settings

The screenshot shows the 'Settings' panel with a dark theme. It contains the following attributes:

Attribute	Value
Display Size	100
Live Search	Off
Show Legend	On
Legend Width	
Bind Variable for page_start, page_size (PGQL Only)	Off
Visibility Toggle Mode	- Select -

The following table describes the attributes in the **Settings** panel:

Table 9-1 Settings Attributes

Attribute	Description
Display Size	An integer value that determines how many elements are displayed in the graph. Default is 100.
Live Search	Switch on this toggle to enable Live Search when visualizing the graph.
Show Legend	Switch on this toggle to display the legend for the graph visualization.
Legend Width	An integer value that controls the legend width if you have enabled Show Legend . Default is 150.
Legend Width	An integer value that controls the legend width if you have enabled Show Legend . Default is 150.
Bind variable for page_start, page_size (PGQL Only)	This toggle enables binding variables for <code>page_start</code> and <code>page_size</code> parameters and applies only for PGQL property graphs. This toggle does not apply for SQL property graphs.
Visibility Toggle Mode	Specifies how the visibility of graph vertices and edges are determined when the visibility checkbox of a legend is toggled. The following options are supported: <ul style="list-style-type: none"> • Hide when any unchecked: Hide vertices or edges when any of the legend items influencing them have the visibility checkbox unchecked. • Hide when all unchecked: Hide vertices or edges when all the legend items influencing them have the visibility checkbox unchecked.

9.3.2 Appearance

The **Appearance** panel appears as shown:

The following table describes the attributes in the **Appearance** panel:

Table 9-2 Appearance Attributes

Attribute	Description
Height	An integer value (in px) to set the size of the graph visualization panel. Default value is 400 px.
Show Display Size Control	This toggle determines if the display size control feature needs to be displayed at the bottom of the graph visualization. It is switched ON by default. If this toggle is switched OFF, then the display size control feature is not displayed in the graph visualization panel.
Group Edges	When this option is enabled, multiple edges between the same source and target vertex will be grouped together in the graph. The grouped edges will be shown as a single edge with a number on it, indicating how many edges have been grouped.
Size Mode	Two size modes are supported: <ul style="list-style-type: none"> • Normal (default) • Compact
Edge Marker	Supported edge markers are: <ul style="list-style-type: none"> • None • Arrow (default)
Escape HTML in Tooltip	Switch on this toggle if you wish to escapes HTML content used on vertex or edge tooltip.
Tooltip Max Length	An integer value that determines the maximum length of characters for the tooltip. Default value is 100.
Dark Theme	Enable this toggle to switch to a dark theme.
Custom Theme	Enable this toggle if you wish to configure a custom theme for the following: <ul style="list-style-type: none"> • Background Color: Enter a color code or pick a color for the background. • Text Color: Enter a color code or pick a color for the text.
Default Values for Modes	Specifies the default state of mode for the following options: <ul style="list-style-type: none"> • Enable Interaction: Specifies the default state of the graph interaction mode. True activates Select mode and false switches to Move/Zoom mode in the toolbar. • Enable Fit to Screen: Specifies the default state of the Fit to Screen toggle button in the toolbar. • Enable Sticky Mode: Specifies the default state of the Sticky mode toggle button in the toolbar. • Enable Evolution Setting: Specifies the default state of the Evolution toggle button in the visualization panel. However, note that the Evolution button will be displayed only if Evolution is enabled in the Evolution section.

Table 9-2 (Cont.) Appearance Attributes

Attribute	Description
Display	<p>You can enable or disable the Modes and Exploration options. Supported Modes Options are:</p> <ul style="list-style-type: none"> • Interaction: • Fit to Screen • Sticky • Evolution <p>Supported Exploration Options are:</p> <ul style="list-style-type: none"> • Expand: To retrieve n-hops neighbors of selected vertices. • Focus: To shift the focus of view; it drops everything and fetches n-hops neighbors of the selected vertex. • Group: To group selected multiple vertices and collapse them into a single one. • Ungroup: To select a group of collapsed vertices and ungroup them. • Drop: To remove selected vertices or edges from the visualization. • Undo: To undo the last action. • Redo: To redo the last action. • Reset: To reset the visualization to its default state.

9.3.3 Layout

The **Layout** panel allows you to choose one of the following layout options:

- *Circle*
- *Concentric*
- *Force* (default)
- *Grid*
- *Hierarchical*
- *Radial*
- *Geographical*

The layout configuration parameters may vary for different layouts.

Force Layout

The *Force* layout configuration parameters are described in the following table:

Table 9-3 Force Layout Attributes

Attribute	Description
Spacing	Spacing determines how close different vertices are rendered next to each other. Default is 1.5.
Alpha Decay	Controls the rate at which the simulation's internal alpha value, which influences node movement, decreases over time, gradually stabilizing the force layout. Default is 0.01.
Velocity Decay	Determines how fast a simulation ends. Default is 0.1.

Table 9-3 (Cont.) Force Layout Attributes

Attribute	Description
Edge Distance	The simulation tries to set each edge to the specified length. This can affect the padding between vertices. Default is 100.
Vertex Charge	Influences the underlying forces (for example, to remain within the viewport, to push vertices away from each other, and so on). If Enable Cluster is true, then it influences the forces among clusters. Default is -60.
Enable Cluster	Switch on this toggle if you wish to enable cluster based layout.
Cluster By	By default, the cluster layout (if enabled) uses the first element in <code>vertex.labels</code> to form the cluster. It can also be set to the property name of a vertex, and the clusters will be formed based on the property value.
Hide Unclustered Vertices	Determines whether to display vertices that do not belong to any cluster. Default is false.

Circle, Concentric, and Radial Layouts

The following layouts require only the **Spacing** configuration:

- *Circle*: Spacing sets the radius of the circle. Default is 2.
- *Concentric*: Spacing sets the minimum spacing in between vertices. It is used for radius adjustment. Default is 2.
- *Radial*: Spacing sets separation gap between neighboring vertices if they share the same parent vertex. If set to 0, then spacing will not be applied. Default is 2.

Grid Layout

The *Grid* layout supports the following configuration options:

- **Spacing**: Spacing sets the space between elements in the grid. Default is 2.
- **Rows**: Determines the number of rows in the grid.
- **Columns**: Determines the number of columns in the grid.

The default number of rows and columns are dynamically calculated depending on the height and the width of the graph visualization panel.

Hierarchical Layout

The *Hierarchical* layout configuration parameters are described in the following table:

Table 9-4 Hierarchical Layout Attributes

Attribute	Description
Rank Direction	Alignment of the ranked vertices. Supported options are - Up to Left, Up to Right, Down to Left, Down to Right, Top to Bottom, Bottom to Top, Left to Right, Right to Left.
Ranker	Specifies the type of algorithm used to rank the vertices. Supported algorithms are: <i>Network Simplex</i> , <i>Tight Tree</i> , and <i>Longest Path</i> .

Table 9-4 (Cont.) Hierarchical Layout Attributes

Attribute	Description
Vertex Separation	Sets the horizontal separation between the vertices.
Edge Separation	Sets the horizontal separation between the edges.
Rank Separation	Sets the separation between two ranks(levels) in the graph.

Geographical Layout

The *Geographical* layout configuration parameters are described in the following table:

Table 9-5 Geographical Layout Attributes

Attribute	Description
Map Type	Select map type in map visualization or graph visualization settings, or provide your own sources and layers.
Longitude	Specify the vertex property to use for determining the longitude of a vertex.
Latitude	Specify the vertex property to use for determining the latitude of a vertex.
App ID	Specify the <i>appid</i> to fetch maps from http://maps.oracle.com/elocation . If omitted, a generic <i>appid</i> will be used.
Show Information	Enabling this toggle, displays an info box in the visualization that shows the latitude and longitude of the mouse position and the zoom level of the map.
Navigation	Displays the navigation controls towards the top right region of the map.
Markers	Displays location markers on the map

See Also

Layouts page in [JavaScript API Reference for Property Graph Visualization](#)

9.3.4 Captions

The **Captions** panel appears as shown:

Figure 9-7 Captions

The following table describes the attributes in the **Caption** panel:

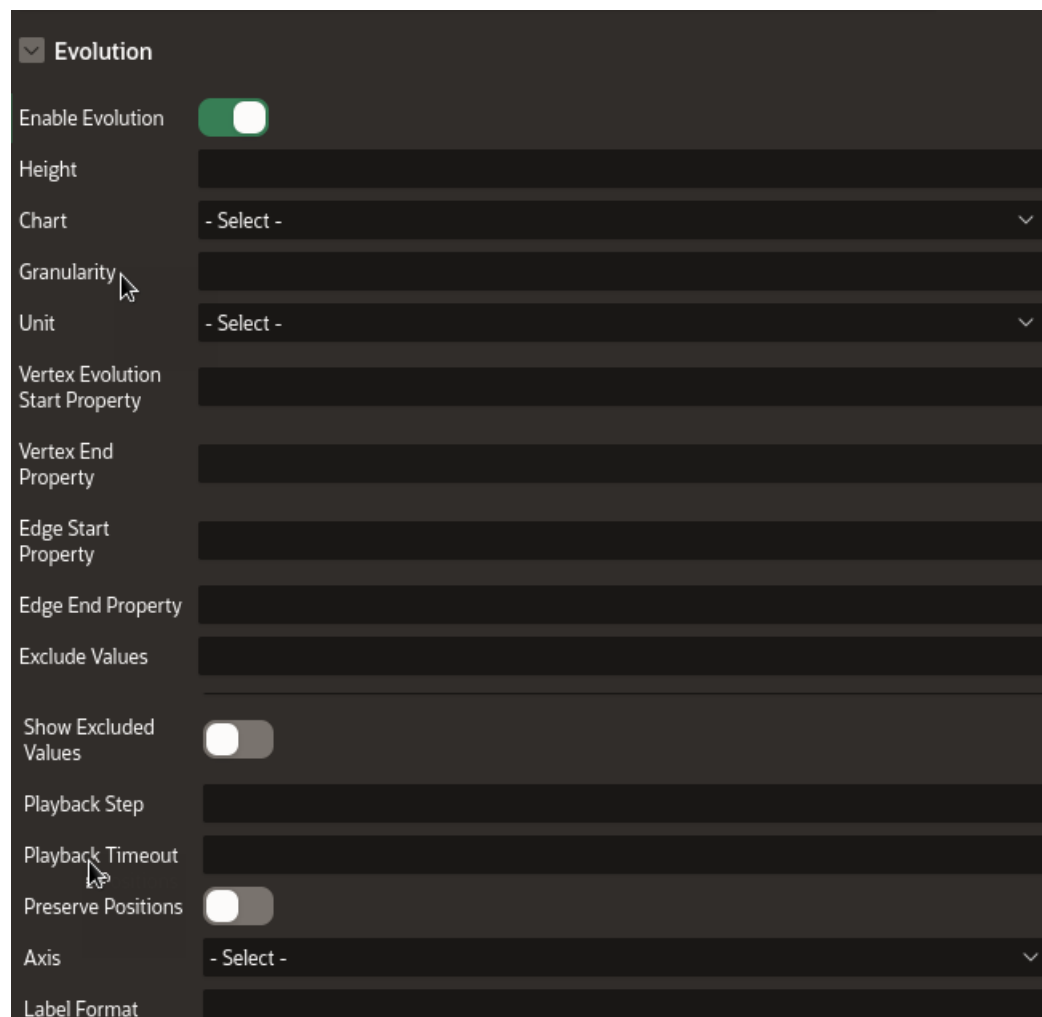

Table 9-6 Caption Attributes

Attribute	Description
Vertex Caption	Specify the property to be displayed as the vertex label.
Edge Caption	Specify the property to be displayed as the edge label.
Maximum Caption Length	Specify the maximum length of the caption.
Show full label text on hover	Enable this toggle if you wish to display the vertex and edge caption when hovering over a specific vertex or edge.

9.3.5 Evolution

The **Evolution** panel appears as shown:

Figure 9-8 Evolution

The following table describes the attributes in the **Evolution** panel:

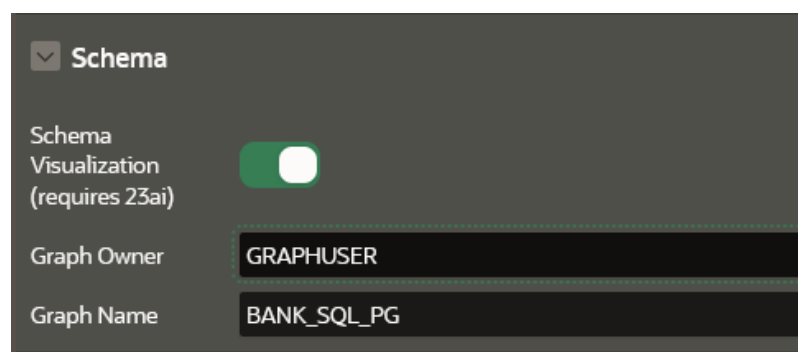

Table 9-7 Evolution Attributes

Attribute	Description
Enable Evolution	Switch on this toggle to enable network evolution in the graph visualization.
Height	Specify the height of the chart.
Chart	Select the chart type - <i>Bar</i> or <i>Line</i> .
Granularity	Specify the aggregation granularity for the input unit.
Unit	Select the unit of time for the increment.
Vertex Evolution Start Property	Select the name of the property to use for the vertex filtering. The time frame for the graph will be after the <i>Vertex Evolution Start Property</i> .
Vertex End Property	Select the name of the property to use for the vertex filtering. The time frame for the graph will be before the <i>Vertex End Property</i> .
Edge Start Property	Select the name of the property to use for the edge filtering. The time frame for the graph will be after the <i>Edge Start Property</i> .
Edge End Property	Select the name of the property to use for the edge filtering. The time frame for the graph will be before the <i>Edge End Property</i> .
Exclude Values	Specify one or more values to be excluded.
Show Excluded Values	Enable this toggle if you wish to display the excluded values.
Playback Step	Specify a value to determine how often does the playback advance in ms.
Playback Timeout	Specify a value to determine how many steps are taken per time out during playback.
Preserve Positions	If switched on, network evolution will keep the original vertex positions of the graph during playback.
Axis	Select one of the supported values - <i>vertices</i> , <i>edges</i> , or <i>both</i> .
Label Format	Specify a string that represents the format in which the date must be displayed. Note that the format must include either YYYY, MM, or DD. Otherwise, the format will be ignored.

9.3.6 Schema

The **Schema** panel appears as shown:

Figure 9-9 Schema

The following table describes the attributes in the **Schema** panel:

Table 9-8 Schema Attributes

Attribute	Description
Schema Visualization	Switch on this toggle to enable graph schema visualization.
Graph Owner	Specify the owner of the SQL property graph used in the SQL graph query. This is a mandatory parameter. If the graph is not qualified with the schema name in the SQL graph query, then the graph owner is the current schema that is associated with the APEX application workspace.
Graph Name	This is a mandatory parameter. Specify the name of the SQL property graph used in the SQL graph query.

9.3.7 Advanced Options

The **Advanced** panel appears as shown:

Figure 9-10 Advanced Options

The screenshot shows the 'Advanced' panel with the following sections and their corresponding text areas:

- Advanced** (checked)
- General Settings**: A large text area for general configuration.
- Rule Based Styles**: A text area for defining rule-based styles, with a cursor visible.
- Base Styles**: A text area for defining base styles, with a cursor visible.
- Styles (Deprecated - use BaseStyles instead)**: A text area for defining deprecated styles.
- Smart Groups**: A text area for defining smart groups.
- Evolution Settings**: A text area for defining evolution settings.

The **Advanced** panel allows you to configure custom and default styling for your graph visualization using the following options:

- [General Settings](#)

- [Rule-Based Styles](#)
- [Base Styles](#)
- [Smart Groups](#)
- [Evolution Settings](#)

9.3.7.1 General Settings

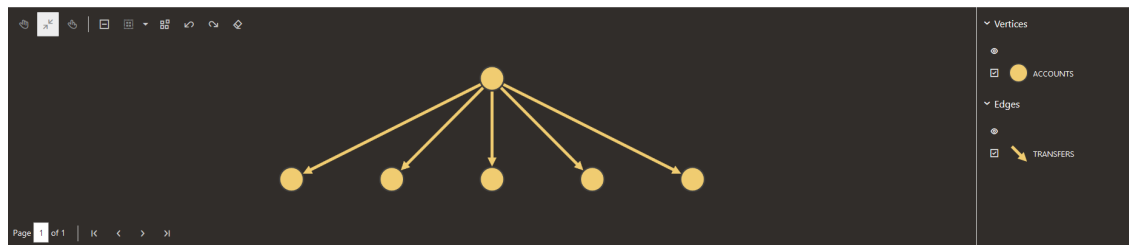

You can specify the general graph visualization settings (see [settings](#)) in JSON format.

For instance, the following JSON example specifies the theme, legend width, and layout configurations:

```
{
  "theme": "dark",
  "layout": "hierarchical",
  "legendWidth": "20"
}
```

The corresponding graph visualization is as shown:

Figure 9-11 Graph Visualization Using General Settings Configuration

9.3.7.2 Rule-Based Styles

Rule-based style expressions are used to specify the target element into which the given style must be applied. The applied custom style is reflected in the legend panel as well. See [Rule Expressions](#) in *Property Graph Visualization Developer's Guide and Reference* for more information.

For instance, the following JSON example creates a custom color style for employee IDs ranging from 100 to 110:

```
[
  {
    "_id": 1,
    "component": "vertex",
    "stylingEnabled": true,
    "target": "vertex",
    "visibilityEnabled": true,
    "conditions": {
      "operator": "and",
      "conditions": [
        {
          "property": "EMPLOYEE_ID",
```

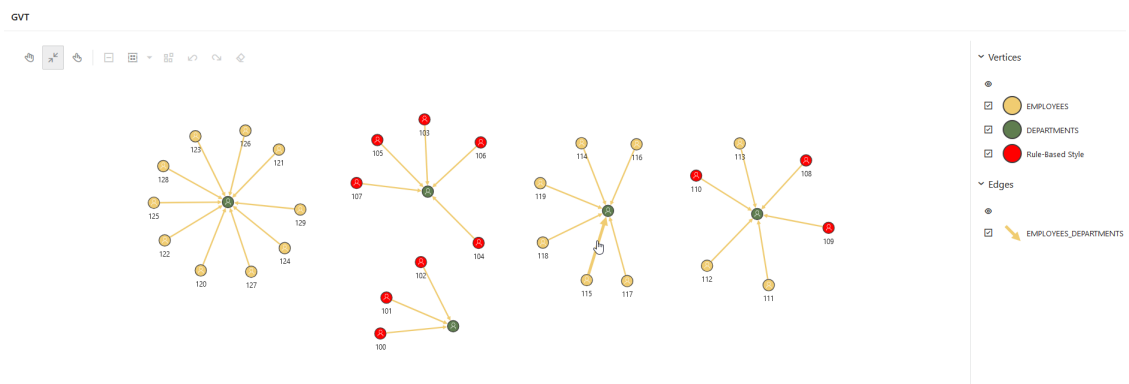

```

        "operator": ">=",
        "value": "100"
      },
      {
        "property": "EMPLOYEE_ID",
        "operator": "<=",
        "value": "110"
      }
    ]
  },
  "legendTitle": "Rule-Based Style",
  "style": {
    "color": "red"
  }
}
]

```

The corresponding graph visualization is as shown:

Figure 9-12 Graph Visualization Using Rule-Based Styling Configuration

For more examples, see [Rules Based Styles Usage](#) in *Property Graph Visualization Developer's Guide and Reference*.

9.3.7.3 Base Styles

Base style expressions are used to overwrite the default styling for the vertices and edges in the graph.

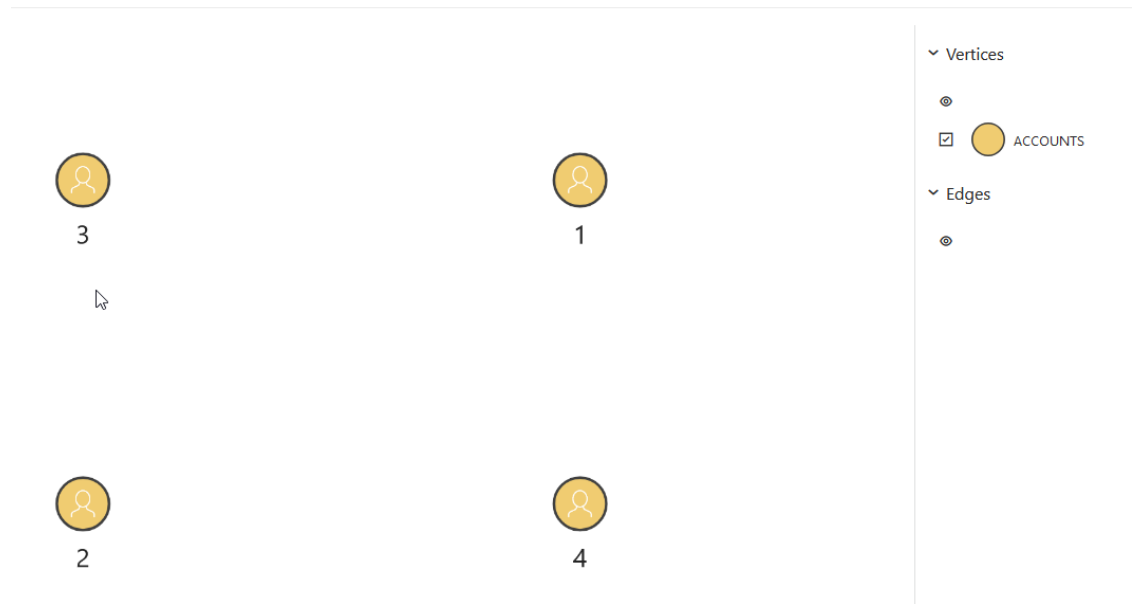

For instance, the following JSON example overwrites the default vertex styling:

```

{
  "vertex": {
    "size": 12,
    "label": "${properties.EMPLOYEE_ID}",
    "icon": "fa-user"
  }
}

```

The corresponding graph visualization is as shown:

Figure 9-13 Graph Visualization Using Base Style Configuration

For more examples, see [Base Style Usage](#) in *Property Graph Visualization Developer's Guide and Reference*.

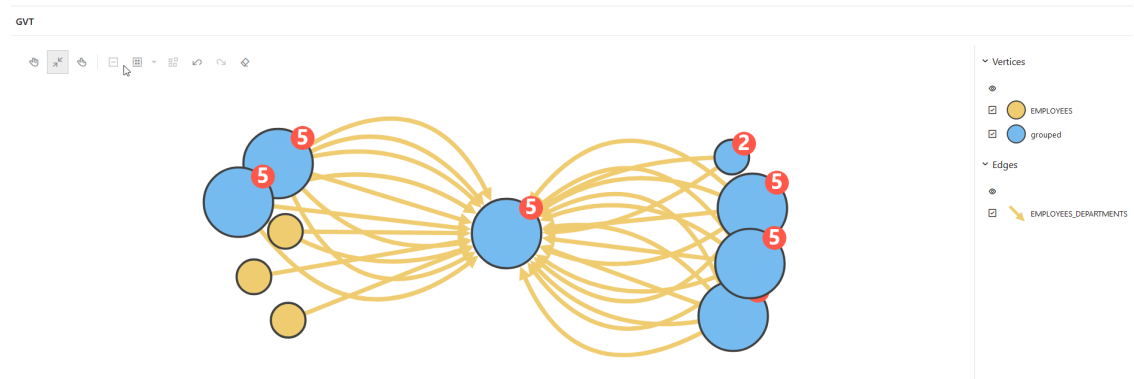

9.3.7.4 Smart Groups

You can specify the configuration for applying smart grouping in JSON format.

For instance, the following JSON example groups employees by their `JOB_ID`:

```
[
  {
    "_id": 1,
    "name": "Group By Job",
    "type": "group",
    "automatic": true,
    "enabled": true,
    "groupBy": "JOB_ID",
    "conditions": {
      "operator": "or",
      "conditions": [
        ]
      ]
    }
  ]
```

The corresponding graph visualization is as shown:

Figure 9-14 Graph Visualization Using Smart Group Configuration

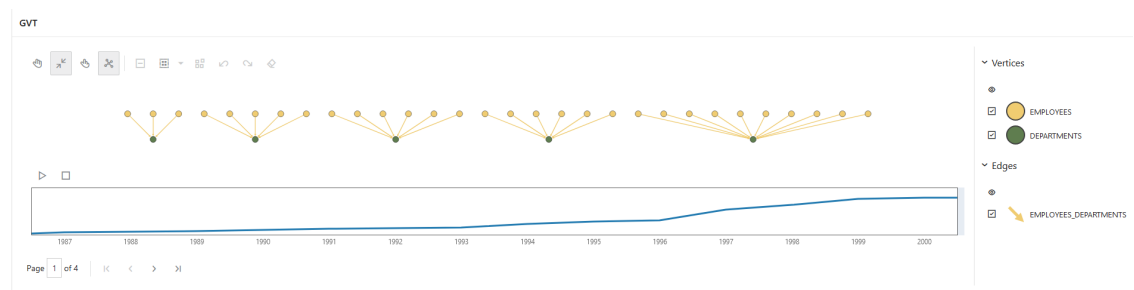

9.3.7.5 Evolution Settings

You can provide the configuration for network evolution in JSON format.

For example:

```
{
  "vertex": {
    "start": "properties.HIRE_DATE"
  },
  "unit": "year",
  "chart": "line"
}
```

The corresponding graph visualization is as shown:

Figure 9-15 Graph Visualization with Network Evolution

9.3.8 Callbacks Options

The **Callbacks** panel appear as shown:

Figure 9-16 Callbacks

The **Callbacks** panel comprises the following options:

Table 9-9 Callbacks Attributes

Attribute	Description
Expand	To expand a selected vertex in the graph visualization, see Expand for more information.
FetchActions	To retrieve the graph actions from a data source, refer to fetchActions for more information.
Persist	To persist the graph actions to a data source, refer to persist for more information.
UpdateGraphdata	Callback to handle events when the graph data is updated.

- [Expand](#)
You can expand a selected vertex in the graph and fetch the adjacent vertices using the Expand attribute in the Property Editor of the Page Designer.

9.3.8.1 Expand

You can expand a selected vertex in the graph and fetch the adjacent vertices using the Expand attribute in the Property Editor of the Page Designer.

1. Switch to the **Processing** tab on the left pane of the Page Designer and navigate to the **After Submit** node.
2. Right-click and select **Create Process** from the context menu.
3. Enter the process **Name**.
4. Specify **Type** as **Execute Code**.
5. Select the source **Location** as **Local Database**.

6. Select the source **Language** as **PL/SQL** and enter the following code in the PL/SQL input box.

```

DECLARE data clob;
  id VARCHAR2(100) := apex_application.g_x01;
  graph VARCHAR2(100) := '<graph_name>';
  hops NUMBER := <no_of_hops>;
  n NUMBER := hops - 1;
  match_clause VARCHAR2(100);
  query VARCHAR2(1000);

BEGIN
  IF n = 0 THEN
    match_clause := ' MATCH (x) -[e]-> (z) ';
  ELSE
    match_clause := ' MATCH (x) ->{',' || n || ' } (y) -[e]-> (z) ';
  END IF;

  query := 'SELECT id_x, id_e, id_z
            FROM GRAPH_TABLE ( ' || graph || ' match_clause ||
            'WHERE JSON_value(vertex_id(x), '$.ELEM_TABLE') ||
json_query(vertex_id(x), '$.KEY_VALUE' returning varchar2) = ''' || id
            || '''
            COLUMNS (vertex_id(x) as id_x, edge_id(e) as id_e,
vertex_id(z) as id_z))';
  SELECT <helper_function>(query) INTO data FROM sys.dual;
  http.p(data);
END;
```

In the preceding code:

- **<graph_name>**: Name of the graph
- **<hops>**: Number of hops to be expanded
- **<helper_function>**: Name of the function that provides the `CURSOR` for the SQL graph query as input to the `ORA_SQLGRAPH_TO_JSON` function and obtains the JSON output for visualization.

Note that the process takes the vertex `id` to be expanded as input and returns the resulting output as JSON.

7. Select the execution **Point** as **Ajax Callback**.
8. Switch to the **Rendering** tab on the left pane of the Page Designer and select the graph visualization component.
9. Switch to the **Attributes** tab on the right pane and enter the following code in the **Expand** input box in the **Callbacks** panel.

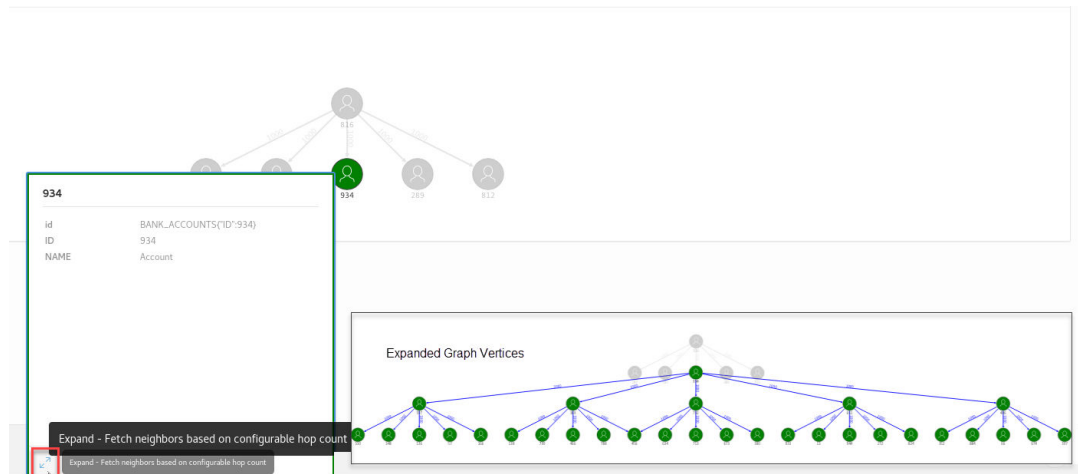

```

const data = await apex.server.process('<process_name>', {
  x01: ids[0]
}, { dataType: 'text' });
try {
  return JSON.parse(data);
} catch (error) {
  return [];
}
```

In the preceding code, `<process_name>` refers to the name of process that was provided at step-3.

10. Click **Save**.
11. Run the application page and you can now click expand (as shown highlighted in the following figure) on any specific vertex in the graph.

Figure 9-17 Expanding on a Specific Graph Vertex

The inset image in the preceding figure shows the graph with expanded vertices as rendered by the plug-in.

Getting Started with the Graph Visualization Extension for VS Code

Oracle SQL Developer Graph Visualization for VSCode enables you to visualize the results of SQL graph queries when using Oracle SQL Developer for Visual Studio Code (VS Code).

[VS Code](#) is a powerful open-source code editor supported on multiple operating systems (such as Linux, Windows, and macOS). [SQL Developer for VS Code](#) allows you to connect to your target database where you can open a SQL Worksheet to execute SQL statements and queries. The Graph Visualization extension extends the capability of the SQL Developer extension to support graph visualization when running SQL graph queries.

Before you begin using the Graph Visualization extension, ensure that you have VS Code Editor installed in your system and you are using Oracle Database 23ai. The instructions also assume that you have a SQL property graph already created in your database.

1. Open the VS Code Editor and click open the **Extensions** view.
2. Search and install **Oracle SQL Developer Graph Visualization for VSCode**.

The Oracle SQL Developer Extension for VS Code gets automatically installed as a dependency. You can view the **SQL Developer** icon in the Activity Bar on the left. If the SQL Developer extension was already installed in your system, then the extension gets updated with the graph visualization feature.

3. Connect to Oracle Database 23ai using the SQL Developer extension.
4. Open a SQL Worksheet and enter a SQL graph query.

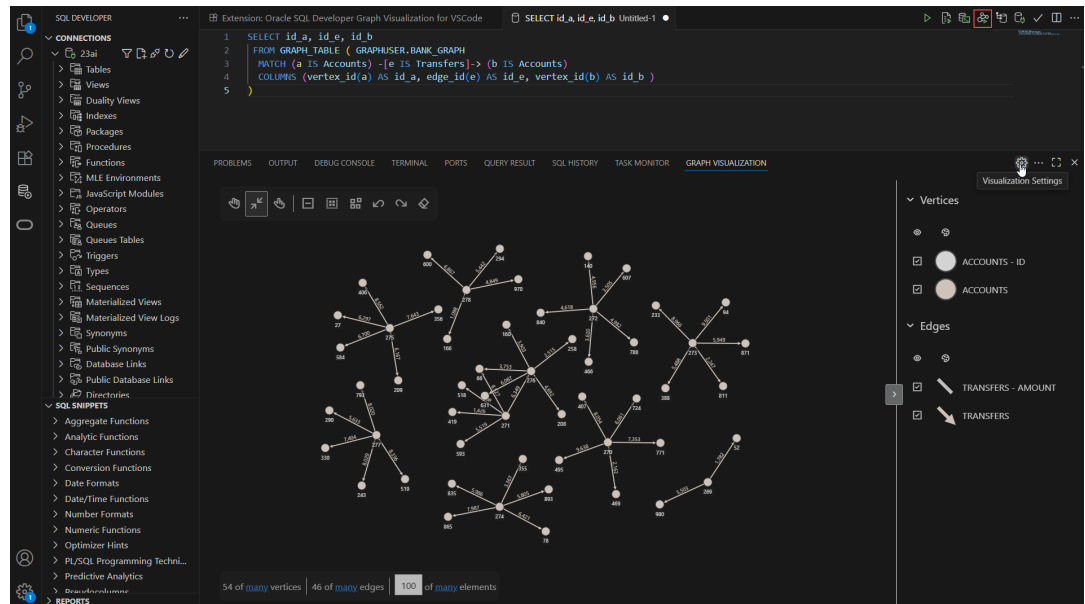

Note that to visualize the output of a SQL graph query, the query must use the `VERTEX_ID` and `EDGE_ID` functions to return the vertex and edge IDs. For example:

```
SELECT id_a, id_e, id_b
FROM GRAPH_TABLE ( GRAPHUSER.BANK_GRAPH
MATCH (a IS Accounts) -[e IS Transfers]-> (b IS Accounts)
COLUMNS (vertex_id(a) AS id_a, edge_id(e) AS id_e, vertex_id(b) AS id_b )
)
```

5. Click the **Visualize SQL Graph** button in the editor toolbar on the top (shown highlighted in the following figure), or use the command palette (`Ctrl+Shift+P`) and select **Visualize SQL Graph**.

The output graph is displayed in the SQL Worksheet output panel under the **Graph Visualization** tab. The graph visualization toolbar is displayed on top of the graph and the legend panel is displayed on the right.

Figure 10-1 Graph Visualization of SQL Graph Queries in VS Code

See Also

- [Layouts](#) and [Exploration Modes](#) in *Property Graph Visualization Developer's Guide and Reference*
- [Managing the Display Size of the Graph](#)

6. Optionally, click **Visualization Settings** to add captions, new styles, or edit the default legend styles.

Part III

PGQL Property Graphs

Learn and work with PGQL property graphs (also known as property graph views).

You can work with PGQL property graphs if you are using Oracle Database 23ai or earlier database versions.

- [About PGQL Property Graphs](#)
You can create PGQL property graphs over data stored in Oracle Database. You can perform various graph analytics operations using PGQL on the graphs.
- [Loading a PGQL property graph into the Graph Server \(PGX\)](#)
You can load a full PGQL property graph or a subgraph into the graph server (PGX).
- [Quick Starts for Using PGQL Property Graphs](#)
This chapter contains quick start tutorials and other resources to help you get started on working with PGQL property graphs.
- [Getting Started with the Client Tools](#)
You can use multiple client tools to interact with the graph server (PGX) or directly with the graph data in the database.
- [Property Graph Query Language \(PGQL\)](#)
PGQL is a SQL-like query language for property graph data structures that consist of *vertices* that are connected to other vertices by *edges*, each of which can have key-value pairs (properties) associated with them.

About PGQL Property Graphs

You can create PGQL property graphs over data stored in Oracle Database. You can perform various graph analytics operations using PGQL on the graphs.

The following sections explain PGQL property graphs in detail:

- [Creating PGQL Property Graphs on Oracle Database Tables](#)
The CREATE PROPERTY GRAPH statement in PGQL can be used to create a view-like object that contains metadata about the graph. This graph can be queried using PGQL.
- [Creating a PGQL Property Graph By Importing a GraphSON file](#)
Using the `GraphImporterBuilder` API, you can create a PGQL property graph by importing graph data from a GraphSON file.
- [Using JSON to Store Vertex and Edge Properties](#)
You can adopt a flexible schema approach in a PGQL property graph by encoding the vertex and edge properties as a single JSON value. You can then map this to a property value in a PGQL property graph.

11.1 Creating PGQL Property Graphs on Oracle Database Tables

The CREATE PROPERTY GRAPH statement in PGQL can be used to create a view-like object that contains metadata about the graph. This graph can be queried using PGQL.

PGQL property graphs are created directly over data that exists in the relational database tables. These graphs are stored in the database tables and therefore they have a schema.

One of the main benefits of PGQL property graphs is that all updates to the database tables are immediately reflected in the graph.

Metadata Tables for PGQL Property Graphs

Each time a CREATE PROPERTY GRAPH statement is executed, metadata tables are created in the user's own schema.

The following table describes the set of metadata tables that are created for each graph on executing CREATE PROPERTY GRAPH statement.

All columns shown underlined in the [Table 11-1](#) are part of the primary key of the table. Also all columns have a NOT NULL constraint.

Table 11-1 Metadata Tables for PGQL Property Graphs

Table Name	Description
graphName_ <u>ELEM_TABLE</u> \$	Metadata for graph element (vertex/edge) tables (one row per element table): <ul style="list-style-type: none"> • <u>ET_NAME</u>: the name of the element table (the "alias") • <u>ET_TYPE</u>: either "VERTEX" or "EDGE" • <u>SCHEMA_NAME</u>: the name of the schema of the underlying table • <u>TABLE_NAME</u>: the name of underlying table

Table 11-1 (Cont.) Metadata Tables for PGQL Property Graphs

Table Name	Description
graphName_LABEL\$	Metadata on labels of element tables (one row per label; one label per element table): <ul style="list-style-type: none"> <u>LABEL_NAME</u>: the name of the label <u>ET_NAME</u>: the name of the element table (the "alias") <u>ET_TYPE</u>: either "VERTEX" or "EDGE"
graphName_PROPERTY\$	Metadata describing the columns that are exposed through a label (one row per property) <ul style="list-style-type: none"> <u>PROPERTY_NAME</u>: the name of the property <u>ET_NAME</u>: the name of the element table (the "alias") <u>ET_TYPE</u>: either "VERTEX" or "EDGE" <u>LABEL_NAME</u>: the name of the label that this property belongs to <u>COLUMN_NAME</u>: the name of the column (initially, only the case where property names equal column names is allowed)
graphName_KEY\$	Metadata describing a vertex/edge key (one row per column in the key) <ul style="list-style-type: none"> <u>COLUMN_NAME</u>: the name of the column in the key <u>COLUMN_NUMBER</u>: the number of the column in the key For example, in KEY (a, b, c), "a" has number 1, "b" has number 2 and "c" has number 3. <u>KEY_TYPE</u>: either "VERTEX" or "EDGE" <u>ET_NAME</u>: the name of the element table (the "alias")
graphName_SRC_DST_KEY\$	Metadata describing the edge source/destination keys (one row per column of a key): <ul style="list-style-type: none"> <u>ET_NAME</u>: the name of the element table (the "alias"), which is always an edge table <u>VT_NAME</u>: the name of the vertex table <u>KEY_TYPE</u>: either "EDGE_SOURCE" or "EDGE_DESTINATION" <u>ET_COLUMN_NAME</u>: the name of the key column <u>ET_COLUMN_NUMBER</u>: the number of the column in the key. For example, in KEY (a, b, c), "a" has number 1, "b" has number 2 and "c" has number 3.

Note

Currently, support is only for **SOURCE KEY (...) REFERENCES T1**. So only the edge source/destination key is stored.

Example 11-1 To create a PGQL property graph

Consider the following CREATE PROPERTY GRAPH statement:

```
CREATE PROPERTY GRAPH student_network
  VERTEX TABLES(
    person
      KEY ( id )
      LABEL student
      PROPERTIES( name ),
    university
```

```

        KEY ( id )
        PROPERTIES( name )
    )
    EDGE TABLES(
        knows
        key (person1, person2)
        SOURCE KEY ( person1 ) REFERENCES person (id)
        DESTINATION KEY ( person2 ) REFERENCES person (id)
        NO PROPERTIES,
        person AS studentOf
        key (id, university)
        SOURCE KEY ( id ) REFERENCES person (id)
        DESTINATION KEY ( university ) REFERENCES university (id)
        NO PROPERTIES
    )
    OPTIONS (PG_PGQL)

```

The `OPTIONS` clause allows the creation of a PGQL property graph. You must simply pass the `CREATE PROPERTY GRAPH` statement to the `execute` method:

Note

- You can create PGQL property graphs using the RDBMS Java API or through SQLcl.
- You can query PGQL property graphs using the graph visualization tool or SQLcl.

```
stmt.execute("CREATE PROPERTY GRAPH student_network ...");
```

This results in the creation of the following metadata tables:

```
SQL> SELECT * FROM STUDENT_NETWORK_ELEM_TABLE$;
```

ET_NAME	ET_TYPE	SCHEMA_NAME	TABLE_NAME
PERSON	VERTEX	SCOTT	PERSON
UNIVERSITY	VERTEX	SCOTT	UNIVERSITY
KNOWS	EDGE	SCOTT	KNOWS
STUDENTOF	EDGE	SCOTT	PERSON

```
SQL> SELECT * FROM STUDENT_NETWORK_LABEL$;
```

LABEL_NAME	ET_NAME	ET_TYPE
STUDENT	PERSON	VERTEX
UNIVERSITY	UNIVERSITY	VERTEX
KNOWS	KNOWS	EDGE
STUDENTOF	STUDENTOF	EDGE

```
SQL> SELECT * FROM STUDENT_NETWORK_PROPERTY$;
```

PROPERTY_NAME	ET_NAME	ET_TYPE	LABEL_NAME	COLUMN_NAME
---------------	---------	---------	------------	-------------

```

-----
NAME          PERSON      VERTEX  STUDENT  NAME
NAME          UNIVERSITY VERTEX  UNIVERSITY NAME

```

```
SQL> SELECT * FROM STUDENT_NETWORK_KEY$;
```

```

COLUMN_NAME  COLUMN_NUMBER KEY_TY ET_NAME
-----
ID            1 VERTEX PERSON
ID            1 VERTEX UNIVERSITY
PERSON1       1 EDGE  KNOWS
PERSON2       2 EDGE  KNOWS
ID            1 EDGE  STUDENTOF
UNIVERSITY    2 EDGE  STUDENTOF

```

```
SQL> SELECT * FROM STUDENT_NETWORK_SRC_DST_KEY$;
```

```

ET_NAME      VT_NAME      KEY_TYPE      ET_COLUMN_NAME  ET_COLUMN_NUMBER
-----
KNOWS        PERSON       EDGE_SOURCE   PERSON1          1
KNOWS        PERSON       EDGE_DESTINATION PERSON2          1
STUDENTOF    PERSON       EDGE_SOURCE   ID               1
STUDENTOF    UNIVERSITY   EDGE_DESTINATION UNIVERSITY        1

```

You can now run PGQL queries on the `student_network` PGQL property graph.

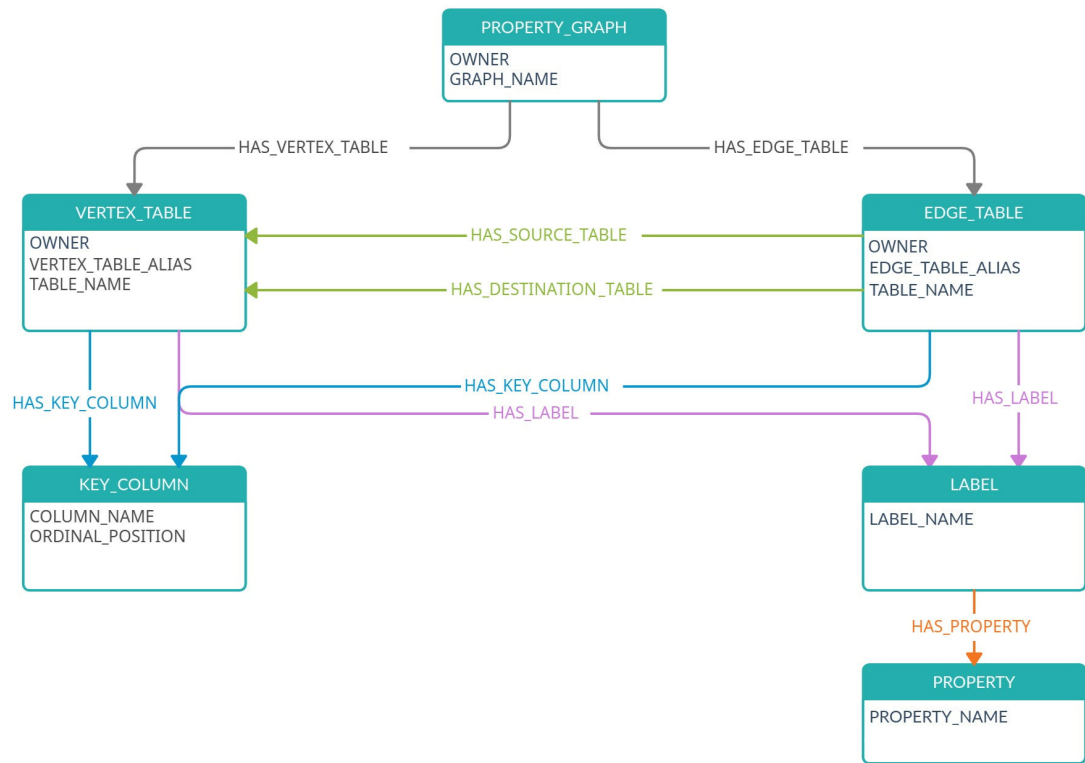

See [Executing PGQL Queries Against PGQL Property Graphs](#) for more details to create, query and drop PGQL property graphs.

- [Retrieving Metadata for PGQL Property Graphs](#)
You can retrieve the metadata of PGQL property graphs created in the database using the built-in `PROPERTY_GRAPH_METADATA` graph in your PGQL queries.
- [Privileges for Working with PGQL Property Graphs](#)
Learn about the privileges that are required for working with PGQL property graphs.

11.1.1 Retrieving Metadata for PGQL Property Graphs

You can retrieve the metadata of PGQL property graphs created in the database using the built-in `PROPERTY_GRAPH_METADATA` graph in your PGQL queries.

The `PROPERTY_GRAPH_METADATA` graph structure including properties is as shown:

Figure 11-1 PROPERTY_GRAPH_METADATA Graph Design

The following describes the preceding design of the metadata graph:

```

PROPERTY_GRAPH -[:HAS_VERTEX_TABLE]-> VERTEX_TABLE
               -[:HAS_EDGE_TABLE]-> EDGE_TABLE

VERTEX_TABLE -[:HAS_KEY_COLUMN]-> KEY_COLUMN
              -[:HAS_LABEL]-> LABEL

EDGE_TABLE -[:HAS_KEY_COLUMN]-> KEY_COLUMN
            -[:HAS_LABEL]-> LABEL
            -[:HAS_SOURCE_TABLE]-> VERTEX_TABLE
            -[:HAS_DESTINATION_TABLE]-> VERTEX_TABLE

LABEL -[:HAS_PROPERTY]-> PROPERTY
  
```

It is important to note the following when using `PROPERTY_GRAPH_METADATA` in PGQL queries:

- The `PROPERTY_GRAPH_METADATA` graph is automatically created and updated the first time you attempt to access it in a PGQL query.
- The `PROPERTY_GRAPH_METADATA` graph is similar to a PGQL property graph and has its own set of metadata tables that describe its structure. In addition to the metadata tables for PGQL property graphs that are described in [Table 11-1](#), the graph data for `PROPERTY_GRAPH_METADATA` is also stored in database objects that are listed in the following table:

Table 11-2 Additional Metadata Tables

Table Name	Description
PROPERTY_GRAPH_METADATA_GRAPH_LIST\$	Metadata table describing the list of PGQL property graphs to which the current user has access
PROPERTY_GRAPH_METADATA_EDGE_KEY_COLUMNS\$	Metadata table describing the edge key columns
PROPERTY_GRAPH_METADATA_EDGE_LABELS\$	Metadata table describing the edge labels
PROPERTY_GRAPH_METADATA_EDGE_TABLES\$	Metadata table describing the edge tables
PROPERTY_GRAPH_METADATA_LABEL_PROPERTIES\$	Metadata table describing the vertex and edge label properties
PROPERTY_GRAPH_METADATA_LABELS\$	Metadata table describing the vertex and edge labels
PROPERTY_GRAPH_METADATA_VERTEX_KEY_COLUMNS\$	Metadata table describing the vertex key columns
PROPERTY_GRAPH_METADATA_VERTEX_LABELS\$	Metadata table describing the vertex labels
PROPERTY_GRAPH_METADATA_VERTEX_TABLES\$	Metadata table describing the vertex tables

Note

It is important that you do not alter or remove any of the metadata tables for the PROPERTY_GRAPH_METADATA graph.

- When running PGQL queries using the Java API, you must disable autocommit on the JDBC connection (`conn.setAutoCommit(false)`). This ensures that PROPERTY_GRAPH_METADATA graph gets created automatically.

The following examples show using PROPERTY_GRAPH_METADATA in PGQL queries to retrieve the required metadata.

You can retrieve the list of graphs to which you have access as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> String pgql =
...> "SELECT g.graph_name "
...> +"FROM MATCH (g:property_graph) ON property_graph_metadata "
...> +"ORDER BY g.graph_name"
pgql ==> "SELECT g.graph_name FROM MATCH (g:property_graph) ON
property_graph_metadata ORDER BY g.graph_name"
opg4j> pgqlStmt.executeQuery(pgql).print()
```

Java

```
String pgql = "SELECT g.graph_name "+
"FROM MATCH (g:property_graph) ON property_graph_metadata "+
"ORDER BY g.graph_name";
PgqlResultSet rs = pgqlStmt.executeQuery(pgql);
rs.print();
```

Python

```
>>> pgql = '''
... SELECT g.graph_name
... FROM MATCH (g:property_graph) ON property_graph_metadata
... ORDER BY g.graph_name
... '''
>>> pgql_statement.execute_query(pgql).print()
```

On execution, the preceding query produces the following result:

```
+-----+
| GRAPH_NAME |
+-----+
| BANK_GRAPH_VIEW |
| FINANCIAL_TRANSACTIONS |
| FRIENDS |
+-----+
```

You can retrieve the vertex properties of a graph as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> String pgql =
...> "SELECT p.property_name "
...> +"FROM MATCH(g:property_graph)-[:has_vertex_table]->(v)-[:has_label]-
>(l:label)-[:has_property]->(p:property) "
...> +"ON property_graph_metadata "
...> +"WHERE g.graph_name = 'FRIENDS' "
pgql ==> "SELECT p.property_name FROM MATCH(g:property_graph)-
[:has_vertex_table]->(v)-[:has_label]->(l:label)-[:has_property]-
>(p:property) ON property_graph_metadata WHERE g.graph_name = 'FRIENDS' "
opg4j> pgqlStmt.executeQuery(pgql).print()
```

Java

```
String pgql = "SELECT p.property_name "+
"FROM MATCH(g:property_graph)-[:has_vertex_table]->(v)-[:has_label]->(l:label)-[:has_property]->(p:property) "+
"ON property_graph_metadata "+
"WHERE g.graph_name = 'FRIENDS' ";
PgqlResultSet rs = pgqlStmt.executeQuery(pgql);
rs.print();
```

Python

```
>>> pgql = '''
... SELECT p.property_name
... FROM MATCH(g:property_graph)-[:has_vertex_table]->(v)-[:has_label]->(l:label)-[:has_property]->(p:property)
... ON property_graph_metadata
... WHERE g.graph_name = 'FRIENDS'
... '''
>>> pgql_statement.execute_query(pgql).print()
```

On execution, the preceding query produces the following result:

```
+-----+
| PROPERTY_NAME |
+-----+
| BIRTHDATE     |
| HEIGHT        |
| NAME          |
+-----+
```

11.1.2 Privileges for Working with PGQL Property Graphs

Learn about the privileges that are required for working with PGQL property graphs.

In order to create PGQL property graphs, ensure that you have the following privileges:

```
CREATE SESSION
CREATE TABLE
```

Note that these privileges can be granted directly to the user:

```
GRANT CREATE SESSION, CREATE TABLE TO <graphuser>
```

Or they can be granted indirectly through an appropriate role:

```
GRANT CREATE SESSION, CREATE TABLE TO GRAPH_DEVELOPER
```

For loading a PGQL property graph created by another user into the graph server (PGX), you must have:

- `SELECT` permission on the underlying source database tables or views.
- `SELECT` permission on the metadata tables used by the PGQL property graph. See [Table 11-1](#) and [Table 11-2](#) for more details on the metadata tables.

11.2 Creating a PGQL Property Graph By Importing a GraphSON file

Using the `GraphImporterBuilder` API, you can create a PGQL property graph by importing graph data from a GraphSON file.

This import functionality consists of the following steps:

1. Parsing of the GraphSON to a data structure.
2. Creating the SQL tables from the data structure and inserting the data.
3. Generating and running the `CREATE PROPERTY GRAPH` statement.

The following example show using the `GraphImporterBuilder` API to create a PGQL property graph from a GraphSON file.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> import oracle.pg.imports.*
opg4j> var importer = new GraphImporter.Builder().
...>   setFilePath("<path_to_graphson_file>").
...>   setBatchSize(2).
...>   setInputFormat(GraphImportInputFormat.GRAPHSON).
...>   setOutputFormat(GraphImportOutputFormat.PG_PGQL).
...>   setThreads(4).
...>   setDbJdbcUrl("<jdbc_url>").
...>   setDbUsername("<username>").
...>   setDbPassword("<password>").
...>   setGraphName("mygraph").
...>   build()
importer ==> oracle.pg.imports.GraphImporter@5d957cf0
opg4j> var ddl = importer.importGraph()
```

Java

```
import oracle.pg.imports.*;
GraphImporter importer = new GraphImporter.Builder()
    .setFilePath("<path_to_graphson_file>")
    .setBatchSize(2)
```

```

.setInputFormat(GraphImportInputFormat.GRAPHSON)
.setOutputFormat(GraphImportOutputFormat.PG_PGQL)
.setThreads(4)
.setDbJdbcUrl("<jdbc_url>")
.setDbUsername("<username>")
.setDbPassword("<password>")
.setGraphName("mygraph")
.build();

```

Python

```

>>> from opg4py.graph_importer import GraphImporter
>>> config = {
...     'jdbc_url'      : '<jdbc_url>',
...     'username'      : '<username>',
...     'password'      : '<password>',
...     'file_path'     : '<path_to_graphson_file>',
...     'graph_name'    : 'mygraph',
...     'output_format' : 'pg_pgql',
...     'input_format'  : 'graphson'
... }
>>> importer = GraphImporter(config)
>>> importer.import_graph()

```

The preceding example sets up the required SQL tables in the database, generates and runs the DDL statement to create *mygraph*. For instance, this example generates the following CREATE PROPERTY GRAPH DDL statement:

```

"CREATE PROPERTY GRAPH mygraph
  VERTEX TABLES (
    software
      KEY (id)
      LABEL software
      PROPERTIES ARE ALL COLUMNS,
    person
      KEY (id)
      LABEL person
      PROPERTIES ARE ALL COLUMNS
  )
  EDGE TABLES (
    created
      KEY (id)
      SOURCE KEY (sid) REFERENCES person (id)
      DESTINATION KEY (did) REFERENCES software (id)
      LABEL created
      PROPERTIES ARE ALL COLUMNS,
    knows
      KEY (id)
      SOURCE KEY (sid) REFERENCES person (id)
      DESTINATION KEY (did) REFERENCES person (id)
      LABEL knows

```

```

        PROPERTIES ARE ALL COLUMNS
    ) OPTIONS ( PG_PGQL )"

```

Alternatively, you can also create a connection to the database by using a data source to connect to the database as shown in the following example:

- [JShell](#)
- [Java](#)

JShell

```

opg4j> import oracle.pg.imports.*
opg4j> import oracle.jdbc.pool.OracleDataSource

opg4j> var ds = new OracleDataSource() // setup the data source
ds ==> oracle.jdbc.pool.OracleDataSource@4154ecd3
ds.setURL("<jdbc_url>")
ds.setUser("<username>")
ds.setPassword("<password>")

opg4j> var importer = new GraphImporter.Builder().
...>     setFilePath("<path_to_graphson_file>").
...>     setBatchSize(2).
...>     setInputFormat(GraphImportInputFormat.GRAPHSON).
...>     setOutputFormat(GraphImportOutputFormat.PG_PGQL).
...>     setThreads(4).
...>     setDataSource(ds).
...>     setGraphName("mygraph").
...>     build()
importer ==> oracle.pg.imports.GraphImporter@5d957cf0
opg4j> var ddl = importer.importGraph()

```

Java

```

import oracle.pg.imports.*;
import oracle.jdbc.pool.OracleDataSource;
//Setup the datasource
var ds = new OracleDataSource();
ds.setURL(<jdbc_url>)
ds.setUser(<username>);
ds.setPassword(<password>);
//Setup the GraphImporter
GraphImporter importer = new GraphImporter.Builder()
    .setFilePath("<path_to_graphson_file>")
    .setBatchSize(2)
    .setInputFormat(GraphImportInputFormat.GRAPHSON)
    .setOutputFormat(GraphImportOutputFormat.PG_PGQL)
    .setThreads(4)
    .setDataSource(ds)
    .setGraphName("mygraph")

```

```
.build();
var ddl = importer.importGraph();
```

Also, note the following:

- The `GraphImporterBuilder` API supports GraphSON file format version 3.0 only.
- Only GraphSON data types listed in [Table 11-7](#) are supported.

The following sections provide more details on the `GraphImporter` parameters and the data type mapping between GraphSON and Oracle Database.

- [Additional Information on the GraphImporter Parameters](#)
Learn more about the parameters used by the `GraphImporter`.
- [Mapping GraphSON Types to Oracle Database Data Types](#)
The GraphSON data types can be mapped to their corresponding Oracle Database data types.

11.2.1 Additional Information on the GraphImporter Parameters

Learn more about the parameters used by the `GraphImporter`.

Table 11-3 Database Connection Parameters

Parameter	Description	Setter in API	Default Value	Optional
<code>dataSource</code>	Data source for the database	<code>setDataSource</code>	NULL	Only if passing <code>dbJdbcUrl</code> , <code>dbUsername</code> and <code>dbPassword</code>
<code>dbJdbcUrl</code>	JDBC url of the database	<code>setDbJdbcUrl</code>	" "	Only if passing a <code>dataSource</code>
<code>dbPassword</code>	Database password	<code>setDbPassword</code>	" "	Only if passing a <code>dataSource</code>
<code>dbUsername</code>	Database user name	<code>setDbUsername</code>	" "	Only if passing a <code>dataSource</code>

Table 11-4 GraphImporter Configuration Parameters

Parameter	Description	Setter in API	Default Value	Optional
<code>pathName</code>	Path to the GraphSON file	<code>setPathname</code>	" "	No
<code>graphName</code>	Resulting graph name	<code>setGraphName</code>	" "	Yes
<code>inFormat</code>	Input format for the importer	<code>setInputFormat</code>	<code>GraphImporterInputFormat.GRAPHSON</code>	Yes

Table 11-4 (Cont.) GraphImporter Configuration Parameters

Parameter	Description	Setter in API	Default Value	Optional
outFormat	Output format for the importer	setOutputFormat	GraphImportOutputFormat.PG_PGQL	Yes
batchSize	Number of rows read before inserting data to the database	setBatchSize	1000	Yes
threads	Number of threads to be used to insert to the database	setThreads	1	Yes

Table 11-5 SQL Storage Parameters

Parameter	Description	Setter in API	Default Value	Optional
stringFieldSize	GraphSON String data type is translated as VARCHAR2 in the database. This parameter represents the VARCHAR2 size for the data storage.	setStringFieldsSize	100	Yes
fractionalSecondsPrecision	The fractional seconds precision parameter found in TIMESTAMP data type in the Oracle Database.	setFractionalSecondsPrecision	6	Yes

Table 11-6 PGQL Supported Parameters

Parameter	Description	Setter in API	Default Value	Optional
parallel	Degree of parallelism to use for query and update operations	setPathname	0	Yes
dynamicSampling	Dynamic sampling value	setGraphName	2	Yes
matchOptions	Additional options used to influence query translation and execution	setMatchOptions	NULL	Yes

Table 11-6 (Cont.) PGQL Supported Parameters

Parameter	Description	Setter in API	Default Value	Optional
options	Additional options used to influence modify translation and execution	setOptions	NULL	Yes

11.2.2 Mapping GraphSON Types to Oracle Database Data Types

The GraphSON data types can be mapped to their corresponding Oracle Database data types.

The following table shows GraphSON data types mapping to Oracle Database data types:

Table 11-7 Mapping GraphSON Types to Oracle Database Types

GraphSON Type	Oracle Database Type
String	VARCHAR2 ¹
g:Int32	NUMBER(10)
g:Int64	NUMBER(10)
g:Float	FLOAT
g:Double	FLOAT
g:Date	DATE
g:Timestamp	TIMESTAMP ²
g:UUID	CHAR(36)

¹ You can use the `stringFieldSize` parameter to determine the string size for the database to store on the String columns.

² You can use the `fractionalSecondsPrecision` parameter to specify the precision on the columns of type Timestamp.

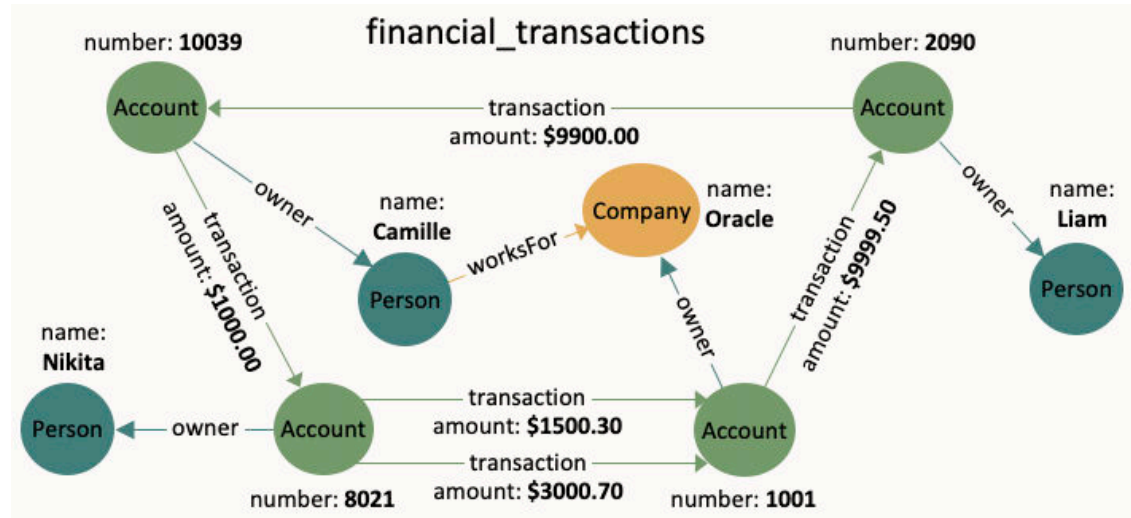

11.3 Using JSON to Store Vertex and Edge Properties

You can adopt a flexible schema approach in a PGQL property graph by encoding the vertex and edge properties as a single JSON value. You can then map this to a property value in a PGQL property graph.

PGQL property graphs do not provide schema flexibility by nature since adding a new label requires adding a new vertex or edge table, and adding a new property requires adding a new column, both of which are schema update operations. However, through the use of JSON you can model schema flexibility on top of PGQL property graphs.

For example, consider the following graph which represents financial transactions between two Account vertices. The Account can be owned either by a Person or a Company.

Figure 11-2 Financial Transactions Graph

You can create a single table for storing all the vertices and another single table for storing all the edges, as shown:

```

CREATE TABLE fin_vertex_table (
  id NUMBER PRIMARY KEY,
  properties VARCHAR2(2000)
);

INSERT INTO fin_vertex_table VALUES ( 1, '{"type":"Person","name":"Nikita"}');
INSERT INTO fin_vertex_table VALUES ( 2,
  '{"type":"Person","name":"Camille"}');
INSERT INTO fin_vertex_table VALUES ( 3, '{"type":"Person","name":"Liam"}');
INSERT INTO fin_vertex_table VALUES ( 4,
  '{"type":"Company","name":"Oracle"}');
INSERT INTO fin_vertex_table VALUES ( 5, '{"type":"Account","number":10039}');
INSERT INTO fin_vertex_table VALUES ( 6, '{"type":"Account","number":2090}');
INSERT INTO fin_vertex_table VALUES ( 7, '{"type":"Account","number":8021}');
INSERT INTO fin_vertex_table VALUES ( 8, '{"type":"Account","number":1001}');

CREATE TABLE fin_edge_table (
  id NUMBER PRIMARY KEY,
  src NUMBER REFERENCES fin_vertex_table ( id ),
  dst NUMBER REFERENCES fin_vertex_table ( id ),
  properties VARCHAR2(2000)
);

INSERT INTO fin_edge_table VALUES ( 1, 7, 1, '{"type":"owner"}');
INSERT INTO fin_edge_table VALUES ( 2, 5, 2, '{"type":"owner"}');
INSERT INTO fin_edge_table VALUES ( 3, 6, 3, '{"type":"owner"}');
INSERT INTO fin_edge_table VALUES ( 4, 8, 4, '{"type":"owner"}');
INSERT INTO fin_edge_table VALUES ( 5, 2, 4, '{"type":"worksFor"}');
INSERT INTO fin_edge_table VALUES ( 6, 5, 7,
  '{"type":"transaction","amount":1000.00}');
INSERT INTO fin_edge_table VALUES ( 7, 7, 8,
  '{"type":"transaction","amount":1500.30}');

```

```

INSERT INTO fin_edge_table VALUES ( 8, 7, 8,
'{"type":"transaction","amount":3000.70}');
INSERT INTO fin_edge_table VALUES ( 9, 8, 6,
'{"type":"transaction","amount":9999.50}');
INSERT INTO fin_edge_table VALUES ( 10, 6, 5,
'{"type":"transaction","amount":9900.00}');

```

As seen in the preceding code, each vertex and edge is represented by a single row in the respective tables. The first column is the unique key of the vertex or the edge. The second and third columns of the edge table are its source key and destination key respectively. The last column of the vertex and edge tables encodes all the properties as well as the labels in a JSON object. A JSON is an unordered set of name and value pairs. Here, you can use such pairs to encode the property names and their values as well as the label's value. In case of the label, you can choose an arbitrary name such as "type" or "label". In this example we use "type".

Because all the labels and properties of a vertex or an edge are encoded as a single JSON value, you do not need to update the schema when new labels or properties are added to the graph. Instead, you can add new labels and properties by inserting additional vertices and edges or by updating the JSON value in the underlying table through SQL.

The following two examples demonstrate how you can extract labels and property values from JSON objects for PGQL on RDBMS and PGQL on PGX respectively.

Example 11-2 Extracting JSON properties using JSON_VALUE (PGQL on RDBMS)

The following code creates a PGQL property graph using the `fin_vertex_table` and `fin_edge_table` tables and executes a PGQL `SELECT` query:

```

PgqlStatement pgqlStmt = pgqlConn.createStatement();

/* Create the property graph */
pgqlStmt.execute(
    "CREATE PROPERTY GRAPH financial_transactions " +
    " VERTEX TABLES ( " +
    "   fin_vertex_table PROPERTIES ( properties ) ) " +
    " EDGE TABLES ( " +
    "   fin_edge_table " +
    "   SOURCE KEY ( src ) REFERENCES fin_vertex_table (id) " +
    "   DESTINATION KEY ( dst ) REFERENCES fin_vertex_table (id) " +
    "   PROPERTIES ( properties ) ) " +
    " OPTIONS ( PG_PGQL )");

/* Set the name of the graph so that we can omit the ON clause from queries */
pgqlConn.setGraph("FINANCIAL_TRANSACTIONS");

/* PGQL query: find all outgoing transactions from account 8021. Output the
transaction amount and the destination account number. */
PgqlResultSet rs = pgqlStmt.executeQuery(
    "SELECT JSON_VALUE(trans.properties, '$.amount') AS transaction_amount, " +
    "   JSON_VALUE(account2.properties, '$.number') AS account_number " +
    "FROM MATCH (account1) -[trans]-> (account2) " +
    "WHERE JSON_VALUE(account1.properties, '$.number') = 8021 " +
    " AND JSON_VALUE(trans.properties, '$.type') = 'transaction'");

rs.print();

```

```
rs.close();
pgqlStmt.close();
```

In the preceding code, the `CREATE PROPERTY GRAPH` statement maps the JSON column into a property named "properties". This property will thus contain all the labels and properties of the vertex or the edge. The PGQL `SELECT` query extracts these labels and properties using `JSON_VALUE`.

For example, instead of `account1.number = 8021`, you must use `JSON_VALUE(account1.properties, '$.number') = 8021`. This causes the query to become a bit lengthier.

The output of the Java code is:

```
+-----+
| AMOUNT | ACCOUNT_NUMBER |
+-----+
| 1500.3 | 1001           |
| 3000.7 | 1001           |
+-----+
```

Example 11-3 Using a UDF to extract a JSON property value (PGQL on PGX)

This example consists of two parts. The first part shows the creation of a UDF and the second part shows loading of the graph into the graph server (PGX) followed by the execution of a PGQL query using the UDF.

Since the Graph Server (PGX) does not have a built-in `JSON_VALUE` function like in PGQL on RDBMS, you can create a Java UDF instead.

Create the Java class (`MyJsonUtils.java`) that implements the UDF:

```
import com.fasterxml.jackson.core.JsonProcessingException;
import com.fasterxml.jackson.databind.JsonNode;
import com.fasterxml.jackson.databind.ObjectMapper;

public class MyJsonUtils {

    private final static ObjectMapper mapper = new ObjectMapper();

    public static String get_prop(String json_string, String prop_name) throws
    JsonProcessingException {
        JsonNode node = mapper.readTree(json_string);
        return node.path(prop_name).asText();
    }
}
```

Compile the class with the JARs from `/opt/oracle/graph/pgx/server/lib/*` added to the class path. This is because the library folder contains the necessary Jackson libraries that are required to parse the JSON.

```
mkdir ./target
javac -classpath ./opt/oracle/graph/pgx/server/lib/* -d ./target *.java
cd target
jar cvf MyJsonUtils.jar *
```

Using the following UDF JSON configuration file (`my_udfs.json`), you can now register the Java UDF on the graph server (PGX) by following step-3 to step-6 in [User-Defined Functions \(UDFs\) in PGX](#):

```
{
  "user_defined_functions": [
    {
      "namespace": "my",
      "function_name": "get_prop",
      "language": "java",
      "implementation_reference": "MyJsonUtils",
      "return_type": "string",
      "arguments": [
        {
          "name": "json_string",
          "type": "string"
        },
        {
          "name": "prop_name",
          "type": "string"
        }
      ]
    }
  ]
}
```

On implementing the UDF for extracting property values from the JSON, you can now load the graph into the Graph Server (PGX) and issue a PGQL query:

```
/* Load the graph into the Graph Server (PGX) */
ServerInstance instance = GraphServer.getInstance("http://localhost:7007",
username, password.toCharArray());
session = instance.createSession("my-session");
PgxDGraph g = session.readGraphByName("FINANCIAL_TRANSACTIONS",
GraphSource.PG_PGQL);

/* PGQL query: find all shortest paths from account 10039 to account 2090
following only outgoing transaction
edges. Output the list of transaction amounts along each path as well as
the total amount of the transactions
along each path. */
g.queryPgql(
  " SELECT LISTAGG(my.get_prop(e.properties, 'amount'), ' + ') || ' = ' AS
amounts_along_path, " +
  " SUM(CAST(my.get_prop(e.properties, 'amount') AS DOUBLE)) AS
total_amount " +
  " FROM MATCH ALL SHORTEST (a) (-[e]-> WHERE my.get_prop(e.properties,
'type') = 'transaction')* (b) " +
  " WHERE my.get_prop(a.properties, 'number') = '10039' AND " +
  " my.get_prop(b.properties, 'number') = '2090' " +
  "ORDER BY total_amount").print().close();
```

The output of the Java code is:

```
+-----+
| amounts_along_path          | total_amount |
+-----+
| 1000.0 + 1500.3 + 9999.5 =  | 12499.8      |
| 1000.0 + 3000.7 + 9999.5 =  | 14000.2      |
+-----+
```

12

Loading a PGQL property graph into the Graph Server (PGX)

You can load a full PGQL property graph or a subgraph into the graph server (PGX).

Note

Ensure that you drop the graph when it is no longer in use to release the graph server (PGX) memory. See [Deleting a Graph](#) for more information.

There are several ways to load a PGQL property graph into the graph server (PGX).

- [Loading a PGQL Property Graph Using the readGraphByName API](#)
You can load a PGQL property graph by name into the graph server (PGX).
- [Loading a Subgraph from a PGQL Property Graph](#)
You can create a subgraph from a PGQL property graph and load it into memory in the graph server (PGX).

12.1 Loading a PGQL Property Graph Using the readGraphByName API

You can load a PGQL property graph by name into the graph server (PGX).

You can use the `PgxSession#readGraphByName` API to load a PGQL property graph:

```
readGraphByName(String schemaName, String graphName, GraphSource source,  
ReadGraphOption options)
```

The arguments used in the method are described in the following table:

Table 12-1 Parameters for the readGraphByName method

Parameter	Description	Optional
schemaName	Schema owner	Yes
graphName	Name of the PGQL property graph	No
source	Source format for the graph: <ul style="list-style-type: none">• <code>GraphSource.PG_PGQL</code>: This applies for PGQL property graphs.• <code>GraphSource.PG_SQL</code>: This applies for SQL Property Graphs (refer to Loading a SQL Property Graph Using the readGraphByName API).	No
options	Represents the graph optimization options	Yes

The `readGraphByName()` method reads the PGQL property graph metadata tables and internally generates the graph configuration to load the graph. You must have `PGX_SESSION_NEW_GRAPH` permission to use this API.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANKDATA", GraphSource.PG_PGQL)
$12 ==> PgxGraph[name=bankdata,N=1000,E=5001,created=1625730942294]
```

Java

```
PgxGraph graph = session.readGraphByName("BANKDATA", GraphSource.PG_PGQL);
Graph: PgxGraph[name=bankdata,N=1000,E=5001,created=1625732149262]
```

Python

```
>>> graph = session.read_graph_by_name('BANKDATA', 'pg_pgql')
>>> graph
PgxGraph(name: bankdata, v: 1000, e: 5001, directed: True, memory(Mb): 0)
```

The `readGraphByName()` method also allows loading of a PGQL property graph from database tables with CLOB data type columns.

- [Specifying Options for the readGraphByName API](#)
You can specify graph optimization options, `OnMissingVertexOption` or both when using the `readGraphByName` API for loading a PGQL property graph.
- [Specifying the Schema Name for the readGraphByName API](#)
You can specify the schema name when using the `readGraphByName` API for loading a PGQL property graph.
- [Specifying PropertyLoadingMode Options for the readGraphByName API](#)
You can specify the `PropertyLoadingMode` options to include or exclude selected properties when loading a PGQL property graph using the `readGraphByName` API.

See Also

[Mapping Oracle Database Types to PGX Types](#) for more information on the supported types in the graph server (PGX)

12.1.1 Specifying Options for the `readGraphByName` API

You can specify graph optimization options, `OnMissingVertexOption` or both when using the `readGraphByName` API for loading a PGQL property graph.

The [ReadGraphOption](#) interface supports an additional `options` parameter when loading a PGQL property graph by name.

The following sections explain the various options supported by the `ReadGraphOption` interface.

Using the Graph Optimization Options

The optimization strategy determines whether the graph is optimized for read-intensive scenarios or for faster updates. It impacts the performance characteristics of graph operations such as querying and updating.

The supported graph optimization options are:

- **`ReadGraphOption.optimizeFor(GraphOptimizedFor.READ)`:** You can choose this option when the primary operations on the graph are read-based, and updates are infrequent or non-existent.
When this strategy is selected, the graph's data structures are replicated whenever a new graph or graph snapshot is created. This results in faster and more efficient read operations, such as traversals and queries. However, creating snapshots can be expensive and it can also lead to performance overhead and increased memory usage during updates.
- **`ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES)`:** You can choose this option when the graph is expected to undergo frequent updates, such as adding or removing nodes and edges, or modifying properties of existing elements.
When this strategy is selected, delta logs are used to manage updates. This approach makes updates more memory-efficient and faster. However, there may be some time overhead when querying the graph due to the need to apply these delta updates.
- **`ReadGraphOption.synchronizable()`:** You can choose this option when the graph is expected to be synchronized.

It is important to note the following:

- `synchronizable()` option can be used in combination with `UPDATE` and `READ`. However, the `UPDATE` and `READ` options cannot be used at the same time.
- If you are loading a PGQL property graph for `SYNCHRONIZABLE` option, then ensure that the vertex and edge keys are numeric and non-composite.

The following example loads a PGQL property graph for `READ` and `SYNCHRONIZABLE` options:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL,
...>
ReadGraphOption.optimizeFor(GraphOptimizedFor.READ),
...>                                ReadGraphOption.synchronizable()
graph ==> PgxGraph[name=BANK_GRAPH_2,N=1000,E=5001,created=1648457198462]
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL,

ReadGraphOption.optimizeFor(GraphOptimizedFor.READ),

ReadGraphOption.synchronizable());
```

Python

```
>>> graph = session.read_graph_by_name('BANK_GRAPH',
...      'pg_pgql', options=['optimized_for_read', 'synchronizable'])
```

Using the OnMissingVertex Options

If either the source or destination vertex or both are missing for an edge, then you can use the `OnMissingVertexOption` which specifies the behavior for handling the edge with the missing vertex. The following values are supported for this option:

- `ReadGraphOption.onMissingVertex(OnMissingVertex.ERROR)`: This is the default option and this specifies that an error must be thrown for edges with missing vertices.
- `ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE)`: Specifies that the edge for a missing vertex must be ignored.
- `ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG)`: Specifies that the edge for a missing vertex must be ignored and all ignored edges must be logged.
- `ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG_ONCE)`: Specifies that the edge for a missing vertex must be ignored and only the first ignored edge must be logged.

The following example loads the PGQL property graph by ignoring the edges with missing vertices and logging only the first ignored edge. Note, to view the logs, you must update the default Logback configuration file in `/etc/oracle/graph/logback.xml` and the graph server (PGX) logger configuration file in `/etc/oracle/graph/logback-server.xml` to log the DEBUG logs. You can then view the ignored edges in `/var/opt/log/pgx-server.log` file.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.readGraphByName("REGIONS", GraphSource.PG_PGQL,
...>
ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG_ONCE))
$7 ==> PgxGraph[name=REGIONVIEW_3,N=27,E=18,created=1655903219910]
```

Java

```
PgxGraph graph = session.readGraphByName("REGIONS", GraphSource.PG_PGQL,
ReadGraphOption.onMissingVertex(OnMissingVertex.IGNORE_EDGE_LOG_ONCE));
```

Python

```
>>> graph = session.read_graph_by_name('REGIONS',
...      'pg_pgql', options=['on_missing_vertex_ignore_edge_log_once'])
```

12.1.2 Specifying the Schema Name for the readGraphByName API

You can specify the schema name when using the `readGraphByName` API for loading a PGQL property graph.

This feature allows you to load a PGQL property graph from another user schema into the graph server (PGX). However, ensure that you have `READ` permission on all the underlying metadata and data tables when loading a PGQL property graph from another schema.

The following example loads a PGQL property graph from the `GRAPHUSER` schema:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var graph = session.readGraphByName("GRAPHUSER", "FRIENDS",
GraphSource.PG_PGQL)
graph ==> PgxGraph[name=FRIENDS,N=6,E=4,created=1672743474212]
```

Java

```
PgxGraph graph = session.readGraphByName("GRAPHUSER", "FRIENDS",
GraphSource.PG_PGQL);
```

12.1.3 Specifying `PropertyLoadingMode` Options for the `readGraphByName` API

You can specify the `PropertyLoadingMode` options to include or exclude selected properties when loading a PGQL property graph using the `readGraphByName` API.

By default, the `readGraphByName` API loads a PGQL property graph into the graph server (PGX) with the complete set of properties. However, you can specify one of the following supported `PropertyLoadingMode` options to include or exclude specified properties:

- `ReadGraphOption.includeProperties()`: You can provide a list of properties to be loaded for each provider while loading the graph.
- `ReadGraphOption.excludeProperties()`: You can provide a list of properties to be skipped for each provider while loading the graph.
- `ReadGraphOption.topologyOnly()`: You can choose this mode if you wish to load only the graph topology and skip all the properties.

The following example shows loading a PGQL property graph with the `ReadGraphOption.includeProperties()` option.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var propertyFilterBuilder = new PropertyFilterBuilder()
propertyFilterBuilder ==> oracle.pgx.config.PropertyFilterBuilder@6b44121e
opg4j> propertyFilterBuilder.addProperty("ACCOUNTS", "NAME")
$8 ==> oracle.pgx.config.PropertyFilterBuilder@6b44121e
opg4j> propertyFilterBuilder.addProperty("TRANSFERS", "AMOUNT")
$9 ==> oracle.pgx.config.PropertyFilterBuilder@6b44121e
opg4j> var graph = session.readGraphByName("BANK_GRAPH_PGQL",
GraphSource.PG_PGQL,
ReadGraphOption.includeProperties(propertyFilterBuilder.build()))
graph ==> PgxGraph[name=BANK_GRAPH_PGQL,N=1000,E=5001,created=1751872689499]
```

Java

```
PropertyFilterBuilder propertyFilterBuilder = new PropertyFilterBuilder();
propertyFilterBuilder.addProperty("ACCOUNTS", "NAME");
propertyFilterBuilder.addProperties("TRANSFERS", "AMOUNT");
PgxGraph graph = session.readGraphByName("BANK_GRAPH_PGQL",
GraphSource.PG_PGQL,
ReadGraphOption.includeProperties(propertyFilterBuilder.build()));
```

Python

```
>>> from pypgx._utils.pgx_types import include_properties
>>> graph = session.read_graph_by_name("BANK_GRAPH_PGQL", "pg_pgql",
```

```
options=(include_properties({"ACCOUNTS": ["NAME"], "TRANSFERS" :
["AMOUNT"] })),))
```

The following example shows loading a PGQL property graph with the `ReadGraphOption.excludeProperties()` option

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var propertyFilterBuilder = new PropertyFilterBuilder()
propertyFilterBuilder ==> oracle.pgx.config.PropertyFilterBuilder@464d5365
opg4j> propertyFilterBuilder.addProperty("ACCOUNTS", "NAME")
$2 ==> oracle.pgx.config.PropertyFilterBuilder@464d5365
opg4j> propertyFilterBuilder.addProperties("TRANSFERS", "DESCRIPTION")
$3 ==> oracle.pgx.config.PropertyFilterBuilder@464d5365
opg4j> var graph = session.readGraphByName("BANK_GRAPH_PGQL",
GraphSource.PG_PGQL,
ReadGraphOption.excludeProperties(propertyFilterBuilder.build()))
graph ==> PgxGraph[name=BANK_GRAPH_PGQL,N=1000,E=5001,created=1751873930712]
```

Java

```
PropertyFilterBuilder propertyFilterBuilder = new PropertyFilterBuilder();
propertyFilterBuilder.addProperty("ACCOUNTS", "NAME");
propertyFilterBuilder.addProperties("TRANSFERS", "DESCRIPTION");
PgxGraph graph = session.readGraphByName("BANK_GRAPH_PGQL",
GraphSource.PG_PGQL,
ReadGraphOption.excludeProperties(propertyFilterBuilder.build()));
```

Python

```
>>> from pypgx._utils.pgx_types import exclude_properties
>>> graph = session.read_graph_by_name("BANK_GRAPH_PGQL", "pg_pgql",
options=(exclude_properties({"ACCOUNTS": ["NAME"], "TRANSFERS" :
["DESCRIPTION"] })), ))
```

The following example shows loading a SQL property graph with the `ReadGraphOption.topologyOnly()` option

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_GRAPH_PGQL",  
GraphSource.PG_PGQL, ReadGraphOption.topologyOnly())  
graph ==> PgxGraph[name=STUDENT_NETWORK_2,N=4,E=4,created=1751204695863]
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_GRAPH_PGQL",  
GraphSource.PG_PGQL, ReadGraphOption.topologyOnly());
```

Python

```
>>> from pypgx._utils.pgx_types import topology_only  
>>> graph = session.read_graph_by_name("BANK_GRAPH_PGQL", "pg_pgql",  
options=(topology_only(),))
```

12.2 Loading a Subgraph from a PGQL Property Graph

You can create a subgraph from a PGQL property graph and load it into memory in the graph server (PGX).

Instead of loading a full graph into memory, you can load a subgraph. This would consume less memory.

The following sections explain in detail on loading and expanding of subgraphs:

- [PGQL Based Subgraph Loading](#)
You can use the `PgViewSubgraphReader#fromPgPgql` API to create an in-memory subgraph from a PGQL property graph using a set of PGQL queries.
- [Prepared PGQL Queries](#)
You can also use prepared queries when loading a subgraph from a PGQL property graph.
- [Providing Database Connection Credentials](#)
You can specify the database connection credentials with the `PgViewSubgraphReader#fromPgPgql` API instead of using the default credentials of the current user.
- [Dynamically Expanding a Subgraph](#)
You can expand an in-memory subgraph by loading another subgraph into memory and merging it with the current in-memory subgraph.

12.2.1 PGQL Based Subgraph Loading

You can use the `PgViewSubgraphReader#fromPgPgql` API to create an in-memory subgraph from a PGQL property graph using a set of PGQL queries.

These PGQL queries define the vertices and edges that are to be loaded into the subgraph. You can also use multiple PGQL queries and the resulting output graph is a union of the subgraphs, each being loaded independently by each PGQL query.

① Note

- Only non-composite vertex and edge keys are supported.
- Only numeric edge keys are supported.
- PGQL queries with `GROUP BY` or `ORDER BY` clauses are not supported for loading of subgraphs from a PGQL property graph.
- Loading a subgraph with properties mapped to CLOB data type is supported.

The following example creates a subgraph from a PGQL property graph using multiple PGQL queries:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readSubgraph().
...>             fromPgPqql("FRIENDS").
...>             queryPgql("MATCH (v1:Person)-[e:FRIENDOF]-
>(v2:Person) WHERE id(v1) = 'PERSONS(1)']").
...>             queryPgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(2)']").
...>             load()
graph ==> PgxGraph[name=FRIENDS,N=3,E=1,created=1646726883194]
```

Java

```
PgxGraph graph = session.readSubgraph()
    .fromPgPqql("FRIENDS")
    .queryPgql("MATCH (v1:Person)-[e:FRIENDOF]-
>(v2:Person) WHERE id(v1) = 'PERSONS(1)')
    .queryPgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(2)')")
    .load();
```

Python

```
>>> graph = session.read_subgraph_from_pg_pqql("FRIENDS", ["MATCH (v1:Person)-
[e:FRIENDOF]->(v2:Person) WHERE id(v1) = 'PERSONS(1)'",
...
                                "MATCH (v:Person) WHERE id(v) = 'PERSONS(2)']")
```

```
>>> graph
PgxGraph(name: FRIENDS, v: 3, e: 1, directed: True, memory(Mb): 0)
```

Loading Subgraphs with Custom Names

By default, the new subgraph gets created with the same name as the PGQL property graph. Alternatively, if you want to load a subgraph with a custom name, then you can configure the subgraph name as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph = session.readSubgraph().
...>             fromPgPsql("FRIENDS").
...>             queryPgql("MATCH (v1:Person)-[e:FRIENDOF]->(v2:Person)
WHERE id(v1) = 'PERSONS(1)']").
...>             queryPgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(2)']").
...>             load("friends_network")
graph ==> PgxGraph[name=friends_network,N=3,E=1,created=1664458398090]
```

Java

```
PgxGraph graph = session.readSubgraph()
    .fromPgPsql("FRIENDS")
    .queryPgql("MATCH (v1:Person)-[e:FRIENDOF]-
>(v2:Person) WHERE id(v1) = 'PERSONS(1)')")
    .queryPgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(2)')")
    .load("friends_network");
```

Python

```
>>> graph = session.read_subgraph_from_pg_psql("FRIENDS",
...             ["MATCH (v1:Person)-[e:FRIENDOF]->(v2:Person) WHERE
id(v1) = 'PERSONS(1)'",
...             "MATCH (v:Person) WHERE id(v) = 'PERSONS(2)']"),
...             graph_name="friends_network")
>>> graph
PgxGraph(name: friends_network, v: 3, e: 1, directed: True, memory(Mb): 0)
```

Loading a Subgraph by Explicitly Specifying the Schema Name

If you want to load a subgraph by reading a PGQL property graph from another schema, you can additionally provide the schema name as an argument to the `PgViewSubgraphReader#fromPgPgql` API. You must also ensure that you have `READ` permission on all the underlying metadata and data tables for the PGQL property graph.

For example:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readSubgraph()
...> .fromPgPgql("GRAPHUSER", "FRIENDS")
...> .queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(2)')")
...> .load()
graph ==> PgxGraph[name=FRIENDS,N=1,E=0,created=1672743755511]
```

Java

```
PgxGraph graph = session.readSubgraph()
    .fromPgPgql("GRAPHUSER", "FRIENDS")
    .queryPgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(2)')")
    .load();
```

Python

```
>>> graph = session.read_subgraph_from_pg_pgql("FRIENDS",
... ["MATCH (v:Person) WHERE id(v) = 'PERSONS(2)']",
... schema="GRAPHUSER")
```

12.2.2 Prepared PGQL Queries

You can also use prepared queries when loading a subgraph from a PGQL property graph.

You can pass bind variables using prepared PGQL queries. The `PreparedPgViewPgqlQuery#preparedPgqlQuery` method adds a prepared query to a list of queries that are executed to load the subgraph. The `PreparedPgViewPgqlQuery` API sets the bindings for the variables and continues with the loading of the subgraph.

For example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var pgViewSubgraphReader = session.readSubgraph().
...>                                fromPgPgql("FRIENDS")
pgViewSubgraphReader ==> oracle.pgx.api.subgraph.PgViewSubgraphReader@33bfe6d3
opg4j> var preparedPgqlQuery = pgViewSubgraphReader.preparedPgqlQuery("MATCH
(v1:Person)-[e:FriendOf]->(v2:Person) WHERE id(v2)=?")
preparedPgqlQuery ==> oracle.pgx.api.subgraph.PreparedPgViewPgqlQuery@2e6b379c
opg4j> preparedPgqlQuery = preparedPgqlQuery.withStringArg(1, "PERSONS(3)")
preparedPgqlQuery ==> oracle.pgx.api.subgraph.PreparedPgViewPgqlQuery@2e6b379c
opg4j> var graph = preparedPgqlQuery.load()
graph ==> PgxGraph[name=FRIENDS_2,N=3,E=2,created=1648566047855]
```

Java

```
import oracle.pgx.api.subgraph.*;
...
...
PgViewSubgraphReader pgViewSubgraphReader=
session.readSubgraph().fromPgPgql("FRIENDS");
PreparedPgViewPgqlQuery preparedPgqlQuery =
pgViewSubgraphReader.preparedPgqlQuery("MATCH (v1:Person)-[e:FriendOf]-
>(v2:Person) WHERE id(v2)=?");
preparedPgqlQuery = preparedPgqlQuery.withStringArg(1, "PERSONS(3)");
PgxGraph graph = preparedPgqlQuery.load();
```

Python

```
>>> from pypgx.api import PreparedPgqlQuery
>>> from pypgx.api import PreparedPgqlQueryStringArgument
>>> graph = session.read_subgraph_from_pg_pgql("FRIENDS",
... [PreparedPgqlQuery("MATCH (v1:Person)-[e:FriendOf]->(v2:Person) WHERE
id(v2)=?", [PreparedPgqlQueryStringArgument("PERSONS(3)"))]])
>>> graph
PgxGraph(name: FRIENDS, v: 3, e: 2, directed: True, memory(Mb): 0)
```

12.2.3 Providing Database Connection Credentials

You can specify the database connection credentials with the `PgViewSubgraphReader#fromPgPgql` API instead of using the default credentials of the current user.

The following example shows loading of a subgraph for non-default database connection settings:

- JShell
- Java

JShell

```
opg4j> var graph = session.readSubgraph().
...>         fromPgPgql("FRIENDS").
...>         username("graphuser").
...>         password("<password_for_graphuser>").
...>         keystoreAlias("database1").
...>         schema("GRAPHUSER").
...>         jdbcUrl("jdbc:oracle:thin:@localhost:1521/orclpdb").
...>         connections(12).
...>         queryPgql("MATCH (a:Person)").
...>         load()
graph ==> PgxGraph[name=FRIENDS,N=4,E=0,created=1648541234520]
```

Java

```
PgxGraph graph = session.readSubgraph()
    .fromPgPgql("FRIENDS")
    .username("graphuser")
    .password("<password_for_graphuser>")
    .keystoreAlias("database1")
    .schema("GRAPHUSER")
    .jdbcUrl("jdbc:oracle:thin:@localhost:1521/orclpdb")
    .connections(12)
    .queryPgql("MATCH (a:Person)")
    .load();
```

12.2.4 Dynamically Expanding a Subgraph

You can expand an in-memory subgraph by loading another subgraph into memory and merging it with the current in-memory subgraph.

The `PgxGraph.expandGraph()` method can be used to expand a subgraph. The following applies when merging two graphs:

- Both the graphs can have separate sets of providers.
- A graph can have some providers same as the other graph. In this case:
 - The providers with the same names must have the same labels.
 - The graph being merged must have the same or a common subset of properties as the base graph. However, it is possible that either of the graphs may have more number of properties.

The following example shows the expansion of the subgraph created in [PGQL Based Subgraph Loading](#):

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph = graph.expandGraph().
...>     withPgql().
...>     fromPgPgql("FRIENDS").
...>     queryPgql("MATCH (v1:PERSON) -[e:FRIENDOF]-> (v2:PERSON) WHERE
id(v1) = 'PERSONS(2)']").
...>     queryPgql("MATCH (v:PERSON) WHERE id(v) = 'PERSONS(4)']").
...>     expand()
graph ==> PgxGraph[name=anonymous_graph_152,N=4,E=3,created=1647347092964]
```

Java

```
graph = graph.expandGraph()
    .withPgql()
    .fromPgPgql("FRIENDS")
    .queryPgql("MATCH (v1:PERSON) -[e:FRIENDOF]-> (v2:PERSON) WHERE
id(v1) = 'PERSONS(2)')")
    .queryPgql("MATCH (v:PERSON) WHERE id(v) = 'PERSONS(4)')")
    .expand();
```

Python

```
>>> from pypgx.api import PreparedPgqlQuery
>>> from pypgx.api import PreparedPgqlQueryStringArgument
>>> graph = graph.expand_with_pgql(["MATCH (v1:PERSON) -[e:FRIENDOF]->
(v2:PERSON) WHERE id(v1) = 'PERSONS(2)'",
...                                "MATCH (v:Person) WHERE id(v)= 'PERSONS(4)']"),
...                                pg_view_name="FRIENDS")
>>> graph
PgxGraph(name: anonymous_graph_66, v: 4, e: 3, directed: True, memory(Mb): 0)
```

Expanding a Subgraph by Explicitly Specifying the Schema Name

When expanding a graph, you can load another subgraph by reading a PGQL property graph from a different schema. For this, you must provide the schema name as an argument to the `PgqlViewGraphExpander#fromPgPgql` API. You must also ensure that you have `READ` permission on all the underlying metadata and data tables for the PGQL property graph.

For example:

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> graph = graph.expandGraph().
...>         withPgql().
...>         fromPgPgql("GRAPHUSER", "FRIENDS").
...>         queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(1)')".
...>         expand()
graph ==> PgxGraph[name=anonymous_graph_18,N=1,E=0,created=1672848726308]
```

Java

```
graph = graph.expandGraph()
        .withPgql()
        .fromPgPgql("GRAPHUSER", "FRIENDS")
        .queryPgql("MATCH (v:Person) WHERE id(v) = 'PERSONS(1)')".
        .expand();
```

Python

```
>>> graph = graph.expand_with_pgql("MATCH (v:Person) WHERE id(v) =
'PERSONS(1)'",
... pg_view_name="FRIENDS", schema="GRAPHUSER")
>>> graph
PgxGraph(name: anonymous_graph_6, v: 2, e: 0, directed: True, memory(Mb): 0)
```

Using Merging Strategy

When expanding a graph, some vertices and edges that are in the new graph data may have already been loaded in the base graph. In such cases, if the vertex and edge property values differ for all vertices and edges that are both in the base graph and in the new graph to be merged, then the following applies:

- If the merging strategy is `KEEP_CURRENT_VALUES`, then the vertex and edge property values coming from the new graph are ignored.
- If the merging strategy is `UPDATE_WITH_NEW_VALUES`, then the vertex and edge property values are updated with the ones found in the new graph.

For example:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> import oracle.pgx.api.expansion.PropertyMergeStrategy
opg4j> graph = graph.expandGraph().
...>         withPgql().
...>         fromPgPgql("FRIENDS").
...>         queryPgql("MATCH (v1:PERSON) -[e:FRIENDOF]-> (v2:PERSON) WHERE
id(v1) = 'PERSONS(2)']").
...>         preparedPgqlQuery("MATCH (v:PERSON) WHERE id(v)
in ?").withStringArg(1, "PERSONS(4)").
...>         vertexPropertiesMergingStrategy(PropertyMergeStrategy.UPDATE_WITH_NEW_VALUES).
...>         expand()
```

Java

```
import oracle.pgx.api.expansion.PropertyMergeStrategy;
graph = graph.expandGraph()
    .withPgql()
    .fromPgPgql("FRIENDS")
    .queryPgql("MATCH (v1:PERSON) -[e:FRIENDOF]-> (v2:PERSON) WHERE
id(v1) = 'PERSONS(2)')
    .preparedPgqlQuery("MATCH (v:PERSON) WHERE id(v)
in ?").withStringArg(1, "PERSONS(4)")
    .vertexPropertiesMergingStrategy(PropertyMergeStrategy.UPDATE_WIT
H_NEW_VALUES)
    .expand();
```

Quick Starts for Using PGQL Property Graphs

This chapter contains quick start tutorials and other resources to help you get started on working with PGQL property graphs.

- [Using Sample Graph Data](#)
The rpm installation of the graph server provides you with sample graph data which can be used for graph analysis.
- [Quick Start: Working with PGQL Property Graphs](#)
This tutorial helps you get started on creating, querying and executing graph algorithms on PGQL property graphs.
- [Quick Start: Using Graph Machine Learning on PGQL Property Graphs](#)
This tutorial helps you get started on applying the DeepWalk machine learning algorithm on a PGQL property graph.
- [Quick Start: Using the Python Client as a Module](#)
This section describes how to use the Python client as a module in Python applications.
- [Oracle LiveLabs Workshops for Graphs](#)
You can also explore Oracle Property Graph features using the graph workshops in Oracle LiveLabs.

13.1 Using Sample Graph Data

The rpm installation of the graph server provides you with sample graph data which can be used for graph analysis.

1. Navigate to `/opt/oracle/graph/data` or `<client_dir>/data` directory.
The `bank_graph` folder contains the following .sql files for setting up the sample graph data:- `bank_graph.sql`, `bank_accounts.sql`, and `bank_transfers.sql`.
2. Ensure that you have the required privileges to create a SQL property graph.
See [Granting System and Object Privileges for SQL Property Graphs](#) for more information.
3. Run `bank_graph.sql` in the required schema.

```
@/opt/oracle/graph/data/bank_graph/bank_graph.sql
```

The script performs the following:

- Creates the `BANK_ACCOUNTS` table, sets the primary key constraint, and populates the table with the graph vertex data.
- Creates the `BANK_TRANSFERS` table, sets the primary and foreign key constraints, and populates the table with the graph edge data.
- Creates a SQL property graph named `bank_graph`.

13.2 Quick Start: Working with PGQL Property Graphs

This tutorial helps you get started on creating, querying and executing graph algorithms on PGQL property graphs.

The instructions assume that you have loaded the sample bank graph data provided with the graph server installation in the database tables (`BANK_ACCOUNTS` and `BANK_TRANSFERS`). See [Using Sample Graph Data](#) for more information.

The following instructions are supported with examples that can be executed either with the OPG4J Java shell or OPG4PY Python shell or through a Java program using the PGX API.

1. Start the interactive graph shell CLI:

-
- [JShell](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph
./bin/opg4j --no_connect
Oracle Graph Server Shell 25.3.0
```

Python

```
cd /opt/oracle/graph
./bin/opg4py --no_connect
Oracle Graph Server Shell 25.3.0
```

-
2. Obtain a JDBC database connection, if using OPG4J shell or a Java program.

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host>:<port>/<sid>"
jdbcUrl ==> "jdbc:oracle:thin:@localhost:1521/orclpdb"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>")
conn ==> oracle.jdbc.driver.T4CConnection@7d463c9f
opg4j> conn.setAutoCommit(false);
```

Java

```
import java.sql.DriverManager;
import java.sql.Connection;
import java.sql.Statement;
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlStatement;
import oracle.pg.rdbms.pgql.PgqlResultSet;
import oracle.pgx.api.*;
import oracle.pg.rdbms.GraphServer;

// Get a jdbc connection
String jdbcUrl="jdbc:oracle:thin:@"+<host>+": "+"<port>+"/"+"<service>;
conn = DriverManager.getConnection(jdbcUrl, <username>, <password>);
conn.setAutoCommit(false);
```

3. Create a PGQL connection.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
pgqlConn ==> oracle.pg.rdbms.pgql.PgqlConnection@5c5c784c
```

Java

```
PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);
```

Python

```
>>> pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"jdbc:oracle:thin:@"<host>:<port>/<sid>")
```

4. Create a PGQL statement to execute PGQL queries.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var pgqlStmt = pgqlConn.createStatement()
pgqlStmt ==> oracle.pg.rdbms.pgql.PgqlExecution@29e3c28
```

Java

```
PgqlStatement pgqlStmt = pgqlConn.createStatement();
```

Python

```
>>> pgql_statement = pgql_conn.create_statement()
```

-
5. Create a PGQL property graph using the `CREATE PROPERTY GRAPH` statement:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> String pgql =
...> "CREATE PROPERTY GRAPH bank_graph "
...> "VERTEX TABLES ( BANK_ACCOUNTS AS ACCOUNTS "
...> "KEY (ID) "
...> "LABEL ACCOUNTS "
...> "PROPERTIES (ID, NAME) "
...> " ) "
...> "EDGE TABLES ( BANK_TXNS AS TRANSFERS "
...> "KEY (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT) "
...> "SOURCE KEY (SRC_ACCT_ID) REFERENCES ACCOUNTS (ID) "
...> "DESTINATION KEY (DST_ACCT_ID) REFERENCES ACCOUNTS (ID) "
...> "LABEL TRANSFERS "
...> "PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION) "
...> " ) OPTIONS (PG_PGQL) "
opg4j> pgqlStmt.execute(pgql)
```

Java

```
String pgql =
    "CREATE PROPERTY GRAPH " + graph + " " +
    "VERTEX TABLES ( BANK_ACCOUNTS AS ACCOUNTS " +
    "KEY (ID) " +
    "LABEL ACCOUNTS " +
    "PROPERTIES (ID, NAME)" +
    " ) " +
    "EDGE TABLES ( BANK_TXNS AS TRANSFERS " +
```

```

"KEY (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT) " +
"SOURCE KEY (SRC_ACCT_ID) REFERENCES ACCOUNTS (ID) " +
"DESTINATION KEY (DST_ACCT_ID) REFERENCES ACCOUNTS (ID) " +
"LABEL TRANSFERS " +
"PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION)" +
") OPTIONS(PG_PGQL)";

pgqlStmt.execute(pgql);

```

Python

```

>>> pgql = """
...     CREATE PROPERTY GRAPH bank_graph
...     VERTEX TABLES (
...         BANK_ACCOUNTS
...         LABEL ACCOUNTS
...         PROPERTIES (ID, NAME)
...     )
...     EDGE TABLES (
...         BANK_TXNS
...         SOURCE KEY (SRC_ACCT_ID) REFERENCES BANK_ACCOUNTS (ID)
...         DESTINATION KEY (DST_ACCT_ID) REFERENCES BANK_ACCOUNTS (ID)
...         LABEL TRANSFERS
...         PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION)
...     ) OPTIONS(PG_PGQL)
... """
>>> pgql_statement.execute(pgql)
False

```

The graph gets created successfully.

6. Execute the following query to retrieve the first 10 elements of the graph as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> String pgqlQuery =
...> "SELECT e.SRC_ACCT_ID, e.DST_ACCT_ID, e.amount FROM "
...> + "MATCH (n:ACCOUNTS) -[e:TRANSFERS]-> (m:ACCOUNTS) ON BANK_GRAPH "
...> + "LIMIT 10"
opg4j> var rs = pgqlStmt.executeQuery(pgqlQuery)
rs ==> oracle.pg.rdbms.pgql.pgview.PgViewResultSet@1e368085
opg4j> rs.print()
+-----+
| SRC_ACCT_ID | DST_ACCT_ID | AMOUNT |
+-----+

```

121	94	1000
121	255	1000
121	221	1000
122	27	1000
122	606	1000
122	495	1000
122	640	1000
122	140	1000
123	95	1000
123	130	1000

```
+-----+
```

```
$!6 ==> oracle.pg.rdbms.pgql.pgview.PgViewSet@1e368085
```

Java

```
String pgqlQuery =
    "SELECT e.src_acct_id, e.dst_acct_id, e.amount FROM " +
    "MATCH (n:ACCOUNTS) -[e:TRANSFERS]-> (m:ACCOUNTS) ON BANK_GRAPH " +
    "LIMIT 10";
PgqlResultSet rs = pgqlStmt.executeQuery(pgqlQuery);
rs.print();
```

Python

```
>>> pgql = """
... SELECT e.src_acct_id, e.dst_acct_id, e.amount FROM
... MATCH (n:ACCOUNTS) -[e:TRANSFERS]-> (m:ACCOUNTS) on BANK_GRAPH
... limit 10
... """
>>> pgql_statement.execute_query(pgql).print()
```

```
+-----+
```

SRC_ACCT_ID	DST_ACCT_ID	AMOUNT
121	94	1000
121	255	1000
121	221	1000
122	27	1000
122	606	1000
122	495	1000
122	640	1000
122	140	1000
123	95	1000
123	130	1000

```
+-----+
```

7. Load the graph into the graph server (PGX). This will enable you to run a variety of different built-in algorithms on the graph and will also improve query performance for larger graphs.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
instance ==> ServerInstance[embedded=false,baseUrl=https://localhost:7007]
opg4j> var session = instance.createSession("mySession")
session ==>
PgxSession[ID=43653128-59cd-4e69-992c-1a2beac05857,source=mySession]
opg4j> var graph =
session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL)
graph ==> PgxGraph[name=BANK_GRAPH,N=1000,E=4996,created=1643308582055]
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxSession session = instance.createSession("my-session");
PgxGraph graph = session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL);
```

Python

```
>>> instance = graph_server.get_instance("https://
localhost:7007","<username>","<password>")
>>> session = instance.create_session("my_session")
>>> graph = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
>>> graph
PgxGraph(name: BANK_GRAPH, v: 1000, e: 4996, directed: True, memory(Mb): 0)
```

8. Execute the PageRank algorithm as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var analyst = session.createAnalyst()
analyst ==> NamedArgumentAnalyst[session=3f0a9a71-f349-4aac-b75f-
a7c4ae50851b]
opg4j> analyst.pagerank(graph)
$10 ==> VertexProperty[name=pagerank,type=double,graph=BANK_GRAPH]
```

Java

```
Analyst analyst = session.createAnalyst();
analyst.pagerank(graph);
```

Python

```
>>> analyst = session.create_analyst()
>>> analyst.pagerank(graph)
VertexProperty(name: pagerank, type: double, graph: BANK_GRAPH)
```

-
9. Query the graph to list the top 10 accounts by pagerank:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> String pgql ==> "SELECT a.id, a.pagerank FROM MATCH (a) ON
BANK_GRAPH ORDER BY a.pagerank DESC LIMIT 10"
opg4j> session.queryPgql(pgql).print()
+-----+
| id | pagerank |
+-----+
| 387 | 0.007292323575404966 |
| 406 | 0.0067300944623203615 |
| 135 | 0.0067205459831892545 |
| 934 | 0.00663484385036358 |

| 4 | 0.004569682370461633 |
+-----+
$18 ==> PgqlResultSetImpl[graph=BANK_GRAPH,numResults=10]
```

Java

```
String pgQuery = "SELECT a.id, a.pagerank FROM MATCH (a) ON BANK_GRAPH
ORDER BY a.pagerank DESC LIMIT 10";
session.queryPgql(pgQuery).print();
```

Python

```
>>> pgql = "SELECT a.id, a.pagerank FROM MATCH (a) ON BANK_GRAPH ORDER BY
a.pagerank DESC LIMIT 10"
>>> session.query_pgql(pgql).print()
```

id	pagerank

13.3 Quick Start: Using Graph Machine Learning on PGQL Property Graphs

This tutorial helps you get started on applying the DeepWalk machine learning algorithm on a PGQL property graph.

The instructions assume that the PGQL property graph is already existing in your current database.

Run the following steps to build and work with a Deep Walk model.

1. Load the PGQL property graph into the graph server (PGX).

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
instance ==> ServerInstance[embedded=false,baseUrl=https://localhost:7007]
opg4j> var session=instance.createSession("mySession")
session ==>
PgxSession[ID=5af9c362-10a3-4a7c-953c-602553d4606b,source=mySession]
opg4j> var graph =
session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL)
graph ==> PgxGraph[name=BANK_GRAPH,N=1000,E=4997,created=1684315831352]
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxCSession session = instance.createSession("my-session");
PgxCGraph graph = session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL);
```

Python

```
>>> instance = graph_server.get_instance("https://
localhost:7007", "<username>", "<password>")
>>> session = instance.create_session("my_session")
>>> graph = session.read_graph_by_name("BANK_GRAPH", "pg_pgql")
>>> graph
PgxCGraph(name: BANK_GRAPH, v: 1000, e: 4997, directed: True, memory(Mb): 0)
```

-
2. Build a Deep Walk model using customized hyper-parameters as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = session.createAnalyst().deepWalkModelBuilder().
...>             setMinWordFrequency(1).
...>             setBatchSize(512).
...>             setNumEpochs(1).
...>             setLayerSize(100).
...>             setLearningRate(0.05).
...>             setMinLearningRate(0.0001).
...>             setWindowSize(3).
...>             setWalksPerVertex(6).
...>             setWalkLength(4).
...>             setNegativeSample(2).
...>             build()
model ==> oracle.pgx.api.mllib.DeepWalkModel@6e0f259e
```

Java

```
import oracle.pgx.api.mllib.DeepWalkModel;
DeepWalkModel model= session.createAnalyst().deepWalkModelBuilder()
    .setMinWordFrequency(1)
    .setBatchSize(512)
    .setNumEpochs(1)
    .setLayerSize(100)
    .setLearningRate(0.05)
    .setMinLearningRate(0.0001)
```

```
.setWindowSize(3)
.setWalksPerVertex(6)
.setWalkLength(4)
.setNegativeSample(2)
.build();
```

Python

```
>>> model = session.create_analyst().deepwalk_builder(min_word_frequency=
1,
...
batch_size= 512,
num_epochs= 1,
layer_size= 100,
learning_rate= 0.05,
min_learning_rate= 0.0001,
window_size= 3,
walks_per_vertex= 6,
walk_length= 4,
negative_sample= 2)
```

3. Train the Deep Walk model as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(graph)
```

Java

```
model.fit(graph);
```

Python

```
>>> model.fit(graph)
```

4. Get the loss value as shown:

- [JShell](#)
- [Java](#)

- [Python](#)

JShell

```
opg4j> var loss = model.getLoss()  
loss ==> -2.097562355629634E-5
```

Java

```
double loss = model.getLoss();
```

Python

```
>>> loss = model.loss  
>>> loss  
-2.0706271243398078e-05
```

-
5. Compute similar vertices as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var similars = model.computeSimilars("ACCOUNTS(280)",10)  
batchSimilars ==> oracle.pgx.api.frames.internal.PgxFrameImpl@308e465b  
opg4j> batchSimilars.print()
```

Java

```
import oracle.pgx.api.frames.*;  
  
PgxFrame similars = model.computeSimilars("ACCOUNTS(280)", 10);  
similars.print();
```

Python

```
>>> similars = model.compute_similars("ACCOUNTS(280)",10)  
>>> similars.print()
```

The example produces a similar output:

dstVertex	similarity
ACCOUNTS(280)	1.0
ACCOUNTS(486)	0.3253505229949951
ACCOUNTS(615)	0.2806776463985443
ACCOUNTS(660)	0.27348122000694275
ACCOUNTS(737)	0.2734076678752899
ACCOUNTS(368)	0.2707795202732086
ACCOUNTS(479)	0.27019545435905457
ACCOUNTS(845)	0.2618815004825592
ACCOUNTS(834)	0.2543807625770569
ACCOUNTS(249)	0.24260951578617096

6. Get all trained vectors and store them in a database table as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexVectors = model.getTrainedVertexVectors().flattenAll()
vertexVectors ==> oracle.pgx.api.frames.internal.PgxFrameImpl@46cb9794
opg4j>
vertexVectors.write().db().name("deepwalkframe").tablename("vertexVectors")
.overwrite(true).store()
```

Java

```
PgxFrame vertexVectors = model.getTrainedVertexVectors().flattenAll();
vertexVectors.write()
    .db()
    .name("vertex vectors")
    .tablename("vertexVectors")
    .overwrite(true)
    .store();
```

Python

```
>>> vertex_vectors = model.trained_vectors.flatten_all()
>>> vertex_vectors.write().db(). \
...     table_name("vertex_vectors"). \
...     overwrite(True). \
...     store()
```

7. Store the trained model in the database as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.export().db().  
...> modelstore("bank_model").  
...> modelname("model").  
...> description("DeepWalk Model for Bank data").  
...> store()
```

Java

```
model.export().db()  
    .modelstore("bank_model")  
    .modelname("model2")  
    .description("DeepWalk Model for Bank data")  
    .store();
```

Python

```
>>> model.export().db(model_store="bank_model",  
...                    model_name="model",  
...                    model_description="DeepWalk Model for Bank data")
```

8. Load a pre-trained model from the database as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> session.createAnalyst().loadDeepWalkModel().db().  
...> modelstore("bank_model").  
...> modelname("model").  
...> load()
```

Java

```
model = session.createAnalyst().loadDeepWalkModel().db()  
    .modelstore("bank_model")  
    .modelname("model")  
    .load();
```

Python

```
>>> model =  
session.create_analyst().get_deepwalk_model_loader().db(model_store="bank_m  
odel",  
...                                                    model_name="model")
```

-
9. Destroy the model as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
>>> model.destroy()
```

See [Using the Machine Learning Library \(PgXML\) for Graphs](#) for more information on the supported machine learning algorithms.

13.4 Quick Start: Using the Python Client as a Module

This section describes how to use the Python client as a module in Python applications.

Remote Server

For this mode, all you need is the Python client to be installed. In your Python program, you must authenticate with the remote server before you can create a session as illustrated in the

following example. Note that you must replace the values for `base_url`, `jdbc_url`, `username`, and `password` with values to match your environment details.

```
import pypgx
import opg4py
import opg4py.graph_server as graph_server
pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"<jdbc_url>")
pgql_statement = pgql_conn.create_statement()
pgql = """
    CREATE PROPERTY GRAPH bank_graph
    VERTEX TABLES (
        bank_accounts
        LABEL ACCOUNTS
        PROPERTIES (ID, NAME)
    )
    EDGE TABLES (
        bank_txns
        SOURCE KEY (SRC_ACCT_ID) REFERENCES bank_accounts (ID)
        DESTINATION KEY (DST_ACCT_ID) REFERENCES bank_accounts (ID)
        LABEL TRANSFERS
        PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION)
    ) OPTIONS(PG_PGQL)
"""
pgql_statement.execute(pgql)
instance = graph_server.get_instance("<base_url>", "<username>", "<password>")
session = instance.create_session("my_session")
graph = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
analyst = session.create_analyst()
analyst.pagerank(graph)
rs = graph.query_pgql("SELECT id(x), x.pagerank FROM MATCH (x) LIMIT 5")
rs.print()
```

To execute, save the above program into a file named `program.py` and run the following command:

```
python3 program.py
```

You will see the following output:

```
+-----+
| id(x)          | pagerank          |
+-----+
| BANK_ACCOUNTS(2) | 9.749447313256548E-4 |
| BANK_ACCOUNTS(4) | 0.004584001759076056 |
| BANK_ACCOUNTS(6) | 5.358461393401424E-4 |
| BANK_ACCOUNTS(8) | 0.0013051552434930175 |
| BANK_ACCOUNTS(10) | 0.0015040122009364232 |
+-----+
```

Converting PGQL result set into pandas dataframe

Additionally, you can also convert the PGQL result set to a `pandas.DataFrame` object using the `to_pandas()` method. This makes it easier to perform various data filtering operations on the result set and it can also be used in Lambda functions. For example,

```
example_query = (
    "SELECT n.name AS name, n.age AS age "
    "WHERE (n)"
)
result_set = sample_graph.query_pgql(example_query)
result_df = result_set.to_pandas()

result_df['age_bin'] = result_df['age'].apply(lambda x: int(x)/20) # create
age bins based on age ranges
```

Note

To view the complete set of available Python APIs, see [OPG4PY Python API Reference](#).

Embedded Server

For this mode, the Python client and the Graph Server RPM package must be installed on the same machine.

```
import os
os.environ["PGX_CLASSPATH"] = "/opt/oracle/graph/lib/*"
instance = graph_server.get_embedded_instance()
session = instance.create_session("python_pgx_client")
print(session)
```

To execute, save the above program into a file named `program.py` and run the following command.

```
python3 program.py
```

After successful login, you must see a similar message indicating a PGX session was created:

```
PgxSession(id: 32fc7037-18f1-4381-ba94-107e5f63aec2, name: python_pgx_client)
```

Note

To view the complete set of available Python APIs, see [OPG4PY Python API Reference](#).

13.5 Oracle LiveLabs Workshops for Graphs

You can also explore Oracle Property Graph features using the graph workshops in Oracle LiveLabs.

See the Oracle LiveLabs Workshop for a complete example on querying, analyzing and visualizing graphs using data stored in a free tier Autonomous Database instance. You will provision a new free tier Autonomous Database instance, load data into it, create a graph, and then query, analyze and visualize the graph.

Getting Started with the Client Tools

You can use multiple client tools to interact with the graph server (PGX) or directly with the graph data in the database.

The following sections explain how to use the various client tools:

- [Interactive Graph Shell CLIs](#)
Both the Oracle Graph server and client packages contain interactive command-line applications for interacting with the Java APIs and the Python APIs of the product, locally or on remote computers.
- [Using Autonomous Database Graph Client](#)
Using the `AdbGraphClient` API, you can access Graph Studio features in Autonomous Database programmatically using the Oracle Graph Client or through your Java or Python application.
- [Using the Graph Visualization Web Client](#)
You can use the Graph Visualization application to visualize graphs that are either loaded into the graph server (PGX) or stored in the database.
- [Using the Jupyter Notebook Interface](#)
You can use the Jupyter notebook interface to create, load, and query PGQL property graphs through Python.
- [Additional Client Tools for Querying PGQL Property Graphs](#)
When working with PGQL property graphs in the database, you can use other supported client tools.

Related Topics

- [Oracle Graph Client Installation](#)
You can interact with the various graph features using the client CLIs and the graph visualization web client.

14.3 Using the Graph Visualization Web Client

You can use the Graph Visualization application to visualize graphs that are either loaded into the graph server (PGX) or stored in the database.

To run the graph visualization application for your installation, see [Running the Graph Visualization Web Client](#).

Related Topics

- [Graph Visualization Application](#)
The Graph Visualization application enables interactive exploration and visualization of property graphs. You can visualize graphs that are loaded into the graph server(PGX) and the graphs stored in the database.

14.4 Using the Jupyter Notebook Interface

You can use the Jupyter notebook interface to create, load, and query PGQL property graphs through Python.

Perform the following steps to perform graph analysis using Jupyter Notebook:

1. Install the Jupyter Notebook application following the [Jupyter documentation](#). The following example installs Jupyter with pip:

```
pip3 install --user jupyter
```

2. Ensure that your Jupyter installation is added to the `PATH` environment variable.
3. Run the notebook server using the `jupyter notebook` command.
4. Launch the web application using the generated URL and open a new notebook.
5. Create and analyse a property graph.
 - The following example shows creating a PGQL property graph and running graph queries:

Figure 14-1 Creating a PGQL property graph in Jupyter Notebook

```
In [5]: import opg4py
import opg4py.graph_server as graph_server
from pygpx import setloglevel
setloglevel("ROOT", "WARN")

In [6]: pgql_conn = opg4py.pgql.get_connection("graphuser", "<password>", "jdbc:oracle:thin:@localhost:1521/orclpdb")
pgql_statement = pgql_conn.create_statement()

In [7]: pgql = """
CREATE PROPERTY GRAPH bg_pgql_view
VERTEX TABLES (
  bank_accounts
  LABEL ACCOUNTS
  PROPERTIES (ID, NAME)
)
EDGE TABLES (
  bank_txns
  SOURCE KEY (from_acct_id) REFERENCES bank_accounts
  DESTINATION KEY (to_acct_id) REFERENCES bank_accounts
  LABEL TRANSFERS
  PROPERTIES (FROM_ACCT_ID, TO_ACCT_ID, AMOUNT, DESCRIPTION)
) OPTIONS(PG_VIEW)
"""
pgql_statement.execute(pgql)

Out[7]: False

In [9]: pgql = """
SELECT e.from_acct_id, e.to_acct_id, e.amount FROM
MATCH (n:accounts) -[e:transfers]-> (m:accounts) on bg_pgql_view
LIMIT 10
"""
pgql_statement.execute_query(pgql).print()

+-----+-----+-----+
| FROM_ACCT_ID | TO_ACCT_ID | AMOUNT |
+-----+-----+-----+
| 179          | 688        | 10000  |
| 179          | 166        | 1000   |
| 179          | 397        | 1000   |
+-----+-----+-----+
```

- The following example shows loading the PGQL property graph into the graph server (PGX) and running graph algorithms for analysis:

Figure 14-2 Running Graph Algorithms in Jupyter Notebook

```

In [2]: import pygpx
import opg4py
import opg4py.graph_server as graph_server
from pygpx import setLogLevel
setLogLevel("ROOT", "WARN")

In [3]: instance = graph_server.get_instance("https://localhost:7007", "graphuser", "<password>")
session = instance.create_session("my_session")
analyst = session.create_analyst()

In [4]: graph = session.read_graph_by_name('BANK_GRAPH_VIEW', 'pg_view')

In [5]: analyst.pagerank(graph)
session.query_pgql("SELECT a.id, a.pagerank FROM MATCH (a) ON BANK_GRAPH_VIEW ORDER BY a.pagerank DESC LIMIT 10").pri

```

id	pagerank
387	0.007303928917145903

14.1 Interactive Graph Shell CLIs

Both the Oracle Graph server and client packages contain interactive command-line applications for interacting with the Java APIs and the Python APIs of the product, locally or on remote computers.

The interactive graph shells dynamically interpret command-line inputs from the user, execute them by invoking the underlying functionality, and can print results or process them further. The graph shells provide a lightweight and interactive way of exercising graph functionality without creating a Java or Python application.

The graph shells are especially helpful if you want to do any of the following:

- Quickly run a "one-off" graph analysis on a specific data set, rather than creating a large application
- Run getting started examples and create demos on a sample data set
- Explore the data set, trying different graph analyses on the data set interactively
- Learn how to use the product and develop a sense of what the built-in algorithms are good for
- Develop and test custom graph analytics algorithms

The graph shell for the Java API (OPG4J) is implemented on top of the Java Shell tool (JShell). As such, it inherits all features provided by JShell such as tab-completion, history, reverse search, semicolon inference, script files, and internal variables. The graph shell for the Python API (OPG4Py) uses IPython in case it is installed.

The following sections explain in detail on how to start the graph shell CLIs:

- [Starting the OPG4J Shell](#)
- [Starting the OPG4Py Shell](#)

① See Also

- [Java API Reference](#) for information on the Java APIs
- [Python API Reference](#) for information on the Python APIs

14.1.1 Starting the OPG4J Shell

Launching the OPG4J Shell

The Java shell executables are found in `/opt/oracle/graph/bin` after the graph server (PGX) installation, and in `<CLIENT_INSTALL_DIR>/bin` after the Java client installation.

The OPG4J shell uses JShell, which means the shell needs to run on Java 11 or later. See [Installing the Java Client From the Graph Server and Client Downloads](#) for more details on the prerequisites. You can then launch the OPG4J shell by entering the following in your terminal:

```
cd /opt/oracle/graph
./bin/opg4j
```

When the shell has started, the following command line prompt appears:

```
For an introduction type: /help intro
Oracle Graph Server Shell 25.3.0
Variables instance, session, and analyst ready to use.
opg4j>
```

By default, the OPG4J shell creates a local PGX instance, to run graph functions in the same JVM as the shell as described in [Developing Applications Using Graph Server Functionality as a Library](#).

Command-line Options

To view the list of available command-line options, add `--help` to the `opg4j` command:

```
./bin/opg4j --help
```

To start the `opg4j` shell without connecting to the graph server (PGX), use the `--no_connect` option as shown:

```
./bin/opg4j --no_connect
```

Starting the OPG4J Shell on Remote Mode

The OPG4J shell can connect to a graph server (PGX) instance that is running on another JVM (possibly on a different machine). In order to launch the OPG4J shell in remote mode, you must specify the `--base_url` parameter as shown:

```
./bin/opg4j --base_url https://<host>:7007 --username <graphuser>
```

where :

- `<host>`: is the server host
- `<graphuser>`: is the database user
You will be prompted for the database password.

Note

The graph server (PGX), listens on port 7007 by default. If needed, you can configure the graph server to listen on a different port by changing the port value in the server configuration file (`server.conf`). See [Configuring the Graph Server \(PGX\)](#) for details.

When the shell has started, the following command line prompt appears:

```
Oracle Graph Server Shell 25.3.0
Variables instance, session, and analyst ready to use.
opg4j>
```

If you have multiple versions of Java installed, you can easily switch between installations by setting the `JAVA_HOME` variable before starting the shell. For example:

```
export JAVA_HOME=/usr/lib/jvm/java-11-oracle
```

Batch Execution of Scripts

The OPG4J shell can execute a script by passing the path(s) to the script(s) to the `opg4j` command. For example:

```
./bin/opg4j /path/to/script.jsh
```

Predefined Functions

The OPG4J shell provides the following utility functions:

- `println(String)`: A shorthand for `System.out.println(String)`.
- `loglevel(String loggerName, String levelName)`: A convenient function to set the loglevel.

The `loglevel` function allows you to set the log level for a logger. For example, `loglevel("ROOT", "INFO")` sets the level of the root logger to `INFO`. This causes all logs of `INFO` and higher (`WARN`, `ERROR`, `FATAL`) to be printed to the console.

Script Arguments

You can also provide parameters to the script executed by the graph server (PGX). For example:

```
./bin/opg4j /path/to/script.jsh script-arg-1 script-arg-2
```

The script `/path/to/script.jsh` can then access the arguments through the `arguments.scriptArgs` variable. The arguments are provided as an array of strings (`String[]`). For example:

```
Arrays.stream(arguments.scriptArgs).forEach((a) ->
    System.out.println(a));
```

The preceding example prints the output as shown:

```
script-arg-1
script-arg-2
```

Staying in Interactive Mode

By default, the OPG4J shell exits after it finishes execution. To stay in interactive mode after the script finishes *successfully*, pass the `--keep_running` flag to the shell. For example:

```
./bin/opg4j -b https://myserver.com:7007/ /path/to/script.jsh --keep_running
```

14.1.2 Starting the OPG4Py Shell

Launching the OPG4Py Shell

The OPG4Py shell executables are found in `/opt/oracle/graph/bin` after the graph server (PGX) installation, and in `<CLIENT_INSTALL_DIR>/bin` after the Python client installation.

Before launching the OPG4Py shell, verify that your system meets these [prerequisites](#). You can then launch the OPG4Py shell by entering the following in your terminal:

```
cd /opt/oracle/graph
./bin/opg4py
```

When the shell has started, the following command line prompt appears:

```
Oracle Graph Server Shell 25.3.0
>>>
```

If IPython is installed the following prompt will appear:

```
In [1]:
```

By default, the OPG4Py shell creates a local PGX instance, to run graph functions in the same JVM as the shell as described in [Developing Applications Using Graph Server Functionality as a Library](#).

Command-line Options

To view the list of available command-line options, add `--help` to the `opg4py` command:

```
./bin/opg4py --help
```

To start the PyPGX shell without connecting to the graph server (PGX), use the `--no_connect` option as shown:

```
./bin/opg4py --no_connect
```

Starting the OPG4Py Shell on Remote Mode

The OPG4Py shell can connect to a graph server (PGX) instance that is running on another JVM (possibly on a different machine). In order to launch the OPG4Py shell in remote mode, you must specify the `--base_url` parameter as shown:

```
./bin/opg4py --base_url https://<host>:7007 --username <graphuser>
```

where :

- `<host>`: is the server host
- `<graphuser>`: is the database user
You will be prompted for the database password.

Note

The graph server (PGX), listens on port 7007 by default. If needed, you can configure the graph server to listen on a different port by changing the port value in the server configuration file (`server.conf`). See [Configuring the Graph Server \(PGX\)](#) for details.

When the OPG4Py shell has started, the following command line prompt appears:

```
Oracle Graph Server Shell 25.3.0  
>>>
```

14.2 Using Autonomous Database Graph Client

Using the `AdbGraphClient` API, you can access Graph Studio features in Autonomous Database programmatically using the Oracle Graph Client or through your Java or Python application.

This API provides the following capabilities:

- Authenticate with Autonomous Database
- Manage the Graph Studio environment
- Execute graph queries and algorithms against the graph server (PGX)
- Execute graph queries directly against Oracle Database

To use the `AdbGraphClient` API, you must have access to Oracle Graph Client installation. The API is provided by the Oracle Graph Client library which is a part of the Oracle Graph Server and Client distribution. See [Installing Oracle Graph Client](#) on how to install and get started with the graph client shell CLIs for Java or Python.

Also, prior to using the Autonomous Database Graph Client, ensure you meet all the prerequisite requirements explained in [Prerequisites for Using Autonomous Database Graph Client](#).

The following example shows using the `AdbGraphClient` API to establish a connection to Graph Studio, start an environment with allocated memory, load a PGQL property graph into memory, execute PGQL queries and run algorithms against the graph.

Note

See the [Javadoc](#) and [Python API Reference](#) for more information on `AdbGraphClient` API.

1. Start the interactive graph shell CLI and connect to your Autonomous Database instance with the `AdbGraphClient` using one of the following methods:

Configuring the `AdbGraphClient` using Tenancy Details

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
cd /opt/oracle/graph
./bin/opg4j --no_connect
For an introduction type: /help intro
Oracle Graph Server Shell 25.3.0
opg4j> import oracle.pg.rdbms.*
opg4j> var config = AdbGraphClientConfiguration.builder()
opg4j> config.database("<DB_name>")
opg4j> config.tenancyOcid("<tenancy_OCID>")
opg4j> config.databaseOcid("<database_OCID>")
opg4j> config.username("ADBDEV")
opg4j> config.password("<password_for_ADBDEV>")
opg4j> config.endpoint("https://<hostname-
prefix>.adb.<region>.oraclecloudapps.com/")
opg4j> var client = new AdbGraphClient(config.build())
client ==> oracle.pg.rdbms.AdbGraphClient@7b8d1537
```

Java

```
import oracle.pg.rdbms.*;

var config = AdbGraphClientConfiguration.builder();
config.tenancyOcid("<tenancy_OCID>");
config.databaseOcid("<database_OCID>");
config.database("<DB_name>");
config.username("ADBDEV");
config.password("<password_for_ADBDEV>");
config.endpoint("https://<hostname-
prefix>.adb.<region>.oraclecloudapps.com/");
```

```
var client = new AdbGraphClient(config.build());
```

Python

```
cd /opt/oracle/graph
./bin/opg4py --no_connect
Oracle Graph Server Shell 25.3.0
>>> from opg4py.adb import AdbClient
>>> config = {
...     'tenancy_ocid': '<tenancy_OCID>',
...     'database': '<DB_name>',
...     'database_ocid': '<DB_OCID>',
...     'username': 'ADBDEV',
...     'password': '<password_for_ADBDEV>',
...     'endpoint': 'https://<hostname-
prefix>.adb.<region>.oraclecloudapps.com/'
... }
>>> client = AdbClient(config)
```

Configuring the AdbGraphClient using JDBC Connection

You can also configure the `AdbGraphClient` to use a JDBC connection to connect to your Autonomous Database instance (as shown in the following code). See [Connect with JDBC Thin Driver](#) in *Using Oracle Autonomous Database Serverless* on how to obtain the JDBC URL to connect to the Autonomous Database.

However, ensure that you have `READ` access to the `v$pdb`s view in your Autonomous Database instance. By default, the `ADMIN` user has `READ` access to the `v$pdb`s view. For all other users (non-administrator users), the `READ` access can be granted by the `ADMIN` (`GRANT SELECT ON v$pdb TO <user>`).

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
import oracle.pg.rdbms.*
opg4j> var conn = DriverManager.getConnection(<jdbcUrl>, <username>,
<password>)
opg4j> var config = AdbGraphClientConfiguration.fromConnection(conn,
<password>)
opg4j> var client = new AdbGraphClient(config)
```

Java

```
import oracle.pg.rdbms.*;
AdbGraphClientConfiguration config =
AdbGraphClientConfiguration.fromCredentials(<jdbcUrl>, <username>,
<password>);
AdbGraphClient client = new AdbGraphClient(config);
```

Python

```
>>> from opg4py.adb import AdbClient
>>> client = AdbClient.from_connection(<jdbcUrl>, <username>, <password>)
```

-
2. Start the PGX server environment with the desired memory as shown in the following code.

This submits a job in Graph Studio for environment creation. `job.get()` waits for the environment to get started. You can always verify if the environment has started successfully with `client.isAttached()`. The method returns a boolean `true` if the environment is running.

However, you can skip the step of creating an environment, if `client.isAttached()` returns `true` in the first step of the code.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> client.isAttached()
$9 ==> false
opg4j> var job=client.startEnvironment(10)
job ==> oracle.pg.rdbms.Job@117e9a56[Not completed]
opg4j> job.get()
$11 ==> null
opg4j> job.getName()
$11 ==> "Environment Creation - 16 GBs"
opg4j> job.getType()
$12 ==> ENVIRONMENT_CREATION
opg4j> job.getCreatedBy()
$13 ==> "ADBDEV"
opg4j> client.isAttached()
$11 ==> true
```

Java

```
if (!client.isAttached()) {
    var job = client.startEnvironment(10);
```

```

        job.get();
        System.out.println("job details: name=" + job.getName() + "type="
+ job.getType() +"created_by= " + job.getCreatedBy());
    }
job details: name=Environment Creation - 16 GBstype=
ENVIRONMENT_CREATIONcreated_by= ADBDEV

```

Python

```

>>> client.is_attached()
False
>>> job = client.start_environment(10)
>>> job.get()
>>> job.get_name()
'Environment Creation - 16 GBs'
>>> job.get_created_by()
'ADBDEV'
>>> client.is_attached()
True

```

-
3. Create an instance and a session object as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> var instance = client.getPgxInstance()
instance ==> ServerInstance[embedded=false,baseUrl=https://<hostname-
prefix>.adb.<region>.oraclecloudapps.com/graph/pgx]
opg4j> var session = instance.createSession("AdbGraphSession")
session ==> PgxSession[ID=c403be26-
ad0c-45cf-87b7-1da2a48bda54,source=AdbGraphSession]

```

Java

```

ServerInstance instance = client.getPgxInstance();
PgxSession session = instance.createSession("AdbGraphSession");

```

Python

```

>>> instance = client.get_pgx_instance()
>>> session = instance.create_session("adb-session")

```

4. Load a PGQL property graph from your Autonomous Database instance into memory.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_GRAPH",  
GraphSource.PG_PGQL)  
graph ==> PgxGraph[name=BANK_GRAPH,N=1000,E=5001,created=1647800790654]
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_GRAPH",  
GraphSource.PG_PGQL);
```

Python

```
>>> graph = session.read_graph_by_name("BANK_GRAPH", "pg_pgql")
```

-
5. Create an Analyst and execute a Pagerank algorithm on the graph as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.createAnalyst().pagerank(graph)  
$16 ==> VertexProperty[name=pagerank,type=double,graph=BANK_GRAPH]
```

Java

```
session.createAnalyst().pagerank(graph);
```

Python

```
>>> session.create_analyst().pagerank(graph)  
VertexProperty(name: pagerank, type: double, graph: BANK_GRAPH)
```

-
6. Execute a PGQL query on the graph and print the result set as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph.queryPgql("SELECT a.acct_id AS source, a.pagerank, t.amount,
b.acct_id AS destination FROM MATCH (a)-[t]->(b) ORDER BY a.pagerank DESC
LIMIT 3").print()
```

Java

```
PgqlResultSet rs = graph.queryPgql("SELECT a.acct_id AS source,
a.pagerank, t.amount, b.acct_id AS destination FROM MATCH (a)-[t]->(b)
ORDER BY a.pagerank DESC LIMIT 3");
rs.print();
```

Python

```
>>> rs = graph.query_pgql("SELECT a.acct_id AS source, a.pagerank,
t.amount, b.acct_id AS destination FROM MATCH (a)-[t]->(b) ORDER BY
a.pagerank DESC LIMIT 3").print()
```

On execution, the query produces the following output:

```
+-----+
| source | pagerank                | amount | destination |
+-----+
| 387    | 0.007302836252205922   | 1000.0 | 188          |
| 387    | 0.007302836252205922   | 1000.0 | 374          |
| 387    | 0.007302836252205922   | 1000.0 | 577          |
+-----+
```

7. Optionally, you can execute a PGQL query directly against the graph in the database as shown in the following code.

In order to establish a JDBC connection to the database, you must download the wallet and save it in a secure location. See [JDBC Thin Connections with a Wallet](#) on how to determine the JDBC URL connection string.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> String jdbcUrl="jdbc:oracle:thin:@<tns_alias>?
TNS_ADMIN=<path_to_wallet>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"ADBDEV","<password_for_ADBDEV>")
conn ==> oracle.jdbc.driver.T4CConnection@36ee8c7b
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
pgqlConn ==> oracle.pg.rdbms.pgql.PgqlConnection@5f27d271
opg4j> var pgqlStmt = pgqlConn.createStatement()
pgqlStmt ==> oracle.pg.rdbms.pgql.PgqlExecution@4349f52c
opg4j> pgqlStmt.executeQuery("SELECT a.acct_id AS source, t.amount,
b.acct_id AS destination FROM MATCH (a)-[t]->(b) ON BANK_GRAPH LIMIT
3").print()
```

Java

```
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlStatement;
import oracle.pg.rdbms.pgql.PgqlResultSet;
import oracle.pgx.api.*;
import oracle.pg.rdbms.GraphServer;
...
String jdbcUrl="jdbc:oracle:thin:@<tns_alias>?TNS_ADMIN=<path_to_wallet>";
Connection conn =
DriverManager.getConnection(jdbcUrl,"ADBDEV","<password_for_ADBDEV>");
PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);
PgqlStatement pgqlStmt = pgqlConn.createStatement();
PgqlResultSet rs = pgqlStmt.executeQuery("SELECT a.acct_id AS source,
t.amount, b.acct_id AS destination FROM MATCH (a)-[t]->(b) ON BANK_GRAPH
LIMIT 3");
rs.print();
```

Python

```
>>> jdbcUrl = "jdbc:oracle:thin:@<tns_alias>?TNS_ADMIN=<path_to_wallet>"
>>> pgql_conn =
opg4py.pgql.get_connection("ADBDEV","<password_for_ADBDEV>", jdbcUrl)
>>> pgql_statement = pgql_conn.create_statement()
>>> pgql_statement.execute_query("SELECT a.acct_id AS source, t.amount,
b.acct_id AS destination FROM MATCH (a)-[t]->(b) ON BANK_GRAPH LIMIT
3").print()
```

On execution, the query produces the following output:

```
+-----+
| SOURCE | AMOUNT | DESTINATION |
```

1000	1000	921
1000	1000	662
1000	1000	506

8. Close the session after executing all graph queries as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> session.close()
```

Java

```
opg4j> session.close();
```

Python

```
>>> session.close()
```

- [Prerequisites for Using Autonomous Database Graph Client](#)
- [Using the PGX JDBC Driver with the AdbGraphClient API](#)
Starting from Graph Server and Client Release 24.1.0, you can use the PGX JDBC driver with the `AdbGraphClient` API to query graphs stored in the memory of the graph server in Graph Studio on Autonomous Database.

14.2.1 Prerequisites for Using Autonomous Database Graph Client

As a prerequisite requirement to get started with the `AdbGraphClient` API, you must:

- Provision an Autonomous Database instance in Oracle Autonomous Database.
- Obtain the following information if you are configuring the `AdbGraphClient` using the tenancy details. Otherwise, skip this step.

Key	Description	More Information
tenancy OCID	The Oracle Cloud ID (OCID) of your tenancy	To determine the OCID for your tenancy, see "Where to Find your Tenancy's OCID" in: Oracle Cloud Infrastructure Documentation .

Key	Description	More Information
database	Database name of your Autonomous Database instance	<ol style="list-style-type: none"> 1. Open the OCI console and click Oracle Database in the left navigation menu. 2. Click Autonomous Database and navigate to the Autonomous Databases page. 3. Select the required Autonomous Database under the Display Name column and navigate to the Autonomous Database Details page. 4. Note the Database Name under "General Information" in the Autonomous Database Information tab.
database OCID	The Oracle Cloud ID (OCID) of your Autonomous Database	<ol style="list-style-type: none"> 1. Open the OCI console and click Oracle Database in the left navigation menu. 2. Click Autonomous Database and navigate to the Autonomous Databases page. 3. Select the required Autonomous Database under the Display Name column and navigate to the Autonomous Database Details page. 4. Note the Database OCID under "General Information" in the Autonomous Database Information tab.
username	Graph enabled Autonomous Database username, used for logging into Graph Studio	See Create a Graph User for more information.
password	Database password for the graph user	If the password for a graph user is forgotten, then you can always reset password for the graph user by logging into Database Actions as the ADMIN user. See Edit User for more information.
endpoint	Graph Studio endpoint URL	<ol style="list-style-type: none"> 1. Select your Autonomous Database instance and navigate to the Autonomous Database Details page. 2. Click the Tools tab. 3. Click on Graph Studio. 4. Copy the URL of the new tab that opens the Graph Studio login screen. 5. Edit the URL to remove the part after <code>oraclecloudapps.com</code> to obtain the endpoint URL. For example, the following shows the format of a sample endpoint URL: <pre>https:// <hostname_prefix>.adb.<region_identifier>. oraclecloudapps.com</pre>

- Access Graph Studio and create a PGQL property graph.
- Download, install and start the Oracle Graph Java or Python client.

14.2.2 Using the PGX JDBC Driver with the AdbGraphClient API

Starting from Graph Server and Client Release 24.1.0, you can use the PGX JDBC driver with the `AdbGraphClient` API to query graphs stored in the memory of the graph server in Graph Studio on Autonomous Database.

To use the PGX JDBC driver to connect to your Autonomous Database instance, note the following:

- Register the PGX JDBC driver with the DriverManager:

```
import java.sql.DriverManager;
import oracle.pgx.jdbc.PgxJdbcDriver;
...
DriverManager.registerDriver(new PgxJdbcDriver());
```

- Use one of the following two ways to establish the connection using the PGX JDBC Driver:

- **Using Properties**

```
properties = new Properties();
properties.put("tenancy_ocid", "<tenancy_OCID>");
properties.put("database_ocid", "<database_OCID>");
properties.put("database", "<database_name>");
properties.put("username", "<username>");
properties.put("password", "<password>");
Connection connection =
DriverManager.getConnection("jdbc:oracle:pgx:https://<hostname-
prefix>.adb.<region>.oraclecloudapps.com", properties);
```

- **Using a Wallet**

```
Connection connection =
DriverManager.getConnection("jdbc:oracle:pgx:@<db_TNS_name>?
TNS_ADMIN=<path_to_wallet>", "<ADB_username>", "<ADB_password>")
```

Note that the JDBC URL in the preceding code samples, use `jdbc:oracle:pgx:` as the prefix.

Example 14-1 Using the PGX JDBC Driver to run graph queries in Autonomous Database

The following example establishes a connection using the PGX JDBC driver to connect to an Autonomous Database instance, starts the compute environment in Graph Studio, loads a graph into the graph server (PGX), creates a statement, and runs a PGQL query on the graph.

```
import java.sql.*;
import oracle.pgx.jdbc.*;
import oracle.pg.rdbms.*;
import oracle.pgx.api.*;

public class AdbPgxJdbc {

    public static void main(String[] args) throws Exception {

        DriverManager.registerDriver(new PgxJdbcDriver());

        try (Connection conn =
DriverManager.getConnection("jdbc:oracle:pgx:@<db_TNS_name>?
TNS_ADMIN=<path_to_wallet>", "<ADB_username>", "<ADB_password>")) {
            AdbGraphClient client = conn.unwrap(AdbGraphClient.class);
            if (!client.isAttached()) {
```

```

        var job = client.startEnvironment(10);
        job.get();
        System.out.println("job details: name=" + job.getName() + "type= " +
job.getType() +"created_by= " + job.getCreatedBy());
    }
    PgxCSession session = conn.unwrap(PgxCSession.class);
    PgxCGraph graph = session.readGraphByName("BANK_PGQL_GRAPH",
GraphSource.PG_PGQL);
    Statement stmt = conn.createStatement();
    ResultSet rs = stmt.executeQuery("SELECT * "+
                                   "FROM GRAPH_TABLE ( BANK_PGQL_GRAPH
"+
                                   "MATCH (a IS ACCOUNTS) -[e IS
TRANSFERS]-> (b IS ACCOUNTS) "+
                                   "WHERE a.ID = 179 AND b.ID = 688 "+
                                   "COLUMNS (e.AMOUNT AS AMOUNT ))");

    while(rs.next()){
        System.out.println("AMOUNT = " + rs.getLong("AMOUNT"));
    }
}
}
}

```

The resulting output of the preceding code is as shown:

```
AMOUNT = 7562
```

14.5 Additional Client Tools for Querying PGQL Property Graphs

When working with PGQL property graphs in the database, you can use other supported client tools.

- [Using Oracle SQLcl](#)
You can access the graph in the database using SQLcl.
- [Using SQL Developer with PGQL Property Graphs](#)
Starting from SQL Developer 23.1 or later, you can view all the PGQL property graphs existing in your database schema by expanding **PGQL Property Graphs** under the **Property Graph** node in the **Connections** navigator.

14.5.1 Using Oracle SQLcl

You can access the graph in the database using SQLcl.

You can run PGQL queries on the graph in SQLcl with a plug-in that is available with Oracle Graph Server and Client. See [PGQL Plug-in for SQLcl](#) in *Oracle SQLcl User's Guide* for more information.

The example in this section helps you get started on executing PGQL queries on a graph in SQLcl. As a prerequisite, to perform the steps in the example, you must set up the bank graph data in your database schema using the sample data provided with the graph server installation. See [Using Sample Graph Data](#) for more information.

The following example creates a PGQL property graph using the PGQL `CREATE PROPERTY GRAPH` statement, executes PGQL queries against the graph and finally drops the graph using SQLcl.

1. Start SQLcl with your database schema credentials. In the following command, *graphuser* is the database user used to connect to SQLcl.

```
sql graphuser/<password_for_graphuser>@<tns_alias>

SQLcl: Release 21.2 Production on Sun Jan 30 04:30:09 2022
Copyright (c) 1982, 2022, Oracle. All rights reserved.
Connected to:
Oracle Database 21c Enterprise Edition Release 21.0.0.0.0 - Production
Version 21.3.0.0.0
```

2. Enable PGQL mode as shown:

```
SQL> pgql auto on;

PGQL Auto enabled for schema=[null], graph=[null], execute=[true],
translate=[false]
```

Note that no arguments are used in the preceding PGQL command.

3. Create a PGQL property graph on the bank graph data tables.

```
PGQL> CREATE PROPERTY GRAPH bank_graph
2      VERTEX TABLES (
3          bank_accounts
4          LABEL ACCOUNTS
5          PROPERTIES (id, name)
6      )
7      EDGE TABLES (
8          bank_transfers
9          SOURCE KEY (src_acct_id) REFERENCES bank_accounts (id)
10         DESTINATION KEY (dst_acct_id) REFERENCES bank_accounts
11         LABEL TRANSFERS
12         PROPERTIES (src_acct_id, dst_acct_id, amount, description)
13*     ) OPTIONS(PG_PGQL);
```

Graph created

4. Set *bank_graph* as the default graph using the *graph* argument when enabling PGQL mode.

```
PGQL> pgql auto on graph bank_graph;

PGQL Auto enabled for schema=[null], graph=[BANK_GRAPH], execute=[true],
translate=[false]
```

- Execute PGQL queries against the default graph. For example, the following PGQL query retrieves the total number of vertices as shown:

```
PGQL> SELECT COUNT(*) AS num_vertices FROM MATCH(n);
```

NUM_VERTICES
1000

Note that in the preceding query, the graph name is not specified using the `ON` clause as part of the `MATCH` clause.

- Reconnect to SQLcl as another schema user.

```
PGQL> conn system/<password_for_system>@<tns_alias>;
Connected.
```

- Enable PGQL mode using the `schema` argument to set the default schema used for creating the graph. Also, set `bank_graph` as the default graph using the `graph` argument :

```
PGQL> pgql auto on schema graphuser graph bank_graph;
```

PGQL Auto enabled for schema=[graphuser], graph=[BANK_GRAPH],
execute=[true], translate=[false]

- Execute a PGQL query to retrieve all the edge properties on the graph as shown:

```
PGQL> SELECT e.* FROM MATCH (n:accounts) -[e:transfers]-> (m:accounts)
LIMIT 10;
```

AMOUNT	DESCRIPTION	src_acct_id	dst_acct_id
1000	transfer	178	921
1000	transfer	178	462
1000	transfer	179	688
1000	transfer	179	166
1000	transfer	179	397

10 rows selected.

Therefore, you can set a default schema and execute PGQL queries against a default graph in SQLcl.

- Finally, drop the graph after executing the required graph queries.

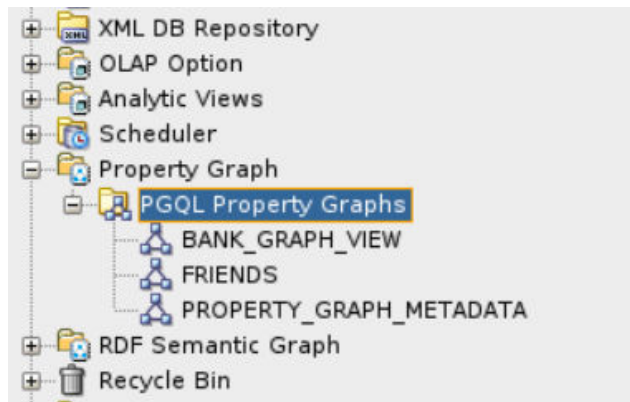

```
PGQL> DROP PROPERTY GRAPH bank_graph;
```

Graph dropped

14.5.2 Using SQL Developer with PGQL Property Graphs

Starting from SQL Developer 23.1 or later, you can view all the PGQL property graphs existing in your database schema by expanding **PGQL Property Graphs** under the **Property Graph** node in the **Connections** navigator.

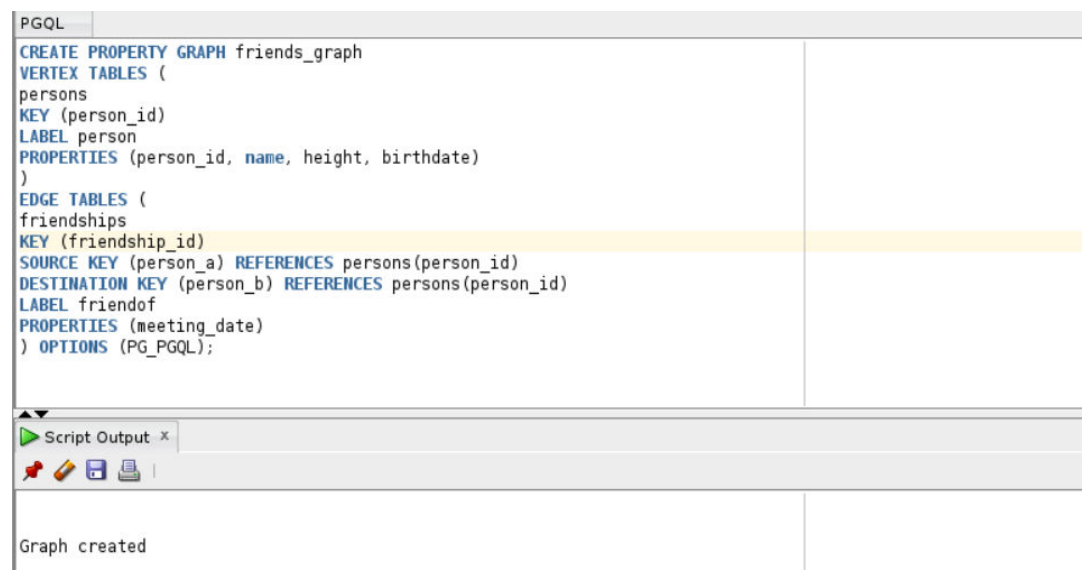

Figure 14-3 PGQL Property Graphs in SQL Developer

The following steps show a few examples for working with PGQL property graphs using SQL Developer.

1. Right-click the **Property Graph** node and select **Open PGQL Worksheet**.
PGQL Worksheet opens in a new tab and it supports the following actions:
 - **Run Query:** To run a single PGQL query
 - **Run Script:** To run multiple PGQL queries
2. Create a PGQL property graph by running a `CREATE PROPERTY GRAPH` statement in the PGQL Worksheet. For example:

Figure 14-4 Create a PGQL property graph

The result of the query execution is displayed in the bottom pane of the Editor. On successful query execution, you can right click and refresh the **PGQL Property Graphs** object to view the newly created graph under **PGQL Property Graphs**.

3. Click on the newly created graph.

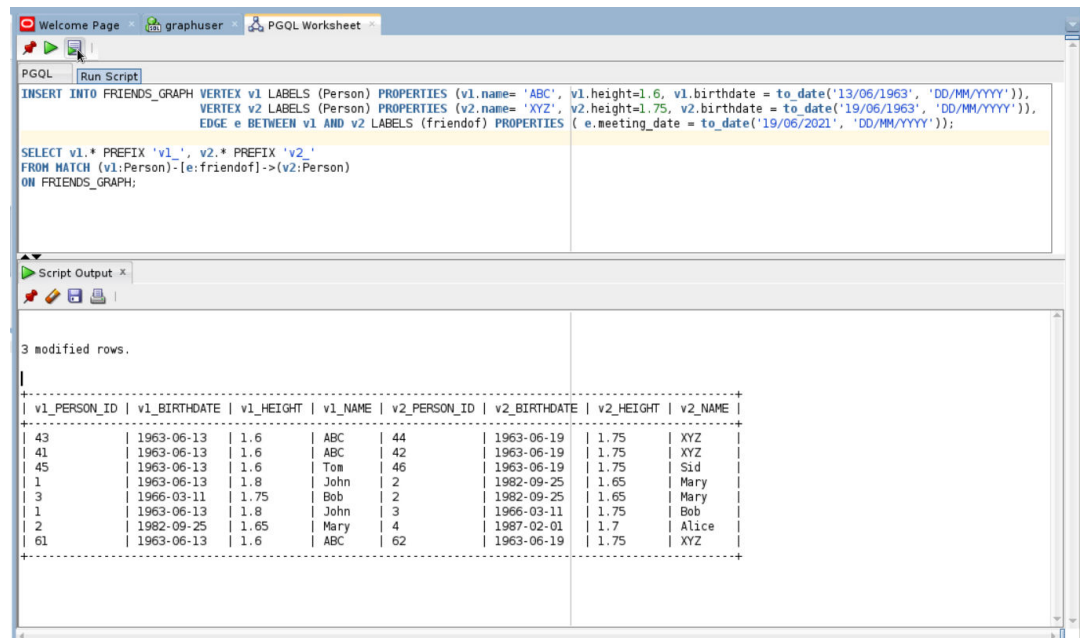

This opens a **PGQL Worksheet** in a new tab with the following default query:

```
SELECT e, v, n FROM MATCH (v)-[e]-(n) ON <graph_name> LIMIT 100
```

4. Run one or more PGQL queries.

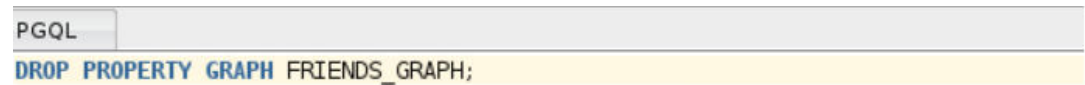

For example, the following shows the execution of PGQL **INSERT** and **SELECT** queries:

Figure 14-5 Running Multiple PGQL Queries

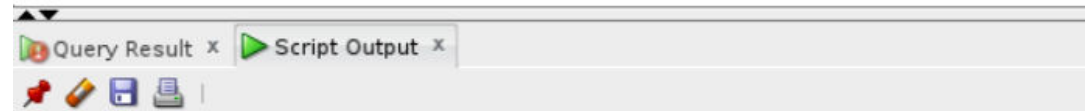

You can view the results in the **Script Output** tab.

5. Delete the PGQL property graph as shown:

Figure 14-6 Dropping a PGQL Property Graph

PGQL

```
DROP PROPERTY GRAPH FRIENDS_GRAPH;
```

The graph is dropped.

Property Graph Query Language (PGQL)

PGQL is a SQL-like query language for property graph data structures that consist of *vertices* that are connected to other vertices by *edges*, each of which can have key-value pairs (properties) associated with them.

The language is based on the concept of *graph pattern matching*, which allows you to specify patterns that are matched against vertices and edges in a data graph.

Note

The graph server (PGX) 25.3.0 supports [PGQL 2.1](#) and earlier versions.

The property graph support provides two ways to execute Property Graph Query Language (PGQL) queries through Java APIs:

- Use the `oracle.pgx.api` Java package to query an in-memory snapshot of a graph that has been loaded into the graph server (PGX), as described in [Executing PGQL Queries Against the Graph Server \(PGX\)](#).
- Use the `oracle.pg.rdbms.pgql` Java package to directly query graph data stored in Oracle Database. See [Executing PGQL Queries Against PGQL Property Graphs](#) and [Executing PGQL Queries Against SQL Property Graphs](#) for more information.

For more information about PGQL, see the [PGQL Specification](#).

- [Creating a Property Graph Using PGQL](#)
- [Pattern Matching with PGQL](#)
- [Edge Patterns Have a Direction with PGQL](#)
- [Vertex and Edge Labels with PGQL](#)
- [Variable-Length Paths with PGQL](#)
- [Aggregation and Sorting with PGQL](#)
- [Executing PGQL Queries Against PGQL Property Graphs](#)
This topic explains how you can execute PGQL queries directly against PGQL property graphs on Oracle Database tables.

15.1 Creating a Property Graph Using PGQL

`CREATE PROPERTY GRAPH` is a PGQL DDL statement to create a PGQL property graph from the database tables.

The `CREATE PROPERTY GRAPH` statement starts with the name you give the graph, followed by a set of vertex tables and edge tables. The graph can have no vertex tables or edge tables (an empty graph), or vertex tables and no edge tables (a graph with only vertices and no edges), or both vertex tables and edge tables (a graph with vertices and edges). However, a graph cannot be specified with only edge tables and no vertex tables.

Optionally, you can also create a PGQL property graph from existing graphs. See [Creating a PGQL Property Graph with the `BASE GRAPHS` Clause](#) for more information.

Note

The following best practices are recommended when creating a PGQL property graph:

- Ensure that a primary key constraint exist for a vertex or an edge key so that the graph does not contain duplicate vertex or edge keys.
- Ensure that a foreign key constraint exists between the edge and the referenced vertex tables so that the graph does not contain edges with missing vertices.
- Run the `pg.validate()` function after creating the graph to verify that the vertex and edge table keys are unique and the source and destination of the edges exist.

```
pgqlStmt.execute("CALL pg.validate('<graph_name>')")
```

For example, consider the `bank_accounts` and `bank_transfers` database tables created using the sample graph data in `opt/oracle/graph/data` directory. See [Using Sample Graph Data](#) for more information.

- **BANK_ACCOUNTS** is a table with columns `id`, `name`, and `balance`. A row is added into this table for every new account.
- **bank_transfers** is a table with columns `txn_id`, `src_acct_id`, `dst_acct_id`, `description`, and `amount`. A row is added into this table for every new transaction from `src_acct_id` to `dst_acct_id`.

You can create a PGQL property graph using the database tables as shown:

```
CREATE PROPERTY GRAPH bank_graph
  VERTEX TABLES(
    bank_accounts AS accounts
      KEY(id)
      LABEL accounts
      PROPERTIES (id, name)
  )
  EDGE TABLES(
    bank_transfers AS transfers
      KEY (txn_id)
      SOURCE KEY (src_acct_id) REFERENCES accounts (id)
      DESTINATION KEY (dst_acct_id) REFERENCES accounts (id)
      PROPERTIES (description, amount)
  ) OPTIONS (PG_PGQL)
```

The following graph concepts are explained by mapping the database tables to the graph and using the preceding PGQL DDL statement:

- **Vertex tables:** A table that contains data entities is a vertex table (for example, `bank_accounts`).
 - Each row in the vertex table is a vertex.
 - The columns in the vertex table are properties of the vertex.

- The name of the vertex table is the default label for this set of vertices. Alternatively, you can specify a label name as part of the CREATE PROPERTY GRAPH statement.
- **Edge tables:** An edge table can be any table that links two vertex tables, or a table that has data that indicates an action from a source entity to a target entity. For example, transfer of money from `FROM_ACCOUNT_ID` to `TO_ACCOUNT_ID` is a natural edge.
 - Foreign key relationships can give guidance on what links are relevant in your data. CREATE PROPERTY GRAPH will default to using foreign key relationships to identify edges.
 - Some of the properties of an edge table can be the properties of the edge. For example, an edge from `src_acct_id` to `dst_acct_id` can have properties `description` and `amount`.
 - The name of an edge table is the default label for the set of edges. Alternatively, you can specify a label name as part of the CREATE PROPERTY GRAPH statement.
- **Keys:**
 - **Keys in a vertex table:** The key of a vertex table identifies a unique vertex in the graph. The key can be specified in the CREATE PROPERTY GRAPH statement; otherwise, it defaults to the primary key of the table. If there are duplicate rows in the table, the CREATE PROPERTY GRAPH statement will return an error.
 - **Key in an edge table:** The key of an edge table uniquely identifies an edge in the graph. The KEY clause specifying source and destination vertices uniquely identifies the source and destination vertex keys.
- **REFERENCES Clause:** This connects the source and destination vertices of an edge to the corresponding vertex tables. Also, note the following:
 - The source and destination keys can reference the key of the vertex table. For example:

```

VERTEX TABLES ( bank_accounts KEY(id))
EDGE TABLES (
  bank_transfers KEY (txn_id)
    SOURCE KEY (src_acct_id) REFERENCES accounts (id)
    DESTINATION KEY (dst_acct_id) REFERENCES accounts (id)
)

```

- The source and destination keys can reference any set of columns of the vertex table. In case the referenced columns do not match a PRIMARY or UNIQUE key, then you must ensure to maintain data integrity in the referenced columns.

```

VERTEX TABLES ( vt KEY ( vt_c1 ) )
EDGE TABLES ( et SOURCE KEY ( et_c1 ) REFERENCES
(vt_any_unique_key_column ))

```

- **Table aliases:** Vertex and edge tables must have unique names. If you need to identify multiple vertex tables from the same relational table, or multiple edge tables from the same relational table, you must use aliases. For example, you can create two vertex tables `bank_accounts` and `accounts` from one table `bank_accounts`, as shown:

```

CREATE PROPERTY GRAPH bank_transfers
  VERTEX TABLES (bank_accounts KEY(id)
    bank_accounts AS accounts KEY(id))

```

In case any of your vertex and edge table share the same name, then you must again use a table alias. In the following example, table alias is used for the edge table, DEPARTMENTS, as there is a vertex table referenced with the same name:

```
CREATE PROPERTY GRAPH hr
VERTEX TABLES (
  employees KEY(employee_id)
  PROPERTIES ARE ALL COLUMNS,
  departments KEY(department_id)
  PROPERTIES ARE ALL COLUMNS
)
EDGE TABLES (
  departments AS managed_by
  SOURCE KEY ( department_id ) REFERENCES departments ( department_id )
  DESTINATION employees
  PROPERTIES ARE ALL COLUMNS
) OPTIONS (PG_PGQL)
```

- **Properties:** The vertex and edge properties of a graph are derived from the columns of the vertex and edge tables respectively and by default have the same name as the underlying table columns. However, you can choose a different property name for each column. This helps to avoid conflicts when two tables have the same column name but with different data types.
In the following example, the vertex properties `id` and `name` are renamed to `acct_no` and `acct_name` respectively:

```
CREATE PROPERTY GRAPH bank_graph
VERTEX TABLES (
  bank_accounts AS accounts
  LABEL accounts
  PROPERTIES (id AS acct_no, name AS acct_name)
)
```

For more details on the `CREATE PROPERTY GRAPH` statement, see the [PGQL Specification](#).

Refer to the following table for creating a property graph:

Table 15-1 CREATE PROPERTY GRAPH Statement Support

Method	More Information
Create a property graph in the graph server (PGX) using the <code>oracle.pgx.api</code> Java package	Java APIs for Executing CREATE PROPERTY GRAPH Statements
Create a property graph in the graph server (PGX) using the <code>pypgx.api</code> Python package	Python APIs for Executing CREATE PROPERTY GRAPH Statements
Create a PGQL property graph on Oracle Database tables	Creating a PGQL Property Graph

- [Creating a PGQL Property Graph with the BASE_GRAPH clause](#)
You can create a PGQL property graph by providing a list of existing PGQL property graphs.
- [Creating a PGQL Property Graph with Arbitrary Property Expressions](#)
You can create a PGQL property graph with vertex and edge properties mapped to arbitrary property expressions.

15.1.1 Creating a PGQL Property Graph with the `BASE GRAPHS` Clause

You can create a PGQL property graph by providing a list of existing PGQL property graphs.

You can specify the `BASE GRAPHS` clause in the `CREATE PROPERTY GRAPH` DDL statement for specifying one or more existing PGQL property graphs from which you wish to create the new PGQL property graph. It is allowed to specify the `BASE GRAPHS` clause without specifying the `VERTEX TABLES` and `EDGE TABLES` clauses.

The syntax of the `BASE GRAPHS` clause in the `CREATE PROPERTY GRAPH` statement is as shown:

```
CreatePropertyGraph ::= 'CREATE' 'PROPERTY' 'GRAPH' GraphName
                        BaseGraphs?
                        VertexTables?
                        EdgeTables?

BaseGraphs            ::= 'BASE' 'GRAPHS' '(' BaseGraph ( ',' BaseGraph )* ')'

BaseGraph             ::= SchemaQualifiedName

ElementTablesClause   ::= AllElementTables
                        | ElementTablesList

AllElementTables      ::= 'ALL' 'ELEMENT' 'TABLES' ExceptElementTables?

ExceptElementTables   ::= 'EXCEPT' '(' ElementTableReference ( ','
ElementTableReference )* ')'

ElementTablesList     ::= '(' ElementTable ( ',' ElementTable )* ')'

ElementTable          ::= ElementTableReference TableAlias?

ElementTableReference ::= Identifier
```

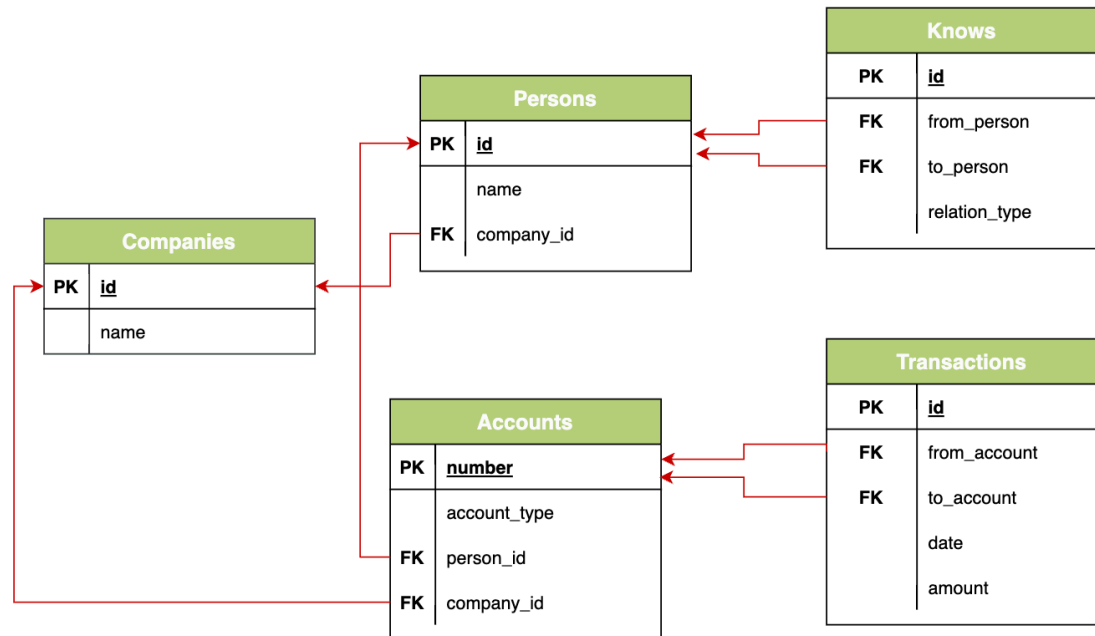

The `BASE GRAPHS` clause option allows you to duplicate a graph using a different name.

```
CREATE PROPERTY GRAPH <new_graph>
  BASE GRAPHS (<old_graph>)
  OPTIONS ( PG_PGQL )
```

Also, note that once the `new_graph` is created, it does not have any dependency on `old_graph`. This implies that updating or deleting the `old_graph` has no impact on the `new_graph`.

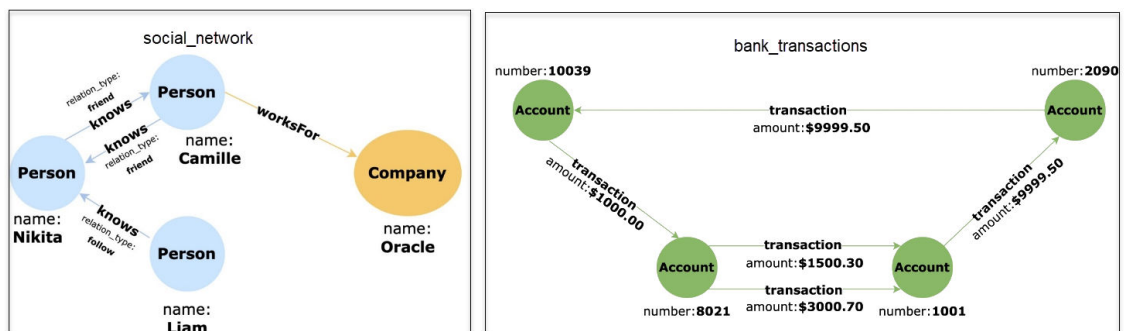

Consider the following example schema:

Figure 15-1 Example Schema

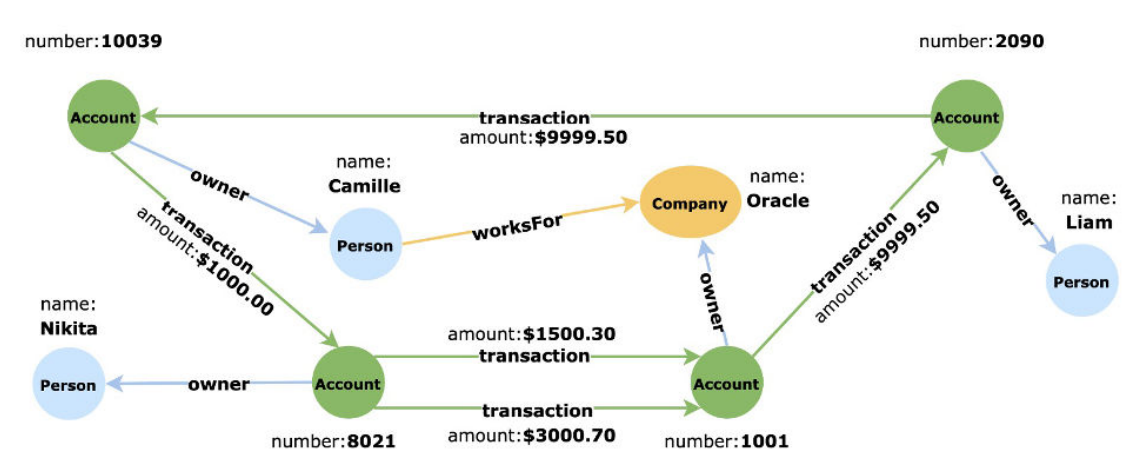

Assume that the following two graphs, `social_network` and `bank_transactions`, are created from the preceding schema:

Figure 15-2 Graphs Created from the Example Schema

Using the `BASE GRAPHS` clause, you can then create a new PGQL property graph by establishing a relationship between both the preceding graphs as shown:

Figure 15-3 Financial_Transactions Graph

To obtain this new graph based on the `social_network` and `bank_transactions` graphs:

1. Specify the names of the two graphs, `social_network` and `bank_transactions`, in the `BASE GRAPHS` clause. If a base graph does not exist in the current schema, then the user must specify the schema name.
2. Eliminate the `Knows` edge in the `social_network` graph. This can be achieved by using the `ALL ELEMENT TABLES EXCEPT` clause and specifying the `table_name` of that edge. Alternatively, you can use the `ELEMENT TABLES` clause and specify only the two tables, `Persons` and `Companies`.
3. Create a new edge between the `Accounts` vertex in the `bank_transactions` graph and the `Persons` vertex in the `social_network` graph.
4. Create a new edge between the `Accounts` vertex in the `bank_transactions` graph and the `Companies` vertex in the `social_network` graph.

The optimized `CREATE PROPERTY GRAPH` statement with the `BASE GRAPHS` clause to create the new PGQL property graph is as shown:

```

CREATE PROPERTY GRAPH financial_transactions
BASE GRAPHS(
  bank_transactions,
  social_network ALL ELEMENT TABLES EXCEPT ( knows )
)
EDGE TABLES(
  Accounts AS PersonOwner
    SOURCE KEY ( "number" ) REFERENCES Accounts ( "number" )
    DESTINATION Persons
    LABEL owner NO PROPERTIES,
  Accounts AS CompanyOwner
    SOURCE KEY ( "number" ) REFERENCES Accounts ( "number" )
    DESTINATION Companies
    LABEL owner NO PROPERTIES
) OPTIONS ( PG_PGQL )

```

15.1.2 Creating a PGQL Property Graph with Arbitrary Property Expressions

You can create a PGQL property graph with vertex and edge properties mapped to arbitrary property expressions.

For instance, consider the following example data. The table contains `emp_dtls` as a JSON column.

```
CREATE TABLE emp_data (
  emp_id NUMBER GENERATED ALWAYS AS IDENTITY (START WITH 1 INCREMENT BY 1),
  emp_dtls JSON,
  CONSTRAINT emp_pk PRIMARY KEY (emp_id));

INSERT INTO emp_data (emp_dtls)
VALUES ('{"name":"John","department":"IT","role":"Software Developer"}');

INSERT INTO emp_data (emp_dtls)
VALUES ('{"name":"Mary","department":"HR","role":"HR Manager"}');

INSERT INTO emp_data (emp_dtls)
VALUES ('{"name":"Bob","department":"IT","role":"Technical Consultant"}');

INSERT INTO emp_data (emp_dtls)
VALUES ('{"name":"Alice","department":"HR","role":"HR Assistant"}');
```

You can then create a PGQL property graph with vertex and edge properties mapped to JSON data using the `JSON_VALUE` function.

```
CREATE PROPERTY GRAPH g
VERTEX TABLES (
  emp_data PROPERTIES (
    JSON_VALUE(emp_dtls, '$.name') AS name,
    JSON_VALUE(emp_dtls, '$.department') AS department,
    JSON_VALUE(emp_dtls, '$.role') AS role)
) OPTIONS(PG_PGQL)
```

Finally, you can query the vertex and edge properties of the graph as shown:

```
SELECT *
FROM GRAPH_TABLE ( g
  MATCH (n IS emp_data)
  COLUMNS (n.name, n.department, n.role) )
```

The query produces the following output:

NAME	DEPARTMENT	ROLE
John	IT	Software Developer
Mary	HR	HR Manager
Bob	IT	Technical Consultant

```
| Alice | HR          | HR Assistant      |
+-----+-----+-----+
```

15.2 Pattern Matching with PGQL

Pattern matching is done by specifying one or more path patterns in the MATCH clause. A single path pattern matches a linear path of vertices and edges, while more complex patterns can be matched by combining multiple path patterns, separated by comma. Value expressions (similar to their SQL equivalents) are specified in the WHERE clause and let you filter out matches, typically by specifying constraints on the properties of the vertices and edges

For example, assume a graph of TCP/IP connections on a computer network, and you want to detect cases where someone logged into one machine, from there into another, and from there into yet another. You would query for that pattern like this:

```
SELECT id(host1) AS id1, id(host2) AS id2, id(host3) AS id3      /* choose
what to return */
FROM MATCH
    (host1) -[connection1]-> (host2) -[connection2]-> (host3)  /* single
linear path pattern to match */
WHERE
    connection1.toPort = 22 AND connection1.opened = true AND
    connection2.toPort = 22 AND connection2.opened = true AND
    connection1.bytes > 300 AND                                  /*
meaningful amount of data was exchanged */
    connection2.bytes > 300 AND
    connection1.start < connection2.start AND                    /* second
connection within time-frame of first */
    connection2.start + connection2.duration < connection1.start +
    connection1.duration
GROUP BY id1, id2, id3                                          /*
aggregate multiple matching connections */
```

For more examples of pattern matching, see the [Writing simple queries](#) section in the PGQL specification.

15.3 Edge Patterns Have a Direction with PGQL

An edge pattern has a direction, as edges in graphs do. Thus, (a) <-[]- (b) specifies a case where *b* has an edge pointing at *a*, whereas (a) -[]-> (b) looks for an edge in the opposite direction.

The following example finds common friends of April and Chris who are older than both of them.

```
SELECT friend.name, friend.dob
FROM MATCH      /* note the arrow directions below */
    (p1:person) -[:likes]-> (friend) <-[:likes]- (p2:person)
WHERE
    p1.name = 'April' AND p2.name = 'Chris' AND
    friend.dob > p1.dob AND friend.dob > p2.dob
ORDER BY friend.dob DESC
```

For more examples of edge patterns, see the [Edge Patterns](#) section in the PGQL specification.

15.4 Vertex and Edge Labels with PGQL

Labels are a way of attaching type information to edges and nodes in a graph, and can be used in constraints in graphs where not all nodes represent the same thing. For example:

```
SELECT p.name
FROM MATCH (p:person) -[e1:likes]-> (m1:movie),
      MATCH (p) -[e2:likes]-> (m2:movie)
WHERE m1.title = 'Star Wars'
      AND m2.title = 'Avatar'
```

The example queries a graph which contains a set of vertices with the label `person`, a set of vertices with the label `movie`, and a set of edges with the label `likes`. A label expression can start with either a colon (`:`) or the keyword `IS` followed by one or more labels. If more than one label is used, then the labels are separated by a vertical bar (`|`).

The following query shows the preceding example query with the keyword `IS` for the label expression:

```
SELECT p.name
FROM MATCH (p IS person) -[e1 IS likes]-> (m1 IS movie),
      MATCH (p IS person) -[e2 IS likes]-> (m2 IS movie)
WHERE m1.title = 'Star Wars'
      AND m2.title = 'Avatar'
```

① See Also

[Label Expression](#) section in the PGQL specification

15.5 Variable-Length Paths with PGQL

Variable-length path patterns have a quantifier like `*` to match a variable number of vertices and edges. Using a `PATH` macro, you can specify a named path pattern at the start of a query that can be embedded into the `MATCH` clause any number of times, by referencing its name. The following example finds all of the common ancestors of Mario and Luigi.

```
PATH has_parent AS () -[:has_father|has_mother]-> ()
SELECT ancestor.name
FROM MATCH (p1:Person) -/:has_parent*/-> (ancestor:Person)
      , MATCH (p2:Person) -/:has_parent*/-> (ancestor)
WHERE
  p1.name = 'Mario' AND
  p2.name = 'Luigi'
```

The preceding path specification also shows the use of anonymous constraints, because there is no need to define names for intermediate edges or nodes that will not be used in additional constraints or query results. Anonymous elements can have constraints, such as

[:has_father|has_mother] -- the edge does not get a variable name (because it will not be referenced elsewhere), but it is constrained.

For more examples of variable-length path pattern matching, see the [Variable-Length Paths](#) section in the PGQL specification.

15.6 Aggregation and Sorting with PGQL

Like SQL, PGQL has support for the following:

- GROUP BY to create groups of solutions
- MIN, MAX, SUM, and AVG aggregations
- ORDER BY to sort results

And for many other familiar SQL constructs.

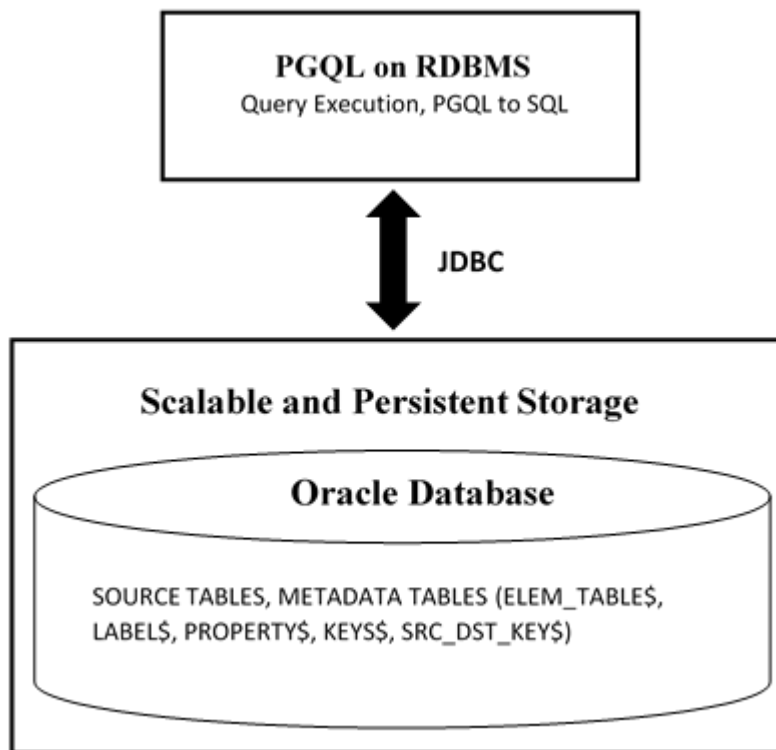

📘 See Also

- See [Grouping and Aggregation](#) for more information on GROUP BY
- See [Sorting and Row Limiting](#) for more information on ORDER BY

15.7 Executing PGQL Queries Against PGQL Property Graphs

This topic explains how you can execute PGQL queries directly against PGQL property graphs on Oracle Database tables.

The PGQL query execution flow is shown in the following figure.

Figure 15-4 PGQL on PGQL Property Graphs in Oracle Database

The basic execution flow is:

1. The PGQL query is submitted to PGQL on RDBMS through a Java API.
 2. The PGQL query is translated into SQL statements using the internal metadata tables for PGQL property graphs.
 3. The translated SQL is submitted to Oracle Database by JDBC.
 4. The SQL result set is wrapped as a PGQL result set and returned to the caller.
- [Supported PGQL Features and Limitations for PGQL Property Graphs](#)
Learn about the supported PGQL features and limitations for PGQL property graphs.
 - [SQL Translation for a PGQL Query](#)
You can obtain the SQL translation for a PGQL query through the `translateQuery()` and `getSqlTranslation()` methods in `PgqlStatement` and `PgqlPreparedStatement`.

15.7.1.1 Additional Information on Supported PGQL Features with Examples

The following PGQL features are supported in PGQL property graphs:

- Recursive queries are supported for the following variable-length path finding goals:
 - Reachability
 - ANY
 - ANY SHORTEST
 - TOP k SHORTEST
- Recursive queries are supported for the following horizontal aggregations:
 - LISTAGG

```
SELECT LISTAGG(src.first_name || ' ' || src.last_name, ',')
FROM MATCH TOP 2 SHORTEST ( (n:Person) ((src)-[e:knows]->)* (m:Person) )
WHERE n.id = 1234
```

- SUM

```
SELECT SUM(e.weight + 3)
FROM MATCH TOP 2 SHORTEST ( (n:Person) -[e:knows]->* (m:Person) )
WHERE n.id = 1234
```

- COUNT

```
SELECT COUNT(e)
FROM MATCH TOP 2 SHORTEST ( (n:Person) -[e:knows]->* (m:Person) )
WHERE n.id = 1234
```

- AVG

```
SELECT AVG(dst.age)
FROM MATCH TOP 2 SHORTEST ( (n:Person) (-[e:knows]->(dst))* (m:Person) )
WHERE n.id = 1234
```

- MIN (Only for property value or CAST expressions)

```
SELECT MIN(CAST(dst.age + 5 AS INTEGER))
FROM MATCH TOP 2 SHORTEST ( (n:Person) (-[e:knows]->(dst))* (m:Person) )
WHERE n.id = 1234
```

- MAX (Only for property value or CAST expressions)

```
SELECT MAX(dst.birthday)
FROM MATCH TOP 2 SHORTEST ( (n:Person) (-[e:knows]->(dst))* (m:Person) )
WHERE n.id = 1234
```

- The following quantifiers are supported in recursive queries:

Table 15-3 Supported Quantifiers in PGQL SELECT Queries

Syntax	Description
*	zero or more
+	one or more
?	zero or one
{ <i>n</i> }	exactly <i>n</i>
{ <i>n</i> ,}	<i>n</i> or more
{ <i>n</i> , <i>m</i> }	between <i>n</i> and <i>m</i> (inclusive)
{, <i>m</i> }	between zero and <i>m</i> (inclusive)

- Data type casting with precision and scale is supported:

```
SELECT CAST(v.id AS VARCHAR2(10)) || '→' || CAST(w.id AS VARCHAR2(10)) AS
friendOf
FROM MATCH (v) -[:friendOf]->(w)
```

```
SELECT CAST(e.mval AS NUMBER(5,2)) AS mval
FROM MATCH (e) -[e:knows]->(w)
WHERE e.mval = '342.5'
```

- Both built-in Oracle Database functions and user defined functions (UDFs) are supported. For example:

- Assuming a table has a JSON column with values such as, {"name": "John", "age": 43}:

```
SELECT JSON_VALUE(p.attributes, '$.name') AS name
FROM MATCH (p:Person)
WHERE JSON_VALUE(p.attributes, '$.age') > 35
```

- Assuming an Oracle Text index exists on a text column in a table:

```
SELECT n.text
FROM MATCH (n)
WHERE CONTAINS(n.text, 'cat', 1) > 0
```

- Assuming a UDF `updated_id` is registered with the graph server (PGX):

```
SELECT my.updated_id(n.ID) FROM MATCH(n) LIMIT 10
```

- Selecting all properties of vertices or edges is supported through `SELECT v.*` clause, where `v` is the variable whose properties are selected. The following example retrieves all the edge properties of a graph:

```
SELECT label(e), e.* FROM MATCH (n)-[e]->(m) ON bank_graph LIMIT 3
```

On execution, the preceding query retrieves all the properties that are bound to the variable `e` as shown:

label(e)	AMOUNT	DESCRIPTION	src_acct_id	dst_acct_id
TRANSFERS	1000	transfer	178	921
TRANSFERS	1000	transfer	178	462
TRANSFERS	1000	transfer	179	688

A `PREFIX` can be specified to avoid duplicate column names in cases where you select all properties using multiple variables. For example:

```
SELECT n.* PREFIX 'n_', e.* PREFIX 'e_', m.* PREFIX 'm_'
FROM MATCH (n:Accounts) -[e:transfers]-> (m:Accounts)
ON bank_graph LIMIT 3
```

The query output is as follows:

n_ID	n_NAME	e_AMOUNT	e_DESCRIPTION	e_src_acct_id	e_dst_acct_id	m_ID	m_NAME
178	Account	1000	transfer	178	921	Account	
178	Account	1000	transfer	178	462	Account	
179	Account	1000	transfer	179	688	Account	

Label expressions can be used such that only properties that belong to the specified vertex or edge labels are selected:

```
SELECT LABEL(n), n.* FROM MATCH (n:Accounts) ON bank_graph LIMIT 3
```

The preceding query output is as shown:

```
+-----+
| LABEL(n) | ID | NAME |
+-----+
| ACCOUNTS | 1  | User1 |
| ACCOUNTS | 2  | User2 |
| ACCOUNTS | 3  | User3 |
+-----+
```

- Support for ALL path finding goal to return all the paths between a pair of vertices. However, to avoid endless cycling, only the following quantifiers are supported:

- ?
- {n}
- {n.m}
- {,m}

For example, the following PGQL query finds all the transaction paths from account 284 to account 616 :

```
SELECT LISTAGG(e.amount, ' + ' ) || ' = ', SUM(e.amount) AS total_amount
FROM MATCH ALL (a:Accounts) -[e:Transfers]->{1,4}(b:Accounts)
WHERE a.id = 284 AND b.id = 616
ORDER BY total_amount
```

On execution, the query produces the following result:

```
+-----+
| LISTAGG(e.amount, ' + ' ) || ' = ' | TOTAL_AMOUNT |
+-----+
| 1000 + 1000 + 1000 =                | 3000          |
| 1000 + 1500 + 1000 =                | 3500          |
| 1000 + 1000 + 1000 + 1000 =         | 4000          |
+-----+
$16 ==> oracle.pg.rdbms.pgql.pgview.PgViewSet@4f38acf
```

- Scalar subqueries which return exactly one column and one row is supported. For example:

```
SELECT p.name AS name , (
    SELECT SUM(t.amount)
    FROM MATCH (a) <-[t:transaction]- (:Account)
) AS sum_incoming , (
    SELECT SUM(t.amount)
    FROM MATCH (a) -[t:transaction]-> (:Account)
) AS sum_outgoing , (
    SELECT COUNT(DISTINCT p2)
    FROM MATCH (a) -[t:transaction]- (:Account) -[:owner]-> (p2:Person)
```

```

WHERE p2 <> p
) AS num_persons_transacted_with , (
  SELECT COUNT(DISTINCT c)
  FROM MATCH (a) -[t:transaction]- (:Account) -[:owner]-> (c:Company)
) AS num_companies_transacted_with
FROM MATCH (p:Person) <-[:owner]- (a:Account)
ORDER BY sum_outgoing + sum_incoming DESC

```

- EXISTS and NOT EXISTS subqueries are supported. Such queries yield TRUE or FALSE depending on whether the query produces at least one results given the bindings of the outer query.
For example:

```

SELECT fof.name, COUNT(friend) AS num_common_friends
FROM MATCH (p:Person) -[:knows]-> (friend:Person) -[:knows]-> (fof:Person)
WHERE NOT EXISTS (
  SELECT * FROM MATCH (p) -[:knows]-> (fof)
)

```

- PGQL LATERAL subqueries are supported. For example:

```

SELECT recipient, COUNT(*) AS num_large_transactions
FROM LATERAL ( SELECT m.id AS recipient
  FROM MATCH (n IS accounts) -[e IS transfers]-> (m IS
accounts)
  WHERE n.id = 772
  ORDER BY e.amount DESC )
GROUP BY recipient
ORDER BY num_large_transactions DESC

```

- PGQL GRAPH_TABLE operator is supported. For example:

```

SELECT * FROM GRAPH_TABLE ( bank_graph
  MATCH (a IS accounts) -[e IS transfers]-> (b IS accounts)
  COLUMNS ( a.id as from_ac, e.amount as amount, b.id as to_ac )
) FETCH FIRST FIVE ROWS ONLY

```

- The source (IS [NOT] SOURCE OF) and destination (IS [NOT] DESTINATION OF) predicates to verify if a vertex is a source or destination of an edge are supported. This is useful when an edge is matched through an any directed edge pattern (-[e]-). Note that this PGQL feature is supported only in Oracle Database 23ai. For example:

```

SELECT e.amount, CASE WHEN n IS SOURCE OF e THEN 'Outgoing transaction'
ELSE 'Incoming transaction' END AS type
FROM MATCH (n:Accounts) -[e:transfers]- (m:Accounts)
WHERE n.id = 284
ORDER BY type, e.amount

```

The preceding query produces the following result:

```

+-----+
| AMOUNT | TYPE                |
+-----+
| 1000    | Incoming transaction |
| 1200    | Outgoing transaction |

```

```
| 1300 | Outgoing transaction |
+-----+
```

- JSON_ARRAYAGG function (see JSON_ARRAYAGG in *Oracle Database SQL Language Reference*) to aggregate values into a JSON array is supported.

```
SELECT JSON_ARRAY_AGG(n.id) AS txn_from
FROM MATCH (n:Accounts) -[e:transfers]- (m:Accounts)
WHERE m.id = 616
```

On execution, the query produces the following result:

```
+-----+
| TXN_FROM |
+-----+
| [202,582,650,108,744,756,801,674,710,764] |
+-----+
```

- Built-in graph validation function `pg.validate()` to check if vertex and edge keys are unique, and if the sources and destinations of edges exist.

```
pgqlStmt.execute("CALL pg.validate('BANK_TXN_GRAPH')")
$1 ==> false
```

Exceptions are raised for invalid keys or edges having missing vertices as shown:

```
pgqlStmt.execute("CALL pg.validate('COUNTRIES')")
opg4j> pgqlStmt.execute("CALL pg.validate('COUNTRIES')")
| Exception oracle.pg.rdbms.pgql.PgqlToSqlException: Invalid vertex key
60 for edge NO in edge table CTY_REG with destination key column(s)
"REGION_ID" referencing REGIONS ( "REGION_ID" )
```

- Unnesting of paths using the ONE ROW PER STEP clause is supported in the PGQL GRAPH_TABLE operator query.

```
SELECT *
FROM GRAPH_TABLE ( financial_transactions
    MATCH
        (a IS account) -[IS transaction]->+ (a)
    KEEP SHORTEST 5 SIMPLE PATHS
    WHERE a.number = 10039
    ONE ROW PER STEP ( v1, e, v2 )
    COLUMNS( MATCHNUM() AS matchnum,
        ELEMENT_NUMBER(e) AS elemnum,
        v1.number AS account1,
        v2.number AS account2, e.amount))
ORDER BY matchnum, elemnum
```

As seen in the preceding example, the `ONE ROW PER STEP` clause declares an iterator vertex variable, an iterator edge variable, and another iterator vertex variable. The query produces one row per step (a step is a vertex-edge-vertex triple) as shown:

matchnum	elemnum	account1	account2	amount
0	2	10039	8021	1000.0
0	4	8021	1001	1500.3
0	6	1001	2090	9999.5
0	8	2090	10039	9900.0
1	2	10039	8021	1000.0
1	4	8021	1001	3000.7
1	6	1001	2090	9999.5
1	8	2090	10039	9900.0

The preceding output shows two paths, each having 4 edges.

The following are a few PGQL features which are not supported:

- The following PGQL `SELECT` features are not supported:
 - Use of bind variables in path expressions.
If you attempt to use a bind variable, it will result in an error as shown:

```
opg4j> String s = "SELECT id(a) FROM MATCH ANY SHORTEST (a) -[e]->* (b)
WHERE id(a) = ?";
s ==> "SELECT id(a) FROM MATCH ANY SHORTEST (a) -[e]->* (b) WHERE id(a)
= ?"
```

```
opg4j> PgqlPreparedStatement ps = pgqlConn.prepareStatement(s);
ps ==> oracle.pg.rdbms.pgql.PgqlExecution@7806db3f
```

```
opg4j> ps.setString(1, "PERSON(3)");
```

```
opg4j> ps.executeQuery();
| Exception java.lang.UnsupportedOperationException: Use of bind
variables for path queries is not supported
```

- `in_degree` and `out_degree` functions.

① Note

- See [Supported PGQL Features and Limitations for PGQL Property Graphs](#) for a complete list of supported and unsupported PGQL features for PGQL property graphs.
- See [Performance Considerations for PGQL Queries](#) for details on recommended practices to enhance query performance for recursive queries.

15.7.2 SQL Translation for a PGQL Query

You can obtain the SQL translation for a PGQL query through the `translateQuery()` and `getSqlTranslation()` methods in `PgqlStatement` and `PgqlPreparedStatement`.

Using the raw SQL for a PGQL query you can:

- Run the SQL directly against the database with other SQL-based tools or interfaces (for example, SQL*Plus or SQL Developer).
- Customize and tune the generated SQL to optimize performance or to satisfy a particular requirement of your application.
- Build a larger SQL query that joins a PGQL subquery with other data stored in Oracle Database (such as relational tables, spatial data, and JSON data).

Several options are available to influence PGQL query translation and execution. The following are the main ways to set query options:

- Through explicit arguments to `executeQuery`, `translateQuery`, and `PgqlConnection.prepareStatement` methods
- Through flags in the `options` string argument of `executeQuery` and `translateQuery`
- Through Java JVM arguments.

The following table summarizes the available query arguments for PGQL translation and execution.

Table 15-4 PGQL Translation and Execution Options

Option	Default	Explicit Argument	Options Flag	JVM Argument
Degree of parallelism	0	parallel	none	none
Timeout	Unlimited	timeout	none	none
Dynamic sampling	2	dynamicSampling	none	none
Maximum number of results	Unlimited	maxResults	none	none
Reverse path optimization	True	None	REVERSE_PATH=F	oracle.pg.rdbms.pgql.reversePath=false
Pushing source filter optimization	True	None	PUSH_SRC_HOPS=F	oracle.pg.rdbms.pgql.pushSrcHops=false
Pushing destination filter optimization	False	None	PUSH_DST_HOPS=T	oracle.pg.rdbms.pgql.pushDstHops=true
Creation of views in shortest path translation	False	None	SP_CREATE_VIEWS=T	oracle.pg.rdbms.pgql.spCreateView=true
Creation of tables in shortest path translation	True	None	SP_CREATE_TABLE=F	oracle.pg.rdbms.pgql.spCreateTable=false
Use of CLOB for path expressions	True	None	EXP_PATH_CLOB=F	oracle.pg.rdbms.pgql.expPathClob=false
Escaping in ID function	True	None	ESCAPE_IDS=F	oracle.pg.rdbms.pgql.escapeIDs=false

15.7.3 Performance Considerations for PGQL Queries

The following sections explain a few recommended practices for query performance.

- [Recursive Queries](#)
- [Using Query Optimizer Hints](#)
- [Speed Up Query Translation Using Graph Metadata Cache and Translation Cache](#)

15.7.3.1 Recursive Queries

The following indexes are recommended in order to speed up execution of recursive queries:

- For underlying VERTEX tables of the recursive pattern, an index on the key column
- For underlying EDGE tables of the recursive pattern, an index on the source key column

Note

You can also create index on (source key, destination key).

For example, consider the following CREATE PROPERTY GRAPH statement:

```
CREATE PROPERTY GRAPH people
  VERTEX TABLES(
    person
      KEY ( id )
      LABEL person
      PROPERTIES( name, age )
  )
  EDGE TABLES(
    knows
      key (person1, person2)
      SOURCE KEY ( person1 ) REFERENCES person (id)
      DESTINATION KEY ( person2 ) REFERENCES person (id)
      NO PROPERTIES
  )
  OPTIONS ( PG_PGQL )
```

And also consider the following query:

```
SELECT COUNT(*)
FROM MATCH ANY SHORTEST ( (n:Person) -[e:knows]->* (m:Person) )
WHERE n.id = 1234
```

In order to improve performance of the recursive part of the preceding query, the following indexes must exist:

- CREATE INDEX <INDEX_NAME> ON PERSON(ID)
- CREATE INDEX <INDEX_NAME> ON KNOWS(PERSON1) or
CREATE INDEX <INDEX_NAME> ON KNOWS(PERSON1, PERSON2)

Composite Vertex Keys

For composite vertex keys, query execution can be optimized with the creation of function-based indexes on the key columns:

- For underlying VERTEX tables of the recursive pattern, a function-based index on the comma-separated concatenation of key columns
- For underlying EDGE tables of the recursive pattern, a function-based index on the comma-separated concatenation of source key columns

Note

You can also create index on (source key columns, destination key columns).

For example, consider the following CREATE PROPERTY GRAPH statement:

```
CREATE PROPERTY GRAPH people
  VERTEX TABLES(
    person
      KEY ( id1, id2 )
      LABEL person
      PROPERTIES( name, age )
  )
  EDGE TABLES(
    knows
      key (id)
      SOURCE KEY ( id1person1, id2person1 ) REFERENCES person (id1,id2)
      DESTINATION KEY ( id1person2, id2person2 ) REFERENCES person (id1,id2)
      NO PROPERTIES
  )
  OPTIONS ( PG_PGQL )
```

And also consider the following query:

```
SELECT COUNT(*)
FROM MATCH ANY SHORTEST ( (n:Person) -[e:knows]->* (m:Person) )
WHERE n.id = 1234
```

In order to improve performance of the recursive part of the preceding query, the following indexes must exist:

- CREATE INDEX <INDEX_NAME> ON PERSON (ID1 || ',' || ID2)
- CREATE INDEX <INDEX_NAME> ON KNOWS (ID1PERSON1 || ',' || ID2PERSON1) or
CREATE INDEX <INDEX_NAME> ON KNOWS (ID1PERSON1 || ',' || ID2PERSON1,
ID1PERSON2 || ',' || ID2PERSON2)

If some of the columns in a composite vertex key is a string column, the column needs to be comma-escaped in the function-based index creation.

For example, if column ID1 in table PERSON of the preceding example is of type VARCHAR2(10), you need to escape the comma for the column as follows:

```
replace(ID1, ',', '\,')
```

So, the indexes to improve performance will result as shown:

- `CREATE INDEX <INDEX_NAME> ON PERSON (replace(ID1, ',', '\,') || ',' || ID2)`
- `CREATE INDEX <INDEX_NAME> ON KNOWS (replace(ID1PERSON1, ',', '\,') || ',' || ID2PERSON1)`

15.7.3.2 Using Query Optimizer Hints

The following hints can be used to influence SQL translation of a PGQL query:

- **REVERSE_PATH:** Switches on or off the reverse path optimization (ON by default). If ON, it automatically determines if the pattern can best be evaluated from source to destination or from destination to source, based on specified filter predicates.
- **PUSH_SRC_HOPS:** Switches on or off pushing source filter optimization (ON by default). If ON, then filter predicates are used to limit the number of source vertices (or destination vertices if path evaluation is reversed) and thereby the search space of variable-length path pattern evaluations.
- **PUSH_DST_HOPS:** Switches on or off pushing destination filter optimization (OFF by default). If ON, then filter predicates are used to limit the number of destination vertices (or source vertices if path evaluation is reversed) and thereby the search space of variable-length path pattern evaluations.
- **ESCAPE_IDS:** Switches on or off the key column escaping for ID function. When ON, a regexp expression is used to escape '(', ',', '\', '' and ')' characters in the key columns. The flag can be turned OFF to avoid performance degradation caused by the use of regexp, but key columns containing any of the escaped characters may lead to wrong results.

The preceding hints can be configured as `options` parameter in the following Java API methods:

- `executeQuery(String pgql, String options)`
- `translateQuery(String pgql, String options)`
- `execute(String pgql, String matchOptions, String options)`

For example, consider the following PGQL query:

```
SELECT v1.name AS v1, v2.name AS v2, v3.name As v3
FROM MATCH (v1:Person)-[e1:friendOf]->(v2:Person),
MATCH ANY (v2:Person)-[e2:friendOf]->*(v3:Person)
WHERE v1.name= 'Bob'
```

When the preceding query is executed using the default option for `PUSH_SRC_HOPS`, the output for `start_nodes_translation` displays the filter expression as shown:

```
System.out.println(pgqlStatement.translateQuery(pgql).getSqlTranslation())
...
...
start_nodes_translation => (to_clob('SELECT ''PERSONS'' AS "src_table",
e1.person_b AS "src_key"
FROM "GRAPHUSER"."PERSONS" "V1", "GRAPHUSER"."FRIENDSHIPS" "E1"
WHERE (((e1.person_a = v1.person_id) AND NOT(e1.person_b IS NULL)) AND
(v1.name = ''Bob''))'),
end_nodes_translation => (to_clob('SELECT ''PERSONS'' AS "dst_table",
v3.person_id AS "dst_key"
FROM "GRAPHUSER"."PERSONS" "V3"')),
```

```
...
...
```

If the preceding query is executed with the hint `PUSH_SRC_HOPS=F`, then the query is translated into SQL as shown:

```
System.out.println(pgqlStatement.translateQuery(pgql, "PUSH_SRC_HOPS=F").getSqlTranslation())
```

```
...
...start_nodes_translation => (to_clob('SELECT ''PERSONS'' AS "src_table",
v2.person_id AS "src_key"
FROM "GRAPHUSER"."PERSONS" "V2"')),
    end_nodes_translation => (to_clob('SELECT ''PERSONS'' AS "dst_table",
v3.person_id AS "dst_key"
FROM "GRAPHUSER"."PERSONS" "V3"')),
...
...
```

15.7.3.3 Speed Up Query Translation Using Graph Metadata Cache and Translation Cache

The following global caches help to speed up PGQL query translation:

- **Graph Metadata Cache:** Stores graph metadata such as tables, labels, properties, and so on.
- **Translation Cache:** Stores PGQL to SQL translation.

You can configure the caches using the following Java APIs:

- `clearTranslationCache()`
- `disableTranslationCache()`
- `enableTranslationCache()`
- `setTranslationCacheMaxCapacity(int maxCapacity)`
- `clearGraphMetadataCache()`
- `disableGraphMetadataCache()`
- `enableGraphMetadataCache()`
- `setGraphMetadataCacheMaxCapacity(int maxCapacity)`
- `setGraphMetadataRefreshInterval(long interval)`

These preceding methods are part of the `PgqlConnection` class. Separate caches are maintained for each database user such that cached objects are shared between different `PgqlConnection` objects if they have the same connection URL and user underneath.

By default, both the metadata and translation caches are refreshed every 1000ms (default value) if they are enabled. This makes it easy to sync the metadata cache in case you are modifying one graph through multiple JVMs. Also, you can increase the time (in milliseconds) taken for refreshing the cache by calling the `setGraphMetadataRefreshInterval(long interval)` function.

15.7.4 Using the Java and Python APIs to Run PGQL Queries

You can run PGQL queries on PGQL property graphs using the Java API in the `oracle.pg.rdbms.pgql` package. Also, you can use the Python OPG4Py package for executing PGQL queries against the graph data in the Oracle Database. This package contains a sub-package `Pgql` with one or more modules that wraps around the Java API in the `oracle.pg.rdbms.pgql` package.

- [Creating a PGQL Property Graph](#)
- [Executing PGQL SELECT Queries](#)
- [Executing PGQL Queries to Modify PGQL Property Graphs](#)
- [Dropping a PGQL Property Graph](#)

15.7.4.1 Creating a PGQL Property Graph

You can create a PGQL property graph using the `CREATE PROPERTY GRAPH` statement.

Example 15-1 Creating a PGQL Property Graph

The following example describes the creation of a PGQL property graph.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<db_service>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>");
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
opg4j> var pgqlStmt = pgqlConn.createStatement() //create a PGQL Statement
opg4j> conn.setAutoCommit(false)
opg4j> var pgql =
...> "CREATE PROPERTY GRAPH bank_graph "
...> + "VERTEX TABLES ( bank_accounts AS Accounts "
...> + "KEY (id) "
...> + "LABEL Accounts "
...> + "PROPERTIES (id, name) "
...> + ") "
...> + "EDGE TABLES ( bank_transfers AS Transfers "
...> + "KEY (txn_id) "
...> + "SOURCE KEY (src_acct_id) REFERENCES Accounts (id) "
...> + "DESTINATION KEY (dst_acct_id) REFERENCES Accounts (id) "
...> + "LABEL Transfers "
...> + "PROPERTIES (src_acct_id, dst_acct_id, amount, description) "
...> + ") OPTIONS (PG_PGQL) "
opg4j> pgqlStmt.execute(pgql)
```

Java

```

import java.sql.Connection;
import java.sql.Statement;
import java.sql.DriverManager;
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlStatement;

/*
 * This example shows how to create a PGQL property graph.
 */
public class PgqlCreate
{

    public static void main(String[] args) throws Exception
    {
        int idx=0;
        String jdbcUrl          = args[idx++];
        String username          = args[idx++];
        String password          = args[idx++];
        String graph              = args[idx++];

        Connection conn = null;
        PgqlStatement pgqlStmt = null;

        try {
            //Get a jdbc connection
            conn = DriverManager.getConnection(jdbcUrl, username, password);
            conn.setAutoCommit(false);

            // Get a PGQL connection
            PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);

            // Create a PGQL Statement
            pgqlStmt = pgqlConn.createStatement();
            // Execute PGQL Query
            String pgql =
                "CREATE PROPERTY GRAPH " + graph + " " +
                "VERTEX TABLES ( bank_accounts as Accounts " +
                "KEY (id) " +
                "LABEL \"Accounts\"" +
                "PROPERTIES (id, name)" +
                ") " +
                "EDGE TABLES ( bank_transfers as Transfers " +
                "KEY (txn_id) " +
                "SOURCE KEY (src_acct_id) REFERENCES Accounts (id) " +
                "DESTINATION KEY (dst_acct_id) REFERENCES Accounts (id) " +
                "LABEL \"Transfers\"" +
                "PROPERTIES (src_acct_id, dst_acct_id, amount, description)" +
                ") OPTIONS (PG_PGQL) ";

            // Print the results
            pgqlStmt.execute(pgql);
        }
    }
}

```

```

    }
    finally {
        // close the statement
        if (pgqlStmt != null) {
            pgqlStmt.close();
        }
        // close the connection
        if (conn != null) {
            conn.close();
        }
    }
}
}

```

Python

```

>>> pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"jdbc:oracle:thin:@localhost:1521/orclpdb")
>>> pgql_statement = pgql_conn.create_statement()
>>> pgql = """
...     CREATE PROPERTY GRAPH bank_graph
...     VERTEX TABLES (
...         bank_accounts as Accounts
...         LABEL Accounts
...         PROPERTIES (id, name)
...     )
...     EDGE TABLES (
...         bank_transfers as Transfers
...         KEY (txn_id)
...         SOURCE KEY (src_acct_id) REFERENCES Accounts(id)
...         DESTINATION KEY (dst_acct_id) REFERENCES Accounts (id)
...         LABEL TRANSFERS
...         PROPERTIES (src_acct_id, dst_acct_id, amount, description)
...     ) OPTIONS(PG_PGQL)
... """
>>> pgql_statement.execute(pgql)
False

```

You can verify the PGQL property graph creation by checking the metadata tables that get created in the database.

15.7.4.2 Executing PGQL SELECT Queries

You can run PGQL `SELECT` queries as described in the following examples.

Example 15-2 Running a Simple `SELECT` Query Using `PgqlStatement` and `PgqlResultSet`

In the following example, `PgqlConnection` is used to obtain a `PgqlStatement`. Then, it calls the `executeQuery` method of `PgqlStatement`, which returns a `PgqlResultSet` object.

`PgqlResultSet` provides a `print()` method, which displays results in a tabular mode.

- [Java](#)
- [Python](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<db_service>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>");
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
opg4j> pgqlConn.setGraph("BANK_GRAPH")
opg4j> var pgqlStmt = pgqlConn.createStatement() //create a PGQL Statement
opg4j> String s = "SELECT n.* FROM MATCH (n:Accounts) LIMIT 3"
opg4j> var resultSet = pgqlStmt.executeQuery(s)
opg4j> resultSet.print() //Prints the query result set
```

ID	NAME
1	Account1
2	Account2
3	Account3

Java

```
import java.sql.Connection;
import java.sql.Statement;
import java.sql.DriverManager;
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlResultSet;
import oracle.pg.rdbms.pgql.PgqlStatement;

/*
 * This example shows how to execute a SELECT query on a PGQL property graph.
 */
public class PgqlExample1
{
    public static void main(String[] args) throws Exception
    {
        int idx=0;
        String jdbcUrl          = args[idx++];
        String username          = args[idx++];
        String password          = args[idx++];
        String graph             = args[idx++];

        Connection conn = null;
        PgqlStatement pgqlStmt = null;
        PgqlResultSet rs = null;

        try {
            //Get a jdbc connection
```

```

conn = DriverManager.getConnection(jdbcUrl, username, password);
conn.setAutoCommit(false);

// Get a PGQL connection
PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);
pgqlConn.setGraph(graph);

// Create a PGQL Statement
pgqlStmt = pgqlConn.createStatement();

// Execute PGQL Query
String query = "SELECT n.* FROM MATCH (n:Accounts) LIMIT 5";
rs = pgqlStmt.executeQuery(query);

// Print the results
rs.print();
}
finally {
    // close the result set
    if (rs != null) {
        rs.close();
    }
    // close the statement
    if (pgqlStmt != null) {
        pgqlStmt.close();
    }
    // close the connection
    if (conn != null) {
        conn.close();
    }
}
}
}

```

Python

```

>>> pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"<jdbcUrl>")
>>> pgql_statement = pgql_conn.create_statement()
>>> pgql_conn.set_graph("BANK_GRAPH")
>>> s = "SELECT n.* FROM MATCH (n:Accounts) LIMIT 3"
>>> pgql_statement.execute_query(s)
>>> pgql_result_set = pgql_statement.execute_query(s)
>>> pgql_result_set.print()
+-----+
| ID | NAME |
+-----+
| 1 | Account1 |
| 2 | Account2 |
| 3 | Account3 |
+-----+
>>> pgql_result_set
PgqlResultSet(java_pgql_result_set: oracle.pg.rdbms.pgql.PgqlResultSet, # of
results: 3)

```

Also, you can convert the PGQL result set obtained in the preceding code to a Pandas dataframe using the `to_pandas()` method.

Note

The `pandas` package must be installed in your system to successfully execute the call to `to_pandas()`. This package is automatically installed at the time of the Python client installation for Python 3.9. However, if your call to `to_pandas()` fails, verify if the `pandas` module is installed in your system. In case the module is found missing or your Python version differs from the earlier mentioned versions, then install the `pandas` package manually.

Example 15-3 Running a `SELECT` Query Using `PgqlPreparedStatement`

+-----+
```

15.7.4.3 Executing PGQL Queries to Modify PGQL Property Graphs

You can execute PGQL `INSERT`, `UPDATE` and `DELETE` queries against PGQL property graphs using the OPG4J Java shell, OPG4Py Python shell or through a Java or Python application.

It is important to note that unique IDs are not auto generated when inserting vertices or edges in a graph. Therefore, you must ensure that the key column values are either present in the graph properties or they are auto generated by the database (through `SEQUENCE` and `TRIGGERS` or implemented with auto increment functionality using `IDENTITY` column).

The following example inserts two new vertices and also adds an edge relationship between the two vertices.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> String pgql =
...> "INSERT VERTEX v1 LABELS (Person) PROPERTIES (v1.name= 'ABC',
v1.height=1.6, v1.birthdate = to_date('13/06/1963', 'DD/MM/YYYY')) "+
...> "          , VERTEX v2 LABELS (Person) PROPERTIES (v2.name= 'XYZ',
v2.height=1.75, v2.birthdate = to_date('19/06/1963', 'DD/MM/YYYY')) "+
...> "          , EDGE e BETWEEN v1 AND v2 LABELS (friendof) PROPERTIES
( e.meeting_date = to_date('19/06/2021', 'DD/MM/YYYY')) "
pgql ==> "INSERT VERTEX v1 LABELS (Person) PROPERTIES (v1.name= 'ABC',
v1.height=1.6, v1.birthdate = to_date('13/06/1963', 'DD/MM/YYYY'))          ,
VERTEX v2 LABELS (Person) PROPERTIES (v2.name= 'XYZ', v2.height=1.75,
v2.birthdate = to_date('19/06/1963', 'DD/MM/YYYY'))          , EDGE e BETWEEN v1
AND v2 LABELS (friendof) PROPERTIES ( e.meeting_date = to_date('19/06/2021',
'DD/MM/YYYY')) "
opg4j> pgqlStmt.execute(pgql)
$14 ==> false
```

Java

```
String pgql =
...> "INSERT VERTEX v1 LABELS (Person) PROPERTIES (v1.name= 'ABC',
v1.height=1.6, v1.birthdate = to_date('13/06/1963', 'DD/MM/YYYY')) "+
...> "          , VERTEX v2 LABELS (Person) PROPERTIES (v2.name= 'XYZ',
```

```
v2.height=1.75, v2.birthdate = to_date('19/06/1963', 'DD/MM/YYYY')) "+
...>      "      , EDGE e BETWEEN v1 AND v2 LABELS (friendof) PROPERTIES
( e.meeting_date = to_date('19/06/2021', 'DD/MM/YYYY')) ";
pgqlStmt.execute(pgql);
```

Python

```
>>> pgql = """
...      INSERT VERTEX v1 LABELS (Person) PROPERTIES (v1.name= 'ABC',
v1.height=1.6, v1.birthdate = to_date('13/06/1963', 'DD/MM/YYYY'))
...      , VERTEX v2 LABELS (Person) PROPERTIES (v2.name= 'XYZ',
v2.height=1.75, v2.birthdate = to_date('19/06/1963', 'DD/MM/YYYY'))
...      , EDGE e BETWEEN v1 AND v2 LABELS (friendof) PROPERTIES
( e.meeting_date = to_date('19/06/2021', 'DD/MM/YYYY'))
... """
>>> pgql_statement.execute(pgql)
False
```

The following example executes an UPDATE query to modify the edge property that was inserted in the preceding example and subsequently verifies the update operation through a SELECT query.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> String pgql = "UPDATE e SET (e.meeting_date = to_date('12/02/2022',
'DD/MM/YYYY')) "+
...>      "FROM MATCH (v1:Person)-[e:friendof]->(v2:Person) "+
...>      "WHERE v1.person_id = 27 AND v2.person_id = 28"
pgql ==> "UPDATE e SET (e.meeting_date = to_date('12/02/2022', 'DD/MM/YYYY'))
FROM MATCH (v1:Person)-[e:friendof]->(v2:Person) WHERE v1.person_id = 27 AND
v2.person_id = 28"
opg4j> pgqlStmt.execute(pgql)
$40 ==> false
opg4j>pgqlStmt.executeQuery("SELECT e.meeting_date FROM MATCH (v1:Person)-
[e:friendof]->(v2:Person) WHERE v1.person_id = 27").print()
+-----+
| MEETING_DATE |
+-----+
| 2022-02-12 00:00:00.0 |
+-----+
```

Java

```
String pgql = "UPDATE e SET (e.meeting_date = to_date('12/02/2022', 'DD/MM/YYYY')) "+
"FROM MATCH (v1:Person)-[e:friendof]->(v2:Person) "+
"WHERE v1.person_id = 27 AND v2.person_id = 28";
pgqlStmt.execute(pgql);
```

Python

```
>>> pgql = """
...     UPDATE e SET (e.meeting_date = to_date('12/02/2022', 'DD/MM/YYYY'))
...     FROM MATCH (v1:Person)-[e:friendof]->(v2:Person)
...     WHERE v1.person_id = 27 AND v2.person_id = 28
... """
>>> pgql_statement.execute(pgql)
False
>>> pgql_statement.execute_query("SELECT e.meeting_date FROM MATCH(v1:Person)-[e:friendof]->(v2:Person) WHERE v1.person_id = 27").print()
+-----+
| MEETING_DATE |
+-----+
| 2022-02-12 00:00:00.0 |
+-----+
```

A **DELETE** query allows deleting of vertices and edges in a graph. The following example executes a **DELETE** query to delete an edge in the graph.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> pgqlStmt.execute("DELETE e FROM MATCH (v1:Person)-[e:friendof]->(v2:Person) WHERE v.person_id=27")
$14 ==> false
```

Java

```
pgqlStmt.execute("DELETE e FROM MATCH (v1:Person)-[e:friendof]->(v2:Person)
WHERE v.person_id=27");
```

Python

```
>>> pgql_statement.execute("DELETE e FROM MATCH (v1:Person)-[e:friendof]-
>(v2:Person) WHERE v1.person_id=27")
False
```

15.7.4.4 Dropping a PGQL Property Graph

You can use the PGQL `DROP PROPERTY GRAPH` statement to drop a PGQL property graph. Note that all the metadata tables for the PGQL property graph are dropped.

Example 15-6 Dropping a PGQL Property Graph

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var jdbcUrl="jdbc:oracle:thin:@<host_name>:<port>/<db_service>"
opg4j> var conn =
DriverManager.getConnection(jdbcUrl,"<username>","<password>")
opg4j> var pgqlConn = PgqlConnection.getConnection(conn)
opg4j> var pgqlStmt = pgqlConn.createStatement() //create a PGQL Statement
opg4j> pgqlStmt.execute("DROP PROPERTY GRAPH <graph>")
$9 ==> false
```

Java

```
import java.sql.Connection;
import java.sql.Statement;
import java.sql.DriverManager;
import oracle.pg.rdbms.pgql.PgqlConnection;
import oracle.pg.rdbms.pgql.PgqlStatement;
/**
 * This example shows how to drop a PGQL property graph.
 */
public class DropPgqlGraph
{

    public static void main(String[] args) throws Exception
    {
        int idx=0;
        String jdbcUrl          = args[idx++];
        String username          = args[idx++];
        String password          = args[idx++];
        String graph             = args[idx++];
```

```
Connection conn = null;
PgqlStatement pgqlStmt = null;

try {
    //Get a jdbc connection
    conn = DriverManager.getConnection(jdbcUrl, username, password);
    conn.setAutoCommit(false);

    // Get a PGQL connection
    PgqlConnection pgqlConn = PgqlConnection.getConnection(conn);

    // Create PGQL Statement
    pgqlStmt = pgqlConn.createStatement();

    String query = "DROP PROPERTY GRAPH " +graph;
    pgqlStmt.execute(query);

}
finally {
    // close the statement
    if (pgqlStmt != null) {
        pgqlStmt.close();
    }
    // close the connection
    if (conn != null) {
        conn.close();
    }
}
}
```

Python

```
>>> pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"jdbc:oracle:thin:@localhost:1521/orclpdb")
>>> pgql_statement = pgql_conn.create_statement()
>>> pgql = "DROP PROPERTY GRAPH <graph>"
>>> pgql_statement.execute(pgql)
False
```

Part IV

Installing Oracle Graph Server (PGX) and Client

Get started on the installation of the Oracle Graph Server (PGX) and the graph clients.

- [Oracle Graph Server and Client Installation](#)
This chapter describes the steps for installing the graph server and the graph clients.
- [Getting Started with the Graph Server \(PGX\)](#)
Once you have installed the graph server (PGX), you can start and connect to a graph server instance.

16

Oracle Graph Server and Client Installation

This chapter describes the steps for installing the graph server and the graph clients.

- [Before You Begin](#)
Before you begin to work with Oracle Property Graphs, you must understand the workflow for installing Oracle Graph Server and Client.
- [Oracle Graph Server Installation](#)
You must install the Oracle Graph Server to run graph queries and analytics in the graph server (PGX).
- [Oracle Graph Client Installation](#)
You can interact with the various graph features using the client CLIs and the graph visualization web client.
- [Setting Up Transport Layer Security](#)
The graph server (PGX), by default, allows only encrypted connections using Transport Layer Security (TLS). TLS requires the server to present a server certificate to the client and the client must be configured to trust the issuer of that certificate.

16.1 Before You Begin

Before you begin to work with Oracle Property Graphs, you must understand the workflow for installing Oracle Graph Server and Client.

Table 16-1 Workflow for Installing Oracle Graph Server and Client

Sequence	Task	Description	More Information
1	Verify Oracle Database Requirements	Ensure that your Oracle Database version is 19c and higher.	Verifying Database Compatibility
2	Download Oracle Graph Server and Client	Download Oracle Graph Server and Client from Oracle Software Delivery Cloud or from Oracle Technology Network .	Downloading Oracle Graph Server and Client
4	Install Oracle Graph Server	Install Oracle Graph server, which is available as a separate downloadable package.	Installing Oracle Graph Server
5	Install Oracle Graph Clients	Install the graph clients (such as the graph shell CLIs and graph visualization application) to work with property graphs.	Oracle Graph Client Installation
6	Set up transport layer security	Configure the graph server and client to trust the self-signed keystore.	Setting Up Transport Layer Security

Table 16-1 (Cont.) Workflow for Installing Oracle Graph Server and Client

Sequence	Task	Description	More Information
7	Add permissions to publish the graph	Grant permissions to publish graphs.	Adding Permissions to Publish the Graph

- [Verifying Database Compatibility](#)
- [Downloading Oracle Graph Server and Client](#)

16.1.1 Verifying Database Compatibility

Oracle Graph Server and Client works with Oracle Database 19c onwards on both on-premises and cloud environments. The cloud environment includes working with all versions of Oracle Autonomous Database Serverless and Oracle Autonomous Database Dedicated.

16.1.2 Downloading Oracle Graph Server and Client

You can download **Oracle Graph Server and Client** from [Oracle Software Delivery Cloud](#) or from [Oracle Technology Network](#).

[Table 16-2](#) summarizes all the files contained in the Oracle Graph Server and Client deployment.

<ver> denoted in the file name in the [Table 16-2](#) reflects the downloaded Oracle Graph Server and Client version.

Table 16-2 Components in the Oracle Graph Server and Client Deployment

File	Component	Description
oracle-graph-<ver>.rpm	Oracle Graph Server	An rpm file to deploy Oracle Graph Server for Linux x86-64.
oracle-graph-<ver>.aarch64.rpm	Oracle Graph Server	An rpm file to deploy Oracle Graph Server for Linux ARM.
oracle-graph-client-<ver>.zip	Oracle Graph Client	A zip file containing Oracle Graph Client.
oracle-graph-sqlcl-plugin-<ver>.zip	Oracle Graph PGQL Plugin for SQLcl	A plugin for SQLcl to run PGQL queries in SQLcl.
oracle-graph-webapps-<ver>.zip	Oracle Graph Web Applications	A zip file containing .war files for deploying graph servers in an application server.
oracle-graph-visualization-library-<ver>.zip	Oracle Graph Visualization Library	A zip file containing a Java Script library for the Graph Visualization application.

16.2 Oracle Graph Server Installation

You must install the Oracle Graph Server to run graph queries and analytics in the graph server (PGX).

You also require the graph server to visualize graphs loaded into the graph server (PGX) and the graphs in the database.

The following sections explain the steps to install the Oracle Graph Server in a standalone mode or deploy the server as a web application using Oracle WebLogic Server or Apache Tomcat.

- [System Requirements for Installing Oracle Graph Server](#)
Verify that you meet a few system requirements when installing the Oracle Graph Server in a standalone mode or when deploying to Oracle WebLogic Server or Apache Tomcat.
- [Using the RPM Installation](#)
You can run the downloaded RPM file to install the Oracle Graph Server.
- [Deploying Oracle Graph Server to a Web Server](#)
You can deploy Oracle Graph Server to Apache Tomcat or Oracle WebLogic Server.
- [Running Oracle Graph Quickstart Container Image](#)
You can easily get started with the property graph feature of Oracle Database using the Oracle Graph Quickstart Container Image.
- [User Authentication and Authorization](#)
The Oracle Graph server (PGX) uses an Oracle Database as identity manager. Both username and password based as well as Kerberos based authentication is supported.

Related Topics

- [Learn About the Graph Server \(PGX\)](#)
The in-memory graph server layer enables you to analyze property graphs using parallel in-memory execution.

16.2.1 System Requirements for Installing Oracle Graph Server

Verify that you meet a few system requirements when installing the Oracle Graph Server in a standalone mode or when deploying to Oracle WebLogic Server or Apache Tomcat.

Table 16-3 System Requirements

Requirement Type	Supported Version
Operating System	<ul style="list-style-type: none">• Oracle Linux 7 or 8 x64• Oracle Linux 7 or 8 for Linux 64-bit Arm• Red Hat Enterprise Linux (RHEL) 7 or 8

Note

Oracle Linux 7 for the x64 and Arm architectures is deprecated. It is recommended that you use Oracle Linux 8 for the x64 and Arm architectures.

Table 16-3 (Cont.) System Requirements

Requirement Type	Supported Version
JDK version	<ul style="list-style-type: none"> • Oracle JDK 11, JDK 17, or JDK 21 • OpenJDK JDK 11, JDK 17 or JDK 21
<div> <p>Note</p> <p>Due to a bug in Oracle JDK and OpenJDK, it is recommended to avoid the following JDK versions:</p> <ul style="list-style-type: none"> • JDK 11.0.9 • JDK 11.0.10 • JDK 11.0.11 • JDK 11.0.12 <p>See this note for more details.</p> </div>	
Disk space	Oracle Graph Server requires at least 2 GB of disk space.

16.2.2 Using the RPM Installation

You can run the downloaded RPM file to install the Oracle Graph Server.

The Oracle Graph Server and Client deployment provides RPM files for both Linux x86-64 and ARM architectures. See [Downloading Oracle Graph Server and Client](#) for more information.

- [Prerequisites for Installing Oracle Graph Server](#)
- [Installing Oracle Graph Server](#)
- [Configuring the Graph Server Using a Quick Setup Script](#)
- [Uninstalling Oracle Graph Server](#)
- [Upgrading Oracle Graph Server](#)

16.2.2.1 Prerequisites for Installing Oracle Graph Server

Before installing the graph server using the RPM file, ensure you perform the following prerequisite steps:

1. Ensure that you meet the system prerequisites as explained in [System Requirements for Installing Oracle Graph Server](#).
2. Verify if you already have an installed version of the graph server by running the following command:

```
sudo rpm -q oracle-graph
[sudo] password for oracle:
oracle-graph-25.3.0-0.x86_64
```

Graph server installation may throw an error if an installation already exists. In that case, see [Upgrading Oracle Graph Server](#) to upgrade to a newer version.

16.2.2.2 Installing Oracle Graph Server

The installation steps for installing Oracle Graph Server in standalone mode are as shown:

1. As a root user or using `sudo`, install the RPM file using the `rpm` command line utility.

- **For Linux x86-64:**

```
sudo rpm -i oracle-graph-<version>.rpm
```

- **For Linux Arm :**

```
sudo rpm -i oracle-graph-<version>.aarch64.rpm
```

In the preceding command, `<version>` reflects the version of the downloaded file. (For example, `oracle-graph-25.3.0.x86_64.rpm` or `oracle-graph-25.3.0.aarch64.rpm`)

The `.rpm` file is the graph server.

The following post-installation steps are carried out at the time of the RPM file installation:

- Creation of a working directory in `/opt/oracle/graph/pgx/tmp_data`.
- Creation of a log directory in `/var/log/oracle/graph`.
- Creation of the `oraclegraph` operating system group.
- Automatic generation of self-signed TLS certificates in `/etc/oracle/graph`.

① Note

- You can also choose to configure and set up transport layer security (TLS) in graph server. See [Setting Up Transport Layer Security](#) for more details.
- For demonstration purposes, if you wish to disable transport layer security (TLS) in graph server, see [Disabling Transport Layer Security \(TLS\) in Graph Server](#) for more details.
Alternatively, you can also disable TLS using a quick setup script. See [Configuring the Graph Server Using a Quick Setup Script](#) for more information.

2. As root or using `sudo`, add operating system users allowed to use the server installation to the operating system group `oraclegraph`. For example:

```
usermod -a -G oraclegraph <graphuser>
```

This adds the specified graph user to the group `oraclegraph`.

Note that `<graphuser>` must log out and log in again for this to take effect.

3. As `<graphuser>`, configure the server by modifying the files under `/etc/oracle/graph` by following the steps under [Prepare the Graph Server for Database Authentication](#).

Alternatively, you can easily configure the graph server (PGX) using a quick setup script. See [Configuring the Graph Server Using a Quick Setup Script](#) for more information.

4. Ensure that authentication is enabled for database users that will connect to the graph server, as explained in [User Authentication and Authorization](#).

5. As a root user or using `sudo`, start the graph server (PGX) by executing the following command:

```
sudo systemctl start pgx
```

You can verify if the graph server has started by running the following command:

```
systemctl status pgx
```

- If the graph server has successfully started, the response may appear as:

```
● pgx.service - Oracle Graph In-Memory Server
   Loaded: loaded (/etc/systemd/system/pgx.service; disabled; vendor
  preset: disabled)
   Active: active (running) since Wed 2021-01-27 10:06:06 EST; 33s ago
 Main PID: 32127 (bash)
    CGroup: /system.slice/pgx.service
            └─32127 /bin/bash start-server
            └─32176 java -Dlogback.configurationFile=/etc/oracle/graph/
logback-server.xml -Doracle.jdbc.fanEnabled=false -cp /opt/oracle/
graph/pgx/bin/../../../../pgx/server/lib/jackson-databind...
```

The graph server is now ready to accept requests. By default, the graph server listens on `localhost:7007`. Note that if `localhost` does not resolve correctly in your system, then this can lead to errors when you attempt to start the server. To avoid this issue, it is recommended that you add entries for your `localhost` in the `/etc/hosts` file in your system. For example:

```
127.0.0.1    localhost
::1         localhost
```

- If the graph server has not started, then you must check the log files in `/var/log/oracle/graph` for errors. Additionally, you can also run the following command to view any `systemd` errors:

```
sudo journalctl -u pgx.service
```

Related Topics

- [Deploying to Oracle WebLogic Server](#)
The example in this topic shows how to deploy the graph server as a web application with Oracle WebLogic Server version 14.1.1.
- [Deploying to Apache Tomcat](#)
The example in this topic shows how to deploy the graph server as a web application with Apache Tomcat.
- [Deploying Oracle Graph Server Behind a Load Balancer](#)
You can deploy multiple graph servers (PGX) behind a load balancer and connect clients to the servers through the load balancer.

16.2.2.3 Configuring the Graph Server Using a Quick Setup Script

You can configure your initial graph server setup using the `quicksetup.sh` script.

1. Navigate to `/opt/oracle/graph/scripts`.
2. Run the `./quicksetup.sh` script with the required options to set up the graph server.

This script allows you to enable or disable TLS in the graph server, specify the JDBC URL to be used for database authentication, or restart the graph server.

The following options are supported:

```
-j <jdbc_url> - Configure Oracle DB to be used by the Graph Server via
JDBC URL
-d           - Setup will disable TLS accordingly on server configuration
-e           - Setup will enable TLS accordingly on server configuration
-u           - Setup will prompt for JDBC URL configuration
-q           - Enable quiet mode
-x           - Restart the server after modifications.
```

The following examples describe the usage of the preceding options:

- To disable TLS in the graph server (PGX):

```
./quicksetup.sh -d
```

- To enable TLS using quiet mode in the graph server (PGX):

```
./quicksetup.sh -eq
```

- To configure the JDBC URL through a prompt:

```
./quicksetup.sh -u
Enter JDBC URL: jdbc:oracle:thin:@<host>:<port>/<sid>
```

- To start the graph server using the JDBC URL through a parameter:

```
./quicksetup.sh -j jdbc:oracle:thin:@<host>:<port>/<sid>
```

- To disable TLS and also use JDBC URL through a parameter:

```
./quicksetup.sh -j jdbc:oracle:thin:@<host>:<port>/<sid> -d
```

- To restart the graph server (PGX):

```
./quicksetup.sh -x
```

- To disable TLS, configure JDBC URL through a parameter, and then restart the graph server (PGX):

```
./quicksetup.sh -j jdbc:oracle:thin:@<host>:<port>/<sid> -dx
```

16.2.2.4 Uninstalling Oracle Graph Server

To uninstall the graph server, make sure the graph server is shut down.

- Run the following command as a root user or with `sudo`:

```
sudo rpm -e oracle-graph
```

- During uninstall `/opt/oracle/graph/pgx/tmp_data/` and `/etc/oracle/graph/server_keystore.jks` are removed.

16.2.2.5 Upgrading Oracle Graph Server

To upgrade the graph server, ensure that you first shut down the existing graph server version. You can then run the following command with the newer RPM file as an argument.

1. Verify the version of your current graph server installation.

```
sudo rpm -q oracle-graph
```

2. Stop the graph server if it is already running.

```
sudo systemctl stop pgx
```

3. Upgrade the graph server by running the following command as a root user or with `sudo`.

- **For Linux x86-64:**

```
sudo rpm -U oracle-graph-25.3.0.x86_64.rpm
```

- **For Linux Arm:**

```
sudo rpm -U oracle-graph-25.3.0.aarch64.rpm
```

Also, note the following:

- The upgrade process automatically preserves the previous PGX (`pgx.conf`), server (`server.conf`), and the logging (`logback-server.xml`, `logback.xml`) configurations files. However, if the new version contains changes, then the upgrade process will create the newest versions of these files with the `.rpmnew` extension. You can then compare the two files (to verify if there are any changes in the default parameter values or if a new parameter is added) and pick up the latest changes.
- Any manual configuration changes in the `systemd` configuration file for the PGX service (`/etc/systemd/system/pgx.service`) is lost. However, if you are using a drop-in file, then all customizations in the drop-in file are maintained.
- Existing log files in `/var/log/oracle/graph` are preserved.
- Existing server keystore file (`/etc/oracle/graph/server_keystore.jks`) is preserved.

Caution

If you are upgrading the graph server from version 22.3.0 or earlier to 25.3.0, then note that the RPM file installation in Graph Server and Client Release 25.3.0 will generate a self-signed server keystore file by default. See [Setting Up Transport Layer Security](#) for more information.

4. Verify if the `tmp_data` folder exists in the `/opt/oracle/graph/pgx/` directory path.

If it does not exist, then create one and assign ownership and permission as shown:

```
mkdir -p /opt/oracle/graph/pgx/tmp_data
chown -R :oraclegraph /opt/oracle/graph/pgx/tmp_data
chmod 0770 /opt/oracle/graph/pgx/tmp_data
```

5. Restart the graph server.

```
sudo systemctl daemon-reload
sudo systemctl start pgx
```

16.2.3 Deploying Oracle Graph Server to a Web Server

You can deploy Oracle Graph Server to Apache Tomcat or Oracle WebLogic Server.

However, before deploying the graph server on any one of these web servers, ensure that your system meets the prerequisites explained in [System Requirements for Installing Oracle Graph Server](#).

The following explains the deployment instructions to a web server:

- [Deploying to Apache Tomcat](#)
The example in this topic shows how to deploy the graph server as a web application with Apache Tomcat.
- [Deploying to Oracle WebLogic Server](#)
The example in this topic shows how to deploy the graph server as a web application with Oracle WebLogic Server version 14.1.1.

16.2.3.1 Deploying to Apache Tomcat

The example in this topic shows how to deploy the graph server as a web application with Apache Tomcat.

The graph server will work with Apache Tomcat 9.0.x.

1. Download the Oracle Graph Webapps zip file from [Oracle Software Delivery Cloud](#). This file contains ready-to-deploy Java web application archives (.war files). The file name will be similar to this: oracle-graph-webapps-<version>.zip.
2. Unzip the file into a directory of your choice.
3. Locate the .war file that follows the naming pattern: graph-server-webapp-<version>.war.
4. Configure the graph server.
 - a. Modify authentication and other server settings by modifying the WEB-INF/classes/pgx.conf file inside the web application archive. See [User Authentication and Authorization](#) section for more information.
 - b. Optionally, change logging settings by modifying the WEB-INF/classes/logback.xml file inside the web application archive.
 - c. Optionally, change other servlet specific deployment descriptors by modifying the WEB-INF/web.xml file inside the web application archive.
5. Copy the .war file into the Tomcat webapps directory. For example:

```
cp graph-server-webapp-<version>.war $CATALINA_HOME/webapps/pgx.war
```

Note

The name you give the war file in the Tomcat `webapps` directory determines the context path of the graph server application. It is recommended naming the war file as `pgx.war`.

6. Export the following `JAVA_OPTS` options only if you are using Oracle JDK 17 or OpenJDK 17. Otherwise, you can skip this step.

```
export JAVA_OPTS="$JAVA_OPTS --add-exports jdk.compiler/
com.sun.tools.javac.api=ALL-UNNAMED \
--add-exports jdk.compiler/com.sun.tools.javac.processing=ALL-UNNAMED \
--add-exports jdk.compiler/com.sun.tools.javac.util=ALL-UNNAMED \
--add-exports jdk.compiler/com.sun.tools.javac.tree=ALL-UNNAMED \
--add-exports jdk.compiler/com.sun.tools.javac.code=ALL-UNNAMED"
```

7. Configure Tomcat specific settings, like the correct use of TLS/encryption.
8. Ensure that port 8080 is not already in use.
9. Start Tomcat:

```
cd $CATALINA_HOME
./bin/startup.sh
```

The graph server will now listen on `localhost:8080/pgx`. Note that if `localhost` does not resolve correctly in your system, then this can lead to errors when you attempt to start the server. To avoid this issue, it is recommended that you add entries for your `localhost` in the `/etc/hosts` file in your system. For example:

```
127.0.0.1    localhost
::1         localhost
```

You can connect to the server from JShell by running the following command:

```
$ <client_install_dir>/bin/opg4j --base_url https://localhost:8080/pgx -u
<graphuser>
```

Related Topics

- [The Tomcat documentation \(select desired version\)](#)

16.2.3.2 Deploying to Oracle WebLogic Server

The example in this topic shows how to deploy the graph server as a web application with Oracle WebLogic Server version 14.1.1.

1. Download the Oracle Graph Webapps zip file from [Oracle Software Delivery Cloud](#). This file contains ready-to-deploy Java web application archives (`.war` files). The file name will be similar to this: `oracle-graph-webapps-<version>.zip`.
2. Unzip the file into a directory of your choice.
3. Locate the `.war` file that follows the naming pattern: `graph-server-webapp-<version>.war`.

4. Configure the graph server.

- a. Modify authentication and other server settings by modifying the `WEB-INF/classes/pgx.conf` file inside the web application archive.
- b. Optionally, change logging settings by modifying the `WEB-INF/classes/logback.xml` file inside the web application archive.
- c. Edit the `WEB-INF/web.xml` file inside the web application archive and remove the following `<session-config>` element:

```
<session-config>
  <tracking-mode>COOKIE</tracking-mode>
  <cookie-config>
    <secure>true</secure>
    <http-only>true</http-only>
  </cookie-config>
  <session-timeout>60</session-timeout>
</session-config>
```

- d. Optionally, change other servlet specific deployment descriptors by modifying the `WEB-INF/web.xml` file inside the web application archive.
 - e. Optionally, change WebLogic Server-specific deployment descriptors by modifying the `WEB-INF/weblogic.xml` file inside the web application archive.
- #### 5. Configure WebLogic specific settings, like the correct use of TLS/encryption.
- #### 6. Add the following `JAVA_OPTS` argument at the beginning of the `$MW_HOME/user_projects/domains/mydomain/bin/setDomainEnv.sh` script file (Weblogic domain settings) only if you are using Oracle JDK 17 or OpenJDK JDK 17. Otherwise, you can skip this step.

```
export JAVA_OPTS="$JAVA_OPTS --add-exports jdk.compiler/
com.sun.tools.javac.api=ALL-UNNAMED \
  --add-exports jdk.compiler/com.sun.tools.javac.processing=ALL-UNNAMED \
  --add-exports jdk.compiler/com.sun.tools.javac.util=ALL-UNNAMED \
  --add-exports jdk.compiler/com.sun.tools.javac.tree=ALL-UNNAMED \
  --add-exports jdk.compiler/com.sun.tools.javac.code=ALL-UNNAMED"
```

- #### 7. Deploy the `.war` file to WebLogic Server. The following example shows how to do this from the command line:

```
. $MW_HOME/user_projects/domains/mydomain/bin/setDomainEnv.sh
. $MW_HOME/wlserver/server/bin/setWLSEnv.sh
java weblogic.Deployer -adminurl http://localhost:7001 -username
<username> -password <password> -deploy -source <path-to-war-file>
```

The graph server will now listen on `localhost:7001/pgx`. Note that if `localhost` does not resolve correctly in your system, then this can lead to errors when you attempt to start the server. To avoid this issue, it is recommended that you add entries for your `localhost` in the `/etc/hosts` file in your system. For example:

```
127.0.0.1    localhost
::1         localhost
```

- [Installing Oracle WebLogic Server](#)

16.2.3.2.1 Installing Oracle WebLogic Server

To download and install the latest version of Oracle WebLogic Server, see

<http://www.oracle.com/technetwork/middleware/weblogic/documentation/index.html>

16.2.4 Running Oracle Graph Quickstart Container Image

You can easily get started with the property graph feature of Oracle Database using the Oracle Graph Quickstart Container Image.

The image comprises the following components:

- Oracle Database 23ai Free (based on 23.8.0.0-lite) image
- JDK 21
- Graph Server (RPM file) and Client (25.3 version)

Also, note that the following are preconfigured in the database:

- GRAPHUSER user account.
- A sample SQL property graph called BANK_GRAPH based on bank transaction data.

Depending on your Linux version, you can use Docker or Podman to run the Oracle Graph Quickstart Container Image:

- Docker is available on Oracle Linux 7 (x86_64) and Red Hat Enterprise Linux 7. Refer to Oracle Container Runtime for Docker User's Guide for more information.
- Podman is available on Oracle Linux 8 (x86_64) and Red Hat Enterprise Linux 8. Refer to Podman User's Guide for more information.

Note that this image is not available for Oracle Linux 8 64-bit Arm architectures.

Before you get started, perform the following prerequisites:

1. Sign in to Oracle Container Registry and accept the Oracle Standard Terms and Restrictions to download the `graph-quickstart` image.
2. Generate an authentication token to authenticate Docker or Podman with the Oracle Container Registry.
See [Generating an Authentication Token for Use With the Oracle Container Registry](#) for more information.

Perform the following steps to run the Oracle Graph Quickstart Container Image inside a Docker or Podman container.

1. Login from the host system by running the following command:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman login container-registry.oracle.com
```

Linux 7

```
docker login container-registry.oracle.com
```

If your host system is behind a firewall, then ensure that you configure the necessary proxy environment variables to the address of the proxy server.
When prompted, provide your Oracle account username and the authentication token for password.

2. Download the latest **graph-quickstart** image from the Oracle Container Registry by running the following command:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman pull container-registry.oracle.com/database/graph-quickstart:25.2.0
```

Linux 7

```
docker pull container-registry.oracle.com/database/graph-quickstart:25.2.0
```

Alternatively, you can skip this step and run the container directly, which will automatically pull the image as shown in the next step.

3. Run the Oracle Graph Quickstart container as shown:

-
- [Linux 8](#)
 - [Linux 7](#)

Linux 8

```
podman run -d --name <container_name> -p <host_port>:7007 -e  
ORACLE_PWD=<database_password> container-registry.oracle.com/database/  
graph-quickstart:25.2.0
```

Linux 7

```
docker run -d --name <container_name> -p <host_port>:7007 -e  
ORACLE_PWD=<database_password> container-registry.oracle.com/database/  
graph-quickstart:25.2.0
```

In the preceding command:

- `--name`: Specifies the name for the container.
- `-d`: Indicates that the container is run at the background.
- `-p`: The port mapping of the host port to the container port.
- `-e`: Sets an environment variable (`ORACLE_PWD`) inside the container that specifies the Oracle Database password for `GRAPHUSER` and `PDBADMIN` user accounts.

See the Oracle Graph Quickstart Container Image [documentation page](#) in Oracle Container Registry for more information.

16.2.5 User Authentication and Authorization

The Oracle Graph server (PGX) uses an Oracle Database as identity manager. Both username and password based as well as Kerberos based authentication is supported.

The actions that you are allowed to do on the graph server are determined by the privileges enabled by roles that have been granted to you in the Oracle Database.

- [Basic Steps for Using an Oracle Database for Authentication](#)
You can follow the steps explained in this section to authenticate users to the graph server (PGX).
- [Prepare the Graph Server for Database Authentication](#)
Locate the `pgx.conf` file of your installation.
- [Store the Database Password in a Keystore](#)
- [Adding Permissions to Publish the Graph](#)
There are two ways by which you can view any graph in your graph server (PGX) session in the graph visualization application.
- [Token Expiration](#)
By default, tokens are valid for 1 hour.
- [Customizing Roles and Permissions](#)
You can fully customize the permissions to roles mapping by adding and removing roles and specifying permissions for a role. You can also authorize individual users instead of roles.
- [Revoking Access to the Graph Server](#)
To revoke a user's ability to access the graph server, either drop the user from the database or revoke the corresponding roles from the user, depending on how you defined the access rules in your `pgx.conf` file.
- [Examples of Custom Authorization Rules](#)
You can define custom authorization rules for developers.
- [Kerberos Enabled Authentication for the Graph Server \(PGX\)](#)
The graph server (PGX) can authenticate users using an Oracle Database with Kerberos enabled as identity provider.

16.2.5.1 Basic Steps for Using an Oracle Database for Authentication

You can follow the steps explained in this section to authenticate users to the graph server (PGX).

1. Use an Oracle Database version that is supported by Oracle Graph Server and Client: version 19c or later, including Autonomous Database.
2. Ensure that you have SYSDBA access for your database (or ADMIN access for autonomous databases) to grant and revoke users access to the graph server (PGX).
3. Ensure that all existing users to which you plan to grant access to the graph server have at least the following privileges granted.

CREATE SESSION, CREATE TABLE

4. Ensure that the database is accessible through JDBC from the host where the graph server runs.
5. As SYSDBA (or ADMIN on autonomous databases), run the following procedure to create the roles required by the graph server.

Note

If you are using an Autonomous Database Serverless instance, or if your on-premises Oracle Database version is 23ai, then you can skip this step as these roles are pre-installed.

```
-- This procedure creates a list of roles needed for graph.
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
    role_exists EXCEPTION;
    PRAGMA EXCEPTION_INIT(role_exists, -01921);
    TYPE graph_roles_table IS TABLE OF VARCHAR2(50);
    graph_roles graph_roles_table;
BEGIN
    graph_roles := graph_roles_table(
        'GRAPH_DEVELOPER',
        'GRAPH_ADMINISTRATOR',
        'GRAPH_USER',
        'PGX_SESSION_CREATE',
        'PGX_SERVER_GET_INFO',
        'PGX_SERVER_MANAGE',
        'PGX_SESSION_READ_MODEL',
        'PGX_SESSION_MODIFY_MODEL',
        'PGX_SESSION_NEW_GRAPH',
        'PGX_SESSION_GET_PUBLISHED_GRAPH',
        'PGX_SESSION_COMPILE_ALGORITHM',
        'PGX_SESSION_ADD_PUBLISHED_GRAPH',
        'PGX_SESSION_SET_IDLE_TIMEOUT');
    FOR elem IN 1 .. graph_roles.count LOOP
        BEGIN
            dbms_output.put_line('create_graph_roles: ' || elem || ': CREATE
ROLE ' || graph_roles(elem));
            EXECUTE IMMEDIATE 'CREATE ROLE ' || graph_roles(elem);
        EXCEPTION
            WHEN role_exists THEN
                dbms_output.put_line('create_graph_roles: role already exists.
continue');
            WHEN OTHERS THEN
                RAISE;
```

```

        END;
    END LOOP;
EXCEPTION
    when others then
        dbms_output.put_line('create_graph_roles: hit error ');
        raise;
END;
/

```

Optionally, this procedure is also available in `/opt/oracle/graph/scripts/create_graph_roles.sql`.

See [Table 16-4](#) for more information on the roles.

6. Assign default permissions to the roles `GRAPH_DEVELOPER`, `GRAPH_USER` and `GRAPH_ADMINISTRATOR` to group multiple permissions together.

Note

If you are using an Autonomous Database serverless instance, or if your on-premises Oracle Database version is 23ai, then you can skip this step as these privileges are available by default.

```

-- This procedure add some grants to the graph roles.
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_CREATE TO GRAPH_ADMINISTRATOR';
    EXECUTE IMMEDIATE 'GRANT PGX_SERVER_GET_INFO TO GRAPH_ADMINISTRATOR';
    EXECUTE IMMEDIATE 'GRANT PGX_SERVER_MANAGE TO GRAPH_ADMINISTRATOR';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_CREATE TO GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_NEW_GRAPH TO GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_GET_PUBLISHED_GRAPH TO
GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_MODIFY_MODEL TO GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_READ_MODEL TO GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_SET_IDLE_TIMEOUT TO
GRAPH_DEVELOPER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_CREATE TO GRAPH_USER';
    EXECUTE IMMEDIATE 'GRANT PGX_SESSION_GET_PUBLISHED_GRAPH TO
GRAPH_USER';
    BEGIN
        EXECUTE IMMEDIATE 'GRANT CREATE PROPERTY GRAPH TO GRAPH_DEVELOPER';
    EXCEPTION WHEN others then
        if sqlcode = -990 then
            mdsys.opg_log.debug('grant create property graph to
graph_developer: missing privilege, continue');
        else
            raise;
        end if;
    END;
EXCEPTION
    when others then
        dbms_output.put_line('add_graph_roles_grants: hit error ');

```

```

        raise;
    END;
/

```

Optionally, this procedure is also available in `/opt/oracle/graph/scripts/create_graph_roles.sql`.

7. Assign roles to all the database developers who should have access to the graph server (PGX). For example:

```
GRANT GRAPH_DEVELOPER TO <graphuser>
```

where `<graphuser>` is a user in the database. You can also assign individual permissions (roles prefixed with `PGX_`) to users directly.

8. Assign the administrator role to users who should have administrative access. For example:

```
GRANT GRAPH_ADMINISTRATOR to <administratoruser>
```

where `<administratoruser>` is a user in the database.

- [Privileges and Roles in Oracle Database](#)
This section describes the database roles and privileges that are required only if you are using the graph server (PGX).

16.2.5.1.1 Privileges and Roles in Oracle Database

This section describes the database roles and privileges that are required only if you are using the graph server (PGX).

Table 16-4 Oracle Database Privileges and Roles Required for Using the Graph Server (PGX)

Role	Operations enabled by this role	Used By
PGX_SESSION_CREATE	Create a new PGX session using the <code>ServerInstance.createSession</code> API.	Graph developers and graph users
PGX_SERVER_GET_INFO	Get status information on the PGX instance using the Admin API .	Users who administer PGX
PGX_SERVER_MANAGE (includes PGX_SERVER_GET_INFO)	Manage the PGX instance using the Admin API to stop or restart PGX.	Users who administer PGX
PGX_SESSION_NEW_GRAPH	Create a new graph in PGX by loading from the database using a config file, using the <code>CREATE PROPERTY GRAPH</code> statement in PGQL, creating a sub-graph from another graph, or using the <code>GraphBuilder</code> .	Graph developers and graph users
PGX_SESSION_GET_PUBLISHED_GRAPH	Query and view graphs published by another user to the public namespace.	Graph developers and graph users
PGX_SESSION_ADD_PUBLISHED_GRAPH (includes PGX_SESSION_GET_PUBLISHED_GRAPH)	Publish a graph to the public namespace.	Graph developers

Table 16-4 (Cont.) Oracle Database Privileges and Roles Required for Using the Graph Server (PGX)

Role	Operations enabled by this role	Used By
PGX_SESSION_COMPILE_ALGORITHM	Compile an algorithm using the PGX Algorithm API.	Graph developers
PGX_SESSION_READ_MODEL	Load and use an ML model using PgxML.	Graph developers
PGX_SESSION_MODIFY_MODEL	Create, train, and store an ML model using PgxML.	Graph developers

Few additional roles are also created to group multiple roles together. They provide a convenient way to grant multiple roles to database users. See [Mapping Graph Server Roles to Default Privileges](#) for more information on these additional roles.

You can create additional groups that are useful for your application, as described in [Adding and Removing Roles](#) and [Defining Permissions for Individual Users](#).

16.2.5.2 Prepare the Graph Server for Database Authentication

Locate the `pgx.conf` file of your installation.

If you installed the graph server via RPM, the file is located at: `/etc/oracle/graph/pgx.conf`

If you use the `webapps` package to deploy into Tomcat or WebLogic Server, the `pgx.conf` file is located inside the web application archive file (WAR file) at: `WEB-INF/classes/pgx.conf`

Tip: On Linux, you can use `vim` to edit the file directly inside the WAR file without unzipping it first. For example:

```
vim graph-server-webapp-<version>.war
```

Inside the `pgx.conf` file, locate the `jdbc_url` line of the realm options:

```
...
"pgx_realm": {
  "implementation": "oracle.pg.identity.DatabaseRealm",
  "options": {
    "jdbc_url": "<REPLACE-WITH-DATABASE-URL-TO-USE-FOR-AUTHENTICATION>",
    "token_expiration_seconds": 3600,
  }
}
...
```

Replace the text with the JDBC URL pointing to your database that you configured in the previous step. For example:

```
...
"pgx_realm": {
  "implementation": "oracle.pg.identity.DatabaseRealm",
  "options": {
    "jdbc_url": "jdbc:oracle:thin:@myhost:1521/myervice",
    "token_expiration_seconds": 3600,
  }
}
...
```

Then, start the graph server by running the following command as a root user or with `sudo`:

```
sudo systemctl start pgx
```

Preparing the Graph Server (PGX) to Connect to Autonomous Database

You can configure your graph server (PGX) to connect to an Autonomous Database instance.

Irrespective of whether your graph server (PGX) instance is running on premises or on Oracle Cloud Infrastructure (OCI), you can perform the following steps to determine the service name to connect to your Autonomous Database instance and update the JDBC URL in `/etc/oracle/graph/pgx.conf` file.

1. Download and save the wallet for your Autonomous Database instance from the Oracle Cloud Infrastructure (OCI) Console. See [Download Client Credentials \(Wallets\)](#) for more information.
2. Unzip the wallet to a new subdirectory in `/etc/oracle/graph/wallets/<dbname>`, and change the group permission as shown:

```
sudo unzip Wallet_<dbname>.zip -d /etc/oracle/graph/wallets/<dbname>
sudo chgrp -R oraclegraph /etc/oracle/graph/wallets/<dbname>
```

3. Determine the connect identifier from the `tnsnames.ora` file in `/etc/oracle/graph/wallets/<dbname>` directory. For example, the entry must be similar to:

```
graphdb_low =
  description= (retry_count=20)(retry_delay=3)
    (address=
      (protocol=tcps)(port=1522)
      (host=adwc.example.oraclecloud.com)
    )
    (connect_data=(service_name=graphdb_low.adwc.oraclecloud.com))
    (security=(ssl_server_cert_dn="CN=adwc.example.oraclecloud.com,
OU=Oracle BMCS US, O=Oracle Corporation, L=Redwood City, ST=California,
C=US"))
  )
```

In the preceding example, `graphdb_low` is the connect identifier.

4. Update the JDBC URL in `/etc/oracle/graph/pgx.conf` file with the connect identifier determined in the preceding step along with the directory path to the unzipped wallet file. For example:

```
...
"pgx_realm": {
  "implementation": "oracle.pg.identity.DatabaseRealm",
  "options": {
    "jdbc_url": "jdbc:oracle:thin:@graphdb_low?TNS_ADMIN=/etc/oracle/graph/
wallets/<dbname>",
    "token_expiration_seconds": 3600,
  }
}
...
```

- Finally, restart the graph server as shown:

```
sudo systemctl restart pgx
```

16.2.5.3 Store the Database Password in a Keystore

PGX requires a database account to read data from the database into memory. The account should be a low-privilege account (see [Security Best Practices with Graph Data](#)).

As described in [Reading Graphs from Oracle Database into the Graph Server \(PGX\)](#), you can read data from the database into the graph server without specifying additional authentication as long as the token is valid for that database user. But if you want to access a graph from a different user, you can do so, as long as that user's password is stored in a Java Keystore file for protection.

You can use the `keytool` command that is bundled together with the JDK to generate such a keystore file on the command line. See the following script as an example:

```
# Add a password for the 'database1' connection
keytool -importpass -alias database1 -keystore keystore.p12
# 1. Enter the password for the keystore
# 2. Enter the password for the database

# Add another password (for the 'database2' connection)
keytool -importpass -alias database2 -keystore keystore.p12

# List what's in the keystore using the keytool
keytool -list -keystore keystore.p12
```

If you are using Java version 8 or lower, you should pass the additional parameter `-storetype pkcs12` to the `keytool` commands in the preceding example.

You can store more than one password into a single keystore file. Each password can be referenced using the alias name provided.

- [Write the PGX graph configuration file to load a graph directly from relational tables](#)
- [Read the data](#)
- [Secure coding tips for graph client applications](#)

Write the PGX graph configuration file to load a graph directly from relational tables

The following example loads a subset of the HR sample data from relational tables directly into PGX as a graph. The configuration file specifies a mapping from relational to graph format by using the concept of vertex and edge providers.

Note

Specifying the `vertex_providers` and `edge_providers` properties loads the data into an optimized representation of the graph.

```
{
  "name": "hr",
```

```

"jdbc_url": "jdbc:oracle:thin:@myhost:1521/orcl",
"username": "hr",
"keystore_alias": "database1",
"vertex_id_strategy": "no_ids",
"vertex_providers": [
  {
    "name": "Employees",
    "format": "rdbms",
    "database_table_name": "EMPLOYEES",
    "key_column": "EMPLOYEE_ID",
    "key_type": "string",
    "props": [
      {
        "name": "FIRST_NAME",
        "type": "string"
      },
      {
        "name": "LAST_NAME",
        "type": "string"
      },
      {
        "name": "EMAIL",
        "type": "string"
      },
      {
        "name": "SALARY",
        "type": "long"
      }
    ]
  },
  {
    "name": "Jobs",
    "format": "rdbms",
    "database_table_name": "JOBS",
    "key_column": "JOB_ID",
    "key_type": "string",
    "props": [
      {
        "name": "JOB_TITLE",
        "type": "string"
      }
    ]
  },
  {
    "name": "Departments",
    "format": "rdbms",
    "database_table_name": "DEPARTMENTS",
    "key_column": "DEPARTMENT_ID",
    "key_type": "string",
    "props": [
      {
        "name": "DEPARTMENT_NAME",
        "type": "string"
      }
    ]
  }
]
}

```

```

],
"edge_providers":[
  {
    "name":"WorksFor",
    "format":"rdbms",
    "database_table_name":"EMPLOYEES",
    "key_column":"EMPLOYEE_ID",
    "source_column":"EMPLOYEE_ID",
    "destination_column":"EMPLOYEE_ID",
    "source_vertex_provider":"Employees",
    "destination_vertex_provider":"Employees"
  },
  {
    "name":"WorksAs",
    "format":"rdbms",
    "database_table_name":"EMPLOYEES",
    "key_column":"EMPLOYEE_ID",
    "source_column":"EMPLOYEE_ID",
    "destination_column":"JOB_ID",
    "source_vertex_provider":"Employees",
    "destination_vertex_provider":"Jobs"
  },
  {
    "name":"WorkedAt",
    "format":"rdbms",
    "database_table_name":"JOB_HISTORY",
    "key_column":"EMPLOYEE_ID",
    "source_column":"EMPLOYEE_ID",
    "destination_column":"DEPARTMENT_ID",
    "source_vertex_provider":"Employees",
    "destination_vertex_provider":"Departments",
    "props":[
      {
        "name":"START_DATE",
        "type":"local_date"
      },
      {
        "name":"END_DATE",
        "type":"local_date"
      }
    ]
  }
]
}

```

Read the data

Now you can instruct PGX to connect to the database and read the data by passing in both the keystore and the configuration file to PGX, using one of the following approaches:

- **Interactively in the graph shell**

If you are using the graph shell, start it with the `--secret_store` option. It will prompt you for the keystore password and then attach the keystore to your current session. For example:

```
cd /opt/oracle/graph
./bin/opg4j --secret_store /etc/my-secrets/keystore.p12

enter password for keystore /etc/my-secrets/keystore.p12:
```

Inside the shell, you can then use normal PGX APIs to read the graph into memory by passing the JSON file you just wrote into the `readGraphWithProperties` API:

```
opg4j> var graph = session.readGraphWithProperties("config.json")
graph ==> PgxGraph[name=hr,N=215,E=415,created=1576882388130]
```

- **As a PGX preloaded graph**

As a server administrator, you can instruct PGX to load graphs into memory upon server startup. To do so, modify the PGX configuration file at `/etc/oracle/graph/pgx.conf` and add the path the graph configuration file to the `preload_graphs` section. For example:

```
{
  ...
  "preload_graphs": [{
    "name": "hr",
    "path": "/path/to/config.json"
  }],
  "authorization": [{
    "pgx_role": "GRAPH_DEVELOPER",
    "pgx_permissions": [{
      "preloaded_graph": "hr",
      "grant": "read"
    }]
  }],
  ....
}]
```

As root user, edit the service file at `/etc/systemd/system/pgx.service` and change the `ExecStart` command to specify the location of the keystore containing the password:

```
ExecStart=/bin/bash start-server --secret-store /etc/keystore.p12
```

Note

Please note that `/etc/keystore.p12` must not be password protected for this to work. Instead protect the file via file system permission that is only readable by `oraclegraph` user.

After the file is edited, reload the changes using:

```
sudo systemctl daemon-reload
```

Finally start the server:

```
sudo systemctl start pgx
```

- **In a Java application**

To register a keystore in a Java application, use the `registerKeystore()` API on the `PgxSession` object. For example:

```
import oracle.pgx.api.*;

class Main {

    public static void main(String[] args) throws Exception {
        String baseUrl = args[0];
        String keystorePath = "/etc/my-secrets/keystore.p12";
        char[] keystorePassword = args[1].toCharArray();
        String graphConfigPath = args[2];
        ServerInstance instance = Pgx.getInstance(baseUrl);
        try (PgxSession session = instance.createSession("my-session")) {
            session.registerKeystore(keystorePath, keystorePassword);
            PgxGraph graph = session.readGraphWithProperties(graphConfigPath);
            System.out.println("N = " + graph.getNumVertices() + " E = " +
graph.getNumEdges());
        }
    }
}
```

You can compile and run the preceding sample program using the Oracle Graph Client package. For example:

```
cd $GRAPH_CLIENT
// create Main.java with above contents
javac -cp 'lib/*' Main.java
java -cp 'lib/*' Main http://myhost:7007 MyKeystorePassword path/to/
config.json
```

Secure coding tips for graph client applications

When writing graph client applications, make sure to never store any passwords or other secrets in clear text in any files or in any of your code.

Do not accept passwords or other secrets through command line arguments either. Instead, use `Console.html#readPassword()` from the JDK.

16.2.5.4 Adding Permissions to Publish the Graph

There are two ways by which you can view any graph in your graph server (PGX) session in the graph visualization application.

When you log into the graph visualization tool in your browser, that will be a different session from your JShell session or application session. To visualize the graph you are working on in

your JShell session or application session in your graph visualization session, you can perform one of the following two steps:

1. Get the session id of your working session using the `PgxSession` API, and use that session id when you log into the graph visualization application. This is the recommended option.

```
opg4j> session.getId();
$2 ==> "898bdb3c3-af80-49b7-9a5e-10ace6c9071c" //session id
```

or

2. Grant `PGX_SESSION_ADD_PUBLISHED_GRAPH` permission and then publish the graph as shown:
 - a. Grant `PGX_SESSION_ADD_PUBLISHED_GRAPH` role in the database to the user visualizing the graph as shown in the following statement:

```
GRANT PGX_SESSION_ADD_PUBLISHED_GRAPH TO <graphuser>
```

- b. Publish the graph when you are ready to visualize the graph using the publish API.

Note

- See [User Authentication and Authorization](#) for more information on authorization rules for Graph Server (PGX) and Client 21.1.
- See [Upgrading From Graph Server and Client 20.4.x to 21.x](#) for more information if you are migrating to Graph Server (PGX) and Client 25.3 from an earlier version.

16.2.5.5 Token Expiration

By default, tokens are valid for 1 hour.

Internally, the graph client automatically renews tokens which are about to expire in less than 30 minutes. This is also configurable by re-authenticating your credentials with the database. By default, tokens can only be automatically renewed for up to 24 times, then you need to login again.

If the maximum amount of auto-renewals is reached, you can log in again without losing any of your session data by using the `GraphServer#reauthenticate (instance, "<user>", "<password>")` API.

Note

If a session time out occurs before you re-authenticate, then you may lose your session data.

For example:

```
opg4j> var graph =
session.readGraphByName("BANK_GRAPH_VIEW",GraphSource.PG_PGQL) // fails
because token cannot be renewed anymore
```

```
opg4j> GraphServer.reauthenticate(instance, "<user>",
"<password>".toCharArray()) // log in again
opg4j> var graph =
session.readGraphByName("BANK_GRAPH_VIEW",GraphSource.PG_PGQL) // works now
```

16.2.5.6 Customizing Roles and Permissions

You can fully customize the permissions to roles mapping by adding and removing roles and specifying permissions for a role. You can also authorize individual users instead of roles.

This topic includes examples of how to customize the permission mapping.

- [Checking Graph Permissions Using API](#)
- [Adding and Removing Roles](#)
You can add new role permission mappings or remove existing mappings by modifying the authorization list.
- [Defining Permissions for Individual Users](#)
In addition to defining permissions for roles, you can define permissions for individual users.
- [Defining Permissions to Use Custom Graph Algorithms](#)
You can define permissions to allow developers to compile custom graph algorithms.

16.2.5.6.1 Checking Graph Permissions Using API

You can view your roles and graph permissions using the following PGX API methods:

Table 16-5 API for Checking Graph Permissions

Class	Method	Description
ServerInstance	<code>getPgxUsername()</code>	Name of the current user
ServerInstance	<code>getPgxUserRoles()</code>	Role names of the current user
ServerInstance	<code>getPgxGenericPermissions()</code>	Non-graph (system) permissions of the current user: <ul style="list-style-type: none"> • Pgx system permissions • File-location permissions
PgxGraph	<code>getPermission()</code>	Permission on the graph instance for a current user

You can get all permission-related information using the API in JShell as shown:

- [JShell](#)
- [Java](#)

JShell

```
/bin/opg4j -b "https://<host>:<port>" -u "<graphuser>"
opg4j> instance
instance ==> ServerInstance[embedded=false,baseUrl=https://
<host>:<port>,serverVersion=null]
```

```

opg4j> instance.getPgxUsername()
$2 ==> "ORACLE"
opg4j> instance.getPgxUserRoles()
$3 ==> [GRAPH_DEVELOPER]
opg4j> instance.getPgxGenericPermissions()
$4 ==> [PGX_SESSION_CREATE, PGX_SESSION_READ_MODEL,
PGX_SESSION_ADD_PUBLISHED_GRAPH, PGX_SESSION_NEW_GRAPH,
PGX_SESSION_GET_PUBLISHED_GRAPH, PGX_SESSION_MODIFY_MODEL]
opg4j> var g = session.readGraphByName("BANK_GRAPH_VIEW", GraphSource.PG_PGQL)
g ==> PgxGraph[name=BANK_GRAPH_VIEW,N=999,E=4993,created=1688558374973]
opg4j> g.getPermission() // To get graph permissions
$9 ==> MANAGE

```

Java

```

        PgxCSession session = instance.createSession("my-session");

        var statement = Files.readString(Path.of("/media/sf_Linux/Java/create-
pg.pgql"));
        stmt = session.preparePgql(statement);
        stmt.execute();

        PgxCGraph g = session.getGraph(graph);
        System.out.println("Graph: " + g);

        String userName = instance.getPgxCUsername();
        var userRoles = instance.getPgxCUserRoles();
        var genericPermissions = instance.getPgxCGenericPermissions();
        String graphPermission = g.getPermission().toString();

        System.out.println("Username is " + userName);
        System.out.println("User Roles are " + userRoles);
        System.out.println("Generic permissions are " + genericPermissions);
        System.out.println("Graph permission is " + graphPermission);

    }

    finally {
        // close the sql statement
        if (stmt != null) {
            stmt.close();
        }
        // close the connection
        if (conn != null) {
            conn.close();
        }
    }
}
}
}

```

On execution, the code gives the following output:

```

Graph: PgxCGraph[name=BANK_GRAPH_PG,N=1000,E=5001,created=1625731370402]
Username is ORACLE
User Roles are [GRAPH_DEVELOPER]
Generic permissions are [PGX_SESSION_MODIFY_MODEL, PGX_SESSION_CREATE,
PGX_SESSION_NEW_GRAPH, PGX_SESSION_READ_MODEL,
PGX_SESSION_ADD_PUBLISHED_GRAPH, PGX_SESSION_GET_PUBLISHED_GRAPH]
Graph permission is MANAGE

```

16.2.5.6.2 Adding and Removing Roles

You can add new role permission mappings or remove existing mappings by modifying the authorization list.

For example:

```
CREATE ROLE MY_CUSTOM_ROLE_1
GRANT PGX_SESSION_CREATE TO MY_CUSTOM_ROLE1
GRANT PGX_SERVER_GET_INFO TO MY_CUSTOM_ROLE1
GRANT MY_CUSTOM_ROLE1 TO SCOTT
```

16.2.5.6.3 Defining Permissions for Individual Users

In addition to defining permissions for roles, you can define permissions for individual users.

For example:

```
GRANT PGX_SESSION_CREATE TO SCOTT
GRANT PGX_SERVER_GET_INFO TO SCOTT
```

16.2.5.6.4 Defining Permissions to Use Custom Graph Algorithms

You can define permissions to allow developers to compile custom graph algorithms.

For example,

- Add the following static permission to the list of permissions:

```
GRANT PGX_SESSION_COMPILE_ALGORITHM TO GRAPH_DEVELOPER
```

16.2.5.7 Revoking Access to the Graph Server

To revoke a user's ability to access the graph server, either drop the user from the database or revoke the corresponding roles from the user, depending on how you defined the access rules in your `pgx.conf` file.

For example:

```
REVOKE graph_developer FROM scott
```

Revoking Graph Permissions

If you have the `MANAGE` permission on a graph, you can revoke graph access from users or roles using the `PgxGraph#revokePermission` API. For example:

```
PgxGraph g = ...
g.revokePermission(new PgxRole("GRAPH_DEVELOPER")) // revokes previously
granted role access
g.revokePermission(new PgxUser("SCOTT")) // revokes previously granted user
access
```

16.2.5.8 Examples of Custom Authorization Rules

You can define custom authorization rules for developers.

- [Example 16-1](#)
- [Example 16-2](#)

- [Example 16-3](#)
- [Example 16-4](#)

Example 16-1 Allowing Developers to Publish Graphs

Sharing of graphs with other users should be done in Oracle Database where possible. Use GRANT statements on the database tables so that other users can create graphs from the tables.

In the graph server (PGX) you can use the following permissions to share a graph that is already in memory, with other users connected to the graph server.

Table 16-6 Allowed Permissions

Permission	Actions Enabled by this Permission
READ	<ul style="list-style-type: none"> • READ the graph via the PGX API or in PGQL queries in PGX, create a subgraph, or clone the graph
MANAGE	<ul style="list-style-type: none"> • Publish the graph or snapshot • Includes READ and EXPORT • Grant or revoke READ and EXPORT permissions on the graph
EXPORT	<ul style="list-style-type: none"> • Export the graph to a file. • Includes READ permission.

The creator of the graph automatically gets the MANAGE permission granted on the graph. If you have the MANAGE permission, you can grant other roles or users READ or EXPORT permission on the graph. You **cannot** grant MANAGE on a graph. The following describes an example of granting READ permission on a graph to the GRAPH_DEVELOPER role by userA:

```
import oracle.pgx.api.*;
import oracle.pgx.common.auth.*;
...
PgxSession session = GraphServer.getInstance("<base-url>", "<userA>",
"<password-of-userA>").createSession("userA");
PgxGraph g = session.readGraphByName("SAMPLE_GRAPH", GraphSource.PG_PGQL);
g.grantPermission(new PgxRole("GRAPH_DEVELOPER"), PgxResourcePermission.READ);
g.publish();
```

Now other users with the GRAPH_DEVELOPER role can access this graph and have READ access on it, as shown in the following example of userB:

```
PgxSession session = GraphServer.getInstance("<base-url>", "<userB>",
"<password-of-userB>").createSession("userB")
PgxGraph g = session.getGraph("sample_graph")
g.queryPgql("select count(*) from match (v)").print().close()
```

Similarly, graphs can be shared with individual users instead of roles, as shown in the following example:

```
g.grantPermission(new PgxUser("OTHER_USER"), PgxResourcePermission.EXPORT)
```

where `OTHER_USER` is the user name of the user that will receive the `EXPORT` permission on graph `g`.

Example 16-2 Allowing Developers to Access Preloaded Graphs

To allow developers to access preloaded graphs (graphs loaded during graph server startup), grant the read permission on the preloaded graph in the `pgx.conf` file. For example:

```
"preload_graphs": [{
  "path": "/data/my-graph.json",
  "name": "global_graph"
}],
"authorization": [{
  "pgx_role": "GRAPH_DEVELOPER",
  "pgx_permissions": [{
    "preloaded_graph": "global_graph"
    "grant": "read"
  }],
  ...
```

You can grant `READ`, `EXPORT`, or `MANAGE` permission.

Example 16-3 Allowing Developers Access to the Local File System

To allow developers access to the local file system (where the graph server runs), you must first declare a directory and then map it to a read or write permission. For example:

```
CREATE OR REPLACE DIRECTORY pgx_file_location AS '/opt/oracle/graph/data'
GRANT READ ON DIRECTORY pgx_file_location TO GRAPH_DEVELOPER
```

Similarly, you can add another permission with `GRANT WRITE` to allow write access. Such a write access is required in order to export graphs.

Note that in addition to the preceding configuration, the operating system user that runs the graph server process must have the corresponding directory privileges to actually read or write into those directories.

Example 16-4 Allowing Access to Directories on Autonomous Database

To allow developers to read and write from files in Oracle Autonomous Database, you must perform the following steps:

1. Connect to your Autonomous Database instance as an `ADMIN` user using any of the SQL based Oracle Database tools or using Database Actions, the built-in web-based interface.

See Also

- [Connect to Autonomous Database Using Oracle Database Tools](#)
- [Connect with Built-in Oracle Database Actions](#)

2. Create the directory by specifying the path to the directory using the `graph:` prefix as shown:

```
CREATE OR REPLACE DIRECTORY pgx_file_location AS 'graph:/opt/oracle/graph/
data'
```

3. Grant read or write permissions to the directory for the desired role. For example:

```
GRANT READ ON DIRECTORY pgx_file_location TO GRAPH_DEVELOPER
```

16.2.5.9 Kerberos Enabled Authentication for the Graph Server (PGX)

The graph server (PGX) can authenticate users using an Oracle Database with Kerberos enabled as identity provider.

You can log into the graph server using a Kerberos ticket and the actions which you are allowed to do on the graph server are determined by the roles that have been granted to you in the Oracle Database.

- [Prerequisite Requirements](#)
- [Prepare the Graph Server for Kerberos Authentication](#)
- [Login to the Graph Server Using Kerberos Ticket](#)

16.2.5.9.1 Prerequisite Requirements

In order to enable Kerberos authentication on the graph server (PGX), the following system requirements must be met:

- The database needs to have Kerberos authentication enabled. See [Configuring Kerberos Authentication](#) for more information.
- Both the database and the Kerberos Authentication Server need to be reachable from the host where the graph server runs.
- The database is prepared for graph server authentication. That is, relevant graph roles have been granted to users who will log into the graph server.

16.2.5.9.2 Prepare the Graph Server for Kerberos Authentication

The following are the steps to enable Kerberos authentication on the graph server (PGX):

1. Locate the `pgx.conf` file of your installation.

Note

If you installed the graph server via RPM, the file is located at: `/etc/oracle/graph/pgx.conf`

2. Locate the `krb5_conf_file` line of the realm options, inside the `pgx.conf` file:

```
"pgx_realm": {  
  "implementation": "oracle.pg.identity.DatabaseRealm",  
  "options": {  
    ...  
    "krb5_conf_file": "<REPLACE-WITH-KRB5-CONF-FILE-PATH-TO-ENABLE-  
KERBEROS-AUTHENTICATION>",  
    "krb5_ticket_cache_dir": "/dev/shm",  
    "krb5_max_cache_size": 1024  
  }  
},
```

3. Replace the text with the `krb5.conf` file that you are using for the database and user authentication. For example:

```
"pgx_realm": {
  "implementation": "oracle.pg.identity.DatabaseRealm",
  "options": {
    ...
    "krb5_conf_file": "/etc/krb5.conf",
    "krb5_ticket_cache_dir": "/dev/shm",
    "krb5_max_cache_size": 1024
  }
},
```

Note

The file provided for the `krb5_conf_file` option needs to be valid and readable by the graph server. In case you don't replace the `krb5_conf_file` value or the value is empty, then the graph server will not use Kerberos authentication.

Also, you can set the cache directory that will be used for the graph server to temporarily store Kerberos tickets given by clients as well as the maximum cache size after which new login attempts will be rejected. The cache size represents the maximum amount of concurrent Kerberos sessions active on the graph server.

16.2.5.9.3 Login to the Graph Server Using Kerberos Ticket

The following are the steps to login to the graph server (PGX) using Kerberos ticket:

1. Create a new Kerberos ticket using the `okinit` command:

```
$ okinit <username>
```

This will prompt for your password and then create a new Kerberos ticket.

2. Connect to a remote graph server with only the base URL parameter using JShell:

```
$ opg4j -b https://localhost:7007
```

Or using Python client:

```
$ opg4py -b https://localhost:7007
```

On Linux, JShell and Python interactive client shells automatically detect the Kerberos ticket on your local file system and use that to authenticate with the graph server.

3. In case the auto-detection is not working, you can also explicitly pass in the ticket to the shell. Run the `oklist` command, to find the location of the ticket on the local file system.

```
$ oklist
```

```
Kerberos Utilities for Linux: Version 19.0.0.0.0 - Production on 31-
MAR-2021 15:26:46
```

Copyright (c) 1996, 2019 Oracle. All rights reserved.

```
Configuration file : /etc/krb5.conf.
Ticket cache: FILE:/tmp/krb5cc_54321
Default principal: oracle@realm
```

4. Specify your Kerberos ticket path using the `--kerberos_ticket` parameter. For example, using JShell:

```
$ opg4j -b https://localhost:7007 --kerberos_ticket /tmp/krb5cc_54321
```

Or using Python Client:

```
$ opg4py -b https://localhost:7007 --kerberos_ticket /tmp/krb5cc_54321
```

If you are using a Java client program (or JShell on embedded mode), you can get a server instance using the following API:

```
...
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "/tmp/krb5cc_54321");
PgxSession session = instance.createSession("my-session");
...
```

If you are using a Python Client program (or opg4py on embedded mode), you can get a server instance using the following API

```
...
instance = graph_server.get_instance("https://localhost:7007", "/tmp/
krb5cc_54321")
session = instance.create_session("my-session")
...
```

If you are connecting to a remote graph server, all you need is the Oracle Graph Client to be installed. For example:

```
import sys
import pypgx as pgx

sys.path.append("/path/to/graph/client/oracle-graph-client-21.2.0/python/
pypgx/pg/rdbms")

import graph_server

base_url = "https://localhost:7007"
kerberos_ticket = "/tmp/krb5cc_54321"

instance = graph_server.get_instance(base_url, kerberos_ticket)
print(instance)
```

16.3 Oracle Graph Client Installation

You can interact with the various graph features using the client CLIs and the graph visualization web client.

The following sections explain the steps to install the various clients:

- [Graph Clients](#)
The Oracle Graph client installation supports a Java and a Python client.
- [Running the Graph Visualization Web Client](#)
You require a running graph server (PGX) to use the Graph Visualization web application.

Related Topics

- [Getting Started with the Client Tools](#)
You can use multiple client tools to interact with the graph server (PGX) or directly with the graph data in the database.

16.3.1 Graph Clients

The Oracle Graph client installation supports a Java and a Python client.

The following sections explain the steps to install the clients:

- [Oracle Graph Java Client](#)
You can install the Java client from the `oracle-graph-client-25.3.0.zip` file that is shipped with Oracle Graph Server and Client or you can use the Java client on Maven Central.
- [Oracle Graph Python Client](#)
You can install the Python client by downloading the `oracle-graph-client-25.3.0.zip` file that is shipped with Oracle Graph Server and Client or from PyPI.

16.3.1.1 Oracle Graph Java Client

You can install the Java client from the `oracle-graph-client-25.3.0.zip` file that is shipped with Oracle Graph Server and Client or you can use the Java client on Maven Central.

- [Installing the Java Client From the Graph Server and Client Downloads](#)
You can download the zip file for Oracle Graph Client 25.3.0 and install the Java client.
- [Using Oracle Graph Java Client on Maven Central](#)
You can obtain the property graph Java client from Maven Central.

16.3.1.1.1 Installing the Java Client From the Graph Server and Client Downloads

You can download the zip file for Oracle Graph Client 25.3.0 and install the Java client.

The prerequisites for installing the Java client are:

- **Supported Operating Systems:** A Unix-based operation system (such as Linux), macOS, or Microsoft Windows
- **Supported JDK versions:**
 - Oracle JDK 11, JDK 17, or JDK21
 - OpenJDK JDK 11, JDK 17, or JDK21

Note

Due to a bug in Oracle JDK and OpenJDK, which causes a deadlock when you attempt to copy and paste into a JShell session, it is recommended that you avoid the following JDK versions:

- JDK 11.0.9
- JDK 11.0.10
- JDK 11.0.11
- JDK 11.0.12

1. Download the Oracle Graph Client from [Oracle Software Cloud](#).
For example, `oracle-graph-client-25.3.0.zip`.
2. Unzip the file into a directory of your choice.
3. Configure your client to trust the self-signed keystore. See [Configuring a Client to Trust the Self-Signed Keystore](#) for more information.
4. Start the OPG4J shell to connect to the graph server (PGX) as shown:

```
cd <CLIENT_INSTALL_DIR>
./bin/opg4j --base_url https://<host>:7007 --username <graphuser>
```

In the preceding code:

- **<CLIENT_INSTALL_DIR>**: Directory where the shell executables are located. The shell executables are generally found in `/opt/oracle/graph/bin` after server installation, and `<CLIENT_INSTALL_DIR>/bin` after the client installation.
- **<host>**: Server host

Note

The graph server (PGX), listens on port 7007 by default. If needed, you can configure the graph server to listen on a different port by changing the port value in the server configuration file (`server.conf`). See [Configuring the Graph Server \(PGX\)](#) for details.

- **<graphuser>**: Database user

You will be prompted for the database password.

See [Starting the OPG4J Shell](#) for more information on the different ways you can start the OPG4J shell.

The OPG4J shell starts and the following command line prompt appears as shown:

```
For an introduction type: /help intro
Oracle Graph Server Shell 25.3.0
Variables instance, session, and analyst ready to use.
opg4j>
```

① See Also

[Java API Reference](#) for more information on the Java APIs

16.3.1.1.2 Using Oracle Graph Java Client on Maven Central

You can obtain the property graph Java client from Maven Central.

The Maven artifact for the graph Java client is described as follows:

- **Group Name:** com.oracle.database.graph
- **Artifact Name:** opg-client
- **Version:** 25.3.0

You can perform the following steps to use the graph Java client from Maven Central:

1. Download and Install Apache Maven on your system.
See [Apache Maven Project](#) for more information.
2. Add the bin folder with the `mvn` command to the `PATH` variable.
3. Build your Maven project and navigate to the project directory.
4. Edit the `pom.xml` file on the following:
 - a. Add the graph Java client dependency as shown:

```
<dependencies>
  <dependency>
    <groupId>com.oracle.database.graph</groupId>
    <artifactId>opg-client</artifactId>
    <version>25.3.0</version>
  </dependency>
</dependencies>
```

① Note

If you use Gradle as a build tool, then the equivalent dependency declaration for the Java client is:

```
implementation group: 'com.oracle.database.graph', name: 'opg-
client', version: '25.3.0'
```

- b. Add the following repository as the Java client depends on the [Spoofox Language Workbench Library](#) to compile PGQL queries:

```
<repositories>
  <repository>
    <id>spoofox</id>
    <url>https://artifacts.metaborg.org/content/repositories/
releases</url>
  </repository>
</repositories>
```

5. Optionally, you can skip step 4 and copy the following minimal POM configuration in `<project_dir>/pom.xml` file:

```
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://
www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://
maven.apache.org/maven-v4_0_0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.mycompany.app</groupId>
  <artifactId>my-app</artifactId>
  <packaging>jar</packaging>
  <version>1.0-SNAPSHOT</version>
  <name>my-app</name>
  <repositories>
    <repository>
      <id>spoofox</id>
      <url>https://artifacts.metaborg.org/content/repositories/releases</
url>
    </repository>
  </repositories>
  <dependencies>
    <dependency>
      <groupId>com.oracle.database.graph</groupId>
      <artifactId>opg-client</artifactId>
      <version>25.3.0</version>
    </dependency>
  </dependencies>
</project>
```

6. Build your Java code in `<project_dir>/src/main/java/com/mycompany/app` and compile with Maven.

For example, the following code is stored in a file `<project_dir>/src/main/java/com/mycompany/app/App1.java`:

```
import java.sql.DriverManager;
import java.sql.Connection;
import java.sql.Statement;
import java.sql.ResultSet;
import oracle.pgx.api.*;
import oracle.pg.rdbms.pgql.jdbc.PgqlJdbcRdbmsDriver;

public class App1 {

    public static void main(String[] args) throws Exception {
        String dbConnectString = args[0];
        String username = args[1];
        String password = args[2];

        // Obtain a JDBC database connection
        DriverManager.registerDriver(new PgqlJdbcRdbmsDriver());
        String jdbcUrl = "jdbc:oracle:pgql:@" + dbConnectString;
        System.out.println("connecting to " + jdbcUrl);

        try (Connection conn = DriverManager.getConnection(jdbcUrl, username,
password)) {
```

```

conn.setAutoCommit(false);

// Create a PGQL statement to execute PGQL queries
Statement stmt = conn.createStatement();

// Create a PGQL property graph using the CREATE PROPERTY GRAPH
statement
String pgPgqlName = "BANK_GRAPH";
String createPgPgqlQuery =
    "CREATE PROPERTY GRAPH " + pgPgqlName + " " +
    "VERTEX TABLES ( BANK_ACCOUNTS AS ACCOUNTS " +
    "KEY (ID) " +
    "LABEL ACCOUNTS " +
    "PROPERTIES (ID, NAME)" +
    ") " +
    "EDGE TABLES ( BANK_TRANSFERS AS TRANSFERS " +
    "KEY (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT) " +
    "SOURCE KEY (SRC_ACCT_ID) REFERENCES ACCOUNTS (ID) " +
    "DESTINATION KEY (DST_ACCT_ID) REFERENCES ACCOUNTS (ID) " +
    "LABEL TRANSFERS " +
    "PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION)" +
    ") OPTIONS(PG_PGQL)";

stmt.execute(createPgPgqlQuery);

// Execute a query to retrieve the first 10 elements of the graph
String pgqlQuery =
    "SELECT * FROM GRAPH_TABLE ( " + pgPgqlName + " " +
    "MATCH " +
    "(a IS accounts) -[e IS transfers]-> (b IS accounts) " +
    "COLUMNS (a.id AS acc_a, b.id AS acc_b, e.amount AS amount) " +
    ") FETCH FIRST 5 ROWS ONLY";

ResultSet rs = stmt.executeQuery(pgqlQuery);
while (rs.next()) {
    Integer from_acct = rs.getInt(1);
    Integer to_acct = rs.getInt(2);
    Float amount = rs.getFloat(3);
    System.out.println("from_acct:" + from_acct);
    System.out.println("to_acct:" + to_acct);
    System.out.println("amount:" + amount);
    System.out.println("");
}

// Drop the PGQL property graph using the DROP PROPERTY GRAPH
statement
String dropPgPgqlQuery = "DROP PROPERTY GRAPH " + pgPgqlName;
stmt.execute(dropPgPgqlQuery);
}
System.exit(0);
}
}

```

You can then compile and run the preceding code by navigating to your project directory and running the following command:

```
mvn compile exec:java -Dexec.mainClass="com.mycompany.app.App1" -  
Dexec.arguments='<db-connect-string>,<username>,<password>'
```

On successful processing, the code may produce an output similar to the following. Note, your output may be different depending on your `<db-connect-string>`.

```
[INFO] --- exec-maven-plugin:3.1.0:java (default-cli) @ my-app ---  
connecting to jdbc:oracle:pgql:@myhost:1521/oradb  
from_acct:227

from_acct:228  
to_acct:126  
amount:9302.0  
  
from_acct:228  
to_acct:901  
amount:4339.0
```

16.3.1.2 Oracle Graph Python Client

You can install the Python client by downloading the `oracle-graph-client-25.3.0.zip` file that is shipped with Oracle Graph Server and Client or from PyPI.

Alternatively, you can also install the python client in embedded mode.

- [Installing the Python Client from PyPI](#)
You can obtain the property graph Python client from PyPI.
- [Upgrading the Python Client](#)
This section describes how to upgrade the Python client.
- [Installing the Python Client From the Graph Server and Client Downloads](#)
You can download the zip file for `oracle-graph-client-25.3.0` from the Graph Server and Client downloads and install the Python client.
- [Installing the Python Client in Embedded Mode](#)
You can install and work with the Python client in embedded mode.
- [Uninstalling the Python Client](#)
This section describes how to uninstall the Python client.

16.3.1.2.1 Installing the Python Client from PyPI

You can obtain the property graph Python client from PyPI.

You can install the `oracle-graph-client-25.3.0.zip` package from the [PyPI](#) repository using `pip`.

Before installing the Python client from PyPI, ensure that your system meets the following requirements:

- **Supported operating systems:** Linux, Windows, or macOS (M1 or M2 processor)
- **Supported JDK versions:**
 - Oracle JDK 11, JDK 17, or JDK 21
 - OpenJDK JDK 11, JDK 17, or JDK21
- Python 3.9 or later
- Ensure that you set the `JAVA_HOME` environment variable.
- If you are behind a firewall, then set the `https_proxy` environment variable to the proxy server.

You can install and verify the Python client installation as shown:

1. Install the client through `pip`.

For example,

```
pip install --user oracle-graph-client
```

This installs the Python client along with all the required dependencies.

2. Verify that your installation is successful.

```
$ python3
Python 3.9.20 (main, Oct 24 2024, 07:04:44)
[GCC 8.5.0 20210514 (Red Hat 8.5.0-22.0.1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import opg4py
>>> import pypgx
```

① See Also

[Python API Reference](#) for more information on the Python APIs

16.3.1.2.2 Upgrading the Python Client

This section describes how to upgrade the Python client.

1. Review the available Python client versions and the currently installed version.

```
pip3 index versions oracle-graph-client
```

WARNING: `pip index` is currently an experimental command. It may be removed/changed in a future release without prior warning.

```
oracle-graph-client (23.3.0)
Available versions: 23.3.0, 23.2.0, 23.1.0
INSTALLED: 23.1.0
LATEST: 23.3.0
```

2. Run the following command to upgrade your Python client.

```
pip3 install oracle-graph-client --upgrade
```

16.3.1.2.3 Installing the Python Client From the Graph Server and Client Downloads

You can download the zip file for `oracle-graph-client-25.3.0` from the Graph Server and Client downloads and install the Python client.

Before you install the Python client, ensure that you meet the following prerequisites.

- **System requirements:**
 - **Supported operating system:** Linux
 - **Supported JDK versions:**
 - * Oracle JDK 11, JDK 17, or JDK 21
 - * OpenJDK JDK 11, JDK 17, or JDK 21
 - **Supported Python versions:** Python 3.9 or later
To verify that you are using the right version of the Python client, run the following command:

```
python3 --version
```

For more information on installing Python 3 on Oracle Linux, see [Python for Oracle Linux](#).

Note

If you are using any other operating system or Python version, then you can install the Python client from PyPI. See [Installing the Python Client from PyPI](#) for more information.

- Ensure that `python3-devel` is installed in your system.

```
sudo yum install python3-devel
```

Note

See [Python API Reference](#) for more information on the Python APIs.

You can perform the following steps to install and connect using the Python client:

1. Download the Oracle Graph Client from [Oracle Software Cloud](#).
For example, `oracle-graph-client-25.3.0.zip`.
2. Unzip the file into a directory of your choice.
The unzipped folder contains the `oracle-graph-python-client-25.3.0.zip` file for installing the Python client.
3. Install the Python client by running the following command.

```
python3 oracle-graph-python-client-25.3.0.zip --user
```

4. Configure your client to trust the self-signed keystore. See [Configuring a Client to Trust the Self-Signed Keystore](#) for more information.
5. Start the OPG4Py shell to connect to the graph server(PGX) by running the following command:

```
cd <CLIENT_INSTALL_DIR>  
./bin/opg4py --base_url https://<host>:7007
```

In the preceding code:

- **<CLIENT_INSTALL_DIR>**: Directory where the shell executables are located. The shell executables are found in **<CLIENT_INSTALL_DIR>/bin** after the client installation.
- **<host>**: Server host

Note

The graph server (PGX), listens on port 7007 by default. If needed, you can configure the graph server to listen on a different port by changing the port value in the server configuration file (`server.conf`). See [Configuring the Graph Server \(PGX\)](#) for details.

You are prompted to enter your username and password.

See [Starting the OPG4Py Shell](#) for more information on the different ways you can start the OPG4Py shell.

The OPG4Py shell starts and the following command line prompt appears as shown:

```
Oracle Graph Server Shell 25.3.0  
>>>
```

Note

You can also install the python client library in Jupyter Notebook. Using the Python API, you can then connect to the graph server (PGX) to run PGQL queries and graph algorithms in a Jupyter Notebook environment. See [Using the Jupyter Notebook Interface](#) for more details.

16.3.1.2.4 Installing the Python Client in Embedded Mode

You can install and work with the Python client in embedded mode.

To install the embedded Python client:

1. Run the following command:

```
python3 /opt/oracle/graph/client/oracle-graph-python-embedded-25.3.0.zip  
--user
```

2. Start the OPG4Py shell in embedded mode as shown:

```
cd /opt/oracle/graph
./bin/opg4py
```

Note that the shell executables are found in `/opt/oracle/graph/bin` after the server installation.

The OPG4Py shell starts and the following command line prompt appears as shown:

```
Oracle Graph Server Shell 25.3.0
>>> instance
ServerInstance(embedded: True, version: 25.3.0)
>>>
```

16.3.1.2.5 Uninstalling the Python Client

This section describes how to uninstall the Python client.

To uninstall the Python client, run the following command:

```
pip3 uninstall oracle-graph-client
```

16.3.2 Running the Graph Visualization Web Client

You require a running graph server (PGX) to use the Graph Visualization web application.

In addition, ensure that you have provided the JDBC URL for your database in the `jdbc_url` parameter in the `/etc/oracle/graph/pgx.conf` file.

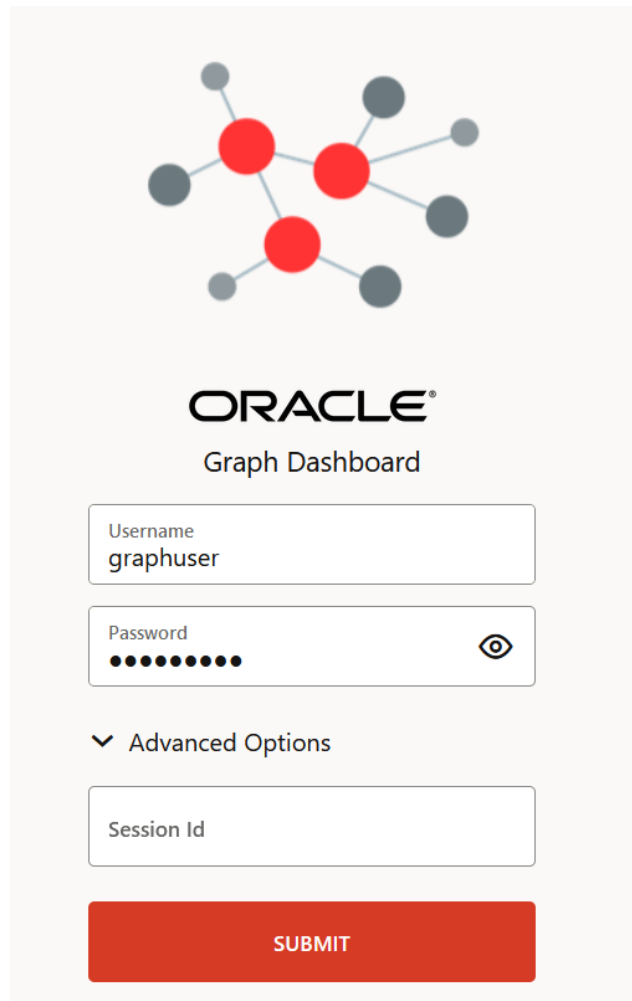

To launch the graph visualization application:

1. Start the graph server on your installation.
 - See [Installing Oracle Graph Server](#) for more information on using the rpm installation.
 - See [Deploying Oracle Graph Server to a Web Server](#) for more information on graph server deployment to a web server.
2. Connect to your browser for running the Graph Visualization application.
 - For rpm installation: `https://localhost:7007/dash/`
 - For Apache Tomcat Server: `https://localhost:8080/dash`
 - For Oracle WebLogic Server: `https://localhost:7001/dash`

Note that if `localhost` does not resolve correctly in your system, then this can lead to errors when you attempt to run the Graph Visualization application. To avoid this issue, it is recommended that you add entries for your `localhost` in the `/etc/hosts` file in your system. For example:

```
127.0.0.1    localhost
::1         localhost
```

The Graph Visualization Login screen opens as shown:

Figure 16-1 Graph Visualization LoginThe image shows a login form for the Oracle Graph Dashboard. At the top is a network graph icon with three red nodes and several grey nodes connected by lines. Below the icon is the Oracle logo and the text "Graph Dashboard". The form contains three input fields: "Username" with the value "graphuser", "Password" with masked characters and an eye icon, and "Session Id". Below these fields is a section titled "Advanced Options" with a dropdown arrow. At the bottom is a red "SUBMIT" button.

ORACLE®
Graph Dashboard

Username
graphuser

Password
●●●●●●●●

▼ Advanced Options

Session Id

SUBMIT

3. Enter your **Username** and **Password**.
4. Optionally, provide the **PGX Session ID**.
5. Click **Submit**.
6. Click , the Graph Visualization icon.
The **Graph Visualization** page opens and the default **Graph Server** tab is displayed. See [Using the Graph Visualization Application](#) for more information on how to visualize graphs using this web application.

16.4 Setting Up Transport Layer Security

The graph server (PGX), by default, allows only encrypted connections using Transport Layer Security (TLS). TLS requires the server to present a server certificate to the client and the client must be configured to trust the issuer of that certificate.

In this release of Graph Server and Client, the RPM file installation, will generate a self-signed server keystore file by default. This `server_keystore.jks` file contains the server certificate and server private key and is generated into `/etc/oracle/graph`, for the server to enable TLS. Note that the default password for the generated keystore is `changeit` and this is configured

using an environment variable `PGX_SERVER_KEYSTORE_PASSWORD` in `/etc/systemd/system/pgx.service` file as shown:

```
[Service]
Environment="PGX_SERVER_KEYSTORE_PASSWORD=changeit"
```

If this default keystore configuration is sufficient for you to get started and if your connections are only to `localhost`, you can skip to [Configuring a Client to Trust the Self-Signed Keystore](#).

- [Using a Self-Signed Server Keystore](#)
This section describes the steps to generate a self-signed keystore into `/etc/oracle/graph` and configure the graph server (PGX) and client to use the keystore.
- [Using a CA-Signed SSL Certificate](#)
The graph server (PGX) and client installation allows you to use your own CA-signed SSL (Secure Sockets Layer) certificate.

16.4.1 Using a Self-Signed Server Keystore

This section describes the steps to generate a self-signed keystore into `/etc/oracle/graph` and configure the graph server (PGX) and client to use the keystore.

- [Generating a Self-Signed Server Keystore](#)
You can create a server key store using the `keytool` command.
- [Configuring the Graph Server \(PGX\) When Using a Server Keystore](#)
You must specify the path to the server keystore in the graph server (PGX) configuration file.
- [Configuring a Client to Trust the Self-Signed Keystore](#)
You must configure your client application to accept the self-signed keystore.

16.4.1.1 Generating a Self-Signed Server Keystore

You can create a server key store using the `keytool` command.

The following steps show how to create a server keystore with a self-signed certificate:

1. Go to the following directory:

```
cd /etc/oracle/graph
```

2. Run the following command:

```
keytool -genkey -alias pgx -keyalg RSA -keystore server_keystore.jks
```

3. Provide the requested details. For example:

```
Enter keystore password:
Re-enter new password:
What is your first and last name?
  [Unknown]: localhost
What is the name of your organizational unit?
  [Unknown]: OU
What is the name of your organization?
  [Unknown]: MyOrganization
What is the name of your City or Locality?
```

```

[Unknown]: MyTown
What is the name of your State or Province?
[Unknown]: MyState
What is the two-letter country code for this unit?
[Unknown]: US
Is CN=localhost, OU=OU, O=MyOrganization, L=MyTown, ST=MyState, C=US
correct?
[no]: yes

```

The `server_keystore.jks` is created successfully in `cd /etc/oracle/graph.`

16.4.1.2 Configuring the Graph Server (PGX) When Using a Server Keystore

You must specify the path to the server keystore in the graph server (PGX) configuration file.

Note

If you deploy the graph server into your web server using the web applications download package, then this section does not apply. Please refer to the manual of your web server for instructions on how to configure TLS.

1. Edit the file at `/etc/oracle/graph/server.conf` to specify server keystore alias, server keystore provider, server keystore type and the path to the server keystore as shown:

```

{
  "port": 7007,
  "enable_tls": true,
  "server_keystore": "/etc/oracle/graph/server_keystore.jks",
  "server_keystore_alias": "pgx",
  "server_keystore_type": "PKCS12",
  "server_keystore_provider": "SUN",
  "ca_certs": [],
  "working_dir": "/opt/oracle/graph/pgx/tmp_data"
}

```

2. Set the keystore password using an OS environment variable called `PGX_SERVER_KEYSTORE_PASSWORD` or with a java property called `pgx.SERVER_KEYSTORE_PASSWORD`.

For example, to set the keystore password in `PGX_SERVER_KEYSTORE_PASSWORD`, edit the file at `/etc/systemd/system/pgx.service` as shown:

```

[Service]
Environment="PGX_SERVER_KEYSTORE_PASSWORD=<keystore_password>"

```

3. Reload the systemd configuration by running the following command:

```
sudo systemctl daemon-reload
```

- Optionally, if the keystore is valid for a different host (other than the `localhost`), then update the `base_url` parameter for the `pgx_realm` configuration in the `pgx.conf` file with the matching host details.

```
...
"pgx_realm": {
  "implementation": "oracle.pg.identity.DatabaseRealm",
  "options": {
    ...
    "base_url": "<request-scheme>://localhost:<request-port>"
  }
}
...
```

In the preceding configuration:

- request-scheme:** Value can be either `HTTP` or `HTTPS`. If not specified, then the graph server will fetch the corresponding value automatically from the browser.
- request-port:** Port number to be used. If not specified, then the graph server will fetch the corresponding value automatically from the browser.

Note that you only have to replace `localhost` (shown highlighted in the preceding example configuration) to the required host name. You need not change the `<request-scheme>` and `<request-port>` components of the URL.

- Restart the graph server.

Caution

- Always use a valid certificate issued by a certificate authority (CA) which is trusted by your organization. If you do not have a CA certificate, you can temporarily create a self-signed certificate and get started. However, it is not recommended to use self-signed certificates for production environments.
- The steps to generate a self-signed server certificate can modify the Java installation on your client-system. Only perform these steps if you are fully aware of the implications of accepting the self-signed certificates system-wide.
- Consider carefully when using commands with `sudo`.

16.4.1.3 Configuring a Client to Trust the Self-Signed Keystore

You must configure your client application to accept the self-signed keystore.

To configure a client to trust the self-signed keystore, the root certificate must be imported to your Java installation local trust store.

- For a Java or a Python client, you must import the root certificate to all the Java installations used by all the clients.
- For the Graph Visualization application, you must import the root certificate to the system Java installation of the environment running the graph server (PGX) or the web server serving the graph visualization application. That is, the JDK installation which is used by the OS user running the server that serves the Graph Visualization application.

You can import the root certificate as shown in the following step:

- Ensure JAVA_HOME is set and run the following command as a root user or with sudo.

```
sudo keytool -importkeystore -srckeystore /etc/oracle/graph/  
server_keystore.jks -destkeystore $JAVA_HOME/lib/security/cacerts -  
deststorepass changeit -srcstorepass changeit -noprompt
```

where `changeit` is the sample keystore password. You can change this password to a password of your choice. Be sure to remember this password as you will need it to modify the certificate.

If you are upgrading the graph server from a previous release, then you must first delete the existing certificate before importing the new certificate. Run the following command using `sudo` or as a root user to delete the certificate:

```
sudo keytool -delete -alias pgx -keystore $JAVA_HOME/lib/security/cacerts -  
storepass changeit
```

16.4.2 Using a CA-Signed SSL Certificate

The graph server (PGX) and client installation allows you to use your own CA-signed SSL (Secure Sockets Layer) certificate.

The following outlines the basic steps for using your own CA-signed SSL certificate:

1. Prepare a CA-signed certificate for the graph server (PGX) and generate the Java keystore file.
2. Edit the `/etc/oracle/graph/server.conf` file and specify the `server_keystore` path to point to the keystore (generated in the previous step).
3. Optionally, set the keystore password in `PGX_SERVER_KEYSTORE_PASSWORD` by editing the file at `/etc/systemd/system/pgx.service`.
4. Reload the `systemd` configuration by running the following command:

```
sudo systemctl daemon-reload
```

5. Restart the graph server.
6. Configure the client to trust the CA-signed keystore if applicable.

Getting Started with the Graph Server (PGX)

Once you have installed the graph server (PGX), you can start and connect to a graph server instance.

- [Starting the Graph Server \(PGX\)](#)
This section describes the commands to start and stop the graph server (PGX).
- [Connecting to the Graph Server \(PGX\)](#)
This section explains how to connect to the graph server (PGX) running in remote mode or when deployed as a web application on Apache Tomcat or Oracle WebLogic Server.

17.1 Starting the Graph Server (PGX)

This section describes the commands to start and stop the graph server (PGX).

A preconfigured version of Apache Tomcat is bundled, which allows you to start the graph server (PGX) by running a script.

As a prerequisite to start the graph server in remote mode, you must ensure that Oracle graph server is installed in your system. See [Installing Oracle Graph Server](#) for instructions to install the graph server (PGX).

Note

See [Usage Modes of the Graph Server \(PGX\)](#) for more information on the different graph server execution modes.

- [Starting and Stopping the Graph Server \(PGX\) Using the Command Line](#)
- [Configuring the Graph Server \(PGX\)](#)

17.1.1 Starting and Stopping the Graph Server (PGX) Using the Command Line

PGX is integrated with `systemd` to run it as a Linux service in the background.

If you need to configure the server before starting it, see [Configuring the Graph Server \(PGX\)](#) and [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information on the configuration options.

The commands to start and stop the graph server (PGX) and the PGX engine are as follows:

Note

You can run the following commands without `sudo` if you are the root user.

To start the PGX server as a daemon process, run the following command:

```
sudo systemctl start pgx
```

To stop the server, run the following command:

```
sudo systemctl stop pgx
```

If the server does not start up, you can see if there are any errors by running:

```
sudo journalctl -u pgx.service
```

For more information about how to interact with `systemd` on Oracle Linux, see the Oracle Linux administrator's documentation.

17.1.2 Configuring the Graph Server (PGX)

You can configure the graph server (PGX) by modifying the `/etc/oracle/graph/server.conf` file. The following table shows the valid configuration options, which can be specified in JSON format.

Table 17-1 Configuration Parameters for the Graph Server (PGX)

Parameter	Type	Description	Default
ca_certs	array of string	List of files storing trusted certificates (PEM format). If <code>enable_tls</code> is set to <code>false</code> , this field has no effect.	[]

Table 17-1 (Cont.) Configuration Parameters for the Graph Server (PGX)

Parameter	Type	Description	Default
ciphers	array of string	List of cipher suites to be used by the server. For example, [cipher1, cipher2.]	["TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256" , "TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384" , "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256" , "TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384" , "TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256" , "TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256" , "TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384" , "TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384" , "TLS_DHE_RSA_WITH_AES_128_GCM_SHA256" , "TLS_DHE_DSS_WITH_AES_128_GCM_SHA256" , "TLS_DHE_RSA_WITH_AES_128_CBC_SHA256" , "TLS_DHE_DSS_WITH_AES_128_CBC_SHA256" , "TLS_DHE_DSS_WITH_AES_256_GCM_SHA384" , "TLS_DHE_RSA_WITH_AES_256_CBC_SHA256" , "TLS_DHE_DSS_WITH_AES_256_CBC_SHA256" , "TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA" , "TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA" , "TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA" , "TLS_DHE_DSS_WITH_AES_128_CBC_SHA" , "TLS_DHE_RSA_WITH_AES_128_CBC_SHA" , "TLS_DHE_DSS_WITH_AES_256_CBC_SHA" , "TLS_DHE_RSA_WITH_AES_256_CBC_SHA" , "TLS_RSA_WITH_AES_128_GCM_SHA256" , "TLS_DH_DSS_WITH_AES_128_GCM_SHA256" , "TLS_ECDH_ECDSA_WITH_AES_128_GCM_SHA256" , "TLS_RSA_WITH_AES_256_GCM_SHA384" , "TLS_DH_DSS_WITH_AES_256_GCM_SHA384" ,

Table 17-1 (Cont.) Configuration Parameters for the Graph Server (PGX)

Parameter	Type	Description	Default
			"TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384", "TLS_RSA_WITH_AES_128_CBC_SHA256", "TLS_DH_DSS_WITH_AES_128_CBC_SHA256", "TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA256", "TLS_RSA_WITH_AES_256_CBC_SHA256", "TLS_DH_DSS_WITH_AES_256_CBC_SHA256", "TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384", "TLS_RSA_WITH_AES_128_CBC_SHA", "TLS_DH_DSS_WITH_AES_128_CBC_SHA", "TLS_ECDH_ECDSA_WITH_AES_128_CBC_SHA", "TLS_RSA_WITH_AES_256_CBC_SHA", "TLS_DH_DSS_WITH_AES_256_CBC_SHA", "TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA"]
context_path	string	This can be used to change the context path. For example, if you specify port as 7007 and context_path as /pgx, the server will listen on https://localhost:7007/pgx	/
enable_tls	boolean	If true, the server enables transport layer security (TLS).	true
max_header_size	integer	Maximum valid header size in bytes. If null, use the default from Tomcat.	null
port	integer	Port the graph server (PGX) server should listen on.	7007
server_keystore	string	The path to the keystore to be used for server connections. If enable_tls is set to false, then this field has no effect.	NULL
server_keystore_alias	string	This is the server keystore alias of server_keystore.	NULL
server_keystore_provider	string	This is the server keystore provider of server_keystore.	SunJSSE
server_keystore_type	string	This is the server keystore type of server_keystore.	JKS
tls_version	string	TLS version to be used by the server. For example, TLSv1.2	TLSv1.2

Table 17-1 (Cont.) Configuration Parameters for the Graph Server (PGX)

Parameter	Type	Description	Default
working_dir	string	The working directory used by the server to store temporary files. Needs to be writable by the process which started the server and should not be touched by any other process while the server is running.	

The graph server (PGX) enables two-way SSL/TLS (Transport Layer Security) by default. The server enforces TLS 1.2 and disables certain cipher suites known to be vulnerable to attacks. Upon a TLS handshake, both the server and the client present certificates to each other, which are used to validate the authenticity of the other party. Client certificates are also used to authorize client applications.

Example Configuration of `server.conf` File Using a Keystore

```
{
  "port": 7007,
  "enable_tls": true,
  "server_keystore": "/pgx/cert/server_keystore.rsa",
  "server_keystore_alias": "pgx",
  "server_keystore_provider": "JsafeJCE",
  "server_keystore_type": "PKCS12"
}
```

17.2 Connecting to the Graph Server (PGX)

This section explains how to connect to the graph server (PGX) running in remote mode or when deployed as a web application on Apache Tomcat or Oracle WebLogic Server.

The prerequisite requirement to connect to the graph server is to have the graph server (PGX) up and running. See [Starting and Stopping the Graph Server \(PGX\) Using the Command Line](#) for more information on the commands to start the graph server.

Note

If you are using the graph server (PGX) as a library, see [Using Graph Server \(PGX\) as a Library](#) for more information.

- [Connecting with the Graph Client CLIs](#)
- [Connecting with Java](#)
- [Connecting with Python](#)

17.2.1 Connecting with the Graph Client CLIs

The simplest way to connect to a remote graph server (PGX) instance is to specify the base URL of the server along with the database user name required for the graph server (PGX) authentication as shown:

- [JShell](#)
- [Python](#)

JShell

```
cd /opt/oracle/graph
./bin/opg4j --base_url https://<host>:<port> --username <graphuser>
```

Python

```
cd /opt/oracle/graph
./bin/opg4py --base_url https://<host>:<port> --username <graphuser>
```

where :

- <host>: is the server host name
- <port>: is the server port
- <graphuser>: is the database user
You will be prompted for the database password.

① See Also

- [User Authentication and Authorization](#)
- [Java API Reference](#) for information on the Java APIs
- [Python API Reference](#) for information on the Python APIs

About Logging HTTP Requests

The graph shell suppresses all debugging messages by default. To see which HTTP requests are executed, set the log level for `oracle.pgx` to `DEBUG`, as shown in this example:

① Note

Enabling these logs can lead to sensitive information like passwords getting printed on the screen.

- [JShell](#)
- [Python](#)

JShell

```

opg4j> loglevel("oracle.pgx","DEBUG")
==> Log level of oracle.pgx logger set to DEBUG

17.2.2 Connecting with Java

You can obtain a connection to a remote graph server (PGX) instance by simply passing the base URL of the remote PGX instance to the `getInstance()` method. By doing this, your application automatically uses the PGX client libraries to connect to a remotely-located graph server (PGX).

You can specify the base URL when you initialize the graph server (PGX) instance using Java. An example is as follows. A URL to a graph server (PGX) is provided to the `getInMemAnalyst` API call.

```
import oracle.pgx.api.*;
import oracle.pg.rdbms.*;
ServerInstance instance = GraphServer.getInstance("https://
<hostname>:<port>", "<username>", "<password>".toCharArray());
PgxSession session = instance.createSession("my-session");
```

Note

See [Java API Reference](#) for more information on the Java APIs.

- [Starting and Stopping the PGX Engine](#)

17.2.2.1 Starting and Stopping the PGX Engine

You can start the graph server (PGX) from the application by making a call to `instance.startEngine()` which takes a JSON object as an argument for PGX configuration.

Note

- See [Connecting with Java](#) for more information about connecting to a graph server (PGX) instance and obtaining a `ServerInstance` object.
- See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for the various configuration options for the graph server (PGX).

Stopping the PGX Engine

You can stop the PGX engine using one of the following APIs:

```
instance.shutdownEngineNow(); // cancels pending tasks, throws exception if
engine is not running
instance.shutdownEngineNowIfRunning(); // cancels pending tasks, only tries
to shut down if engine is running
if (instance.shutdownEngine(30, TimeUnit.SECONDS) == false) {
    // doesn't accept new tasks but finishes up remaining tasks
    // pending tasks didn't finish after 30 seconds
}
```

Note

Shutting down the PGX engine keeps the Apache Tomcat server alive, but new sessions cannot be created. Also, all the current sessions and tasks will be cancelled and terminated.

17.2.3 Connecting with Python

You can connect to a remote graph server (PGX) instance in your Python program. You must first authenticate with the remote server before you can create a session as illustrated in the following example:

```
import pypgx
import opg4py
import opg4py.graph_server as graph_server
pgql_conn = opg4py.pgql.get_connection("<username>", "<password>",
"<jdbc_url>")
pgql_statement = pgql_conn.create_statement()
pgql = """
    CREATE PROPERTY GRAPH bank_graph
    VERTEX TABLES (
        bank_accounts
        LABEL ACCOUNTS
        PROPERTIES (ID, NAME)
    )
    EDGE TABLES (
        bank_txns
        SOURCE KEY (SRC_ACCT_ID) REFERENCES bank_accounts (ID)
        DESTINATION KEY (DST_ACCT_ID) REFERENCES bank_accounts (ID)
        LABEL TRANSFERS
        PROPERTIES (SRC_ACCT_ID, DST_ACCT_ID, AMOUNT, DESCRIPTION)
    ) OPTIONS(PG_PGQL)
"""
pgql_statement.execute(pgql)
instance = graph_server.get_instance("<base_url>", "<username>", "<password>")
session = instance.create_session("my_session")
graph = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
analyst = session.create_analyst()
analyst.pagerank(graph)
rs = graph.query_pgql("SELECT id(x), x.pagerank FROM MATCH (x) LIMIT 5")
rs.print()
```

To execute, save the above program into a file named `program.py` and run the following command:

```
python3 program.py
```

You will see the following output:

```
+-----+
| id(x)          | pagerank          |
+-----+
| BANK_ACCOUNTS(2) | 9.749447313256548E-4 |
| BANK_ACCOUNTS(4) | 0.004584001759076056 |
| BANK_ACCOUNTS(6) | 5.358461393401424E-4 |
| BANK_ACCOUNTS(8) | 0.0013051552434930175 |
| BANK_ACCOUNTS(10) | 0.0015040122009364232 |
+-----+
```

Converting PGQL result set into pandas dataframe

Additionally, you can also convert the PGQL result set to a `pandas.DataFrame` object using the `to_pandas()` method. This makes it easier to perform various data filtering operations on the result set and it can also be used in Lambda functions. For example,

```
example_query = (
    "SELECT n.name AS name, n.age AS age "
    "WHERE (n)"
)
result_set = sample_graph.query_pgql(example_query)
result_df = result_set.to_pandas()

result_df['age_bin'] = result_df['age'].apply(lambda x: int(x)/20) # create
age bins based on age ranges
```

Note

To view the complete set of available Python APIs, see [OPG4PY Python API Reference](#).

Part V

Using the Graph Server (PGX)

The graph server (PGX) of Oracle Graph supports a set of analytical functions.

This part describes the following:

- [Developing Applications with Graph Analytics](#)
In order to run graph algorithms, the graph application connects to the graph server (PGX) in the middle tier, which in turn connects to the Oracle Database.
- [Using the Machine Learning Library \(PgxML\) for Graphs](#)
The graph server (PGX) provides a machine learning library `oracle.pgx.api.mllib`, which supports graph-empowered machine learning algorithms.
- [Executing PGQL Queries Against the Graph Server \(PGX\)](#)
This section describes the Java APIs that are used to execute PGQL queries in the graph server (PGX).
- [REST Endpoints for the Graph Server](#)
This chapter describes the graph server REST API endpoints.

Developing Applications with Graph Analytics

In order to run graph algorithms, the graph application connects to the graph server (PGX) in the middle tier, which in turn connects to the Oracle Database.

- [Using the Graph Server Administrator Dashboard](#)
The graph server administrator can efficiently track and manage the memory usage of the graph server (PGX) using the Administrator Dashboard.
- [About Vertex and Edge IDs](#)
The graph server (PGX) enforces by default the existence of a unique identifier for each vertex and edge in a graph.
- [Graph Management in the Graph Server \(PGX\)](#)
You can load a graph into the graph server (PGX) and perform different actions such as publish, store, or delete a graph.
- [Keeping the Graph in Oracle Database Synchronized with the Graph Server](#)
You can use the `FlashbackSynchronizer` API to automatically apply changes made to graph in the database to the corresponding `PgxGraph` object in memory, thus keeping both synchronized.
- [Optimizing Graphs for Read Versus Updates in the Graph Server \(PGX\)](#)
The graph server (PGX) can store an optimized graph for other reads or updates. This is only relevant when the updates are made directly to a graph instance in the graph server.
- [Executing Built-in Algorithms](#)
The graph server (PGX) contains a set of built-in algorithms that are available as Java APIs.
- [Using Custom PGX Graph Algorithms](#)
A custom PGX graph algorithm allows you to write a graph algorithm in Java syntax and have it automatically compiled to an efficient parallel implementation.
- [User-Defined Functions \(UDFs\) in PGX](#)
User-defined functions (UDFs) allow users of PGX to add custom logic to their PGQL queries or custom graph algorithms, to complement built-in functions with custom requirements.
- [Using Graph Server \(PGX\) as a Library](#)
When you utilize PGX as a library in your application, the graph server (PGX) instance runs in the same JVM as the Java application and all requests are translated into direct function calls instead of remote procedure invocations.

18.1 Using the Graph Server Administrator Dashboard

The graph server administrator can efficiently track and manage the memory usage of the graph server (PGX) using the Administrator Dashboard.

You can access the Administrator Dashboard only if you are granted the `GRAPH_ADMINISTRATOR` role having the `PGX_GET_SERVER_INFO` privilege.

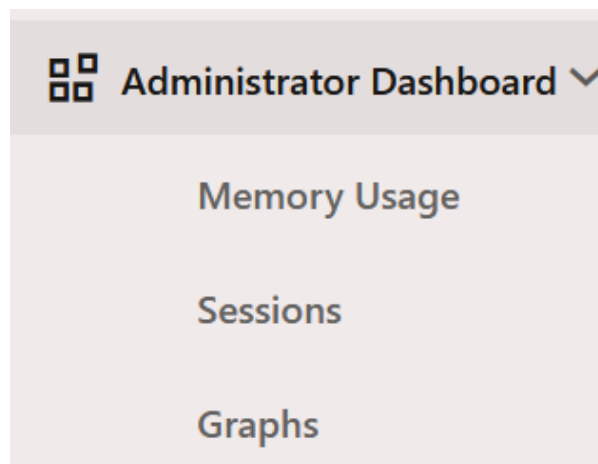

The user-friendly interface of the Administrator Dashboard comprises the following components:

- **Memory Usage:** To view data charts on real-time memory usage, study the current memory consumption patterns and identify any potential issues.
- **Sessions:** To manage, monitor, and search active user sessions.
- **Graphs:** To track and monitor memory usage per graph for all the active users.

Perform the following steps to access the Administrator Dashboard:

1. Open the following URL in your web browser.
`https://<server_host>:7007/dash/`
The Graph Dashboard login screen opens.
2. Enter your **Username** and **Password**.
3. Click **Submit**.
4. Click **Administrator Dashboard** in the left navigation menu.
The **Memory Usage** page of the Administrator Dashboard opens.
5. Optionally, click **Sessions** or **Graphs** to navigate to the respective pages.

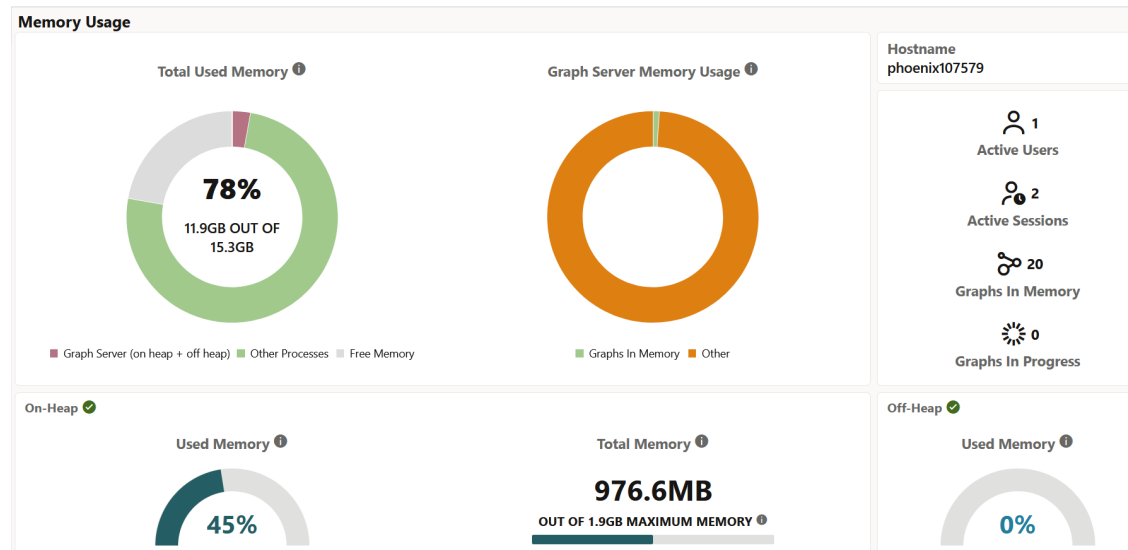

Figure 18-1 Administrator Dashboard Menu

- [Memory Usage](#)
The Memory Usage dashboard provides in-depth information on the amount of memory used by the graph server (PGX).
- [Sessions](#)
The Sessions page displays all the active user sessions.
- [Graphs](#)
The Graphs page lists the graphs for all the active users and provides the total memory usage for each graph.

18.1.1 Memory Usage

The Memory Usage dashboard provides in-depth information on the amount of memory used by the graph server (PGX).

Figure 18-2 Memory Usage Dashboard

The dashboard comprises the following sections:

- **Total Used Memory:** This chart displays the total memory usage at the system level. It shows the memory consumption by the graph server (sum of on-heap and off-heap memory) and other processes. You can also view the available amount of free memory.
- **Graph Server Memory Usage:** This chart displays the memory consumed by graphs that are loaded into the graph server and also the memory usage for other graph operations such as loading graphs, running graph algorithms and so on.
- **On-Heap:** This section provides the following details:
 - **Used Memory:** This displays the on-heap memory used currently by the graph server out of the total heap size that is dynamically allocated by the JVM.
 - **Total Memory:** This displays the total (determined by the -Xms flag) and maximum heap size (determined by the -Xmx flag) allocated by the JVM.
- **Off-heap:** This displays the off-heap memory used currently by the graph server.
- **Hostname:** Graph server hostname
- **Active Users:** Number of active users
- **Active Sessions:** Number of active sessions
- **Graphs In Memory:** Number of graphs loaded in to memory
- **Graphs in Progress:** Number of graphs that are being loaded into memory

18.1.2 Sessions

The Sessions page displays all the active user sessions.

You can view the number of graphs associated with each session as shown in the following figure. In addition, you can terminate one or more user sessions.

Figure 18-3 Sessions

Sessions						
Active Users sessions						
Session Id	Source	Active Since	Total Graphs	Total Graphs In Memory	Total Graphs In Progress	
<div> <div></div> <div>GRAPHUSER</div> </div>						<div>Total Sessions</div> <div>2</div>
be24e784-49e3-4b08-abcd-53ac9511ff22	pgxShell	19s	0	0	0	
f7195c08-80bb-4059-91db-24da7aa519e3	DASH	2m 45s	0	0	0	

18.1.3 Graphs

The Graphs page lists the graphs for all the active users and provides the total memory usage for each graph.

This page comprises the following two tabs:

- **Graphs In Memory (default):** Displays graphs that are loaded into memory.
- **Graphs In Progress:** Displays graphs that are being loaded into memory.

The following figure shows the Graphs page for the **Graphs In Memory** tab. You can inspect the memory usage for the graphs, or terminate one or more user sessions.

Figure 18-4 Graphs

18.2 About Vertex and Edge IDs

The graph server (PGX) enforces by default the existence of a unique identifier for each vertex and edge in a graph.

When loading a graph into the graph server(PGX), you can retrieve these unique vertex and edge IDs using `PgxGraph.getVertex(ID id)` and `PgxGraph.getEdge(ID id)`, or by PGQL queries using the built-in `id()` method.

The following supported ID generation strategies can be selected through the configuration parameters `vertex_id_strategy` and `edge_id_strategy`:

- `keys_as_ids`: This is the default strategy to generate vertex IDs.
- `partitioned_ids`: This is the recommended strategy for partitioned graphs.
- `unstable_generated_ids`: This results in system generated vertex or edge IDs.
- `no_ids`: This strategy disables vertex or edge IDs and therefore prevents you from calling APIs using vertex or edge IDs.

Using keys to generate IDs

The default strategy to generate the vertex IDs is to use the keys provided during loading of the graph (`keys_as_ids`). In that case, each vertex should have a vertex key that is unique across all providers.

For edges, by default no keys are required in the edge data, and edge IDs will be automatically generated by PGX (`unstable_generated_ids`). This automatic ID generation can be applied for vertex IDs also. Note that the generation of vertex or edge IDs is not guaranteed to be deterministic. If required, it is also possible to load edge keys as IDs.

The `partitioned_ids` strategy requires keys to be unique only *within* a vertex or edge provider (data source). The keys do not have to be globally unique. Globally unique IDs are derived from a combination of the provider name and the key inside the provider, as `<provider_name>(<unique_key_within_provider>)`. For example, `Account(1)`.

The `partitioned_ids` strategy can be set through the configuration fields `vertex_id_strategy` and `edge_id_strategy`. For example,

```
{
  "name": "bank_graph_analytics",
  "optimized_for": "updates",
  "vertex_id_strategy" : "partitioned_ids",
  "edge_id_strategy" : "partitioned_ids",
  "vertex_providers": [
    {
      "name": "Accounts",
      "format": "rdbms",
      "database_table_name": "BANK_ACCOUNTS",
      "key_column": "ID",
      "key_type": "integer",
      "props": [
        {

          "name": "NAME",
          "type": "string"
        }
      ],
      "loading": {
        "create_key_mapping" : true
      }
    }
  ],
  "edge_providers": [
```

```

{
  "name": "Transfers",
  "format": "rdbms",
  "database_table_name": "BANK_TXNS",
  "key_column": "ID",
  "source_column": "FROM_ACCT_ID",
  "destination_column": "TO_ACCT_ID",
  "source_vertex_provider": "Accounts",
  "destination_vertex_provider": "Accounts",
  "props": [
    {
      "name": "ID",
      "type": "integer"
    },
    {
      "name": "AMOUNT",
      "type": "double"
    }
  ],
  "loading": {
    "create_key_mapping" : true
  }
}
]
}

```

Note

All available key types are supported in combination with partitioned IDs.

After the graph is loaded, PGX maintains information about which property of a provider corresponds to the key of the provider. In the preceding example, the vertex property `ID` happens to correspond to the vertex key and also the edge property `ID` happens to correspond to the edge key. Each provider can have at most one such "key property" and the property can have any name.

Key properties are used for internal optimizations as well as for providing keys for the vertex or edge or both when inserting new entities. Key properties are currently non-updatable. Trying to update a key property will result in an error. For example,

```
vertex key property ID cannot be updated
```

Using an auto-incrementer to generate partitioned IDs

It is recommended to always set `create_key_mapping` to `true` to benefit from performance optimizations. But if there are no single-column keys for edges, `create_key_mapping` can be set to `false`. Similarly, `create_key_mapping` can be set to `false` for vertex providers also. IDs will be generated via an auto-incrementer, for example `Accounts(1)`, `Accounts(2)`, `Accounts(3)`.

See [PGQL Queries with Partitioned IDs](#) for more information on executing PGQL queries with partitioned IDs.

18.3 Graph Management in the Graph Server (PGX)

You can load a graph into the graph server (PGX) and perform different actions such as publish, store, or delete a graph.

Note

Ensure that you drop the graph when it is no longer in use to release the graph server (PGX) memory. See [Deleting a Graph](#) for more information.

- [Reading Graphs from Oracle Database into the Graph Server \(PGX\)](#)
Once logged into the graph server (PGX), you can read graphs from the database into the graph server.
- [Storing a Graph Snapshot on Disk](#)
After reading a graph into memory, you can make any changes to the graph (such as running the PageRank algorithm and storing the values as vertex properties), and then store this snapshot of the graph on disk.
- [Publishing a Graph](#)
You can publish a graph that is loaded into the graph server (PGX), so that it can be referenced by other sessions. Similarly, the snapshots of a graph can also be made available to other sessions.
- [Deleting a Graph](#)
In order to reduce the memory usage of the graph server (PGX), the session must drop the unused graph objects created through the `getGraph()` method, by invoking the `close()` method.
- [Graph Sharing Options and Validating Graph Permissions](#)
The `graph_sharing_option` parameter in the `pgx.conf` file determines if and how a graph can be shared.

18.3.1 Reading Graphs from Oracle Database into the Graph Server (PGX)

Once logged into the graph server (PGX), you can read graphs from the database into the graph server.

Your database user must exist and have read access on the graph data in the database.

The following options are supported for loading a graph:

SQL Property Graphs

- Using the `readGraphByName` API - see [Loading a SQL Property Graph Using the readGraphByName API](#) for more details.
- Using the `PgSqlSubgraphReader` API to create and load a subgraph - see [Loading a Subgraph Using PGQL Queries](#) for more details.
- Using the `PGQL CREATE PROPERTY GRAPH` statement - see [Creating a SQL Property Graph Using PGQL](#) for more details.

PGQL Property Graphs

- Using the `readGraphByName` API - see [Loading a PGQL Property Graph Using the readGraphByName API](#) for more details.

- Using the PGQL `CREATE PROPERTY GRAPH` statement - see [Creating a Property Graph Using PGQL](#) for more details.
- Using the `PgViewSubgraphReader#fromPgPgql` API to create and load a subgraph - see [Loading a Subgraph from a PGQL Property Graph](#) for more details.

Also, refer to the following sections:

- [Enabling Lazy Loading of Graphs](#)
Starting from Graph Server and Client Release 24.3, you can enable lazy loading for database graphs.
- [Reading Entity Providers at the Same SCN](#)
If you have a graph which consists of multiple vertex or edge tables or both, then you can read all the vertices and edges at the same System Change Number (SCN).
- [Progress Reporting and Estimation for Graph Loading](#)
Loading a large graph into the graph server (PGX) can be a long running operation. However, if you load the graph using an asynchronous action, then you can monitor the progress of the graph loading operation.
- [Graph Configuration Options](#)
Learn about the graph configuration options.
- [Data Loading Security Best Practices](#)
Loading a graph from the database requires authentication and it is therefore important to adhere to certain security guidelines when configuring access to this kind of data source.
- [Data Format Support Matrix](#)
Learn about the different data formats supported in the graph server (PGX).
- [Immutability of Loaded Graphs](#)
Once the graph is loaded into the graph server (PGX), the graph and its properties are automatically marked as immutable.

18.3.1.1 Enabling Lazy Loading of Graphs

Starting from Graph Server and Client Release 24.3, you can enable lazy loading for database graphs.

When lazy loading is enabled, the graphs are automatically loaded into the graph server (PGX) the first time you access them in a PGQL query. This implies that you can run a PGQL query from a `PgxSession` instance even if the graph was not loaded into the graph server (PGX) earlier. However, ensure that you specify the graph name using the `ON` clause as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.queryPgql("SELECT x.* FROM MATCH (x) ON <graph_name>")
```

Java

```
session.queryPgql("SELECT x.* FROM MATCH (x) ON <graph_name>");
```

Python

```
session.query_pgql("SELECT x.* FROM MATCH (x) ON <graph_name>")
```

Also, note the following details when lazy loading a graph into the graph server (PGX) memory:

- To use the lazy loading feature, you must add (if not previously added) and enable the `allow_lazy_loading_for_database_graphs` configuration field in the `pgx.conf` file.

```
{
    "allow_lazy_loading_for_database_graphs": true
}
```
- The graph will be loaded by name if it exists in the database. Loading a graph by name relies on the database credentials provided in the `pgx_realm` options in the `pgx.conf` file.
- Loading will only happen if the graph is not already loaded into the graph server (PGX) memory.
- Lazy loading is supported for both PGQL and SQL property graphs. The graph server (PGX) first attempts to load the graph as a SQL property graph. In case it does not exist, then the graph is loaded as a PGQL property graph.
- You must have `READ` permission on the graph and underlying data source tables.
- Lazily loaded graph is added as a session dependency and periodic permission checks are performed on the graph.
- The following APIs support lazy loading of graphs upon first use:
 - `PgxSession.queryPgql`
 - `PgxSession.executePgql`
 - `PgxSession.preparePgql`
 - `PgxSession.explainPgql`

The following example shows the various queries that will trigger lazy loading of a graph. The example assumes that `allow_lazy_loading_for_database_graphs` is enabled and `MY_GRAPH` exists in the database and is not already loaded into the graph server (PGX) memory.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.queryPgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH")
opg4j> session.preparePgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH WHERE
x.age = ?")
opg4j> session.executePgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH")
opg4j> session.explainPgql("SELECT x.name, x.* FROM MATCH (x) ON MY_GRAPH")
```

Java

```
session.queryPgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH");
session.preparePgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH WHERE x.age
= ?");
session.executePgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH");
session.explainPgql("SELECT x.name, x.* FROM MATCH (x) ON MY_GRAPH");
```

Python

```
session.query_pgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH")
session.prepare_pgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH WHERE x.age
= ?")
session.execute_pgql("SELECT x.name FROM MATCH (x) ON MY_GRAPH")
session.explain_pgql("SELECT x.name, x.* FROM MATCH (x) ON MY_GRAPH")
```

18.3.1.2 Reading Entity Providers at the Same SCN

If you have a graph which consists of multiple vertex or edge tables or both, then you can read all the vertices and edges at the same System Change Number (SCN).

This helps to overcome issues such as reading edge providers at a later SCN than the SCN at which the vertices were read, as some edges may reference missing vertices.

Note that reading a graph from the database is still possible even if Flashback is not enabled on Oracle Database. In case of multiple databases, SCN can be used to maintain consistency for entity providers belonging to the same database only.

You can use the `as_of` flag in the graph configuration to specify at what SCN an entity provider must be read. The valid values for the `as_of` flag are as follows:

Table 18-1 Valid values for "as_of" Key in Graph Configuration

Value	Description
A positive long value	This is a parseable SCN value.
"<current-scn>"	The current SCN is determined at the beginning of the graph loading.
"<no-scn>"	This is to disable SCN at the time of graph loading.
null	This defaults to "<current-scn>" behavior.

If `"as_of"` is omitted for a vertex or an edge provider in the graph configuration file, then this follows the same behavior as `"as_of": null`.

Example 18-1 Graph Configuration Using "as_of" for Vertex and Edge Providers in the Same Database

The following example configuration has three vertex providers and one edge provider pointing to the same database.

```
{
  "name": "employee_graph",
  "vertex_providers": [
    {
      "name": "Department",
      "as_of": "<current-scn>",
      "format": "rdbms",
      "database_table_name": "DEPARTMENTS",
      "key_column": "DEPARTMENT_ID",
      "props": [
        {
          "name": "DEPARTMENT_NAME",
          "type": "string"
        }
      ]
    },
    {
      "name": "Location",
      "as_of": "28924323",
      "format": "rdbms",
      "database_table_name": "LOCATIONS",
      "key_column": "LOCATION_ID",
      "props": [
        {
          "name": "CITY",
          "type": "string"
        }
      ]
    },
    {
      "name": "Region",
      "as_of": "<no-scn>",
      "format": "rdbms",
      "database_table_name": "REGIONS",
      "key_column": "REGION_ID",
      "props": [
        {
          "name": "REGION_NAME",
          "type": "string"
        }
      ]
    }
  ],
  "edge_providers": [
    {
      "name": "LocatedAt",
      "format": "rdbms",
      "database_table_name": "DEPARTMENTS",
      "key_column": "DEPARTMENT_ID",
      "source_column": "DEPARTMENT_ID",

```

```

        "destination_column": "LOCATION_ID",
        "source_vertex_provider": "Department",
        "destination_vertex_provider": "Location"
    }
]
}

```

When reading the `employee_graph` using the preceding configuration file, the graph is read at the same SCN for the `Department` and `LocatedAt` entity providers. This is explained in the following table:

Table 18-2 Example Scenario Using "as_of"

Entity Provider	"as_of"	SCN Value
Department	"<current-scn>"	SCN determined automatically
Location	"28924323"	"28924323" used as SCN
Region	"<no-scn>"	No SCN used
LocatedAt	"as_of" flag is omitted	SCN determined automatically

The current SCN value of the database can be determined using one of the following options:

- Querying `V$DATABASE` view:

```
SELECT CURRENT_SCN FROM V$DATABASE;
```

- Using `DBMS_FLASHBACK` package:

```
SELECT DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER FROM DUAL;
```

If you do not have the required privileges to perform either of the preceding operations, then you can use:

```
SELECT TIMESTAMP_TO_SCN(SYSDATE) FROM DUAL;
```

However, note that this option is less precise than the earlier two options.

You can then read the graph into the graph server using the JSON configuration file as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var g = session.readGraphWithProperties("employee_graph.json")
```

Java

```
PgxGraph g = session.readGraphWithProperties("employee_graph.json");
```

Python

```
g = session.read_graph_with_properties("employee_graph.json")
```

18.3.1.3 Progress Reporting and Estimation for Graph Loading

Loading a large graph into the graph server(PGX) can be a long running operation. However, if you load the graph using an asynchronous action, then you can monitor the progress of the graph loading operation.

The following table shows the asynchronous graph loading APIs supported for the following formats:

Table 18-3 Asynchronous Graph Loading APIs

Data Format	API
PGQL Property Graph	<code>session.readGraphByNameAsync()</code>
CSV	<code>session.readGraphFileAsync()</code>

These supported APIs return a `PgxFuture` object.

You can then use the `PgxFuture.getProgress()` method to collect the following statistics:

- Report on the progress of the graph loading operation
- Estimate of the remaining vertices and edges that need to be loaded into memory

For example, the following code shows the steps to load a PGQL property graph graph asynchronously and subsequently obtain the `FutureProgress` object to report and estimate the loading progress. However, note that the graph loading estimate (for example, the number of loaded entities and providers or the number of total entities and providers) can be obtained only until the graph loading operation is in progress. Also, the system internally computes the graph loading progress for every 10000 entries of entities that are loaded into the graph server (PGX).

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var graphLoadingFuture = session.readGraphByNameAsync("BANK_GRAPH",
GraphSource.PG_PGQL)
readGraphFuture ==> oracle.pgx.api.PgxFuture@6106dfb6[Not completed]

opg4j> while (!graphLoadingFuture.isDone()) {
```

```

...> var progress = graphLoadingFuture.getProgress();
...> var graphLoadingProgress = progress.asGraphLoadingProgress();
...> if (graphLoadingProgress.isPresent()) {
...>     var numLoadedVertices =
graphLoadingProgress.get().getNumLoadedVertices();
...> }
...> Thread.sleep(1000);
...> }

opg4j> var graph = graphLoadingFuture.get();
graph ==> PgxDGraph[name=BANK_GRAPH_3,N=999,E=4993,created=1664289985985]

```

Java

```

PgxDFuture<PgxDGraph> graphLoadingFuture =
session.readGraphByNameAsync("BANK_GRAPH", GraphSource.PG_PGQL);
while (!graphLoadingFuture.isDone()) {
    FutureProgress progress = graphLoadingFuture.getProgress();
    Optional < GraphLoadingProgress > graphLoadingProgress =
progress.asGraphLoadingProgress();
    if (graphLoadingProgress.isPresent()) {
        long numLoadedVertices =
graphLoadingProgress.get().getNumLoadedVertices();
    }
    Thread.sleep(1000);
}
PgxDGraph graph = graphLoadingFuture.get();

```

It is recommended that you do not use the `FutureProgress` object in a chain of asynchronous operations.

18.3.1.4 Graph Configuration Options

Learn about the graph configuration options.

The following table lists the JSON fields that are common to all graph configurations:

Table 18-4 Graph Config JSON Fields

Field	Type	Description	Default
name	string	Name of the graph.	Required

Table 18-4 (Cont.) Graph Config JSON Fields

Field	Type	Description	Default
array_compaction_threshold	number	<i>[only relevant if the graph is optimized for updates]</i> Threshold used to determine when to compact the delta-logs into a new array. If lower than the engine <code>min_array_compaction_threshold</code> value, <code>min_array_compaction_threshold</code> will be used instead.	0.2
attributes	object	Additional attributes needed to read and write the graph data.	null
data_source_id	string	Data source id to use to connect to an RDBMS instance.	null
edge_id_strategy	enum[no_ids, keys_as_ids, unstable_generated_ids]	Indicates what ID strategy should be used for the edges of this graph. If not specified (or set to null), the strategy will be determined during loading or using a default value.	null
edge_id_type	enum[long]	Type of the edge ID. Setting it to <code>long</code> requires the IDs in the edge providers to be unique across the graphs; those IDs will be used as global IDs. Setting it to <code>null</code> (or omitting it) will allow repeated IDs across different edge providers and PGX will automatically generate globally-unique IDs for the edges.	null
edge_providers	array of object	List of edge providers in this graph.	[]
error_handling	object	Error handling configuration.	null
external_stores	array of object	Specification of the external stores where external string properties reside.	[]
jdbc_url	string	JDBC URL pointing to an RDBMS instance	null
keystore_alias	string	Alias to the keystore to use when connecting to database.	null
loading	object	Loading-specific configuration to use.	null
local_date_format	array of string	array of <code>local_date</code> formats to use when loading and storing <code>local_date</code> properties. See DateTimeFormatter for more details of the format string	[]
max_prefetched_rows	integer	Maximum number of rows prefetched during each round trip resultset-database.	1000

Table 18-4 (Cont.) Graph Config JSON Fields

Field	Type	Description	Default
num_connections	integer	Number of connections to read and write data from or to the RDBMS table.	<number of CPUs>
optimized_for	enum[read, updates]	Indicates if the graph should use data-structures optimized for read-intensive scenarios or for fast updates.	read
password	string	Password to use when connecting to database.	null
point2d	string	Longitude and latitude as floating point values separated by a space.	0.0 0.0
prepared_queries	array of object	An additional list of prepared queries with arguments, working in the same way as 'queries'. Data matching at least one those queries will also be loaded.	[]
queries	array of string	A list of queries used to determine which data to load from the database. Data matching at least one of the queries will be loaded. Not setting any query will load the entire graph.	[]
redaction_rules	array of object	Array of redaction rules.	[]
rules_mapping	array of object	Mapping for redaction rules to users and roles.	[]
schema	string	Schema to use when reading or writing RDBMS objects	null
source_name	string	Name of the database graph, if the graph is loaded from a database.	null
source_type	enum[pg_pgql, pg_sql]	Source type for database graphs.	null
time_format	array of string	The time format to use when loading and storing time properties. See DateTimeFormatter for a documentation of the format string.	[]
time_with_timezone_format	array of string	The time with timezone format to use when loading and storing time with timezone properties. Please see DateTimeFormatter for more information of the format string.	[]
timestamp_format	array of string	The timestamp format to use when loading and storing timestamp properties. See DateTimeFormatter for more information of the format string.	[]
timestamp_with_timezone_format	array of string	The timestamp with timezone format to use when loading and storing timestamp with timezone properties. See DateTimeFormatter for more information of the format string.	[]

Table 18-4 (Cont.) Graph Config JSON Fields

Field	Type	Description	Default
username	string	Username to use when connecting to an RDBMS instance.	null
vector_component_delimiter	character	Delimiter for the different components of vector properties.	;
vertex_id_strategy	enum[no_ids, keys_as_ids, unstable_generated_ids]	Indicates what ID strategy should be used for the vertices of this graph. If not specified (or set to null), the strategy will be automatically detected.	null
vertex_id_type	enum[int, integer, long, string]	Type of the vertex ID. For partitioned graphs, setting it to a specific type requires the IDs in the vertex providers to be unique across the graphs, and these IDs will be used as global IDs. Setting it to null (or omitting it) will allow repeated IDs across different vertex provider, and the graph server (PGX) will automatically generate globally-unique partitioned IDs for the vertices.	null
vertex_providers	array of object	List of vertex providers in this graph.	[]

Note

Database connection fields specified in the graph configuration will be used as default in case underlying data provider configuration does not specify them.

Provider Configuration JSON file Options

You can specify the meta-information about each provider's data using provider configurations. Provider configurations include the following information about the provider data:

- Location of the data: a file, multiple files or database providers
- Information about the properties: name and type of the property

Table 18-5 Provider Configuration JSON file Options

Field	Type	Description	Default
format	enum[pgb, csv, rdbms]	Provider format.	Required
name	string	Entity provider name.	Required
attributes	object	Additional attributes needed to read and write the graph data.	null
destination_key_columns	array of object	Destination key columns of the entity provider.	[]
destination_vertex_provider	string	Name of the destination vertex provider to be used for this edge provider.	null
error_handling	object	Error handling configuration.	null

Table 18-5 (Cont.) Provider Configuration JSON file Options

Field	Type	Description	Default
has_keys	boolean	Indicates if the provided entities data have keys.	true
key_columns	array of object	Key columns of the entity provider.	[]
key_type	enum[int, integer, long, string]	Type of the keys.	long
keystore_alias	string	Alias to the keystore to use when connecting to database.	null
label	string	label for the entities loaded from this provider.	null
loading	object	Loading-specific configuration.	null
local_date_formats	array of string	Array of local_date formats to use when loading and storing local_date properties. See DateTimeFormatter for a documentation of the format string.	[]
password	string	Password to use when connecting to database.	null
point2d	string	Longitude and latitude as floating point values separated by a space.	0.0 0.0
props	array of object	Specification of the properties associated with this entity provider.	[]
source_key_columns	array of object	Source key columns of the entity provider.	[]
source_vertex_provider	string	Name of the source vertex provider to be used for this edge provider.	null
time_format	array of string	The time format to use when loading and storing time properties. See DateTimeFormatter for a documentation of the format string.	[]
time_with_timezone_format	array of string	The time with timezone format to use when loading and storing time with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_format	array of string	The timestamp format to use when loading and storing timestamp properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_with_timezone_format	array of string	The timestamp with timezone format to use when loading and storing timestamp with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
vector_component_delimiter	character	Delimiter for the different components of vector properties.	;

Provider Labels

The `label` field in the provider configuration can be used to set a label for the entities loaded from the provider. If no `label` is specified, all entities from the provider are labeled with the name of the provider. It is only possible to set the same label for two different providers if they have exactly the same properties (same names and same types).

Property Configuration

The `props` entry in the `Provider` configuration is an object with the following JSON fields:

Table 18-6 Property Configuration

Field	Type	Description	Default
<code>name</code>	<code>string</code>	Name of the property.	Required
<code>type</code>	<code>enum[boolean, integer, vertex, edge, float, long, double, string, date, local_date, time, timestamp, time_with_timezone, timestamp_with_timezone, point2d]</code>	Type of the property .	Required
		<div>  Note <code>date</code> is deprecated, use one of <code>local_date / time / timestamp / time_with_timezone / timestamp_with_timezone</code> instead). </div>	
<code>aggregate</code>	<code>enum[identity, group_key, min, max, avg, sum, concat, count]</code>	<code>vertex/edge</code> are place-holders for the type specified in <code>vertex_id_type/edge_id_type</code> fields. [currently unsupported] which aggregation function to use, aggregation always happens by vertex key.	<code>null</code>
<code>column</code>	<code>value</code>	Name or index (starting from 0) of the column holding the property data. If it is not specified, the loader will try to use the property name as column name (for CSV format only).	<code>null</code>
<code>default</code>	<code>value</code>	Default value to be assigned to this property if datasource does not provide it. In case of <code>date</code> type: string is expected to be formatted with <code>yyyy-MM-dd HH:mm:ss</code> . If no default is present (<code>null</code>), non-existent properties will contain default Java types (primitives) or empty string (<code>string</code>) or <code>01.01.1970 00:00</code> (date).	<code>null</code>
<code>dimension</code>	<code>integer</code>	Dimension of property.	<code>0</code>
<code>drop_after_loading</code>	<code>boolean</code>	[currently unsupported] indicating helper properties only used for aggregation, which are dropped after loading	<code>false</code>

Table 18-6 (Cont.) Property Configuration

Field	Type	Description	Default
field	value	Name of the JSON field holding the property data. Nesting is denoted by dot - separation. Field names containing dots are possible, in this case the dots need to be escaped using backslashes to resolve ambiguities. Only the exactly specified object are loaded, if they are non existent, the default value is used.	null
format	array of string	Array of formats of property.	[]
group_key	string	[currently unsupported] can only be used if the property / key is part of the grouping expression.	null
max_distinct_strings_per_pool	integer	<i>[only relevant if string_pooling_strategy is indexed]</i> Amount of distinct strings per property after which to stop pooling. If the limit is reached an exception is thrown. If set to null, the default value from the global PGX configuration will be used.	null
stores	array of object	A list of storage identifiers that indicate where this property resides.	[]
string_pooling_strategy	enum[indexed, on_heap, none]	Indicates which string pooling strategy to use. If set to null, the default value from the global PGX configuration will be used.	null

Loading Configuration

The loading entry is a JSON object with the following fields:

Table 18-7 Loading Configuration

Field	Type	Description	Default
create_key_mapping	boolean	If true, a mapping between entity keys and internal IDs is prepared during loading.	true
filter	string	[currently unsupported] the filter expression	null
grouping_by	array of string	[currently unsupported] array of edge properties used for aggregator. For Vertices, only the ID can be used (default)	[]
load_labels	boolean	Whether or not to load the entity label if it is available.	false
strict_mode	boolean	If true, exceptions are thrown and logged with ERROR level whenever loader encounters problems with input file, such as invalid format, repeated keys, missing fields, mismatches and other potential errors. If false, loader may use less memory during loading phase, but behave unexpectedly with erratic input files.	true

Error Handling Configuration

The `error_handling` entry is a JSON object with the following fields:

Table 18-8 Error Handling Configuration

Field	Type	Description	Default
<code>on_missed_prop_key</code>	enum[silent, log_warn, log_warn_once, error]	Error handling for a missing property key.	log_warn_once
<code>on_missing_vertex</code>	enum[ignore_edge, ignore_edge_log, ignore_edge_log_once, create_vertex, create_vertex_log, create_vertex_log_once, error]	Error handling for a missing source or destination vertex of an edge in a vertex data source.	error
<code>on_parsing_issue</code>	enum[silent, log_warn, log_warn_once, error]	Error handling for incorrect data parsing. If set to silent, log_warn or log_warn_once, will attempt to continue loading. Some parsing issues may not be recoverable and provoke the end of loading.	error
<code>on_prop_conversion</code>	enum[silent, log_warn, log_warn_once, error]	Error handling when encountering a different property type other than the one specified, but coercion is possible.	log_warn_once
<code>on_type_mismatch</code>	enum[silent, log_warn, log_warn_once, error]	Error handling when encountering a different property type other than the one specified, but coercion is <i>not</i> possible.	error
<code>on_vector_length_mismatch</code>	enum[silent, log_warn, log_warn_once, error]	Error handling for a vector property that does not have the correct dimension.	error

Note

The only supported setting for the `on_missing_vertex` error handling configuration is `ignore_edge`.

18.3.1.5 Data Loading Security Best Practices

Loading a graph from the database requires authentication and it is therefore important to adhere to certain security guidelines when configuring access to this kind of data source.

The following guidelines are recommended:

- The user or role used to access the data should be a read-only account that only has access to the required graph data.
- The graph data should be marked as read-only, for example, with non-updateable views in the case of the database.

18.3.1.6 Data Format Support Matrix

Learn about the different data formats supported in the graph server (PGX).

The following table illustrates the supported data formats:

Table 18-9 Data Format Support Matrix

Format	Vertex IDs	Edge IDs	Vertex Labels	Edge Labels	Vector properties
PGB	int, long, string	long	multiple	single	supported (vectors can be of type integer, long, float or double)
CSV	int, long, string	long	multiple	single	supported (vectors can be of type integer, long, float or double)

18.3.1.7 Immutability of Loaded Graphs

Once the graph is loaded into the graph server (PGX), the graph and its properties are automatically marked as immutable.

The immutability of loaded graphs is due to the following design choices:

- Typical graph analyses happen on a snapshot of a graph instance, and therefore they do not require mutations of the graph instance.
- Immutability allows PGX to use an internal graph representation optimized for fast analysis.
- In remote mode, the graph instance might be shared among multiple clients.

However, the graph server (PGX) also provides methods to customize and mutate graph instances for the purpose of analysis. See [Graph Mutation and Subgraphs](#) for more information.

18.3.2 Storing a Graph Snapshot on Disk

After reading a graph into memory, you can make any changes to the graph (such as running the PageRank algorithm and storing the values as vertex properties), and then store this snapshot of the graph on disk.

If you want to save the state of the graph in memory, then a snapshot of a graph can be saved as a file in binary format (PGB file).

In general, if you must shut down the graph server, then it is recommended that you store all the graph queries and analytics APIs that have been run on the graph. Once the graph server (PGX) is restarted, you can reload the graph and rerun the APIs.

However, if you must save the state of the graph, then the following example explains how to store the graph snapshot on disk.

As a prerequisite for storing the graph snapshot, you need to explicitly authorize access to the corresponding directories by defining a directory object pointing to the directory (on the graph server) that contains the files to read or write.

```
CREATE OR REPLACE DIRECTORY pgx_file_location AS '<path_to_dir>';
GRANT READ, WRITE ON directory pgx_file_location to GRAPH_DEVELOPER;
```

Also, note the following:

- The directory in the `CREATE DIRECTORY` statement must exist on the graph server (PGX).
- The directory must be readable (and/or writable) at the OS level by the graph server (PGX).

The preceding code grants the privileges on the directory to the `GRAPH_DEVELOPER` role. However, you can also grant permissions to an individual user:

```
GRANT READ, WRITE ON DIRECTORY pgx_file_location TO <graph_user>;
```

You can then run the following code to load a PGQL property graph into the graph server (PGX) and save the graph snapshot as a file. Note that multiple PGB files will be generated, one for each vertex and edge provider in the graph.

```
opg4j> var g = session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL)
g ==> PgxGraph[name=BANK_GRAPH,N=999,E=4993,created=1676021791568]

opg4j> analyst.pagerank(graph)
$8 ==> VertexProperty[name=pagerank,type=double,graph=BANK_GRAPH]

// Now save the state of this graph
opg4j> var storedPgbConfig = graph.store(ProviderFormat.PGB, "<path_to_dir>")
```

In a three-tier deployment, the file is written on the server-side file system. You must also ensure that the file location to write is specified in the graph server (PGX). (As explained in [Three-Tier Deployments of Oracle Graph with Autonomous Database](#), in a three-tier deployment, access to the PGX server file system requires a list of allowed locations to be specified.)

18.3.3 Publishing a Graph

You can publish a graph that is loaded into the graph server (PGX), so that it can be referenced by other sessions. Similarly, the snapshots of a graph can also be made available to other sessions.

Publishing a Graph with Snapshots

After loading a graph is loaded into the graph server, if you want to make all snapshots of the graph visible to other sessions (under the same user), then use the `publishWithSnapshots()` method. When a graph is published with snapshots, the `GraphMetaData` information of each snapshot is also made available to the other sessions, with the exception of the graph configuration, which is `null`.

When calling the `publishWithSnapshots()` method, all the persistent properties of all the snapshots are published and made visible to the other sessions. Transient properties are session-private and therefore they must be published explicitly. Once published, all properties

become read-only. Hence, **transient properties are not published** when calling `publishWithSnapshots()` without arguments.

Publishing a graph with `publishWithSnapshots()` method, will move the graph name from the session-private namespace to the public namespace. If a graph with the same name has been already published, then the `publishWithSnapshots()` method will fail with an exception.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> graph.publishWithSnapshots()
```

Java

```
graph.publishWithSnapshots();
```

Python

```
>>> graph.publish_with_snapshots()
```

If you want to publish specific transient properties, then you can list them within the `publishWithSnapshots()` call, as shown in the following example:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var prop1 = graph.createVertexProperty(PropertyType.INTEGER, "prop1")
opg4j> prop1.fill(0)
opg4j> var cost = graph.createEdgeProperty(PropertyType.DOUBLE, "cost")
opg4j> cost.fill(0d)
opg4j> graph.publishWithSnapshots(List.of(prop1), List.of(cost))
```

Java

```
VertexProperty<Integer, Integer> prop1 =
graph.createVertexProperty(PropertyType.INTEGER, "prop1");
prop1.fill(0);
EdgeProperty<Double> cost = graph.createEdgeProperty(PropertyType.DOUBLE,
```

```
"cost");
cost.fill(0d);
Collection<VertexProperty<?, ?>> vertexProps = Arrays.asList(prop1);
Collection<EdgeProperty<?>> edgeProps = Arrays.asList(cost);
graph.publishWithSnapshots(vertexProps, edgeProps);
```

Alternatively, all properties can be published at once by passing the built-in `VertexProperty.ALL` and `EdgeProperty.ALL` to `publishWithSnapshots()`, as in the following example.

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var prop1 = graph.createVertexProperty(PropertyType.INTEGER, "prop1")
opg4j> prop1.fill(0)
opg4j> var cost = graph.createEdgeProperty(PropertyType.DOUBLE, "cost")
opg4j> cost.fill(0d)
opg4j> graph.publishWithSnapshots(VertexProperty.ALL, EdgeProperty.ALL)
```

Java

```
VertexProperty<Integer, Integer> prop1 =
graph.createVertexProperty(PropertyType.INTEGER, "prop1");
prop1.fill(0);
EdgeProperty<Double> cost = graph.createEdgeProperty(PropertyType.DOUBLE,
"cost");
cost.fill(0d);
Collection<VertexProperty<?, ?>> vertexProps = Arrays.asList(prop);
Collection<EdgeProperty<?>> edgeProps = Arrays.asList(cost);
graph.publishWithSnapshots(VertexProperty.ALL, EdgeProperty.ALL);
```

After creating a snapshot, properties in the new snapshot will inherit the publishing state of properties in the old snapshot. This implies that if a property is published in the old snapshot, it will also be published in the new snapshot. Otherwise it will remain session private in the new snapshot. This behavior is configurable with `enable_snapshot_properties_publish_state_propagation` flag (see [Configuration Parameters for the Graph Server \(PGX\) Engine](#)). By default, this flag is enabled. However, it can be disabled by setting its value to false, in which case, the publishing state of the properties will be ignored when creating new snapshots and the properties in new snapshots will be session-private.

Note

By default, calling `publishWithSnapshots()` is allowed only on the **latest** snapshot. Calling `publishWithSnapshots()` on an old snapshot will result in an exception. To allow calling `publishWithSnapshots()` on any snapshot, set the `enable_snapshot_properties_publish_state_propagation` configuration field in the `pgx.conf` file to `false`.

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var prop1 = graph.createVertexProperty(PropertyType.INTEGER, "prop1")
opg4j> prop1.fill(0)
opg4j> var prop2 = graph.createVertexProperty(PropertyType.INTEGER, "prop2")
opg4j> prop2.fill(0)
opg4j> var cost = graph.createEdgeProperty(PropertyType.DOUBLE, "cost")
opg4j> cost.fill(0d)

// the example intentionally avoids publishing prop2
opg4j> graph.publishWithSnapshots(List.of(prop1), List.of(cost))
opg4j> var snapshot = graph.createChangeSet().buildNewSnapshot()
opg4j> snapshot.getVertexProperty("prop1").isPublished()
=> true
opg4j> snapshot.getVertexProperty("prop2").isPublished()
=> false
opg4j> snapshot.getEdgeProperty("cost").isPublished()
=> true

// publish prop2 in snapshot, this will make it published in future snapshots
// too
// but not in the previous snapshots
opg4j> snapshot.getVertexProperty("prop2").publish()
opg4j> var snapshot2 = snapshot.createChangeSet().buildNewSnapshot();
opg4j> snapshot2.getVertexProperty("prop1").isPublished()
=> true
opg4j> snapshot2.getVertexProperty("prop2").isPublished()
=> true
opg4j> snapshot2.getEdgeProperty("cost").isPublished()
=> true
```

Java

```
VertexProperty<Integer, Integer> prop1 =
graph.createVertexProperty(PropertyType.INTEGER, "prop1");
prop1.fill(0);
VertexProperty<Integer, Integer> prop2 =
graph.createVertexProperty(PropertyType.INTEGER, "prop2");
prop2.fill(0);
```

```

EdgeProperty<Double> cost = graph.createEdgeProperty(PropertyType.DOUBLE,
"cost");
cost.fill(0d);

// the example intentionally avoids publishing prop2
graph.publishWithSnapshots(List.of(prop1), List.of(cost));
PgxGraph snapshot = graph.createChangeSet().buildNewSnapshot();
System.out.println(snapshot.getVertexProperty("prop1").isPublished()); //
Returns true
System.out.println(snapshot.getVertexProperty("prop2").isPublished()); //
Returns false
System.out.println(snapshot.getEdgeProperty("cost").isPublished()); //
Returns true

// publish prop2 in snapshot, this will make it published in future snapshots
too
// but not in the previous snapshots.
snapshot.getVertexProperty("prop2").publish();
PgxGraph snapshot2 = snapshot.createChangeSet().buildNewSnapshot();
System.out.println(snapshot2.getVertexProperty("prop1").isPublished()); //
Returns true
System.out.println(snapshot2.getVertexProperty("prop2").isPublished()); //
Returns true
System.out.println(snapshot2.getEdgeProperty("cost").isPublished()); //
Returns true

```

Publishing a Single Graph Snapshot

The `PgxGraph#publish()` method can be used to publish the current selected snapshot of the graph. The publish operation will move the graph name from the session-private namespace to the public namespace. If a graph with the same name has been already published, then the `publish()` method will fail with an exception. Graphs published with snapshots and single published snapshots share the same namespace.

[Table 16-6](#) describes the grants required to publish a graph.

Note that calling the `publish()` method without arguments publishes the snapshot with its persistent properties only. However, if you want to publish specific transient properties, then you must list them within the `publish()` call as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

opg4j> var prop1 = graph.createVertexProperty(PropertyType.INTEGER, "prop1")
opg4j> prop1.fill(0)
opg4j> var cost = graph.createEdgeProperty(PropertyType.DOUBLE, "cost")

```

```
opg4j> cost.fill(0d)
opg4j> graph.publish(List.of(prop1), List.of(cost))
```

Java

```
VertexProperty<Integer, Integer> prop1 =
graph.createVertexProperty(PropertyType.INTEGER, "prop1");
prop1.fill(0);
EdgeProperty<Double> cost = graph.createEdgeProperty(PropertyType.DOUBLE,
"cost");
cost.fill(0d);
Collection<VertexProperty<?, ?>> vertexProps = Arrays.asList(prop);
Collection<EdgeProperty<?>> edgeProps = Arrays.asList(cost);
graph.publish(vertexProps, edgeProps);
```

Python

```
prop = graph.create_vertex_property("integer", "prop1")
prop1.fill(0)
cost = graph.create_edge_property("double", "cost")
cost.fill(float(0))
vertex_props = [prop]
edge_props = [cost]
graph.publish(vertex_props, edge_props)
```

Referencing a Published Graph from Another Session

You can reference a published graph by its name in another session, using the `PgxSession#getGraph()` method.

The following example references a published graph `myGraph` in a new session (`session2`):

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var session2 = instance.createSession("session2")
opg4j> var graph2 = session2.getGraph(Namespace.PUBLIC, "myGraph")
```

Java

```
PgxSession session2 = instance.createSession("session2");
PgxGraph graph2 = session2.getGraph(Namespace.PUBLIC, "myGraph");
```

Python

```
session2 = pypgx.get_session("session2");  
PgxGraph graph2 = session2.get_graph("myGraph")
```

`session2` can access only the published snapshot. If the graph has been published without snapshots, calling the `getAvailableSnapshots()` method will return an empty queue.

In case if the graph snapshots have been published, then the call to `getGraph()` returns the most recent available snapshot. `session2` can see all the available snapshots through the `getAvailableSnapshots()` method. You can then set a specific snapshot using the `PgxSession#setSnapshot()` method.

Note

If a referenced graph is not required anymore, then it is important that you release the graph. See [Deleting a Graph](#) for more information.

Publishing a Property

After publishing (a single snapshot or all of them), you can still publish transient properties individually. By default, the publishing state of the transient properties are associated to the specific snapshot on which they are created and thus they are visible only on that snapshot.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph.getVertexProperty("prop1").publish()  
opg4j> graph.getEdgeProperty("cost").publish()
```

Java

```
graph.getVertexProperty("prop1").publish();  
graph.getEdgeProperty("cost").publish();
```

Python

```
graph.get_vertex_property("prop1").publish()  
graph.get_edge_property("cost").publish()
```

Getting a Published Property in Another Session

Sessions referencing a published graph (with or without snapshots) can reference a published property through the `PgxGraph#getVertexProperty` and `PgxGraph#getEdgeProperty`.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var session2 = instance.createSession("session2")
opg4j> var graph2 = session2.getGraph(Namespace.PUBLIC, "myGraph")
opg4j> var vertexProperty = graph2.getVertexProperty("prop1")
opg4j> var edgeProperty = graph2.getEdgeProperty("cost")
```

Java

```
PgxSession session2 = instance.createSession("session2");
PgxGraph graph2 = session2.getGraph(Namespace.PUBLIC, "myGraph");
VertexProperty<Integer, Integer> vertexProperty =
graph2.getVertexProperty("prop1");
EdgeProperty<Double> edgeProperty = graph2.getEdgeProperty("cost");
```

Python

```
session2 = pypgx.get_session(session_name="session2")
graph2 = session2.get_graph("myGraph")
vertex_property = graph2.get_vertex_property("prop1")
edge_property = graph2.get_edge_property("cost")
```

Pinning a Published Graph

You can pin a published graph so that it remains published even if no session uses it.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> graph.pin()
```

Java

```
graph.pin();
```

Python

```
>>> graph.pin()
```

Unpinning a Published Graph

You can unpin a published graph that was earlier pinned. By doing this, you can remove the graph and all its snapshots, if no other session is using a snapshot of the graph.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.getGraph("bank_graph_analytics")
graph ==>
PgxGraph[name=bank_graph_analytics,N=999,E=4993,created=1660217577201]
opg4j> graph.unpin()
```

Java

```
PgxGraph graph = session.getGraph("bank_graph_analytics");
graph.unpin();
```

Python

```
>>> graph = session.get_graph("bank_graph_analytics")
>>> graph.unpin()
```

Related Topics

- [Namespaces and Sharing](#)
The graph server (PGX) supports separate namespaces that help you to organize your entities.

18.3.4 Deleting a Graph

In order to reduce the memory usage of the graph server (PGX), the session must drop the unused graph objects created through the `getGraph()` method, by invoking the `close()` method.

Calling the `close()` method not only destroys the specified graph, but all of its associated properties, including transient properties as well. In addition, all of the collections related to the graph instance (for example, a `VertexSet`) are also deleted automatically. If a session holds multiple `PgxGraph` objects referencing the same graph, invoking `close()` on any of them will invalidate all the `PgxGraph` objects referencing that graph, making any operation on those objects fail.

For example:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph1 = session.getGraph("myGraphName")
opg4j> var graph2 = session.getGraph("myGraphName")
opg4j> graph2.close() // Delete graph2
opg4j> var properties = graph1.getVertexProperties() //throws an exception as
graph1 reference is not valid anymore
opg4j> properties = graph2.getVertexProperties() //throws an exception as
graph2 reference is not valid anymore
```

Java

```
PgxGraph graph1 = session.getGraph("myGraphName");

// graph2 references the same graph of graph1
PgxGraph graph2 = session.getGraph("myGraphName");

// Delete graph2
graph2.close();

// Both the following calls throw an exception, as both references are not
valid anymore
Set<VertexProperty<?, ?>> properties = graph1.getVertexProperties();
properties = graph2.getVertexProperties();
```

Python

```
graph1 = session.get_graph("myGraphName")

# graph2 references the same graph of graph1
```

```
graph2 = session.get_graph("myGraphName")

# Delete graph2
graph2.close()

# Both the following calls throw an exception, as both references are not
valid anymore
properties = graph1.get_vertex_properties()
properties = graph2.get_vertex_properties()
```

The same behavior occurs when multiple `PgxGraph` objects reference the same snapshot. Since a snapshot is effectively a graph, closing a `PgxGraph` object referencing a certain snapshot invalidates all `PgxGraph` objects referencing the same snapshot, but does not invalidate those referencing other snapshots:

```
// Get a snapshot of "myGraphName"
PgxGraph graph1 = session.getGraph("myGraphName");

// graph2 and graph3 reference the same snapshot as graph1
PgxGraph graph2 = session.getGraph("myGraphName");
PgxGraph graph3 = session.getGraph("myGraphName");

// Assume another snapshot is created ...

// Make graph3 references the latest snapshot available
session.setSnapshot(graph3, PgxSession.LATEST_SNAPSHOT);
graph2.close();

// Both the following calls throw an exception, as both references are not
valid anymore
Set<VertexProperty<?, ?>> properties = graph1.getVertexProperties();
properties = graph2.getVertexProperties();

// graph3 is still valid, so the call succeeds
properties = graph3.getVertexProperties();
```

Note

Even if a graph is closed by a session, the graph data may still remain in the server memory, if the graph is currently shared by other sessions. In such a case, the graph may still be visible among the available graphs through the `PgxSession.getGraphs(Namespace.PUBLIC)` method.

As a safe alternative to the manual removal of each graph, the PGX API supports some implicit resource management features which allow developers to safely omit the `close()` call. See [Resource Management Considerations](#) for more information.

18.3.5 Graph Sharing Options and Validating Graph Permissions

The `graph_sharing_option` parameter in the `pgx.conf` file determines if and how a graph can be shared.

It mainly depends on whether or not the graph source is known. The graph server (PGX) supports sharing of graphs within sessions of a single user (through the publish API) or across sessions of different users (through the publish and grant permission APIs).

The graph server (PGX) defines the following three levels of graph traceability:

- *Fully Traceable Graph*: All providers of the graph are traceable. For example, loading data from a set of database tables is a traceable source. Therefore, graphs loaded using `session.readGraphByName()` are considered traceable.
- *Partially Traceable Graph*: The graph contains mixed providers, that is, few traceable and few non-traceable providers.
- *Non-Traceable Graph*: All providers of the graph are not traceable. Graphs created as a result of mutation (through graph alteration APIs) on a loaded graph instance are considered not traceable.

In addition, the graph server (PGX) will perform periodic checks on all partially traceable and fully traceable graphs to make sure that the user holding a reference to a traceable graph has all the permissions to access the source graph data in the database. If the permission check fails (for example, the user privileges on the original data source have been revoked), then the user session will be destroyed and all sessions of the same user accessing the graph data will be released from memory. The `permission_checks_interval` field in the `pgx.conf` file can be used to control the frequency at which the graph server must check the graph permissions.

The following table shows the three `graph_sharing_option` modes that are supported by the graph server (PGX).

Table 18-10 Graph Sharing Options

Graph Sharing Option	Description	Publish API Allowed	Grant Permission API Allowed	PgetGraph Permission Check Interval
ALLOW_DATA_SHARING<default>	This indicates that all graph types (traceable or not) is allowed across sessions of a single user and across users.	Yes	Yes	Yes
ALLOW_TRACEABLE_DATA_SHARING_WITHIN_SAME_USER	This allows only sharing of fully traceable graphs among sessions of a single user. It does not allow sharing across multiple users, or sharing of non-traceable graphs or partially traceable graphs .	Yes (only for fully traceable graphs)	No	Yes
DISALLOW_DATA_SHARING	This indicates graphs are always session private.	No	No	Yes (not really needed)

For instance, consider the following example in which the `graph_sharing_option` is set as `ALLOW_TRACEABLE_DATA_SHARING_WITHIN_SAME_USER` and the `permission_checks_interval` parameter defaults to 60 seconds in the `pgx.conf` file. Assume that a graph user's permission to an underlying source table is revoked after the user publishes the graph. If the user attempts to access the graph data, in the current or in another session, the graph gets invalidated and the respective sessions are destroyed.

The following code shows the graph invalidation scenario in the current user session:

- [JShell](#)
- [Java](#)
- [Python](#)

JSHELL

```
opg4j> var graph = session.readGraphByName("HR", "EMP_GRAPH",
GraphSource.PG_PGQL)
graph ==> PgxGraph[name=EMP_GRAPH,N=134,E=11,created=1696308375704]
opg4j> session.getGraph("EMP_GRAPH")
$2 ==> graph ==> PgxGraph[name=EMP_GRAPH,N=134,E=11,created=1696402820966]
opg4j> graph.publish()
// Source table permission revoked for the user
opg4j> session.getGraph("EMP_GRAPH") //throws exception and the current
session is explicitly destroyed
```

JAVA

```
PgxGraph graph = session.readGraphByName("HR", "EMP_GRAPH",
GraphSource.PG_PGQL);
session.getGraph("EMP_GRAPH");
graph.publish();
// Source table permission revoked for the user
session.getGraph("EMP_GRAPH"); //throws exception and the current session is
explicitly destroyed
```

PYTHON

```
>>> graph = session.read_graph_by_name("EMP_GRAPH", "pg_pgql", schema="HR")
>>> session.get_graph("EMP_GRAPH")
PgxGraph(name: EMP_GRAPH, v: 134, e: 11, directed: True, memory(Mb): 0)
>>> graph.publish()
>>> # Source table permission revoked for the user
>>> session.get_graph("EMP_GRAPH") #throws exception and the current session
is explicitly destroyed
```

The following code shows that the referenced graph also gets invalidated in another session of the given user after permission to the source data table is revoked for the user:

- [JSHELL](#)
- [JAVA](#)
- [PYTHON](#)

JSHELL

```
opg4j> //throws exception in another session and the session gets explicitly
destroyed
opg4j> graph.queryPgql("SELECT n.* from MATCH (n:employees) LIMIT 5").print()
```

Java

```
//throws exception in another session and the session gets explicitly  
destroyed  
graph.queryPgql("SELECT n.* from MATCH (n:employees) LIMIT 5").print();
```

Python

```
>>> #throws exception in another session and the session gets explicitly  
destroyed  
>>> graph.query_pgql("SELECT n.* from MATCH (n:employees) LIMIT 5").print()
```

18.4 Keeping the Graph in Oracle Database Synchronized with the Graph Server

You can use the `FlashbackSynchronizer` API to automatically apply changes made to graph in the database to the corresponding `PgxGraph` object in memory, thus keeping both synchronized.

This API uses [Oracle's Flashback Technology](#) to fetch the changes in the database since the last fetch and then push those changes into the graph server using the `ChangeSet` API. After the changes are applied, the usual snapshot semantics of the graph server apply: each delta fetch application creates a new in-memory snapshot. Any queries or algorithms that are executing concurrently to snapshot creation are unaffected by the changes until the corresponding session refreshes its `PgxGraph` object to the latest state by calling the `session.setSnapshot(graph, PgxSession.LATEST_SNAPSHOT)` procedure.

Also, if the changes from the previous fetch operation no longer exist, then the synchronizer will throw an exception. This occurs if the previous fetch duration is longer than the `UNDO_RETENTION` parameter setting in the database. To avoid this exception, ensure to fetch the changes at intervals less than the `UNDO_RETENTION` parameter value. The default setting for the `UNDO_RETENTION` parameter is 900 seconds. See *Oracle Database Reference* for more information.

Prerequisites for Synchronizing

The Oracle database must have Flashback enabled and the database user that you use to perform synchronization must have:

- Read access to all tables which need to be kept synchronized.
- Permission to use flashback APIs. For example:

```
GRANT EXECUTE ON DBMS_FLASHBACK TO <user>
```

The database must also be configured to retain changes for the amount of time needed by your use case.

Types of graphs that can be synchronized

Not all `PgxGraph` objects in PGX can be synchronized. The following limitations apply:

- Only the original creator of the graph can synchronize it. That is, the current user must have the `MANAGE` permission of the graph.
- Only graphs loaded from database tables (PGQL property graphs and SQL property graphs) can be synchronized. Graphs created from other formats or graphs created via the graph builder API or PGQL property graphs created from database views cannot be synchronized.
- Only the *latest snapshot* of a graph can be synchronized.

Types of changes that can be synchronized

The synchronizer supports keeping the in-memory graph snapshot in sync with the following database-side modifications:

- insertion of new vertices and edges
- removal of existing vertices and edges
- update of property values of any vertex or edge

The synchronizer does not support schema-level changes to the input graph, such as:

- alteration of the list of input vertex or edge tables
- alteration of any columns of any input tables (vertex or edge tables)

Furthermore, the synchronizer does not support updates to vertex and edge keys.

For a detailed example, see the following topic:

- [Synchronizing a SQL Property Graph](#)
You can synchronize a SQL property graph that is loaded into the graph server (PGX) with the changes made to the graph data in the database.
- [Synchronizing a PGQL Property Graph](#)
You can synchronize a PGQL property graph loaded into the graph server (PGX) with the changes made to the graph data in the database.

18.4.1 Synchronizing a SQL Property Graph

You can synchronize a SQL property graph that is loaded into the graph server (PGX) with the changes made to the graph data in the database.

The following example shows the steps for synchronizing a SQL property graph using the `FlashbackSynchronizer` API:

1. Load the SQL property graph into the graph server (PGX) using the `readGraphByName()` API as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_SQL_PG",  
GraphSource.PG_SQL,
```

```
...>
ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES),
...> ReadGraphOption.synchronizable()
graph ==> PgxGraph[name=BANK_SQL_PG_2,N=1000,E=5001,created=1697259571499
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_SQL_PG",GraphSource.PG_SQL,
    ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES),
    ReadGraphOption.synchronizable());
```

Python

```
>>> graph = session.read_graph_by_name('BANK_SQL_PG', 'pg_sql',
... options=['optimized_for_updates', 'synchronizable'])
```

2. Open a new JDBC connection to the database and change the data in the underlying database tables for the SQL property graph. For example, the following code updates the database value for one of the edge properties:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var conn =
DriverManager.getConnection(<jdbcUrl>,<username>,<password>)
conn ==> oracle.jdbc.driver.T4CConnection@738e79ec
opg4j> var stmt = conn.createStatement()
stmt ==> oracle.jdbc.driver.OracleStatementWrapper@71f056a
opg4j> stmt.executeQuery("UPDATE bank_transfers SET amount=2000 WHERE
txn_id=2")
$8 ==> oracle.jdbc.driver.ForwardOnlyResultSet@19b0a9f2
opg4j> conn.commit()
```

Java

```
Connection conn =
DriverManager.getConnection(<jdbcUrl>,<username>,<password>);
Statement stmt = conn.createStatement();
stmt.executeQuery("UPDATE bank_transfers SET amount=2000 WHERE txn_id=2");
conn.commit();
```

Python

```
>>> conn = opg4py.pgql.get_connection(<username>,<password>,  
<jdbcUrl>).get_jdbc_connection()  
>>> conn.prepareStatement("UPDATE bank_transfers SET amount=2000 WHERE  
txn_id=2").execute()  
False  
>>> conn.commit()
```

Committing the changes to the database causes the graph in the memory to go out of sync with the database source tables.

3. Synchronize the in-memory graph with the database by creating a new synchronizer object as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var synchronizer =  
graph.createSynchronizer(FlashbackSynchronizer.class, conn)  
synchronizer ==> oracle.pgx.api.FlashbackSynchronizer@5f65e0c0
```

Java

```
Synchronizer synchronizer =  
graph.createSynchronizer(FlashbackSynchronizer.class, conn);
```

Python

```
>>> synchronizer =  
graph.create_synchronizer(synchronizer_class='oracle.pgx.api.FlashbackSynch  
ronizer',  
...                      jdbc_url=<jdbcUrl>, username=<username>,  
password=<password>)
```

-
4. Fetch and apply the database changes by calling the sync() function and create a new in-memory graph snapshot:

-
- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> graph=synchronizer.sync()  
graph ==> PgxGraph[name=BANK_SQL_PG,N=1000,E=5001,created=1696332603804]
```

Java

```
graph=synchronizer.sync();
```

Python

```
graph=synchronizer.sync()
```

Note that the `Synchronizer` object needs to be created only once per session. Once created, you can perform the `synchronizer.sync()` operation multiple times to generate the latest graph snapshot that is consistent with the changes in the database.

5. Query the graph to verify the updates to the edge property.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> graph.queryPsql("SELECT e.amount FROM MATCH (v1:Accounts)-  
[e:Transfers]->(v2:Accounts) WHERE e.from_acct_id = 237 AND  
e.to_acct_id=777").print()
```

Java

```
graph.queryPsql("SELECT e.amount FROM MATCH (v1:Accounts)-[e:Transfers]-  
>(v2:Accounts) WHERE e.from_acct_id = 237 AND e.to_acct_id=777").print();
```

Python

```
>>> graph.query_psql("SELECT e.amount FROM MATCH (v1:Accounts)-  
[e:Transfers]->(v2:Accounts) WHERE v1.id = 237 AND v2.id=777").print()
```

On execution, the preceding example produces the following output:

```
+-----+
| amount |
+-----+
| 2000.0 |
+-----+
```

18.4.2 Synchronizing a PGQL Property Graph

You can synchronize a PGQL property graph loaded into the graph server (PGX) with the changes made to the graph data in the database.

The following example shows the steps for synchronizing a PGQL property graph using the FlashbackSynchronizer API:

1. Load the PGQL property graph into the graph server (PGX) using the `readGraphByName()` API as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph =
session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL,

ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES),ReadGraphOption.sync
hronizable())
graph ==> PgxGraph[name=BANK_GRAPH,N=999,E=4993,created=1660275936010]
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL,

ReadGraphOption.optimizeFor(GraphOptimizedFor.UPDATES),ReadGraphOption.sync
hronizable());
```

Python

```
>>> graph = session.read_graph_by_name('BANK_GRAPH','pg_pgql',
...                                     options=['optimized_for_updates', 'synchronizable'])
```

2. Open a new JDBC connection to the database and change the data in the underlying database tables for the PGQL property graph. For example, the following code updates the database value for one of the edge properties:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var conn =
DriverManager.getConnection(<jdbcUrl>,<username>,<password>)
conn ==> oracle.jdbc.driver.T4CConnection@60f7261f
opg4j> var stmt = conn.createStatement()
stmt ==> oracle.jdbc.driver.OracleStatementWrapper@1a914a00
opg4j> stmt.executeQuery("UPDATE bank_transfers SET amount=4000 WHERE
txn_id=3")
$5 ==> oracle.jdbc.driver.ForwardOnlyResultSet@627d5f99
opg4j> conn.setAutoCommit(false)
opg4j> conn.commit()
```

Java

```
Connection conn =
DriverManager.getConnection(<jdbcUrl>,<username>,<password>);
Statement stmt = conn.createStatement();
stmt.executeQuery("UPDATE bank_transfers SET amount=4000 WHERE txn_id=3");
conn.setAutoCommit(false);
conn.commit();
```

Python

```
>>> conn = opg4py.pgql.get_connection(<username>,<password>,
<jdbc_url>).get_jdbc_connection()
>>> conn.prepareStatement("UPDATE bank_transfers SET amount=4000 WHERE
txn_id=3").execute()
False
>>> conn.commit()
```

Committing the changes to the database causes the graph in the memory to go out of sync with the database source tables.

3. Synchronize the in-memory graph with the database by creating a new synchronizer object as shown in the following code:

```
Synchronizer synchronizer = new
Synchronizer.Builder<FlashbackSynchronizer>()
    .setType(FlashbackSynchronizer.class)
    .setGraph(graph)
    .setConnection(conn)
```

```
.setParallelHintDegree(4)
.build();
```

Internally, the graph server keeps track of the Oracle system change number (SCN) to which the current graph snapshot belongs. The synchronizer is a client-side component which connects to the database, detects changes by comparing state of the original input tables using the current SCN via the flashback mechanism and then sends any changes to the graph server using the changeset API. In order to do so, the synchronizer needs to know how to connect to the database (`conn` parameter) as well as which graph to keep in sync (`graph` parameter).

You can specify the degree of parallelism in the Flashback Synchronizer builder using the `setParallelHintDegree` API. The specified parallel hint degree will be taken into account by the Flashback Synchronizer when executing the SQL queries.

Alternatively, you can use this equivalent shortcut as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var synchronizer =
graph.createSynchronizer(FlashbackSynchronizer.class, conn)
synchronizer ==> oracle.pgx.api.FlashbackSynchronizer@4ac2b4c6
```

Java

```
Synchronizer synchronizer =
graph.createSynchronizer(FlashbackSynchronizer.class, conn);
```

Python

```
>>> synchronizer =
graph.create_synchronizer(synchronizer_class='oracle.pgx.api.FlashbackSynch
ronizer', jdbc_url=<jdbc_url>, username=<username>, password=<password>)
```

-
4. Fetch and apply the database changes by calling the `sync()` function and create a new in-memory graph snapshot:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph=synchronizer.sync()  
g ==> PgxGraph[name=BANK_GRAPH,N=999,E=4993,created=1660308128037]
```

Java

```
graph=synchronizer.sync();
```

Python

```
>>> graph = synchronizer.sync()
```

Note that the `Synchronizer` object needs to be created only once per session. Once created, you can perform the `synchronizer.sync()` operation multiple times to generate the latest graph snapshot that is consistent with the changes in the database.

Splitting the Fetching and Applying of Changes

The `synchronizer.sync()` invocation in the preceding code, fetches the changes and applies them in one call. However, you can encode a more complex update logic by splitting this process into separate `fetch()` and `apply()` invocations. For example:

```
synchronizer.fetch(); // fetches changes from the database  
if (synchronizer.getGraphDelta().getTotalNumberOfChanges() > 100) { //  
    only create snapshot if there have been more than 100 changes  
    synchronizer.apply();  
}
```

5. Query the graph to verify the updates to the edge property.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> graph.queryPgql("SELECT e.amount FROM MATCH (v1:Accounts)-  
[e:Transfers]->(v2:Accounts) WHERE e.src_acct_id = 179 AND  
e.dst_acct_id=688").print()
```

Java

```
graph.queryPgql("SELECT e.amount FROM MATCH (v1:Accounts)-[e:Transfers]-  
>(v2:Accounts) WHERE e.src_acct_id = 179 AND e.dst_acct_id=688").print();
```

Python

```
>>> graph.query_pgql("SELECT e.amount FROM MATCH (v1:Accounts)-
[e:Transfers]->(v2:Accounts) WHERE e.src_acct_id = 179 AND
e.dst_acct_id=688").print()
```

On execution, the preceding example produces the following output:

```
+-----+
| amount |
+-----+
| 4000.0 |
+-----+
```

18.5 Optimizing Graphs for Read Versus Updates in the Graph Server (PGX)

The graph server (PGX) can store an optimized graph for other reads or updates. This is only relevant when the updates are made directly to a graph instance in the graph server.

Graph Optimized for Reads

Graphs optimized for reads will provide the best performance for graph analytics and PGQL queries. In this case there could be potentially higher latencies to update the graph (adding or removing vertex and edges or updating the property values of previously existing vertex or edges through `GraphChangeSet` API). There could also be higher memory consumption. When using graphs optimized for reads, each updated graph or graph snapshot consumes memory proportional to the size of the graph in terms of vertices and edges.

The `optimized_for` configuration property can be set to `reads` when loading the graph into the graph server (PGX) to create a graph instance that is optimized for reads.

Graph Optimized for Updates

Graphs optimized for updates use a representation enabling low-latency update of graphs. With this representation, the graph server can reach millisecond-scale latencies when updating graphs with millions of vertices and edges (this is indicative and will vary depending on the hardware configuration).

To achieve faster update operations, graph server avoids as much as possible doing a full duplication of the previous graph (snapshot) to create a new graph (snapshot). This also improves the memory consumption (in typical scenarios). New snapshots (or new graphs) will only consume additional memory proportional to the memory required for the changes applied.

In this representation, there could be lower performance of graph queries and analytics.

The `optimized_for` configuration property can be set to `updates` when loading the graph into the graph server (PGX) to create a graph instance that is optimized for reads.

18.6 Executing Built-in Algorithms

The graph server (PGX) contains a set of built-in algorithms that are available as Java APIs.

The following table provides an overview of the available algorithms, grouped by category. Note that these algorithms can be invoked through the [Analyst Class](#).

Note

See the supported [Built-In Algorithms](#) on GitHub for more details.

Table 18-11 Overview of Built-In Algorithms

Category	Algorithms
Classic graph algorithms	Prim's Algorithm, Prim's Algorithm (Ignoring edge directions)
Community detection	Conductance Minimization (Soman and Narang Algorithm), Infomap, Label Propagation, Louvain, LouvainDirected, Speaker Listener Label Propagation
Connected components	Strongly Connected Components, Weakly Connected Components (WCC)
Link prediction	WTF (Whom To Follow) Algorithm
Matrix factorization	Matrix Factorization
Other	Graph Traversal Algorithms
Path finding	All Vertices and Edges on Filtered Path, Bellman-Ford Algorithms, Bidirectional Dijkstra Algorithms, Compute Distance Index, Compute High-Degree Vertices, Dijkstra Algorithms, Enumerate Simple Paths, Fast Path Finding, Fattest Path, Fattest Path (ignoring edge directions), Filtered Fast Path Finding, Hop Distance Algorithms
Ranking and walking	ArticleRank Algorithms, Closeness Centrality Algorithms, Degree Centrality Algorithms, Eigenvector Centrality, Harmonic Centrality, Hyperlink-Induced Topic Search (HITS), PageRank Algorithms, Random Walk with Restart, Stochastic Approach for Link-Structure Analysis (SALSA) Algorithms, Vertex Betweenness Centrality Algorithms
Structure evaluation	Adamic-Adar algorithms, Bipartite Check, Clustering Coefficient Algorithms, Conductance, Cycle Detection Algorithms, Degree Distribution Algorithms, Eccentricity Algorithms, K-Core, Modularity, Partition Conductance, Reachability Algorithms, Topological Ordering Algorithms, Triangle Counting Algorithms

The following topics describe the use of the graph server (PGX) using Triangle Counting and PageRank analytics as examples.

- [About Built-In Algorithms in the Graph Server \(PGX\)](#)
The graph server (PGX) contains a set of built-in algorithms that are available as Java and Python APIs.
- [Getting the Progress of a Running Algorithm](#)
The progress of a graph algorithm is based on the value of a monotonically increasing counter that gets incremented periodically during algorithm executions.
- [Centrality Algorithms](#)
Centrality algorithms are used to assess the importance or influence of nodes within a graph.
- [Running the Triangle Counting Algorithm](#)

18.6.1 About Built-In Algorithms in the Graph Server (PGX)

The graph server (PGX) contains a set of built-in algorithms that are available as Java and Python APIs.

The `oracle.pgx.api.Analyst` class provides convenience methods for invoking a set of built-in algorithms.

For example, this is the PageRank procedure signature:

```
/**
 * Classic pagerank algorithm. Time complexity:  $O(E * K)$  with  $E$  = number of
 * edges,  $K$  is a given constant (max
 * iterations)
 *
 * @param graph
 *         graph
 * @param e
 *         maximum error for terminating the iteration
 * @param d
 *         damping factor
 * @param max
 *         maximum number of iterations
 * @return Vertex Property holding the result as a double
 */
public <ID extends Comparable<ID>> VertexProperty<ID, Double>
pagerank(PgxGraph graph, double e, double d, int max);
```

18.6.2 Getting the Progress of a Running Algorithm

The progress of a graph algorithm is based on the value of a monotonically increasing counter that gets incremented periodically during algorithm executions.

You can track the progress of the algorithms using the `AlgorithmProgress` Java API and review the progress by comparing the counter value at various points in time to an estimate of the final value of the counter.

The `AlgorithmProgress` object represents the progress of an algorithm execution at a certain time. It contains the following two attributes:

- **numberOfStepsCompleted:** This counter represents the current number of steps executed.
- **numberOfStepsEstimatedForCompletion:** This value is an estimation of the total number of steps needed for completion.
A default positive value is provided for `numberOfStepsEstimatedForCompletion` for the following list of built-in algorithms:
 - *PageRank*
 - *Approximate PageRank*
 - *Personalized PageRank*
 - *Personalized PageRank (for a set of vertices)*
 - *Personalized Weighted PageRank*
 - *Personalized Weighted PageRank (for a set of vertices)*

- *Weighted PageRank*
- *Degree Centrality*
- *In-Degree Centrality*
- *Out-Degree Centrality*
- *Filtered Speaker Listener Label Propagation*
- *Filtered Weighted Speaker Listener Label Propagation*
- *Weighted Speaker Listener Label Propagation*
- *Speaker Listener Label Propagation*
- *Label Propagation*
- *Louvain*
- *Soman and Narang*
- *Weighted Infomap*
- *Dijkstra*
- *Undirected Dijkstra*
- *Filtered Dijkstra*
- *Undirected Filtered Dijkstra*
- *Multi-Destination Dijkstra*
- *Bidirectional Dijkstra*
- *Bidirectional Undirected Dijkstra*
- *Bidirectional Filtered Dijkstra*
- *Bidirectional Undirected Filtered Dijkstra*
- *Fattest Path*
- *Undirected Fattest Path*
- *Hop Distance*
- *Undirected Hop Distance*
- *Backward Hop Distance*
- *Bellman-Ford*
- *Backward Bellman-Ford*
- *Undirected Bellman-Ford*
- *Single Destination Bellman-Ford*

You cannot estimate the progress as a percentage for algorithms that do not provide a value for `numberOfStepsEstimatedForCompletion`. In such a case, you can only access the value of the counter (`numberOfStepsCompleted`).

However, you can set the `numberOfStepsEstimatedForCompletion` value for a custom PGX graph algorithm. See [Tracking the Progress of a Running Custom PGX Graph Algorithm](#) for more information.

The following example uses the in-built PageRank algorithm and describes the steps to get the progress of the running built-in algorithm using the `AlgorithmProgress` Java API:

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_TXN_GRAPH",
GraphSource.PG_PGQL)
g ==> PgxGraph[name=BANK_TXN_GRAPH,N=1000,E=4993,created=1712307339271]
opg4j> var future = analyst.pagerankAsync(graph)
future ==> oracle.pgx.api.PgxFuture@1dfe5dd1[Not completed]
opg4j> var futureProgress = future.getProgress()
futureProgress ==> oracle.pgx.api.DefaultFutureProgress@6d7bb5cc
opg4j> var algorithmProgress = futureProgress.asAlgorithmExecutionProgress()
```

Java

```
PgxGraph graph = session.readGraphByName("BANK_TXN_GRAPH",
GraphSource.PG_PGQL);
PgxFuture<?> future = analyst.pagerank.runAsync(graph);
FutureProgress futureProgress = future.getProgress();
Optional<AlgorithmProgress> algorithmProgress =
futureProgress.asAlgorithmExecutionProgress();
```

The following code shows how you can estimate the progress as a percentage for the running algorithm:

- [JShell](#)
- [Java](#)

JShell

```
opg4j> if (algorithmProgress.isPresent()) {
...> var progress = algorithmProgress.get();
...> var completedSteps = progress.getNumberOfStepsCompleted();
...> var numberOfStepsEstimatedForCompletion =
progress.getNumberOfStepsEstimatedForCompletion();
...> var progressPercentage = completedSteps * 100 /
numberOfStepsEstimatedForCompletion;
...> System.out.println(completedSteps);
...> System.out.println(numberOfStepsEstimatedForCompletion);
...> System.out.println(progressPercentage);
...> }
```

Java

```

if (algorithmProgress.isPresent()) {
    AlgorithmProgress progress = algorithmProgress.get();
    long completedSteps = progress.getNumberOfStepsCompleted();
    Long numberOfStepsEstimatedForCompletion =
progress.getNumberOfStepsEstimatedForCompletion();
    long progressPercentage = completedSteps * 100 /
numberOfStepsEstimatedForCompletion;
    System.out.println(completedSteps);
    System.out.println(numberOfStepsEstimatedForCompletion);
    System.out.println(progressPercentage);
};

```

The preceding code shows the progress at that current moment. If you try to get the progress of the running algorithm after a while (for example, 1min), then you should get a larger value for `progressPercentage`.

18.6.3 Centrality Algorithms

Centrality algorithms are used to assess the importance or influence of nodes within a graph.

These algorithms can be broadly classified into three categories based on their locality and focus.

Table 18-12 Classification of Centrality Algorithms

Category	Description	Example Algorithms
Local Measures	These algorithms evaluate a node's importance based on its immediate connections, offering straightforward and computationally efficient insights.	Degree Centrality
Global Path-Based Measures	These algorithms evaluate nodes based on their overall connectivity and shortest paths within the entire graph.	Closeness Centrality, Harmonic Centrality, Betweenness Centrality
Global Influence-Based Measures	These algorithms evaluate a node's influence based on their direct and indirect connections, offering in-depth insights into hierarchical importance and influence within complex graphs.	Eigenvector centrality, Random Walk with Restart (RWR), PageRank, ArticleRank, Hyperlink-Induced Topic Search (HITS), Stochastic Approach for Link-Structure Analysis (SALSA)

Learn more about the Centrality algorithms in the following topics.

- [Degree Centrality](#)
The Degree Centrality algorithm measures the number of direct connections each node has in a graph, indicating its immediate level of influence or prominence within the graph.
- [Closeness Centrality](#)
The Closeness Centrality algorithm identifies nodes that can quickly reach all other nodes, highlighting efficient communicators or spreaders of information.

- [Harmonic Centrality](#)
The Harmonic Centrality algorithm improves closeness centrality to better account for disconnected graphs.
- [Vertex Betweenness Centrality](#)
The Vertex Betweenness Centrality algorithm identifies nodes that act as critical bridges, controlling the flow of information or resources through the graph.
- [PageRank](#)
PageRank assigns a numerical weight to each vertex, measuring its relative importance within the graph.

18.6.3.1 Degree Centrality

The Degree Centrality algorithm measures the number of direct connections each node has in a graph, indicating its immediate level of influence or prominence within the graph.

This algorithm can be applied in the following scenarios:

- To quickly gain local insights into node importance based on direct connections.
- To understand immediate influence or activity levels.
- Social networking analysis, such as identifying users with most friends or followers.
- Financial transactions analysis, such as detecting accounts with the highest number of transactions.
- Studying spreading of diseases by pinpointing individuals who have direct contact with most people.

The following variants of Degree Centrality algorithms are supported:

- **Degree Centrality:** Returns the sum of the number of incoming and outgoing edges for each vertex in the graph.
- **In-Degree Centrality:** Returns the sum of the number of incoming edges for each vertex in the graph.
- **Out-Degree Centrality:** Returns the sum of the number of outgoing edges for each vertex in the graph.

See the [Javadoc](#) and [Python API Reference](#) for more information on the corresponding APIs for running these algorithms.

Example 18-2 Running the In-Degree Centrality Algorithm

The following example runs the in-degree centrality algorithm on `BANK_GRAPH` to identify the top 10 accounts having the maximum number of incoming transactions.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL)
graph ==> PgxGraph[name=BANK_GRAPH,N=1000,E=4996,created=1643308582055]
```

```

opg4j> var a = session.createAnalyst()
a ==> NamedArgumentAnalyst[session=4c054326-600d-47d3-ab40-36b41fa0e339]
opg4j> a.inDegreeCentrality(graph)
$3 ==> VertexProperty[name=in_degree,type=integer,graph=BANK_GRAPH_PGQL]
opg4j> graph.queryPgql("SELECT DISTINCT m.id, m.in_degree FROM MATCH
(m:accounts) -[e:transfers]-> (n:accounts) ORDER BY m.in_degree DESC LIMIT
10").print()
+-----+
| id | in_degree |
+-----+
| 387 | 39        |
| 934 | 39        |
| 135 | 36        |
| 534 | 32        |
| 380 | 31        |
| 330 | 30        |
| 406 | 28        |
| 746 | 28        |
| 259 | 26        |
| 352 | 26        |
+-----+
$5 ==> PgqlResultSetImpl[graph=BANK_GRAPH_PGQL,numResults=10]

```

Java

```

PgxGraph graph = session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL);
Analyst a = session.createAnalyst();
a.inDegreeCentrality(graph);
PgqlResultSet rs = graph.queryPgql("SELECT DISTINCT m.id, m.in_degree FROM MATCH
MATCH (m:accounts) -[e:transfers]-> (n:accounts) ORDER BY m.in_degree DESC
LIMIT 10");
rs.print();

```

Python

```

>>> graph = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
>>> a = session.create_analyst()
>>> a.in_degree_centrality(graph)
VertexProperty(name: in_degree, type: integer, graph: BANK_GRAPH_PGQL)
>>> graph.query_pgql("SELECT DISTINCT m.id, m.in_degree FROM MATCH
(m:accounts) -[e:transfers]-> (n:accounts) ORDER BY m.in_degree DESC LIMIT
10").print()
+-----+
| id | in_degree |
+-----+
| 387 | 39        |
| 934 | 39        |
| 135 | 36        |
| 534 | 32        |
| 380 | 31        |
| 330 | 30        |
| 406 | 28        |
| 746 | 28        |
| 259 | 26        |
+-----+

```

	352		26	
+	-----+			

18.6.3.2 Closeness Centrality

The Closeness Centrality algorithm identifies nodes that can quickly reach all other nodes, highlighting efficient communicators or spreaders of information.

This algorithm can be applied in the following scenarios:

- To determine nodes that are central to the overall structure of the graph, facilitating efficient information flow or influence spreading.
- In social network analysis, for example, finding influencers who can disseminate information quickly to the entire network.
- In financial transactions analysis, for example, accounts with high closeness centrality might facilitate rapid money movement, making them potential candidates for closer monitoring for fraudulent activities such as money laundering.
- In studying spreading of diseases, for example, identifying individuals who can potentially spread a disease to many others quickly due to their central position in the network.

The following two variants are supported for Closeness Centrality:

- **Closeness Centrality (Unit Length):** The Closeness Centrality of a node v is the reciprocal of the sum of all the distances from the possible shortest paths starting from v . Thus the higher the centrality value of v , the closer it is to all the other vertices in the graph.
- **Closeness Centrality (with weights):** This takes into account the weights from the edges when computing the reciprocal of the sum of all the distances from the possible shortest paths starting from the vertex v , for every vertex in the graph. The weights of the edges must be positive values greater than 0.

See the [Javadoc](#) and [Python API Reference](#) for more information on the corresponding APIs for running these algorithms.

Example 18-3 Running the Closeness Centrality Algorithm

The following example runs the Closeness Centrality algorithm on `BANK_GRAPH` to identify the top five accounts that have higher levels of connections with the other accounts.

- [JShell](#)
- [Java](#)

18.6.3.3 Harmonic Centrality

The Harmonic Centrality algorithm improves closeness centrality to better account for disconnected graphs.

This algorithm can be applied in the following scenarios for a disconnected graph:

- To determine nodes that are central to the overall structure of the graph, facilitating efficient information flow or influence spreading.
- In social network analysis, for example, finding influencers who can disseminate information quickly to the entire network.
- In financial transactions analysis, for example, accounts with high closeness centrality might facilitate rapid money movement, making them potential candidates for closer monitoring for fraudulent activities such as money laundering.
- In studying spreading of diseases, for example, identifying individuals who can potentially spread a disease to many others quickly due to their central position in the network.

See the [Javadoc](#) and [Python API Reference](#) for more information on the corresponding APIs for running these algorithms.

Example 18-4 Running the Harmonic Centrality Algorithm

The following example measures the harmonic centrality value for each vertex account in BANK_GRAPH and prints the top five accounts that have higher levels of connections with the other accounts.

18.6.3.4 Vertex Betweenness Centrality

The Vertex Betweenness Centrality algorithm identifies nodes that act as critical bridges, controlling the flow of information or resources through the graph.

This algorithm can be applied in the following scenarios:

- To identifying nodes that are strategically positioned for mediating interactions within the graph.
- In social network analysis, for example, highlighting users who act as connectors between different groups or communities.
- In financial transactions analysis, for example, detecting accounts that facilitate transactions between otherwise unconnected parts of the financial network.
- In studying spreading of diseases, for example, identifying individuals who serve as bridges between different social groups, potentially controlling the spread of a disease across the entire population.

The following three variants are supported for Vertex Betweenness Centrality:

- **Vertex Betweenness Centrality:** The Betweenness Centrality of a vertex v in a graph is the sum of the fraction of shortest paths that pass through v from all the possible shortest paths connecting every possible pair of vertices s , t in the graph, such that v is different from s and t . This algorithm applies for connected graphs.
- **Approximate Vertex Betweenness Centrality with Random Seeds:** This variant of betweenness centrality approximates the centrality of the vertices by just using k random vertices as starting points for the BFS traversals of the graph, instead of computing the exact value by using all the vertices in the graph.

- **Approximate Vertex Betweenness Centrality From seeds:** This variant of betweenness centrality approximates the centrality of the vertices by just using the vertices from the given sequence as starting points for the BFS traversals of the graph, instead of computing the exact value by using all the vertices in the graph.

See the [Javadoc](#) and [Python API Reference](#) for more information on the corresponding APIs for running these algorithms.

Example 18-5 Running the Betweenness Centrality Algorithm

The following example identifies the top five accounts that act as critical bridges in graph `g1`.

352	16625.818593102595
135	15190.461087012543
934	14642.317059371073
222	13688.935057639192

18.6.3.5 PageRank

PageRank assigns a numerical weight to each vertex, measuring its relative importance within the graph.

This algorithm can be applied in the following scenarios:

- To identify nodes that directly and indirectly influence other nodes.
- In place of Eigenvector centrality, when the underlying process includes randomness, for example, random browsing.
- In social networks analysis, for example, finding influencers with direct and indirect influence within the graph.
- In disease spreading analysis, for example, assessing the risk of individuals in spreading a disease.

PageRank computes a rank value between 0 and 1 for each vertex (node) in the graph and stores the values in a `double` property. The algorithm therefore creates a *vertex property* of type `double` for the output.

In the graph server (PGX), there are two types of vertex and edge properties:

- **Persistent Properties:** Properties that are loaded with the graph from a data source are fixed, in-memory copies of the data on disk, and are therefore persistent. Persistent properties are read-only, immutable and shared between sessions.
- **Transient Properties:** Values can only be written to transient properties, which are private to a session. You can create transient properties by calling `createVertexProperty` and `createEdgeProperty` on `PgxGraph` objects, or by copying existing properties using `clone()` on `Property` objects.

Transient properties hold the results of computation by algorithms. For example, the PageRank algorithm computes a rank value between 0 and 1 for each vertex in the graph and stores these values in a transient property named `pg_rank`. Transient properties are destroyed when the `Analyst` object is destroyed.

The following variants of PageRank algorithms are supported:

- **Classic PageRank:** Computes ranking scores for the vertices using the network created by the incoming edges in the graph. Although it is intended for directed graphs, undirected graphs can be treated as well by converting them into directed graphs with reciprocated edges (that is, keeping the original edge and creating a second one going in the opposite direction).
- **Approximate PageRank:** Computes the ranking scores for the vertices in similar way to the classic algorithm without normalization and with a more relaxed convergence criteria since the tolerated error value is compared against each single vertex in the graph, instead of looking at the cumulative vertex error. Thus this variant will converge faster than the classic algorithm, but the ranking values might not be as accurate as in the classic implementation.
- **Weighted PageRank:** Similar to the classic PageRank algorithm, except that it allows for a weight value to be assigned to each edge. This weight determines the fraction of the PageRank score that will flow from the source vertex through the current edge to its destination vertex.

See the [Javadoc](#) and [Python API Reference](#) for more information on the corresponding APIs for running these algorithms.

Example 18-6 Running the PageRank Algorithm

The following example runs the PageRank algorithm on `BANK_GRAPH` to identify the top five accounts with the highest PageRank values. The PageRank algorithm uses the following default values for the input parameters: error (tolerance = 0.001), damping factor = 0.85, and maximum number of iterations = 100.

```

18.6.4 Running the Triangle Counting Algorithm

For triangle counting, the `sortByDegree` boolean parameter of `countTriangles()` allows you to control whether the graph should first be sorted by degree (`true`) or not (`false`). If `true`, more memory will be used, but the algorithm will run faster; however, if your graph is very large, you might want to turn this optimization off to avoid running out of memory.

- [JShell](#)
- [Java](#)

JShell

```
opg4j> analyst.countTriangles(graph, true)
==> 1
```

Java

```
import oracle.pgx.api.*;

Analyst analyst = session.createAnalyst();
long triangles = analyst.countTriangles(graph, true);
```

The algorithm finds one triangle in the sample graph.

✓ Tip

When using the graph shell, you can increase the amount of log output during execution by changing the logging level. See information about the `:loglevel` command with `:h :loglevel`.

18.7 Using Custom PGX Graph Algorithms

A custom PGX graph algorithm allows you to write a graph algorithm in Java syntax and have it automatically compiled to an efficient parallel implementation.

- [Writing a Custom PGX Algorithm](#)
- [Compiling and Running a Custom PGX Algorithm](#)
- [Example Custom PGX Algorithm: PageRank](#)
- [Tracking the Progress of a Running Custom PGX Graph Algorithm](#)

18.7.1 Writing a Custom PGX Algorithm

A PGX algorithm is a regular .java file with a single class definition that is annotated with `@GraphAlgorithm`. For example:

```
import oracle.pgx.algorithm.annotations.GraphAlgorithm;

@GraphAlgorithm
public class MyAlgorithm {
    ...
}
```

A PGX algorithm class must contain exactly one public method which will be used as entry point. The class may contain any number of private methods.

For example:

```
import oracle.pgx.algorithm.PgxGraph;
import oracle.pgx.algorithm.VertexProperty;
import oracle.pgx.algorithm.annotations.GraphAlgorithm;
import oracle.pgx.algorithm.annotations.Out;

@GraphAlgorithm
public class MyAlgorithm {
    public int myAlgorithm(PgxGraph g, @Out VertexProperty<Integer> distance)
```

```
{
    System.out.println("My first PGX Algorithm program!");

    return 42;
}
```

As with normal Java methods, a PGX algorithm method only supports primitive data types as return values (an integer in this example). More interesting is the `@Out` annotation, which marks the vertex property `distance` as output parameter. The caller passes output parameters by reference. This way, the caller has a reference to the modified property after the algorithm terminates.

- [Collections](#)
- [Iteration](#)
- [Reductions](#)

18.7.1.1 Collections

To create a collection you call the `.create()` function. For example, a `VertexProperty<Integer>` is created as follows:

```
VertexProperty<Integer> distance = VertexProperty.create();
```

To get the value of a property at a certain vertex `v`:

```
distance.get(v);
```

Similarly, to set the property of a certain vertex `v` to a value `e`:

```
distance.set(v, e);
```

You can even create properties of collections:

```
VertexProperty<VertexSequence> path = VertexProperty.create();
```

However, PGX Algorithm assignments are always *by value* (as opposed to *by reference*). To make this explicit, you *must* call `.clone()` when assigning a collection:

```
VertexSequence sequence = path.get(v).clone();
```

Another consequence of values being passed *by value* is that you can check for equality using the `==` operator instead of the Java method `.equals()`. For example:

```
PgxVertex v1 = G.getRandomVertex();
PgxVertex v2 = G.getRandomVertex();
System.out.println(v1 == v2);
```

18.7.1.2 Iteration

The most common operations in PGX algorithms are iterations (such as looping over all vertices, and looping over a vertex's neighbors) and graph traversal (such as breath-first/depth-first). All collections expose a `forEach` and `forSequential` method by which you can iterate over the collection in parallel and in sequence, respectively.

For example:

- To iterate over a graph's vertices in parallel:

```
G.getVertices().forEach(v -> {
    ...
});
```

- To iterate over a graph's vertices in sequence:

```
G.getVertices().forSequential(v -> {
    ...
});
```

- To traverse a graph's vertices from `r` in breadth-first order:

```
import oracle.pgx.algorithm.Traversal;

Traversal.inBFS(G, r).forward(n -> {
    ...
});
```

Inside the `forward` (or `backward`) lambda you can access the current level of the BFS (or DFS) traversal by calling `currentLevel()`.

18.7.1.3 Reductions

Within these parallel blocks it is common to atomically update, or reduce to, a variable defined outside the lambda. These atomic reductions are available as methods on `Scalar<T>`: `reduceAdd`, `reduceMul`, `reduceAnd`, and so on. For example, to count the number of vertices in a graph:

```
public int countVertices() {
    Scalar<Integer> count = Scalar.create(0);

    G.getVertices().forEach(n -> {
        count.reduceAdd(1);
    });

    return count.get();
}
```

Sometimes you want to update multiple values atomically. For example, you might want to find the smallest property value as well as the vertex whose property value attains this smallest value. Due to the parallel execution, two separate reduction statements might get you in an inconsistent state.

To solve this problem the `Reductions` class provides `argMin` and `argMax` functions. The first argument to `argMin` is the current value and the second argument is the potential new minimum. Additionally, you can chain `andUpdate` calls on the `ArgMinMax` object to indicate other variables and the values that they should be updated to (atomically). For example:

```
VertexProperty<Integer> rank = VertexProperty.create();
int minRank = Integer.MAX_VALUE;
PgxVertex minVertex = PgxVertex.NONE;

G.getVertices().forEach(n ->
    argMin(minRank, rank.get(n)).andUpdate(minVertex, n)
);
```

18.7.2 Compiling and Running a Custom PGX Algorithm

To be able to compile and run a custom PGX algorithm, you must perform the following actions:

1. Set the following two configuration parameters in the `conf/pgx.conf` file:
 - Set the `graph_algorithm_language` option to `JAVA`.
 - Set the `java_home_dir` option to the path to your Java home (use `<system-java-home-dir>` to have PGX infer Java home from the system properties).

```
{
  "graph_algorithm_language": "JAVA",
  "java_home_dir": "<system-java-home-dir>"
}
```

2. Create a session.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph
./bin/opg4j
```

Java

```
import oracle.pgx.algorithm.*;
PgxSession session = Pgx.createSession("my-session");
```

Python

```
session = instance.create_session("my-session")
```

3. Compile a PGX Algorithm. For example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var myAlgorithm = session.compileProgram("/path/to/MyAlgorithm.java")
myAlgorithm ==> CompiledProgram[name=MyAlgorithm]
```

Java

```
import oracle.pgx.algorithm.CompiledProgram;
CompiledProgram myAlgorithm = session.compileProgram("/path/to/MyAlgorithm.java");
```

Python

```
my_algorithm = session.compile_program("/path/to/MyAlgorithm.java")
```

4. Run the algorithm. For example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graph =
session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL)
g ==> PgxGraph[name=BANK_GRAPH_2,N=999,E=4993,created=1689325558251]
opg4j> var property = graph.createVertexProperty(PropertyType.INTEGER)
property ==>
VertexProperty[name=vertex_prop_integer_9,type=integer,graph=bank_graph_analytics]
opg4j> myAlgorithm.run(graph, property)
$6 ==> {
  "success" : true,
  "canceled" : false,
  "exception" : null,
```

```

    "returnValue" : 42,
    "executionTimeMs" : 0
}

```

Java

```

import oracle.pgx.algorithm.VertexProperty;
PgxGraph graph =
session.readGraphByName("BANK_GRAPH", GraphSource.PG_PGQL);
VertexProperty property = graph.createVertexProperty(PropertyType.INTEGER);
myAlgorithm.run(graph, property);

```

Python

```

graph = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
property = graph.create_vertex_property("integer")
my_algorithm.run(graph, property)
{'success': True, 'canceled': False, 'exception': None, 'return_value':
42, 'execution_time(ms)': 1}

```

18.7.3 Example Custom PGX Algorithm: PageRank

The following is an implementation of pagerank as a PGX algorithm:

```

import oracle.pgx.algorithm.PgxGraph;
import oracle.pgx.algorithm.Scalar;
import oracle.pgx.algorithm.VertexProperty;
import oracle.pgx.algorithm.annotations.GraphAlgorithm;
import oracle.pgx.algorithm.annotations.Out;

@GraphAlgorithm
public class Pagerank {
    public void pagerank(PgxGraph G, double tol, double damp, int max_iter,
boolean norm, @Out VertexProperty<Double> rank) {
        Scalar<Double> diff = Scalar.create();
        int cnt = 0;
        double N = G.getNumVertices();

        rank.setAll(1 / N);
        do {
            diff.set(0.0);
            Scalar<Double> dangling_factor = Scalar.create(0d);

            if (norm) {
                dangling_factor.set(damp / N * G.getVertices().filter(v ->
v.getOutDegree() == 0).sum(rank::get));
            }

            G.getVertices().forEach(t -> {
                double in_sum = t.getInNeighbors().sum(w -> rank.get(w) /
w.getOutDegree());

```

```

        double val = (1 - damp) / N + damp * in_sum + dangling_factor.get();
        diff.reduceAdd(Math.abs(val - rank.get(t)));
        rank.setDeferred(t, val);
    });
    cnt++;
} while (diff.get() > tol && cnt < max_iter);
}
}

```

18.7.4 Tracking the Progress of a Running Custom PGX Graph Algorithm

You can track the progress of a running custom graph algorithm using the `AlgorithmProgress` Java API.

The `AlgorithmProgress` object, which comprises the `numberOfStepsCompleted` and `numberOfStepsEstimatedForCompletion` attributes, is used to calculate the progress of the algorithm as a percentage.

In case of custom algorithms, the value of `numberOfStepsEstimatedForCompletion` is not automatically provided. You are therefore expected to provide the value by calling `ControlFlow.setNumberOfStepsEstimatedForCompletion` while implementing your algorithms. If no value is provided, or the provided value is negative, then `number_of_steps_estimated_for_completion` uses the default null value.

The following example describes the steps for setting the `numberOfStepsEstimatedForCompletion` value in a custom graph algorithm followed by tracking and estimating the progress as a percentage of a running custom graph algorithm using the `AlgorithmProgress` Java API.

1. Set the value for `numberOfStepsEstimatedForCompletion` in your custom graph algorithm.

Note that you cannot estimate the progress as a percentage for algorithms that do not provide a value for `numberOfStepsEstimatedForCompletion`. However you can still access the value of the counter (`numberOfStepsCompleted`).

The value of `numberOfStepsEstimatedForCompletion` should ideally be equal to the total number of execution steps that an algorithm will perform. An execution step is simply a loop iteration. If the exact value cannot be specified, you should provide an upper bound estimate of that value.

Consider the following `outDegreeCentrality` algorithm:

```

import oracle.pgx.algorithm.PgxGraph;
import oracle.pgx.algorithm.VertexProperty;
import oracle.pgx.algorithm.annotations.GraphAlgorithm;
import oracle.pgx.algorithm.annotations.Out;
import oracle.pgx.algorithm.ControlFlow;

@GraphAlgorithm
public class OutdegreeCentrality {
    public void outdegreeCentrality(PgxGraph g, @Out VertexProperty<Integer>
outdegreeCentrality) {
        g.getVertices().forEach(n ->
            outdegreeCentrality.set(n, (int) n.getOutDegree())
        );
    }
}

```

The algorithm just iterates over all vertices of the graph and updates a property. Therefore, the total number of execution steps in this case is equal to the number of vertices of the graph:

```
@GraphAlgorithm
public class OutdegreeCentrality {
    public void outdegreeCentrality(PgxGraph g, @Out VertexProperty<Integer>
outdegreeCentrality) {

        long totNbOfSteps = g.getNumVertices();
        ControlFlow.setNumberOfStepsEstimatedForCompletion(totNbOfSteps);

        g.getVertices().forEach(n ->
            outdegreeCentrality.set(n, (int) n.getOutDegree())
        );
    }
}
```

2. Run and track the progress of the custom Out-Degree Centrality algorithm as shown:

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var myAlgorithm = session.compileProgram("/path/to/
OutdegreeCentrality.java")
myAlgorithm ==> CompiledProgram[name=outdegreeCentrality]
opg4j> var graph = session.readGraphByName("BANK_TXN_GRAPH",
GraphSource.PG_PGQL)
graph ==> PgxGraph[name=BANK_TXN_GRAPH,N=1000,E=4993,created=1712307339271]
opg4j> var future = analyst.outDegreeCentralityAsync(graph)
future ==> oracle.pgx.api.PgxFuture@55fe9c2f[Not completed]
opg4j> var futureProgress = future.getProgress()
futureProgress ==> oracle.pgx.api.DefaultFutureProgress@637506d8
opg4j> var algorithmProgress =
futureProgress.asAlgorithmExecutionProgress()
```

Java

```
import oracle.pgx.algorithm.CompiledProgram;

CompiledProgram myAlgorithm = session.compileProgram("/path/to/
OutdegreeCentrality.java");
PgxGraph graph = session.readGraphByName("BANK_TXN_GRAPH",
GraphSource.PG_PGQL);
PgxFuture<?> future = analyst.pagerankAsync(graph);
FutureProgress futureProgress = future.getProgress();
Optional<AlgorithmProgress> algorithmProgress =
futureProgress.asAlgorithmExecutionProgress();
```

3. Estimate the progress of the running algorithm as a percentage.

- ```

if (algorithmProgress.isPresent()) {
 AlgorithmProgress progress = algorithmProgress.get();
 long completedSteps = progress.getNumberOfStepsCompleted();
 Long numberOfStepsEstimatedForCompletion =
progress.getNumberOfStepsEstimatedForCompletion();
 long progressPercentage = completedSteps * 100 /
numberOfStepsEstimatedForCompletion;
 System.out.println(completedSteps); // 153
 System.out.println(numberOfStepsEstimatedForCompletion); // 2343
 System.out.println(progressPercentage); // 6.53
}

```
- ```

if (algorithmProgress.isPresent()) {
    AlgorithmProgress progress = algorithmProgress.get();
    long completedSteps = progress.getNumberOfStepsCompleted();
    Long numberOfStepsEstimatedForCompletion =
progress.getNumberOfStepsEstimatedForCompletion();
    long progressPercentage = completedSteps * 100 /
numberOfStepsEstimatedForCompletion;
    System.out.println(completedSteps); // 153
    System.out.println(numberOfStepsEstimatedForCompletion); // 2343
    System.out.println(progressPercentage); // 6.53
};

```

The preceding code shows the progress as 6.53 % at that current moment. If you try to get the progress of the running algorithm after a while (for example, 1min), then you should get a larger value.

[Getting the Progress of a Running Algorithm](#)

18.8 User-Defined Functions (UDFs) in PGX

User-defined functions (UDFs) allow users of PGX to add custom logic to their PGQL queries or custom graph algorithms, to complement built-in functions with custom requirements.

Caution

UDFs enable running arbitrary code in the PGX server, possibly accessing sensitive data. Additionally, any PGX session can invoke any of the UDFs that are enabled on the PGX server. The application administrator who enables UDFs is responsible for checking the following:

- All the UDF code can be trusted.
- The UDFs are stored in a secure location that cannot be tampered with.

Furthermore, PGX assumes UDFs to be state-less and side-effect free.

PGX supports two types of UDFs:

- Java UDFs
- JavaScript UDFs

How to Use Java UDFs

The following simple example shows how to register a Java UDF at the PGX server and invoke it.

1. Create a class with a public static method. For example:

```
package my.udfs;

public class MyUdfs {
    public static String concat(String a, String b) {
        return a + b;
    }
}
```

2. Compile the class and compress into a JAR file. For example:

```
mkdir ./target
javac -d ./target *.java
cd target
jar cvf MyUdfs.jar *
```

3. Copy the JAR file into `/opt/oracle/graph/pgx/server/lib`.
4. Create a UDF JSON configuration file. For example, assume that `/path/to/my/udfs/dir/my_udfs.json` contains the following:

```
{
  "user_defined_functions": [
    {
      "namespace": "my",
      "language": "java",
      "implementation_reference": "my.udfs.MyUdfs",
      "function_name": "concat",
      "return_type": "string",
      "arguments": [
        {
          "name": "a",
          "type": "string"
        },
        {
          "name": "b",
          "type": "string"
        }
      ]
    }
  ]
}
```

5. Point to the directory containing the UDF configuration file in `/etc/oracle/graph/pgx.conf`. For example:

```
"udf_config_directory": "/path/to/my/udfs/dir/"
```

6. Restart the PGX server. For example:

```
sudo systemctl restart pgx
```

7. Try to invoke the UDF from within a PGQL query. For example:

```
graph.queryPgql("SELECT my.concat(my.concat(n.firstName, ' '), n.lastName)
FROM MATCH (n:Person)")
```

8. Try to invoke the UDF from within a PGX algorithm. For example:

Note

For each UDF you want to use, you need to create an abstract method with the same schema that gets annotated with the `@Udf` annotation.

```
import oracle.pgx.algorithm.annotations.Udf;
....

@GraphAlgorithm
public class MyAlogrithm {
    public void bomAlgorithm(PgxGraph g, VertexProperty<String> firstName,
        VertexProperty<String> lastName, @Out VertexProperty<String> fullName) {

        ... fullName.set(v, concat(firstName.get(v), lastName.get(v))); ...

    }

    @Udf(namespace = "my")
    abstract String concat(String a, String b);
}
```

JavaScript UDFs

The requirements for a JavaScript UDF is as follows:

- The JavaScript source must contain all dependencies.
- The source must contain at least one valid export.
- The language parameter must be set to `javascript` in the UDF configuration file.

For example, consider a JavaScript source file `format.js` as shown:

```
//format.js
const fun = function(name, country) {
    if (country == null) return name;
    else return name + " (" + country + ")";
}
```

```
module.exports = {stringFormat: fun};
```

In order to load the UDF from `format.js`, the UDF configuration file will appear as follows:

```
{
  "namespace": "my",
  "function_name": "format",
  "language": "javascript",
  "source_location": "format.js",
  "source_function_name": "stringFormat",
  "return_type": "string",
  "arguments": [
    {
      "name": "name",
      "type": "string"
    },
    {
      "name": "country",
      "type": "string"
    }
  ]
}
```

Note

In this case, since the name of the UDF and the implementing method differ, you need to set the name of the UDF in the `source_function_name` field. Also, you can provide the path of the source code file in the `source_location` field.

UDF Configuration File Information

A UDF configuration file is a JSON file containing an array of `user_defined_functions`. (An example of such a file is in the step to "Create a UDF JSON configuration file" in the preceding [How to Use Java UDFs](#) subsection.)

Each user-defined function supports the fields shown in the following table.

Table 18-13 Fields for Each UDF

Field	Data Type	Description	Required?
<code>function_name</code>	string	Name of the function used as identifier in PGX	Required
<code>language</code>	enum[java, javascript]	Source language for the function (java or javascript)	Required
<code>return_type</code>	enum[boolean, integer, long, float, double, string]	Return type of the function	Required
<code>arguments</code>	array of object	Array of arguments. For each argument: type, argument name, required?	[]

Table 18-13 (Cont.) Fields for Each UDF

Field	Data Type	Description	Required?
implementation_reference	string	Reference to the function name on the classpath	null
namespace	string	Namespace of the function in PGX	null
source_code	string	Source code of the function provided inline	null
source_function_name	string	Name of the function in the source language	null
source_location	string	Local file path to the function's source code	null

All configured UDFs must be unique with regard to the combination of the following fields:

- namespace
- function_name
- arguments

18.9 Using Graph Server (PGX) as a Library

When you utilize PGX as a library in your application, the graph server (PGX) instance runs in the same JVM as the Java application and all requests are translated into direct function calls instead of remote procedure invocations.

In this case, you must install the graph server (PGX) using `RPM` in the same machine as the client applications. The shell executables provided by the graph server installation helps you to launch the Java or the Python shell in an embedded server mode. See [Installing Oracle Graph Server](#) for more information.

You can now start the Java shell without any parameters as shown:

```
cd /opt/oracle/graph
./bin/opg4j
```

The local PGX instance will try to load a PGX configuration file from:

```
/etc/oracle/graph/pgx.conf
```

You can change the location of the configuration file by passing the `--pgx_conf` command-line option followed by the path to the configuration file:

```
# start local PGX instance with custom config
./bin/opg4j --pgx_conf <path_to_pgx.conf>
```

You can also start the Python shell without any parameters as shown:

```
cd /opt/oracle/graph/
./bin/opg4py
```

When using Java, you can obtain a reference to the local PGX instance as shown:

```
import oracle.pg.rdbms.*;
import oracle.pgx.api.*;
...
ServerInstance instance = GraphServer.getEmbeddedInstance();
```

In a Python application, you can obtain a reference to the local PGX instance as shown:

```
import os
os.environ["PGX_CLASSPATH"] = "/opt/oracle/graph/lib/*"
import opg4py.graph_server as graph_server
...
instance = graph_server.get_embedded_instance()
```

Starting the PGX Engine

PGX provides a convenience mechanism to start the PGX Engine when using the graph server (PGX) as a library. That is, the graph server (PGX) is automatically initialized and starts up automatically when `ServerInstance.createSession()` is called the first time. This is provided that the engine is not already running at that time.

For this implicit initialization, PGX will configure itself with the PGX configuration file at the default locations. If the PGX configuration file is not found, PGX will configure itself using default parameter values as shown in [Configuration Parameters for the Graph Server \(PGX\) Engine](#).

Stopping the PGX Engine

When using the graph server (PGX) as a library, the `shutdownEngine()` method will be called automatically via a JVM shutdown hook on exit. Specifically, the shutdown hook is invoked once all the [non-daemon threads](#) of the application exit.

It is recommended that you do not terminate your PGX application forcibly with `kill -9`, as it will not clear the `tmp` directory. See `tmp_dir` in [Configuration Parameters for the Graph Server \(PGX\) Engine](#).

- [Using the PGX JDBC Driver when Graph Server \(PGX\) is Utilized as a Library](#)
When using the graph server (PGX) as a library, you can use the PGX JDBC driver to query graphs that are loaded from files.

18.9.1 Using the PGX JDBC Driver when Graph Server (PGX) is Utilized as a Library

When using the graph server (PGX) as a library, you can use the PGX JDBC driver to query graphs that are loaded from files.

Note the following to use the PGX JDBC driver:

- Register the PGX JDBC driver with the `DriverManager`:

```
import java.sql.DriverManager;
import oracle.pgx.jdbc.PgxJdbcDriver;
DriverManager.registerDriver(new PgxJdbcDriver());
```

- The JDBC URL to obtain a connection object is as shown:
`jdbc:oracle:pgx:embedded`

The following example uses the PGX JDBC driver to query a graph loaded from .csv files.

```
opg4j> import oracle.pgx.jdbc.*
opg4j> DriverManager.registerDriver(new PgxJdbcDriver())
opg4j> var conn = DriverManager.getConnection("jdbc:oracle:pgx:embedded")
conn ==> oracle.pgx.jdbc.PgxConnection@1b96d447
opg4j> PgxSession session = conn.unwrap(PgxSession.class)
session ==> PgxSession[ID=738da6ff-81a5-4d6f-9bdc-a912f2193b44,source=PGX-
JDBC]
opg4j> session.readGraphFiles("/scratch/PG/Data/accounts.csv", "/scratch/PG/
Data/transfers.csv", "bank_graph")
$5 ==> PgxGraph[name=bank_graph,N=1000,E=5001,created=1705401162835]
opg4j> var stmt = conn.createStatement()
stmt ==> oracle.pgx.jdbc.StatementWrapper@48dc9950
opg4j> var rs = stmt.executeQuery("SELECT e.AMOUNT as AMOUNT FROM MATCH (a) -
[e]-> (b) ON bank_graph LIMIT 5")
rs ==> oracle.pgx.jdbc.ResultSetWrapper@16a89351
opg4j> while(rs.next()){
...> System.out.println("AMOUNT = " + rs.getDouble("amount"));
...> }
AMOUNT = 1000.0
AMOUNT = 1000.0
AMOUNT = 1000.0
AMOUNT = 1000.0
AMOUNT = 1000.0
```

Related Topics

- [Executing PGQL Queries Using the PGX JDBC Driver](#)

Starting from Graph Server and Client Release 24.1.0, you can use the PGX JDBC driver to access a PGX session and query graphs that are loaded in to the graph server (PGX).

Using the Machine Learning Library (PgXML) for Graphs

The graph server (PGX) provides a machine learning library `oracle.pgx.api.mllib`, which supports graph-empowered machine learning algorithms.

The following machine learning algorithms are currently supported:

- [Using the DeepWalk Algorithm](#)
DeepWalk is a widely employed vertex representation learning algorithm used in industry.
- [Using the Supervised GraphWise Algorithm \(Vertex Embeddings and Classification\)](#)
Supervised GraphWise is an inductive vertex representation learning algorithm which is able to leverage vertex feature information. It can be applied to a wide variety of tasks, including vertex classification and link prediction.

SupervisedEdgeWise is an inductive edge representation learning algorithm which is able to leverage vertex and edge feature information. It can be applied to a wide variety of tasks, including edge classification and link prediction.
- [Using the Unsupervised GraphWise Algorithm \(Vertex Embeddings\)](#)
Unsupervised GraphWise is an unsupervised inductive vertex representation learning algorithm which is able to leverage vertex information. The learned embeddings can be used in various downstream tasks including vertex classification, vertex clustering and similar vertex search.
- [Using the Unsupervised EdgeWise Algorithm](#)
UnsupervisedEdgeWise is an inductive edge representation learning algorithm which is able to leverage vertex and edge feature information. It can be applied to a wide variety of tasks, including unsupervised learning edge embeddings for edge classification.
- [Using the Unsupervised Anomaly Detection GraphWise Algorithm \(Vertex Embeddings and Anomaly Scores\)](#)
UnsupervisedAnomalyDetectionGraphWise is an inductive vertex representation learning and anomaly detection algorithm which is able to leverage vertex and edge feature information. Although it can be applied to a wide variety of tasks, it is particularly suitable for unsupervised learning of vertex embeddings for anomaly detection. After training this model, it is possible to infer anomaly scores or labels for unseen nodes.
- [Using the Pg2vec Algorithm](#)
Pg2vec learns representations of graphlets (partitions inside a graph) by employing edges as the principal learning units and thereby packing more information in each learning unit (as compared to employing vertices as learning units) for the representation learning task.
- [Model Repository and Model Stores](#)
A model store can be used to persist the trained graph server (PGX) machine learning models along with a model name (a unique identifier of the model in a particular model store) and a description.

① See Also

[Model Repository and Model Stores](#) for information on model store management and how models can be persisted in a model store.

19.1 Using the DeepWalk Algorithm

DeepWalk is a widely employed vertex representation learning algorithm used in industry.

It consists of two main steps:

1. First, the random walk generation step computes random walks for each vertex (with a pre-defined walk length and a pre-defined number of walks per vertex).
2. Second, these generated walks are fed to a **Word2vec** algorithm to generate the vector representation for each vertex (which is the word in the input provided to the Word2vec algorithm). See [KDD](#) technical brief for more details on DeepWalk algorithm.

DeepWalk creates vertex embeddings for a specific graph and cannot be updated to incorporate modifications on the graph. Instead, a new DeepWalk model should be trained on this modified graph. Lastly, it is important to note that the memory consumption of the DeepWalk model is $O(2n*d)$ where n is the number of vertices in the graph and d is the embedding length.

The following describes a few use cases where DeepWalk algorithm can be applied:

- **Community Detection in Social Networks:** To leverage the vertex embedding to identify groups of users who interact more frequently with each other than with the rest of the network. This can help in targeted marketing, understanding social dynamics, or improving network moderation strategies.
- **New Items Recommendation:** To analyze user interactions and content consumption patterns that help recommendation systems to recommend new content (such as videos, articles, or products) based on the embeddings of similar users or items.
- **Knowledge Graph Enhancement:** To enhance knowledge graphs by generating embeddings for entities (vertices). This helps to infer missing relationships, thereby improving the completeness of the graph and its usability in search engines and question-answering systems.

The following describes the usage of the main functionalities of DeepWalk in PGX using [DBpedia](#) graph as an example with 8,637,721 vertices and 165,049,964 edges:

- [Loading a Graph](#)
- [Building a Minimal DeepWalk Model](#)
- [Building a Customized DeepWalk Model](#)
- [Training a DeepWalk Model](#)
- [Getting the Loss Value For a DeepWalk Model](#)
- [Computing Similar Vertices for a Given Vertex](#)
- [Computing Similar Vertices for a Vertex Batch](#)
- [Getting All Trained Vertex Vectors](#)
- [Storing a Trained DeepWalk Model](#)
- [Loading a Pre-Trained DeepWalk Model](#)

- [Destroying a DeepWalk Model](#)

19.1.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.mllib.DeepWalkModel;  
import oracle.pgx.api.frames.*;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

-
2. Load the **graph**.

Note

Though the DeepWalk algorithm implementation can be applied to directed or undirected graphs, currently only undirected random walks are considered.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var graph =
session.readGraphByName("<graph_name>", GraphSource.PG_PGQL)
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxCSession session = instance.createSession("my-session");
PgxCGraph graph =
session.readGraphByName("<graph_name>", GraphSource.PG_PGQL);
```

Python

```
instance = graph_server.get_instance("https://
localhost:7007", "<username>", "<password>")
session = instance.create_session("my_session")
graph = session.read_graph_by_name("<graph_name>", "pg_pgql")
```

19.1.2 Building a Minimal DeepWalk Model

You can build a DeepWalk model using the minimal configuration and default hyper-parameters as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.deepWalkModelBuilder().
    setWindowSize(3).
    setWalksPerVertex(6).
    setWalkLength(4).
    build()
```

Java

```
DeepWalkModel model = analyst.deepWalkModelBuilder()
    .setWindowSize(3)
    .setWalksPerVertex(6)
```

```
.setWalkLength(4)  
.build();
```

Python

```
model =  
analyst.deepwalk_builder(window_size=3,walks_per_vertex=6,walk_length=4)
```

19.1.3 Building a Customized DeepWalk Model

You can build a DeepWalk model using customized hyper-parameters as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.deepWalkModelBuilder().  
    setMinWordFrequency(1).  
    setBatchSize(512).  
    setNumEpochs(1).  
    setLayerSize(100).  
    setLearningRate(0.05).  
    setMinLearningRate(0.0001).  
    setWindowSize(3).  
    setWalksPerVertex(6).  
    setWalkLength(4).  
    setSampleRate(0.00001).  
    setNegativeSample(2).  
    build()
```

Java

```
DeepWalkModel model= analyst.deepWalkModelBuilder()  
    .setMinWordFrequency(1)  
    .setBatchSize(512)  
    .setNumEpochs(1)  
    .setLayerSize(100)  
    .setLearningRate(0.05)  
    .setMinLearningRate(0.0001)  
    .setWindowSize(3)  
    .setWalksPerVertex(6)  
    .setWalkLength(4)  
    .setSampleRate(0.00001)
```

```
.setNegativeSample(2)  
.build();
```

Python

```
model = analyst.deepwalk_builder(min_word_frequency=1,  
                                batch_size=512,num_epochs=1,  
                                layer_size=100,  
                                learning_rate=0.05,  
                                min_learning_rate=0.0001,  
                                window_size=3,  
                                walks_per_vertex=6,  
                                walk_length=4,  
                                sample_rate=0.00001,  
                                negative_sample=2)
```

See [DeepWalkModelBuilder](#) in Javadoc for more explanation for each builder operation along with the default values.

19.1.4 Training a DeepWalk Model

You can train a DeepWalk model with the specified default or customized settings as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(graph)
```

Java

```
model.fit(graph);
```

Python

```
model.fit(graph)
```

19.1.5 Getting the Loss Value For a DeepWalk Model

You can fetch the loss value as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var loss = model.getLoss()
```

Java

```
double loss = model.getLoss();
```

Python

```
loss = model.loss
```

19.1.6 Computing Similar Vertices for a Given Vertex

You can fetch the *k* most similar vertices for a given vertex as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var similars = model.computeSimilars("Albert_Einstein", 10)
opg4j> similars.print()
```

Java

```
PgxFrame similars = model.computeSimilars("Albert_Einstein", 10);
similars.print();
```

Python

```
similar = model.compute_similar("Albert_Einstein",10)
similar.print()
```

Searching for similar vertices for [Albert_Einstein](#) using the trained model, will result in the following output:

dstVertex	similarity
Albert_Einstein	1.0000001192092896
Physics	0.8664291501045227
Werner_Heisenberg	0.8625140190124512
Richard_Feynman	0.8496938943862915
List_of_physicists	0.8415523767471313
Physicist	0.8384397625923157

19.1.7 Computing Similar Vertices for a Vertex Batch

You can fetch the k most similar vertices for a list of input vertices as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertices = new ArrayList()
opg4j> vertices.add("Machine_learning")
opg4j> vertices.add("Albert_Einstein")
opg4j> batchedSimilar = model.computeSimilar(vertices, 10)
opg4j> batchedSimilar.print()
```

Java

```
List vertices = Arrays.asList("Machine_learning","Albert_Einstein");
PgxFram batchedSimilar = model.computeSimilar(vertices,10);
batchedSimilar.print();
```

Python

```
vertices = ["Machine_learning", "Albert_Einstein"]
batched_similars = model.compute_similars(vertices, 10)
batched_similars.print()
```

The following describes the output result:

srcVertex	dstVertex	similarity
Machine_learning	Machine_learning	1.0000001192092896
Machine_learning	Data_mining	0.9070799350738525

19.1.8 Getting All Trained Vertex Vectors

You can retrieve the trained vertex vectors for the current DeepWalk model and store it in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexVectors = model.getTrainedVertexVectors().flattenAll()
opg4j> vertexVectors.write().db().name("vertex
vectors").tablename("vertexVectors").overwrite(true).store()
```

Java

```
PgxFrame vertexVectors = model.getTrainedVertexVectors().flattenAll();
vertexVectors.write()
    .db()
    .name("vertex vectors")
    .tablename("vertexVectors")
    .overwrite(true)
    .store();
```

Python

```
vertex_vectors = model.trained_vectors.flatten_all()
vertex_vectors.write().db().table_name("table_name").name("vertex_vectors").ov
erwrite(True).store()
```

19.1.9 Storing a Trained DeepWalk Model

You can store models in database. The models get stored as a row inside a model store table.

The following code shows how to store a trained DeepWalk model in database in a specific model store table:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.export().db().
    modelstore("modelstoretablename"). // name of the model store
table
    modelname("model").                // model name (primary key
of model store table)
    description("a model description"). // description to store
alongside the model
    store()
```

Java

```
model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
```

```
model
    .store();
```

Python

```
model.export().db(model_store="modeltablename",           # name of the
model store table
                    model_name="model",                   # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model
```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

- [Storing a Trained Model in Another Database](#)

19.1.9.1 Storing a Trained Model in Another Database

You can store models in a different database other than the one used for login.

The following code shows how to store a trained model in a different database:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.export().db().
        username("user").                               // DB user to use for
storing the model
        password("password").                           // password of the DB user
        jdbcUrl("jdbcUrl").                             // jdbc url to the DB
        modelstore("modelstoretablename").              // name of the model store
table
        modelname("model").                             // model name (primary key
of model store table)
        description("a model description").              // description to store
alongside the model
        store()
```

Java

```

model.export().db()
    .username("user")           // DB user to use for storing the
model
    .password("password")       // password of the DB user
    .jdbcUrl("jdbcUrl")        // jdbc url to the DB
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")         // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();

```

Python

```

model.export().db(username="user",           # DB user to use
for storing the model
                    password="password",      # password of the
DB user
                    jdbc_url="jdbc_url",      # jdbc url to the
DB
                    model_store="modelstoretablename", # name of the
model store table
                    model_name="model",        # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model

```

19.1.10 Loading a Pre-Trained DeepWalk Model

You can load models from a database.

You can load a pre-trained DeepWalk model from a model store table in database as described in the following code:

Loading a Pre-Trained DeepWalk Model Using JShell

```

opg4j> var model = analyst.loadDeepWalkModel().db()
    .modelstore("modeltablename") // name of the model store table
    .modelname("model")           // model name (primary key of
model store table)
    .load();

```

Loading a Pre-Trained DeepWalk Model Using Java

```

DeepWalkModelmodel = analyst.loadDeepWalkModel().db()
    .modelstore("modeltablename") // name of the model store table
    .modelname("model")           // model name (primary key of model store

```

```
table)
    .load();
```

Loading a Pre-Trained DeepWalk Model Using Python

```
analyst.get_deepwalk_model_loader().db(model_store="modelstoretablename",
                                       model_name="model")
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

- [Loading a Pre-Trained Model From Another Database](#)

19.1.10.1 Loading a Pre-Trained Model From Another Database

You can load models from a different database other than the one used for login.

You can load a pre-trained model from a model store table in database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.<modelLoader>.db().
        username("user").           // DB user to use for storing
the model
        password("password").       // password of the DB user
        jdbcUrl("jdbcUrl").        // jdbc url to the DB
        modelstore("modeltablename"). // name of the model store table
        modelName("model").         // model name (primary key of
model store table)
        load()
```

where <modelLoader> applies as follows:

- `loadDeepWalkModel()`: Loads a Deepwalk model
- `loadSupervisedGraphWiseModel()`: Loads a Supervised GraphWise model
- `loadUnsupervisedGraphWiseModel()`: Loads an Unsupervised GraphWise model
- `loadSupervisedEdgeWiseModel()`: Loads a Supervised EdgeWise model
- `loadUnsupervisedEdgeWiseModel()`: Loads an Unsupervised EdgeWise model

- `loadUnsupervisedAnomalyDetectionGraphWiseModel()`: Loads an Unsupervised Anomaly Detection GraphWise model
- `loadPg2vecModel()`: Loads a Pg2vec model

Java

```
<modeltype> model = analyst.<modelLoader>.db(
    .username("user")           // DB user to use for storing the model
    .password("password")       // password of the DB user
    .jdbcUrl("jdbcUrl")        // jdbc url to the DB
    .modelstore("modeltablename") // name of the model store table
    .modelname("model")         // model name (primary key of model store
table)
    .load());
```

where *<modeltype>* can have the following values based on the model to be loaded:

- `DeepWalkModel`: represents a Deepwalk model
- `SupervisedGraphWiseModel`: represents a Supervised GraphWise model
- `UnsupervisedGraphWiseModel`: represents an Unsupervised GraphWise model
- `SupervisedEdgeWiseModel`: represents a Supervised EdgeWise model
- `UnsupervisedEdgeWiseModel`: represents an Unsupervised EdgeWise model
- `UnsupervisedAnomalyDetectionGraphWiseModel`: represents an Unsupervised Anomaly Detection GraphWise model
- `Pg2vecModel`: represents a Pg2vec model

where *<modelLoader>* applies as follows:

- `loadDeepWalkModel()`: Loads a Deepwalk model
- `loadSupervisedGraphWiseModel()`: Loads a Supervised GraphWise model
- `loadUnsupervisedGraphWiseModel()`: Loads an Unsupervised GraphWise model
- `loadSupervisedEdgeWiseModel()`: Loads a Supervised EdgeWise model
- `loadUnsupervisedEdgeWiseModel()`: Loads an Unsupervised EdgeWise model
- `loadUnsupervisedAnomalyDetectionGraphWiseModel()`: Loads an Unsupervised Anomaly Detection GraphWise model
- `loadPg2vecModel()`: Loads a Pg2vec model

Python

```
model = analyst.<modelLoader>.db(model_store="modelstoretablename", # name
of the model store table
                                model_name="model",                # model name (primary
key of model store table)
                                username="user",                    # DB user to use for
storing the model
                                password="password",                 # password of the DB
user
                                jdbc_url="jdbc_url")                 # jdbc url to the DB
```

where <modelLoader> applies as follows:

- `get_deepwalk_model_loader()`: Loads a Deepwalk model
- `get_supervised_graphwise_model_loader()`: Loads a Supervised GraphWise model
- `get_unsupervised_graphwise_model_loader()`: Loads an Unsupervised GraphWise model
- `get_supervised_edgewise_model_loader()`: Loads a Supervised EdgeWise model
- `get_unsupervised_edgewise_model_loader()`: Loads an Unsupervised EdgeWise model
- `get_unsupervised_anomaly_detection_graphwise_model_loader()`: Loads an Unsupervised Anomaly Detection GraphWise model
- `get_pg2vec_model_loader()`: Loads a Pg2vec model

19.1.11 Destroying a DeepWalk Model

You can destroy a DeepWalk model as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.2 Using the Supervised GraphWise Algorithm (Vertex Embeddings and Classification)

Supervised GraphWise is an inductive vertex representation learning algorithm which is able to leverage vertex feature information. It can be applied to a wide variety of tasks, including vertex classification and link prediction.

Supervised GraphWise is based on [GraphSAGE](#) by Hamilton et al.

Model Structure

A Supervised GraphWise model consists of graph convolutional layers followed by several prediction layers.

The forward pass through a convolutional layer for a vertex proceeds as follows:

1. A set of neighbors of the vertex is sampled.
2. The previous layer representations of the neighbors are mean-aggregated, and the aggregated features are concatenated with the previous layer representation of the vertex.
3. This concatenated vector is multiplied with weights, and a bias vector is added.
4. The result is normalized to such that the layer output has unit norm.

The prediction layers are standard neural network layers.

The following describes a few use cases where SupervisedGraphWise algorithm can be applied:

- **Node Classification in Citation Networks:** To predict the category of a paper (such as biology, computer science, and so on) based on the papers it cites and its attributes. This can be useful for academic research tools and repositories that classify research papers for easier discovery.
- **Customer Segmentation:** To classify customers in a transaction network into different segments based on their purchasing behavior and relationships with other customers. This can be used for personalized marketing campaigns.
- **Disease Prediction in Healthcare Networks:** To predict the likelihood of disease spread or emergence of symptoms based on patient data and interactions within healthcare networks, such as hospitals or clinics.

The following describes the usage of the main functionalities of the implementation of **GraphSAGE** in PGX using the Cora graph as an example:

- [Loading a Graph](#)
- [Building a Minimal GraphWise Model](#)
- [Advanced Hyperparameter Customization](#)
- [Building a GraphWise Model Using Partitioned Graphs](#)
- [Supported Property Types for Supervised GraphWise Model](#)
- [Classification Versus Regression Models on Supervised GraphWise Models](#)
- [Setting a Custom Loss Function and Batch Generator \(for Anomaly Detection\)](#)
- [Training a Supervised GraphWise Model](#)
- [Getting the Loss Value For a Supervised GraphWise Model](#)
- [Getting the Training Log for a Supervised GraphWise Model](#)
- [Inferring the Vertex Labels for a Supervised GraphWise Model](#)
- [Evaluating the Supervised GraphWise Model Performance](#)
- [Inferring Embeddings for a Supervised GraphWise Model](#)
- [Storing a Trained Supervised GraphWise Model](#)
- [Loading a Pre-Trained Supervised GraphWise Model](#)
- [Destroying a Supervised GraphWise Model](#)

- [Explaining a Prediction of a Supervised GraphWise Model](#)

19.2.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst  
opg4j> import oracle.pgx.config.mllib.ActivationFunction  
opg4j> import oracle.pgx.config.mllib.WeightInitScheme
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.mllib.SupervisedGraphWiseModel;  
import oracle.pgx.api.filter.VertexFilter;  
import oracle.pgx.api.frames.*;  
import oracle.pgx.config.mllib.ActivationFunction;  
import oracle.pgx.config.mllib.GraphWiseConvLayerConfig;  
import oracle.pgx.config.mllib.GraphWisePredictionLayerConfig;  
import oracle.pgx.config.mllib.SupervisedGraphWiseModelConfig;  
import oracle.pgx.config.mllib.WeightInitScheme;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

-
2. Load the **graph**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var fullGraph =
session.readGraphByName("<cora_graph>",GraphSource.PG_PGQL)
opg4j> var filter =
VertexFilter.fromPgqlResultSet(session.queryPgql("SELECT v FROM cora MATCH
(v) WHERE ID(v) % 4 > 0"), "v")
opg4j> var trainGraph = fullGraph.filter(filter)
opg4j> var testVertices = fullGraph.getVertices().
    stream().
    filter(v -> !trainGraph.hasVertex(v.getId())).
    collect(Collectors.toList())

```

Java

```

ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxCSession session = instance.createSession("my-session");
PgxCGraph fullGraph =
session.readGraphByName("<cora_graph>",GraphSource.PG_PGQL);
VertexFilter filter =
VertexFilter.fromPgqlResultSet(session.queryPgql("SELECT v FROM cora MATCH
(v) WHERE ID(v) % 4 > 0"),"v");PgxCGraph trainGraph=fullGraph.filter(filter);
PgxCGraph trainGraph = fullGraph.filter(filter);
List<PgxCVertex> testVertices = fullGraph.getVertices()
    .stream()
    .filter(v->!trainGraph.hasVertex(v.getId()))
    .collect(Collectors.toList());

```

Python

```

from pypgx.api.filters import VertexFilter
instance = graph_server.get_instance("https://
localhost:7007","<username>","<password>")
session = instance.create_session("my_session")
full_graph = session.read_graph_by_name("<cora_graph>", "pg_pgql")
vertex_filter =
VertexFilter.from_pgql_result_set(session.query_pgql("SELECT v FROM cora
MATCH (v) WHERE ID(v) % 4 > 0"),"v")
train_graph = full_graph.filter(vertex_filter)
test_vertices = []
train_vertices = train_graph.get_vertices()
for v in full_graph.get_vertices():
    if(not train_vertices.contains(v)):
        test_vertices.append(v)

```

19.2.2 Building a Minimal GraphWise Model

You can build a GraphWise model using the minimal configuration and default hyper-parameters as described in the following code. You can create a model with one of the following options:

- only vertex properties
- only edge properties
- both vertex and edge properties

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().  
    setVertexInputPropertyNames("features").  
    setVertexTargetPropertyName("label").  
    setEdgeInputPropertyNames("cost").  
    build()
```

Java

```
SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()  
    .setVertexInputPropertyNames("features")  
    .setVertexTargetPropertyName("labels")  
    .setEdgeInputPropertyNames("cost")  
    .build();
```

Python

```
params = dict(vertex_target_property_name="label",  
              edge_input_property_names=["cost"],  
              vertex_input_property_names=["features"])  
  
model = analyst.supervised_graphwise_builder(**params)
```

Note

Even though only one vertex and one edge property is specified in the preceding example, you can specify a list of vertex or edge properties.

19.2.3 Advanced Hyperparameter Customization

You can build a GraphWise model using rich hyperparameter customization. Internally for each node, GraphWise applies an aggregation of the representation of neighbors. You can configure this operation through one of the following sub-config classes:

- `GraphWiseConvLayerConfig`: `GraphWiseConvLayer` is based on [Inductive Representation Learning on Large Graphs \(GraphSage\) by Hamilton et al.](#)
- `GraphWiseAttentionLayerConfig`: `GraphWiseAttentionLayer` is based on [Graph Attention Networks \(GAT\) by Velickovic et al.](#) which makes the aggregation smarter but comes with larger computation cost.

The `GraphWisePredictionLayerConfig` class implements the prediction layer config.

Also, you can enable or disable a graphics processing unit (GPU) by using the `enable_ml_accelerators` graph server (PGX) configuration parameter (see [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information). In addition, ensure that your system meets the following prerequisites to use the GPU support:

- You must have a GPU device with the CUDA (Compute Unified Device Architecture) toolkit installed.
- The following list of CUDA libraries are expected:
 - `libcuda.so.1`
 - `libnvrtc.so.12`
 - `libnvToolsExt.so.1`
 - `libcudart.so.12`

Note that the `enable_ml_accelerators` option is enabled by default. But if a GPU device is not detected and the CUDA toolkit is not installed, then this feature gets disabled and the CPU will be used for all the PgxML library operations.

The following code examples uses the `GraphWiseConvLayerConfig` class for the convolutional layer configuration. The examples specifies a weight decay parameter of 0.001 and dropout with dropping probability 0.5 for the GraphWise model to counteract overfitting. Also, note that the `setEnabledAccelerator` method is enabled to use any available GPU.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var weightProperty = analyst.pagerank(trainGraph).getName();
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.TANH).
    setWeightInitScheme(WeightInitScheme.XAVIER).
    setWeightedAggregationProperty(weightProperty).
    setDropoutRate(0.5).
```

```

        build()
opg4j> var predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(32).
    setActivationFunction(ActivationFunction.RELU).
    setWeightInitScheme(WeightInitScheme.HE).
    setDropoutRate(0.5).
    build()
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setVertexTargetPropertyName("labels").
    setConvLayerConfigs(convLayerConfig).
    setPredictionLayerConfigs(predictionLayerConfig).
    setWeightDecay(0.001).
    setNormalize(false).
    setEmbeddingDim(256).
    setLearningRate(0.05).
    setNumEpochs(30).
    setSeed(42).
    setShuffle(false).
    setStandardize(true).
    setBatchSize(64).
    setEnableAccelerator(true). // Enable or disable GPU
    build()

```

Java

```

String weightProperty = analyst.pagerank(trainGraph).getName();
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.TANH)
    .setWeightInitScheme(WeightInitScheme.XAVIER)
    .setWeightedAggregationProperty(weightProperty)
    .setDropoutRate(0.5)
    .build();

GraphWisePredictionLayerConfig predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(32)
    .setActivationFunction(ActivationFunction.RELU)
    .setWeightInitScheme(WeightInitScheme.HE)
    .setDropoutRate(0.5)
    .build();

SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setVertexTargetPropertyName("labels")
    .setConvLayerConfigs(convLayerConfig)
    .setPredictionLayerConfigs(predictionLayerConfig)
    .setWeightDecay(0.001)
    .setNormalize(false)
    .setEmbeddingDim(256)

```

```

.setLearningRate(0.05)
.setNumEpochs(30)
.setSeed(42)
.setShuffle(false)
.setStandardize(true)
.setBatchSize(64)
.setEnableAccelerator(true) // Enable or disable GPU
.build();

```

Python

```

weightProperty = analyst.pagerank(train_graph).name

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        dropout_rate=0.5)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

pred_layer_config = dict(hidden_dim=32,
                        activation_fn='relu',
                        weight_init_scheme='he',
                        dropout_rate=0.5)

pred_layer = analyst.graphwise_pred_layer_config(**pred_layer_config)

params = dict(vertex_target_property_name="labels",
              conv_layer_config=[conv_layer],
              pred_layer_config=[pred_layer],
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              seed=17,
              weight_decay=0.001,
              normalize=false,
              layer_size=256,
              learning_rate=0.05,
              num_epochs=30,
              seed=42,
              standardize=true,
              batch_size=64,
              enable_accelerator=True # Enable or disable GPU
)

model = analyst.supervised_graphwise_builder(**params)

```

In the preceding example, you can replace `GraphWiseConvLayerConfig` with the `GraphWiseAttentionLayerConfig` class to build a graph attention network model. Also, note that if the number of sampled neighbors is set to -1 using `setNumSampledNeighbors`, then all the neighboring nodes will be sampled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseAttentionLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.LEAKY_RELU).
    setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM).
    setHeadAggregation(AggregationOperation.MEAN).
    setNumHeads(4).
    setDropoutRate(0.5).
    build()
```

Java

```
GraphWiseAttentionLayerConfig convLayerConfig =
analyst.graphWiseAttentionLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.LEAKY_RELU)
    .setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM)
    .setHeadAggregation(AggregationOperation.MEAN)
    .setNumHeads(4)
    .setDropoutRate(0.5)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='leaky_relu',
                        weight_init_scheme='xavier_uniform',
                        aggregation_operation='mean',
                        num_heads=4,
                        dropout_rate=0.5)
```

See the Javadoc for more information.

19.2.4 Building a GraphWise Model Using Partitioned Graphs

You can build a GraphWise model using partitioned graphs which have different providers and features.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> analyst.supervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setVertexTargetPropertyName("target_property").
    build()
```

Java

```
SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setVertexTargetPropertyName("target_property")
    .build();
```

Python

```
params = dict(vertex_target_property_name="target_property",
              vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"])
model = analyst.supervised_graphwise_builder(**params)
```

Also, you can select the providers as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setVertexTargetPropertyName("target_property").
    setTargetVertexLabels("provider1").
    build()
```

Java

```
SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()  
    .setVertexInputPropertyNames("vertex_provider1_features",  
    "vertex_provider2_features")  
    .setEdgeInputPropertyNames("edge_provider_features")  
    .setVertexTargetPropertyName("target_property")  
    .setTargetVertexLabels("provider1")  
    .build();
```

Python

```
params = dict(vertex_target_property_name="target_property",  
              vertex_input_property_names=["vertex_provider1_features",  
              "vertex_provider2_features"],  
              edge_input_property_names=["edge_provider_features"],  
              target_vertex_labels=["provider1"])  
model = analyst.supervised_graphwise_builder(**params)
```

If you wish to control the flow of the embeddings at each layer, you can enable or disable the required connections. By default, all the connections are enabled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().  
    setNumSampledNeighbors(25).  
    useVertexToVertexConnection(true).  
    useEdgeToVertexConnection(true).  
    useEdgeToEdgeConnection(false).  
    useVertexToEdgeConnection(false).  
    build()  
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().  
    setVertexInputPropertyNames("vertex_provider1_features",  
    "vertex_provider2_features").  
    setEdgeInputPropertyNames("edge_provider_features").  
    setVertexTargetPropertyName("target_property").  
    setTargetVertexLabels("provider1").  
    build()
```

Java

```
GraphWiseConvLayerConfig convLayerConfig =  
analyst.graphWiseConvLayerConfigBuilder()
```

```

        .setNumSampledNeighbors(10)
        .useVertexToVertexConnection(true)
        .useEdgeToVertexConnection(true)
        .useEdgeToEdgeConnection(false)
        .useVertexToEdgeConnection(false)
        .build();

SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
    "vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setVertexTargetPropertyName("target_property")
    .setTargetVertexLabels("provider1")
    .setConvLayerConfigs(convLayerConfig)
    .build();

```

Python

```

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        vertex_to_vertex_connection=True,
                        edge_to_vertex_connection=True,
                        vertex_to_edge_connection=False,
                        edge_to_edge_connection=False)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

params = dict(vertex_target_property_name="target_property",
              vertex_input_property_names=["vertex_provider1_features",
              "vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"],
              target_vertex_labels=["provider1"],
              conv_layer_config=[conv_layer])

model = analyst.supervised_graphwise_builder(**params)

```

19.2.5 Supported Property Types for Supervised GraphWise Model

The model supports two types of properties for both vertices and edges:

- continuous properties (boolean, double, float, integer, long)
- categorical properties (string)

For categorical properties, two categorical configurations are possible:

- **One-hot-encoding:** Each category is mapped to a vector, that is concatenated to other features (default)
- **Embedding table:** Each category is mapped to an embedding that is concatenated to other features and is trained along with the model

One-hot-encoding converts each category into an independent vector. This is useful if you want each category to be interpreted as an equally independent group. For instance, if there are categories ranging from A to E, where each alphabet has no specific meaning, then one-hot-encoding can be a good fit.

Embedding table is recommended if the semantics of the properties matter, and you want certain categories to be closer to each other than the others. For example, assume there is a day property with values ranging from *Monday* to *Sunday*. If you wish to preserve the idea that *Tuesday* is closer to *Wednesday* than *Saturday*, then by choosing the embedding table configuration, you can let the vectors that represent the categories to be learned during training, so that the vector that is mapped to *Tuesday* becomes close to that of *Wednesday*.

One advantage that the embedding table approach has over one-hot-encoding is that you can learn more suitable vectors to represent each category. However, this also means that a good amount of data is required to train the embedding table properly. The one-hot-encoding approach might be better for use-cases with limited training data.

When using the embedding table, users are allowed to set the out-of-vocabulary probability. With the given probability, the embedding will be set to the out-of-vocabulary embedding randomly during training, in order to make the model more robust to unseen categories during inference.

)

model = analyst.supervised_graphwise_builder(**model_params)

```

19.2.6 Classification Versus Regression Models on Supervised GraphWise Models

When predicting a property, the loss function defines if the model will perform classification tasks or regression tasks.

For classification tasks, the Supervised GraphWise model will infer labels. Even if the property is a number, the model will assign one label for each value found and classify on it. The possible losses for classification tasks are softmax cross entropy, sigmoid cross entropy, and DevNet loss.

For regression tasks, the Supervised GraphWise model will infer values for the property. The loss for regression tasks is the MSE loss.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> import oracle.pgx.config.mllib.loss.LossFunctions
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setVertexTargetPropertyName("scores").
    setConvLayerConfigs(convLayerConfig).
    setPredictionLayerConfigs(predictionLayerConfig).
    setLossFunction(LossFunctions.MSELoss()).
    setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING).
    build()

```

Java

```
import oracle.pgx.config.mllib.loss.LossFunctions;
```

```
SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setVertexTargetPropertyName("scores")
    .setConvLayerConfigs(convLayerConfig)
    .setPredictionLayerConfigs(predictionLayerConfig)
    .setLossFunction(LossFunctions.MSELoss())
    .setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING)
    .build();
```

Python

```
from pypgx.api.mllib import MSELoss

params = dict(edge_target_property_name="scores",
              conv_layer_config=[conv_layer],
              pred_layer_config=[pred_layer],
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              batch_gen='StratifiedOversampling',
              loss_fn=MSELoss())

model = analyst.supervised_graphwise_builder(**params)
```

19.2.7 Setting a Custom Loss Function and Batch Generator (for Anomaly Detection)

It is possible to select different loss functions for the supervised model by providing a `LossFunction` object, and different batch generators by providing a `BatchGenerator` object. This is useful for applications such as Anomaly Detection, which can be cast into the standard supervised framework but require different loss functions and batch generators.

`SupervisedGraphWise` model can use the [DevNetLoss](#) and the `StratifiedOversamplingBatchGenerator`. The `DevNetLoss` takes confidence margin and the value the anomaly takes in the target property as the two parameters.

The following example assumes that the `convLayerConfig` has already been defined:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.loss.LossFunctions
opg4j> import oracle.pgx.config.mllib.batchgenerator.BatchGenerators
opg4j> var predictionLayerConfig =
```

```

analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(32).
    setActivationFunction(ActivationFunction.LINEAR).
    build()
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setVertexTargetPropertyName("labels").
    setConvLayerConfigs(convLayerConfig).
    setPredictionLayerConfigs(predictionLayerConfig).
    setLossFunction(LossFunctions.devNetLoss(5.0, true)).
    setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING).
    build()

```

Java

```

import oracle.pgx.config.mllib.loss.LossFunctions;
import oracle.pgx.config.mllib.batchgenerator.BatchGenerators;

GraphWisePredictionLayerConfig predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(32)
    .setActivationFunction(ActivationFunction.LINEAR)
    .build();

SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setVertexTargetPropertyName("labels")
    .setConvLayerConfigs(convLayerConfig)
    .setPredictionLayerConfigs(predictionLayerConfig)
    .setLossFunction(LossFunctions.devNetLoss(5.0, true))
    .setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING)
    .build();

```

Python

```

from pypgx.api.mllib import DevNetLoss

pred_layer_config = dict(hidden_dim=32,
                          activation_fn='LINEAR')

pred_layer = analyst.graphwise_pred_layer_config(**pred_layer_config)

params = dict(vertex_target_property_name="labels",
              conv_layer_config=[conv_layer],
              pred_layer_config=[pred_layer],
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              loss_fn=DevNetLoss(5.0, True),
              batch_gen='StratifiedOversampling',
              seed=17)

model = analyst.supervised_graphwise_builder(**params)

```

19.2.8 Training a Supervised GraphWise Model

You can train a Supervised GraphWise model on a graph as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(trainGraph)
```

Java

```
model.fit(trainGraph);
```

Python

```
model.fit(train_graph)
```

You can also add a validation step to the training. When training a model, the optimal number of training epochs is not known in advance and it is one of the key parameters that determines the model quality. Being able to monitor the training and validation losses helps you to identify a good value for the model parameters and gain visibility in the training process. The evaluation frequency can be specified in terms of epoch or step. To configure a validation step, create a `GraphWiseValidationConfig` and pass it to the model builder as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.EvaluationFrequencyScale;

opg4j> var validationConfig = analyst.graphWiseValidationConfigBuilder().
    setEvaluationFrequency(2). // set
the evaluation frequency (default: 1)
    setEvaluationFrequencyScale(EvaluationFrequencyScale.EPOCH). //
available options: EPOCH, STEP (default: EPOCH)
```

```

        build()
opg4j> var model = analyst.supervisedGraphWiseModelBuilder().
        setVertexInputPropertyNames("features").
        setVertexTargetPropertyName("labels").
        setValidationConfig(validationConfig).
configuring the validation to be executed every 2 epochs
        build()

```

Java

```

import oracle.pgx.config.mllib.GraphWiseValidationConfig;
import oracle.pgx.config.mllib.EvaluationFrequencyScale;

GraphWiseValidationConfig validationConfig =
analyst.graphWiseValidationConfigBuilder()
    .setEvaluationFrequency(2) // set the
evaluation frequency (default: 1)
    .setEvaluationFrequencyScale(EvaluationFrequencyScale.EPOCH) //
available options: EPOCH, STEP (default: EPOCH)
    .build();

SupervisedGraphWiseModel model = analyst.supervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("features")
    .setVertexTargetPropertyName("labels")
    .setValidationConfig(validationConfig) // configuring the validation to
be executed every 2 epochs
    .build();

```

Python

```

validation_config = analyst.graphwise_validation_config(
    evaluation_frequency=2, # set the evaluation frequency
    (default: 1)
    evaluation_frequency_scale="epoch", # available options: "epoch", "step"
    (default: "epoch")
)

params = dict(vertex_target_property_name="labels"
              vertex_input_property_names=["features"],
              validation_config=validation_config, # configuring the
validation to be executed every 2 epochs
              seed=17)

model = analyst.supervised_graphwise_builder(**params)

```

After configuring a validation step, you can then pass a graph for validation to the `fit` method together with the graph for training:

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(trainGraph, valGraph)
```

Java

```
model.fit(trainGraph, valGraph);
```

Python

```
model.fit(train_graph, valGraph)
```

19.2.9 Getting the Loss Value For a Supervised GraphWise Model

You can fetch the training loss value as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var loss = model.getTrainingLoss()
```

Java

```
double loss = model.getTrainingLoss();
```

Python

```
loss = model.get_training_loss()
```

19.2.10 Getting the Training Log for a Supervised GraphWise Model

If you configured a validation step (see [Training a Supervised GraphWise Model](#)) earlier, then you can fetch the training log that contains the training and validation loss information.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var trainingLog = model.getTrainingLog()
```

Java

```
PgxFrame trainingLog = model.getTrainingLog();
```

Python

```
training_log = model.get_training_log()
```

The output frame will be similar to the following example output:

epoch	training_loss	validation_loss
2	1.5059218406677246	0.41696539521217346
4	0.5052874088287354	0.3255307078361511
6	0.3264007568359375	0.44015955924987793

Also, note the following:

- The first column will be named according to the evaluation frequency scale that was set in the validation configuration ("epoch" or "step").
- The validation loss is the average of the losses evaluated on all batches of the validation graph, while the training loss is the loss value logged at that epoch or step (that is, the loss evaluated on the last batch).
- The training log will be overwritten if the `fit` method is called multiple times.

19.2.11 Inferring the Vertex Labels for a Supervised GraphWise Model

You can infer the labels for vertices on any graph (including vertices or graphs that were not seen during training) as described in the following code:

- [JShell](#)
- [Java](#)

- [Python](#)

JShell

```
opg4j> var labels = model.inferLabels(fullGraph, testVertices)
opg4j> labels.head().print()
```

Java

```
PgxFrame labels = model.inferLabels(fullGraph, testVertices);
labels.head().print();
```

Python

```
labels = model.infer_labels(full_graph, test_vertices)
labels.print()
```

The output will be similar to the following example output:

```
+-----+
| vertexId | label |
+-----+
| 2        | Neural Networks |
| 6        | Theory          |
| 7        | Case Based      |
| 22       | Rule Learning   |
| 30       | Theory          |
| 34       | Neural Networks |
| 47       | Case Based      |
| 48       | Probabalistic Methods |
| 50       | Theory          |
| 52       | Theory          |
+-----+
```

Similarly, you can also get the model confidence for each class by inferring the prediction logits as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var logits = model.inferLogits(fullGraph, testVertices)
opg4j> labels.head().print()
```

Java

```
PgxFrame logits = model.inferLogits(fullGraph,testVertices);
logits.head().print();
```

Python

```
logits = model.infer_logits(full_graph, test_vertices)
logits.print()
```

19.2.12 Evaluating the Supervised GraphWise Model Performance

You can evaluate various classification metrics for the model using the `evaluateLabels` method as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.evaluateLabels(fullGraph, testVertices).print()
```

Java

```
model.evaluateLabels(fullGraph,testVertices).print();
```

Python

```
model.evaluate_labels(full_graph, test_vertices).print()
```

The output will be similar to the following example output:

```
+-----+
| Accuracy | Precision | Recall | F1-Score |
+-----+
| 0.8488   | 0.8523    | 0.831   | 0.8367    |
+-----+
```

19.2.13 Inferring Embeddings for a Supervised GraphWise Model

You can use a trained model to infer embeddings for unseen nodes and store in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexVectors = model.inferEmbeddings(fullGraph,
testVertices).flattenAll()
opg4j> vertexVectors.write().
    db().
    name("vertex vectors").
    tablename("vertexVectors").
    overwrite(true).
    store()
```

Java

```
PgxFrame vertexVectors =
model.inferEmbeddings(fullGraph,testVertices).flattenAll();
vertexVectors.write()
    .db()
    .name("vertex vectors")
    .tablename("vertexVectors")
    .overwrite(true)
    .store();
```

Python

```
vertex_vectors = model.infer_embeddings(full_graph,
test_vertices).flatten_all()
vertex_vectors.write().db().table_name("table_name").name("vertex_vectors").ov
erwrite(True).store()
```

The schema for the `vertexVectors` will be as follows without flattening (`flattenAll` splits the vector column into separate double-valued columns):

```
+-----+
| vertexId                                | embedding                                |
+-----+
```

Note

All the preceding examples assume that you are inferring the embeddings for a model in the current logged in database. If you must infer embeddings for the model in a different database then refer to the examples in [Inferring Embeddings for a Model in Another Database](#).

- [Inferring Embeddings for a Model in Another Database](#)

19.2.13.1 Inferring Embeddings for a Model in Another Database

You can infer embeddings on a trained model and store in a different database other than the one used for login.

The following code shows how to infer embeddings and store in a different database:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg-jshell> var vertexVectors = model.inferEmbeddings(fullGraph,
testVertices).flattenAll()
opg-jshell> vertexVectors.write().
    db().
        username("user").                // DB user to use for storing the
model
        password("password").            // password of the DB user
        jdbcUrl("jdbcUrl").             // jdbc url to the DB
        name("vertex vectors").
        tablename("vertexVectors").      // indicates the name of the table
in which the data should be stored
        overwrite(true).
        store()
```

Java

```
PgxFrame vertexVectors =
model.inferEmbeddings(fullGraph,testVertices).flattenAll();
vertexVectors.write()
    .db()
    .username("user")                    // DB user to use for storing the
model
    .password("password")                // password of the DB user
    .jdbcUrl("jdbcUrl")                 // jdbc url to the DB
    .name("vertex vectors")
    .tablename("vertexVectors")          // indicates the name of the table in
which the data should be stored
```

```
.overwrite(true)
.store();
```

Python

```
vertex_vectors = model.infer_embeddings(fullGraph, test_vertices).flattenAll()
vertex_vectors.write().db().username("user") \
    .password("password") \
    .jdbc_url("jdbcUrl") \
    .table_name("table_name") \
    .name("vertex_vectors") \
    .overwrite(True) \
    .store()
```

19.2.14 Storing a Trained Supervised GraphWise Model

You can store models in database. The models get stored as a row inside a model store table.

The following code shows how to store a trained Supervised GraphWise model in database in a specific model store table:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.export().db().
    modelstore("modelstoretablename"). // name of the model store
table
    modelname("model").                // model name (primary key
of model store table)
    description("a model description"). // description to store
alongside the model
    store()
```

Java

```
model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();
```

Python

```
model.export().db(model_store="modeltablename",           # name of the
model store table
                    model_name="model",                   # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model
```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.2.15 Loading a Pre-Trained Supervised GraphWise Model

You can load models from a database.

You can load a pre-trained Supervised GraphWise model from a model store table in database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.loadSupervisedGraphWiseModel().db().
        modelstore("modeltablename"). // name of the model store table
        modelname("model").           // model name (primary key of
model store table)
        load();
```

Java

```
SupervisedGraphWiseModel model = analyst.loadSupervisedGraphWiseModel().db()
        .modelstore("modeltablename") // name of the model store table
        .modelname("model")           // model name (primary key of model store
table)
        .load();
```

Python

```
model = analyst.get_supervised_graphwise_model_loader(). \
    db(model_store="modelstoretablename", # name of the model
    store table
        model_name="model") # model name (primary
key of model store table)
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.2.16 Destroying a Supervised GraphWise Model

You can destroy a GraphWise model as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.2.17 Explaining a Prediction of a Supervised GraphWise Model

In order to understand which features and vertices are important for a prediction of the Supervised GraphWise model, you can generate a `SupervisedGnnExplanation` using a technique similar to the [GNNEExplainer](#) by Ying et al.

The explanation holds information related to:

- **Graph structure:** An importance score for each vertex
- **Features:** An importance score for each graph property

① Note

The vertex being explained is always assigned importance 1. Further, the feature importances are scaled such that the most important feature has importance 1.

Additionally, an `SupervisedGnnExplanation` contains the inferred embeddings, logits, and label. You can get explanations for a model's predictions by using the `SupervisedGnnExplainer` object. The object can be obtained using the `gnnExplainer` method. After obtaining the `SupervisedGnnExplainer` object, you can use the `inferAndExplain` method to request an explanation for a vertex.

The parameters of the explainer can be configured while the explainer is being created or afterwards using the relevant setter functions. The configurable parameters for the `SupervisedGnnExplainer` are as follows:

- **numOptimizationSteps:** Number of optimization steps used by the explainer.
- **learningRate:** Learning rate of the explainer.
- **marginalize:** Determines if the explainer loss is marginalized over features. This can help in cases where there are important features that take values close to zero. Without marginalization the explainer can learn to mask such features out even if they are important. Marginalization solves this by learning a mask for the deviation from the estimated input distribution.

Note that, in order to achieve best results, the features should be centered around 0.

For example, assume a simple graph that contains a feature that correlates with the label and another feature that does not. It is therefore expected that the importance of the features to differ significantly (with the feature correlating with the label being more important), while structural importance does not play a big role. In this case, you can generate an explanation as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var simpleGraph = session.createGraphBuilder().
    addVertex(0).setProperty("label_feature",
0.5).setProperty("const_feature", 0.5).
    setProperty("label", true).
    addVertex(1).setProperty("label_feature",
-0.5).setProperty("const_feature", 0.5).
    setProperty("label", false).
    addEdge(0, 1).build()
```

// build and train a Supervised GraphWise model as explained in [Advanced](#)

Hyperparameter Customization

```
// obtain and configure GnnExplainer
var explainer = model.gnnExplainer().learningRate(0.05)
explainer.numOptimizationSteps(200)

// explain prediction of vertex 0
opg4j> var explanation = explainer.inferAndExplain(simpleGraph,
simpleGraph.getVertex(0))
// if you used the devNet loss, you can add the decision threshold as an
extra parameter:
// var explanation = explainer.inferAndExplain(simpleGraph,
simpleGraph.getVertex(0), 6f)

opg4j> var constProperty = simpleGraph.getVertexProperty("const_feature")
opg4j> var labelProperty = simpleGraph.getVertexProperty("label_feature")

// retrieve feature importances
opg4j> var featureImportances = explanation.getVertexFeatureImportance()
opg4j> var importanceConstProp = featureImportances.get(constProperty) //
small as unimportant
opg4j> var importanceLabelProp = featureImportances.get(labelProperty) //
large (1) as important

// retrieve computation graph with importances
opg4j> var importanceGraph = explanation.getImportanceGraph()

// retrieve importance of vertices
opg4j> var importanceProperty = explanation.getVertexImportanceProperty()
opg4j> var importanceVertex0 = importanceProperty.get(0) // has importance 1
opg4j> var importanceVertex1 = importanceProperty.get(1) // available if
vertex 1 part of computation
```

Java

```
PgxGraph simpleGraph = session.createGraphBuilder()
    .addVertex(0).setProperty("label_feature",
0.5).setProperty("const_feature", 0.5)
    .setProperty("label", true)
    .addVertex(1).setProperty("label_feature",
-0.5).setProperty("const_feature", 0.5)
    .setProperty("label", false)
    .addEdge(0, 1).build();

// build and train a Supervised GraphWise model as explained in Advanced
Hyperparameter Customization

// obtain and configure the explainer
SupervisedGnnExplainer explainer=model.gnnExplainer().learningRate(0.05);
explainer.numOptimizationSteps(200);

// explain prediction of vertex 0
SupervisedGnnExplanation<Integer> explanation =
explainer.inferAndExplain(simpleGraph,
```

```

    simpleGraph.getVertex(0));

// if we used the devNet loss, we can add the decision threshold as an extra
parameter:
// SupervisedGnnExplanation<Integer> explanation =
explainer.inferAndExplain(simpleGraph, simpleGraph.getVertex(0), 6f);

VertexProperty<Integer, Float> constProperty =
simpleGraph.getVertexProperty("const_feature");
VertexProperty<Integer, Float> labelProperty =
simpleGraph.getVertexProperty("label_feature");

// retrieve feature importances
Map<VertexProperty<Integer, ?>, Float> featureImportances =
explanation.getVertexFeatureImportance();
float importanceConstProp = featureImportances.get(constProperty); // small
as unimportant
float importanceLabelProp = featureImportances.get(labelProperty); // large
(1) as important

// retrieve computation graph with importances
PgxGraph importanceGraph = explanation.getImportanceGraph();

// retrieve importance of vertices
VertexProperty<Integer, Float> importanceProperty =
explanation.getVertexImportanceProperty();
float importanceVertex0 = importanceProperty.get(0); // has importance 1
float importanceVertex1 = importanceProperty.get(1); // available if vertex 1
part of computation

```

Python

```

simple_graph = session.create_graph_builder()
    .add_vertex(0).set_property("label_feature",
0.5).set_property("const_feature", 0.5)
    .set_property("label", true)
    .add_vertex(1).set_property("label_feature",
-0.5).set_property("const_feature", 0.5)
    .set_property("label", false)
    .add_edge(0, 1).build()

# build and train a Supervised GraphWise model as explained in Advanced
Hyperparameter Customization

# obtain the explainer
explainer = model.gnn_explainer(learning_rate=0.05)
explainer.num_optimization_steps=200

# explain prediction of vertex 0
explanation =
explainer.inferAndExplain(simple_graph,simple_graph.get_vertex(0))
# if we used the devNet loss, we can add the decision threshold as an extra
parameter:
# explanation = explainer.inferAndExplain(simple_graph,
simple_graph.get_vertex(0), 6)

```

```
const_property = simple_graph.get_vertex_property("const_feature")
label_property = simple_graph.get_vertex_property("label_feature")

# retrieve feature importances
feature_importances = explanation.get_vertex_feature_importance()
importance_const_prop = feature_importances[const_property]
importance_label_prop = feature_importances[label_property]

# retrieve computation graph with importances
importance_graph = explanation.get_importance_graph()

# retrieve importance of vertices
importance_property = explanation.get_vertex_importance_property()
importance_vertex_0 = importance_property[0]
importance_vertex_1 = importance_property[1]
```

19.3 Using the Supervised EdgeWise Algorithm (Edge Embeddings and Classification)

SupervisedEdgeWise is an inductive edge representation learning algorithm which is able to leverage vertex and edge feature information. It can be applied to a wide variety of tasks, including edge classification and link prediction.

Supervised EdgeWise is based on top of the **GraphWise** model, leveraging the source vertex embedding and the destination vertex embedding generated by the **GraphWise** model to generate inductive edge embeddings.

Model Structure

A **SupervisedEdgeWise** model consists of graph convolutional layers followed by several prediction layers.

First, the source and destination vertices of the target edge are processed through the convolutional layers. The forward pass through a convolutional layer for a vertex proceeds as follows:

1. A set of neighbors of the vertex is sampled.
2. The previous layer representations of the neighbors are mean-aggregated, and the aggregated features are concatenated with the previous layer representation of the vertex.
3. This concatenated vector is multiplied with weights, and a bias vector is added.
4. The result is normalized such that the layer output has unit norm.

The edge embedding layer concatenates the source vertex embedding, the edge features and the destination vertex embedding, and then forwards it through a linear layer to get the edge embedding.

The prediction layers are standard neural network layers.

The following describes a few use cases where `SupervisedEdgeWise` algorithm can be applied:

- **Friends Recommendation:** To predict future friendships or connections between users based on current social graph data.
 - **Customer Retention:** To predict which customers are likely to stop using a service by analyzing interaction patterns within the customer support network or usage logs.
 - **Predictive Maintenance in IoT Networks:** To forecast potential failures in IoT (Internet of Things) networks by classifying the edges (connections) between sensors and devices based on historical data. This helps in proactive maintenance scheduling.

19.3.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/
./bin/opg4j
// starting the shell will create an implicit session and analyst
opg4j> import oracle.pgx.config.mllib.ActivationFunction
opg4j> import oracle.pgx.config.mllib.WeightInitScheme
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.mllib.SupervisedEdgeWiseModel;
import oracle.pgx.api.filter.EdgeFilter;
import oracle.pgx.api.frames.*;
import oracle.pgx.config.mllib.ActivationFunction;
import oracle.pgx.config.mllib.GraphWiseConvLayerConfig;
import oracle.pgx.config.mllib.GraphWisePredictionLayerConfig;
import oracle.pgx.config.mllib.SupervisedEdgeWiseModelConfig;
import oracle.pgx.config.mllib.WeightInitScheme;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

2. Load the graph.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var fullGraph =
session.readGraphByName("<movieLens_graph>",GraphSource.PG_PGQL)
opg4j> var filter = EdgeFilter.fromPgqlResultSet(session.queryPgql("SELECT
e FROM movielens MATCH (v1) -[e]-> (v2) WHERE ID(e) % 4 > 0"), "e")
opg4j> var trainGraph = fullGraph.filter(filter)
opg4j> var testEdges = fullGraph.getEdges().
    stream().
    filter(e -> !trainGraph.hasEdge(e.getId())).
    collect(Collectors.toList())
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxCSession session = instance.createSession("my-session");
PgxCGraph fullGraph =
session.readGraphByName("<movielens_graph>", GraphSource.PG_PGQL);
EdgeFilter filter = EdgeFilter.fromPgqlResultSet(session.queryPgql("SELECT
e FROM movielens MATCH (v1) -[e]-> (v2) WHERE ID(e) % 4 > 0"), "e");
PgxCGraph trainGraph = fullGraph.filter(filter);
List<PgxCEdge> testEdges = fullGraph.getEdges()
    .stream()
    .filter(e -> !trainGraph.hasEdge(e.getId()))
    .collect(Collectors.toList());
```

Python

```
from pypgx.api.filters import EdgeFilter
instance = graph_server.get_instance("https://
localhost:7007", "<username>", "<password>")
session = instance.create_session("my_session")
full_graph = session.read_graph_by_name("<movielens_graph>", "pg_pgql")
edge_filter = EdgeFilter.from_pgql_result_set(
    session.query_pgql("SELECT e FROM movielens MATCH (v1) -[e]-> (v2)
WHERE ID(e) % 4 > 0"), "e"
)
train_graph = full_graph.filter(edge_filter)
test_edges = []
train_edges = train_graph.get_edges()
for e in full_graph.get_edges():
    if(not train_edges.contains(e)):
        test_vertices.append(e)
```

19.3.2 Building a Minimal Supervised EdgeWise Model

You can build an EdgeWise model using the minimal configuration and default hyper-parameters as described in the following code. Note that even though only one feature property is needed (either on vertices with `setVertexInputPropertyNames` or edges with `setEdgeInputPropertyNames`) for the model to work, you can specify as many as required.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
```

```
setEdgeInputPropertyNames("edge_features").  
setEdgeTargetPropertyName("label").  
build()
```

Java

```
SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()  
    .setVertexInputPropertyNames("vertex_features")  
    .setEdgeInputPropertyNames("edge_features")  
    .setEdgeTargetPropertyName("labels")  
    .build();
```

Python

```
params = dict(edge_target_property_name="label",  
              vertex_input_property_names=["vertex_features"],  
              edge_input_property_names=["edge_features"])  
  
model = analyst.supervised_edgewise_builder(**params)
```

19.3.3 Advanced Hyperparameter Customization

You can build a Supervised EdgeWise model using rich hyperparameter customization. Internally for each node, GraphWise applies an aggregation of the representation of neighbors. You can configure this operation through one of the following sub-config classes:

- `GraphWiseConvLayerConfig`: `GraphWiseConvLayer` is based on [Inductive Representation Learning on Large Graphs \(GraphSage\) by Hamilton et al.](#)
- `GraphWiseAttentionLayerConfig`: `GraphWiseAttentionLayer` is based on [Graph Attention Networks \(GAT\) by Velickovic et al.](#) which makes the aggregation smarter but comes with larger computation cost.

Also, you can enable or disable a graphics processing unit (GPU) by using the `enable_ml_accelerators` graph server (PGX) configuration parameter (see [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information). In addition, ensure that your system meets the following prerequisites to use the GPU support:

- You must have a GPU device with the CUDA (Compute Unified Device Architecture) toolkit installed.
- The following list of CUDA libraries are expected:
 - `libcuda.so.1`
 - `libnvrtc.so.12`
 - `libnvToolsExt.so.1`
 - `libcudart.so.12`

Note that the `enable_ml_accelerators` option is enabled by default. But if a GPU device is not detected and the CUDA toolkit is not installed, then this feature gets disabled and the CPU will be used for all the PgxML library operations.

The following code examples use the `GraphWiseConvLayerConfig` class for the convolutional layer configuration. The examples specify a weight decay parameter of 0.001 and dropout with dropping probability 0.5 for the GraphWise model to counteract overfitting. Also, note that the `setEnabledAccelerator` method is enabled to use any available GPU.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var weightProperty = analyst.pagerank(trainGraph).getName()
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.TANH).
    setWeightInitScheme(WeightInitScheme.XAVIER).
    setWeightedAggregationProperty(weightProperty).
    setDropoutRate(0.5).
    build()
opg4j> var predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(32).
    setActivationFunction(ActivationFunction.RELU).
    setWeightInitScheme(WeightInitScheme.HE).
    setDropoutRate(0.5).
    build()
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setEdgeTargetPropertyName("labels").
    setConvLayerConfigs(convLayerConfig).
    setPredictionLayerConfigs(predictionLayerConfig).
    setWeightDecay(0.001).
    setEnabledAccelerator(true). // Enable or disable GPU
    build()
```

Java

```
String weightProperty = analyst.pagerank(trainGraph).getName();
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.TANH)
    .setWeightInitScheme(WeightInitScheme.XAVIER)
    .setWeightedAggregationProperty(weightProperty)
    .setDropoutRate(0.5)
    .build();

GraphWisePredictionLayerConfig predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(32)
```

```

        .setActivationFunction(ActivationFunction.RELU)
        .setWeightInitScheme(WeightInitScheme.HE)
        .setDropoutRate(0.5)
        .build();

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setEdgeTargetPropertyName("labels")
    .setConvLayerConfigs(convLayerConfig)
    .setPredictionLayerConfigs(predictionLayerConfig)
    .setWeightDecay(0.001)
    .setEnableAccelerator(true) // Enable or disable GPU
    .build();

```

Python

```

weightProperty = analyst.pagerank(train_graph).name

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        dropout_rate=0.5)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

pred_layer_config = dict(hidden_dim=32,
                        activation_fn='relu',
                        weight_init_scheme='he',
                        dropout_rate=0.5)

pred_layer = analyst.graphwise_pred_layer_config(**pred_layer_config)

params = dict(edge_target_property_name="labels",
              conv_layer_config=[conv_layer],
              pred_layer_config=[pred_layer],
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              seed=17,
              weight_decay=0.001,
              enable_accelerator=True # Enable or disable GPU
)

model = analyst.supervised_edgewise_builder(**params)

```

In the preceding example, you can replace `GraphWiseConvLayerConfig` with the `GraphWiseAttentionLayerConfig` class to build a graph attention network model. Also, note that if the number of sampled neighbors is set to -1 using `setNumSampledNeighbors`, then all the neighboring nodes will be sampled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseAttentionLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.LEAKY_RELU).
    setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM).
    setHeadAggregation(AggregationOperation.MEAN).
    setNumHeads(4).
    setDropoutRate(0.5).
    build()
```

Java

```
GraphWiseAttentionLayerConfig convLayerConfig =
analyst.graphWiseAttentionLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.LEAKY_RELU)
    .setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM)
    .setHeadAggregation(AggregationOperation.MEAN)
    .setNumHeads(4)
    .setDropoutRate(0.5)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='leaky_relu',
                        weight_init_scheme='xavier_uniform',
                        aggregation_operation='mean',
                        num_heads=4,
                        dropout_rate=0.5)
```

See the Javadoc for more information.

19.3.4 Applying EdgeWise for Partitioned Graphs

You can apply EdgeWise on partitioned graphs, where you have different providers and different features.

-
- [JShell](#)
 - [Java](#)

- [Python](#)

JShell

```
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider_features").
    setEdgeInputPropertyNames("edge_provider1_features",
"edge_provider2_features").
    setEdgeTargetPropertyName("target_property").
    build()
```

Java

```
SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider_features")
    .setEdgeInputPropertyNames("edge_provider1_features",
"edge_provider2_features")
    .setEdgeTargetPropertyName("target_property")
    .build();
```

Python

```
params = dict(edge_target_property_name="target_property",
    vertex_input_property_names=["vertex_provider_features"],
    edge_input_property_names=["edge_provider1_features",
"edge_provider2_features"])

model = analyst.supervised_edgewise_builder(**params)
```

You can select which providers you want to train or infer on:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider_features").
    setEdgeInputPropertyNames("edge_provider1_features",
"edge_provider2_features").
    setEdgeTargetPropertyName("target_property").
    setTargetEdgeLabels("provider1").
    build()
```

Java

```
SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()  
    .setVertexInputPropertyNames("vertex_provider_features")  
    .setEdgeInputPropertyNames("edge_provider1_features",  
"edge_provider2_features")  
    .setEdgeTargetPropertyName("target_property")  
    .setTargetEdgeLabels("provider1")  
    .build();
```

Python

```
params = dict(edge_target_property_name="target_property",  
              vertex_input_property_names=["vertex_provider_features"],  
              edge_input_property_names=["edge_provider1_features",  
"edge_provider2_features"],  
              target_edge_labels=["provider1"])  
  
model = analyst.supervised_edgewise_builder(**params)
```

If you wish to control the flow of the embeddings at each graph convolutional layer of the underlying Graphwise model, then you can enable or disable the connections of interest. By default, all the connections are enabled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().  
    setNumSampledNeighbors(25).  
    useVertexToVertexConnection(true).  
    useEdgeToVertexConnection(true).  
    useEdgeToEdgeConnection(false).  
    useVertexToEdgeConnection(false).  
    build()  
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().  
    setVertexInputPropertyNames("vertex_provider1_features",  
"vertex_provider2_features").  
    setEdgeInputPropertyNames("edge_provider_features").  
    setEdgeTargetPropertyName("target_property").  
    setTargetEdgeLabels("provider1").  
    build()
```

Java

```
GraphWiseConvLayerConfig convLayerConfig =
    analyst.graphWiseConvLayerConfigBuilder()
        .setNumSampledNeighbors(10)
        .useVertexToVertexConnection(true)
        .useEdgeToVertexConnection(true)
        .useEdgeToEdgeConnection(false)
        .useVertexToEdgeConnection(false)
        .build();

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
    "vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setEdgeTargetPropertyName("target_property")
    .setTargetEdgeLabels("provider1")
    .setConvLayerConfigs(convLayerConfig)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        vertex_to_vertex_connection=True,
                        edge_to_vertex_connection=True,
                        vertex_to_edge_connection=False,
                        edge_to_edge_connection=False)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

params = dict(edge_target_property_name="target_property",
              vertex_input_property_names=["vertex_provider1_features",
              "vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"],
              target_edge_labels=["provider1"],
              conv_layer_config=[conv_layer])

model = analyst.supervised_edgewise_builder(**params)
```

19.3.5 Supported Property Types for Supervised EdgeWise Model

The model supports two types of properties for both vertices and edges:

- continuous properties (boolean, double, float, integer, long)
- categorical properties (string)

For categorical properties, two categorical configurations are possible:

- **One-hot-encoding:** Each category is mapped to a vector, that is concatenated to other features (default).
- **Embedding table:** Each category is mapped to an embedding that is concatenated to other features and is trained along with the model.

One-hot-encoding converts each category into an independent vector. This is useful if you want each category to be interpreted as an equally independent group. For instance, if there are categories ranging from A to E, where each alphabet has no specific meaning, then one-hot-encoding can be a good fit.

Embedding table is recommended if the semantics of the properties matter, and you want certain categories to be closer to each other than the others. For example, assume there is a day property with values ranging from *Monday* to *Sunday*. If you wish to preserve the idea that *Tuesday* is closer to *Wednesday* than *Saturday*, then by choosing the embedding table configuration, you can let the vectors that represent the categories to be learned during training, so that the vector that is mapped to *Tuesday* becomes close to that of *Wednesday*.

One advantage that the embedding table approach has over one-hot-encoding is that you can learn more suitable vectors to represent each category. However, this also means that a good amount of data is required to train the embedding table properly. The one-hot-encoding approach might be better for use-cases with limited training data.

When using the embedding table, users are allowed to set the out-of-vocabulary probability. With the given probability, the embedding will be set to the out-of-vocabulary embedding randomly during training, in order to make the model more robust to unseen categories during inference.

        "vertex_str_feature_3", // string feature using one-hot-encoding
    ],
    vertex_input_property_configs=vertex_input_property_configs,
    edge_target_property_name="labels"
)

model = analyst.supervised_edgewise_builder(**model_params)

```

19.3.6 Classification Versus Regression on Supervised EdgeWise Models

When predicting a property, the loss function defines if the model will perform classification tasks or regression tasks.

For classification tasks, the Supervised EdgeWise model will infer labels. Even if this property is a number, the model will assign one label for each value found and classify on it. The possible losses for classification tasks are softmax cross entropy, sigmoid cross entropy, and DevNet loss.

For regression tasks, the Supervised EdgeWise model will infer values for the property. The loss for regression tasks is the MSE loss.

It is possible to select different loss functions for the supervised model by providing a `LossFunction` object.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> import oracle.pgx.config.mllib.loss.LossFunctions;
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setEdgeTargetPropertyName("labels").
    setLossFunction(LossFunctions.MSE_LOSS).
    build()

```

Java

```
import oracle.pgx.config.mllib.loss.LossFunctions;

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setEdgeTargetPropertyName("labels")
    .setLossFunction(LossFunctions.MSE_LOSS)
    .build();
```

Python

```
from pypgx.api.mllib import MSELoss

params = dict(edge_target_property_name="labels",
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              loss_fn=MSELoss())

model = analyst.supervised_edgewise_builder(**params)
```

19.3.7 Setting a Custom Loss Function and Batch Generator (for Anomaly Detection)

In addition to different loss functions, it is also possible to select different batch generators by providing a batch generator type. This is useful for applications such as Anomaly Detection, which can be cast into the standard supervised framework but require different loss functions and batch generators.

SupervisedEdgeWise model can use the [DevNetLoss](#) and the [StratifiedOversamplingBatchGenerator](#). [DevNetLoss](#) takes confidence margin and the value the anomaly takes in the target property as the two parameters.

The following example assumes that the `convLayerConfig` has already been defined:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.loss.LossFunctions
opg4j> import oracle.pgx.config.mllib.batchgenerator.BatchGenerators
opg4j> var predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(32).
```

```

        setActivationFunction(ActivationFunction.LINEAR).
        build()
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
        setVertexInputPropertyNames("vertex_features").
        setEdgeInputPropertyNames("edge_features").
        setEdgeTargetPropertyName("labels").
        setConvLayerConfigs(convLayerConfig).
        setPredictionLayerConfigs(predictionLayerConfig).
        setLossFunction(LossFunctions.devNetLoss(5.0, true)).
        setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING).
        build()

```

Java

```

import oracle.pgx.config.mllib.loss.LossFunctions;
import oracle.pgx.config.mllib.batchgenerator.BatchGenerators;

GraphWisePredictionLayerConfig predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(32)
    .setActivationFunction(ActivationFunction.LINEAR)
    .build();

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setEdgeTargetPropertyName("labels")
    .setConvLayerConfigs(convLayerConfig)
    .setPredictionLayerConfigs(predictionLayerConfig)
    .setLossFunction(LossFunctions.devNetLoss(5.0, true))
    .setBatchGenerator(BatchGenerators.STRATIFIED_OVERSAMPLING)
    .build();

```

Python

```

from pypgx.api.mllib import DevNetLoss

pred_layer_config = dict(hidden_dim=32,
                        activation_fn='linear')

pred_layer = analyst.graphwise_pred_layer_config(**pred_layer_config)

params = dict(edge_target_property_name="labels",
              conv_layer_config=[conv_layer],
              pred_layer_config=[pred_layer],
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              loss_fn=DevNetLoss(5.0, True),
              batch_gen='StratifiedOversampling',
              seed=17)

model = analyst.supervised_edgewise_builder(**params)

```

19.3.8 Setting the Edge Embedding Production Method

By default, the edge embedding is computed by combining the source vertex embedding, the destination vertex embedding and the edge features. You can manually set these by setting the `EdgeCombinationMethod` with boolean parameters:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethods

opg4j> var method =
EdgeCombinationMethods.concatEdgeCombinationMethod(useSourceVertex,
useDestinationVertex, useEdge)
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setEdgeTargetPropertyName("labels").
    setEdgeCombinationMethod(method).
    build()
```

Java

```
import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethod;
import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethods;

EdgeCombinationMethod method =
EdgeCombinationMethods.concatEdgeCombinationMethod(useSourceVertex,
useDestinationVertex, useEdge);

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setEdgeTargetPropertyName("labels")
    .setEdgeCombinationMethod(method)
    .build();
```

Python

```
from pypgx.api.mllib import ConcatEdgeCombinationMethod

method_config = dict(use_source_vertex=True,
    use_destination_vertex=False,
    use_edge=True)
```

```
method = ConcatEdgeCombinationMethod(**method_config)

params = dict(edge_target_property_name="labels",
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              edge_combination_method=method,
              seed=17)

model = analyst.supervised_edgewise_builder(**params)
```

19.3.9 Training a Supervised EdgeWise Model

You can train a `SupervisedEdgeWiseModel` on a graph as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(trainGraph)
```

Java

```
model.fit(trainGraph);
```

Python

```
model.fit(train_graph)
```

You can also add a validation step to the training. When training a model, the optimal number of training epochs is not known in advance and it is one of the key parameters that determines the model quality. Being able to monitor the training and validation losses helps you to identify a good value for the model parameters and gain visibility in the training process. The evaluation frequency can be specified in terms of epoch or step. To configure a validation step, create a `GraphWiseValidationConfig` and pass it to the model builder as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

opg4j> import oracle.pgx.config.mllib.EvaluationFrequencyScale;

opg4j> var validationConfig = analyst.graphWiseValidationConfigBuilder().
    setEvaluationFrequency(2). // set
the evaluation frequency (default: 1)
    setEvaluationFrequencyScale(EvaluationFrequencyScale.EPOCH). //
available options: EPOCH, STEP (default: EPOCH)
    build()

opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setEdgeTargetPropertyName("labels").
    setValidationConfig(validationConfig). // configuring the
validation to be executed every 2 epochs
    build()

```

Java

```

import oracle.pgx.config.mllib.GraphWiseValidationConfig;
import oracle.pgx.config.mllib.EvaluationFrequencyScale;

GraphWiseValidationConfig validationConfig =
analyst.graphWiseValidationConfigBuilder()
    .setEvaluationFrequency(2) // set the
evaluation frequency (default: 1)
    .setEvaluationFrequencyScale(EvaluationFrequencyScale.EPOCH) //
available options: EPOCH, STEP (default: EPOCH)
    .build();

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setEdgeTargetPropertyName("labels")
    .setValidationConfig(validationConfig) // configuring the validation to
be executed every 2 epochs
    .build();

```

Python

```

validation_config = analyst.graphwise_validation_config(
    evaluation_frequency=2, # set the evaluation frequency
    (default: 1)
    evaluation_frequency_scale="epoch", # available options: "epoch", "step"
    (default: "epoch")
)

params = dict(edge_target_property_name="labels",
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              validation_config=validation_config, # configuring the
validation to be executed every 2 epochs

```

```
seed=17)  
  
model = analyst.supervised_edgewise_builder(**params)
```

After configuring a validation step, you can then pass a graph for validation to the `fit` method together with the graph for training:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(trainGraph, valGraph)
```

Java

```
model.fit(trainGraph, valGraph);
```

Python

```
model.fit(train_graph, valGraph)
```

19.3.10 Getting the Loss Value for a Supervised EdgeWise Model

You can fetch the training loss value for a Supervised EdgeWise Model as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var loss = model.getTrainingLoss()
```

Java

```
double loss = model.getTrainingLoss();
```

Python

```
loss = model.get_training_loss()
```

19.3.11 Getting the Training Log for a Supervised EdgeWise Model

If you configured a validation step (see [Training a Supervised EdgeWise Model](#)) earlier, then you can fetch the training log that contains the training and validation loss information.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var trainingLog = model.getTrainingLog()
```

Java

```
PgxFrame trainingLog = model.getTrainingLog();
```

Python

```
training_log = model.get_training_log()
```

The output frame will be similar to the following example output:

epoch	training_loss	validation_loss
2	1.5059218406677246	0.41696539521217346
4	0.5052874088287354	0.3255307078361511
6	0.3264007568359375	0.44015955924987793

Also, note the following:

- The first column will be named according to the evaluation frequency scale that was set in the validation configuration ("epoch" or "step").

- The validation loss is the average of the losses evaluated on all batches of the validation graph, while the training loss is the loss value logged at that epoch or step (that is, the loss evaluated on the last batch).
- The training log will be overwritten if the `fit` method is called multiple times.

19.3.12 Inferring Edge Labels for a Supervised EdgeWise Model

You can infer the edge labels on any graph (including edges or graphs that were not seen during training):

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var labels = model.infer(fullGraph, testEdges)
opg4j> labels.head().print()
```

Java

```
PgxFrame labels = model.infer(fullGraph, testEdges);
labels.head().print();
```

Python

```
labels = model.infer(full_graph, test_edges)
labels.print()
```

If the loss is `SigmoidCrossEntropy` or `DevNetLoss`, then it is also possible to set the decision threshold applied to the logits by adding it as an extra parameter, which is by default 0:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var labels = model.infer(fullGraph, testEdges, 6f)
opg4j> labels.head().print()
```

Java

```
PgxFrame labels = model.infer(fullGraph, testEdges, 6f);
labels.head().print();
```

Python

```
labels = model.infer(full_graph, full_graph.get_edges(), 6)
labels.print()
```

The output will be similar to the following example output:

```
+-----+
| edgeId | value |
+-----+
| 68472  | 2.2346956729888916 |
| 53436  | 2.1515913009643555 |
| 73364  | 1.9499346017837524 |
| 12096  | 2.1704165935516357 |
| 78740  | 2.1174447536468506 |
| 27664  | 2.1041007041931152 |
| 34844  | 2.148571491241455  |
| 74224  | 2.089123010635376  |
| 33744  | 2.0866644382476807 |
| 32812  | 2.0604987144470215 |
+-----+
```

Similarly, if the task is a classification task, you can get the model confidence for each class by inferring the prediction logits:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var logits = model.inferLogits(fullGraph, testEdges)
opg4j> logits.head().print()
```

Java

```
PgxFrame logits = model.inferLogits(fullGraph, testEdges);
logits.head().print();
```

Python

```
logits = model.infer_logits(full_graph, test_edges)
logits.print()
```

If the model is a classification model, the `inferLabels` method is also available and it is equivalent to the `infer` method.

19.3.13 Evaluating Model Performance

You can use the `evaluate` convenience method to evaluate various metrics for the model:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.evaluate(fullGraph, testEdges).print()
```

Java

```
model.evaluate(fullGraph, testEdges).print();
```

Python

```
model.evaluate(full_graph, test_edges).print()
```

Similar to inferring labels, if the task is a classification task, you can add the decision threshold as an extra parameter:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.evaluate(fullGraph, testEdges, 6f).print()
```

Java

```
model.evaluate(fullGraph,testEdges, 6f).print();
```

Python

```
model.evaluate(full_graph,test_edges, 6).print()
```

For a classification model, the output will be similar to the following:

```
+-----+
| Accuracy | Precision | Recall | F1-Score |
+-----+
| 0.8488   | 0.8523    | 0.831  | 0.8367   |
+-----+
```

For a regression model, the output will be similar to the following:

```
+-----+
| MSE |
+-----+
| 0.9573243436116953 |
+-----+
```

Note that for a classification model, the `evaluateLabels` method is also available and this is equivalent to the `evaluate` method.

19.3.14 Inferring Embeddings for a Supervised EdgeWise Model

You can use a trained model to infer embeddings for unseen nodes and store them in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var edgeVectors = model.inferEmbeddings(fullGraph,
testEdges).flattenAll()
opg4j> edgeVectors.write().
    db().
    name("edge vectors").
    tablename("edgeVectors").
    overwrite(true).
    store()
```

Java

```
PgxFrame edgeVectors = model.inferEmbeddings(fullGraph,
testEdges).flattenAll();
edgeVectors.write()
    .db()
    .name("edge_vectors")
    .tablename("edgeVectors")
    .overwrite(true)
    .store();
```

Python

```
edge_vectors = model.infer_embeddings(full_Graph, test_edges).flatten_all()
edge_vectors.write().db().table_name("table_name").name("edge_vectors").overwr
ite(True).store()
```

The schema for the `edgeVectors` will be as follows without flattening (`flattenAll` splits the vector column into separate double-valued columns):

```
+-----+
| edgeId | embedding |
+-----+
```

All the preceding examples assume that you are inferring the embeddings for a model in the current logged in database. If you must infer embeddings for the model in a different database, then you must additionally provide the database credentials such as username, password and JDBC URL to the `inferEmbeddings` method. Refer to [Inferring Embeddings for a Model in Another Database](#) for an example.

19.3.15 Storing a Supervised EdgeWise Model

You can store models in the database. The models get stored as a row inside a model store table.

The following shows how to store a trained `SupervisedEdgeWise` model in the database in a specific model store table:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.export().db().
    modelstore("modelstoretablename"). // name of the model store
table
    modelname("model"). // model name (primary key
```

```

of model store table)
        description("a model description"). // description to store
alongside the model
        store()

```

Java

```

model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();

```

Python

```

model.export().db(model_store="modeltablename",           # name of the
model store table
                    model_name="model",                   # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model

```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.3.16 Loading a Pre-Trained Supervised EdgeWise Model

You can load a pre-trained SupervisedEdgeWise model from a model store table in the database as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> var model = analyst.loadSupervisedEdgeWiseModel().db().
        modelstore("modeltablename"). // name of the model store table
        modelname("model").           // model name (primary key of

```

```
model store table)
        load()
```

Java

```
SupervisedEdgeWiseModel model = analyst.loadSupervisedEdgeWiseModel().db()
        .modelstore("modeltablename") // name of the model store table
        .modelname("model")           // model name (primary key of model store
table)
        .load();
```

Python

```
model = analyst.get_supervised_edgewise_model_loader(). \
        db(model_store="modelstoretablename", # name of the model
store table
        model_name="model")                  # model name (primary
key of model store table)
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.3.17 Destroying a Supervised EdgeWise Model

You can destroy a Supervised EdgeWise model as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.3.18 Example: Predicting Ratings on the Movielens Dataset

This section describes the usage of `SupervisedEdgeWise` in the graph server (PGX) using the [Movielens](#) graph as an example.

This data set consists of 100,000 ratings (1-5) from 943 users on 1682 movies, with simple demographic information for the users (age, gender, occupation) and movies (year, aggravating, genre). Users and movies are vertices, while ratings of users to movies are edges with a rating feature.

The following example predicts the ratings using the `SupervisedEdgeWise` model. The model is first built and it is then fit on the `trainGraph`.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> import oracle.pgx.config.mllib.loss.LossFunctions
opg4j> var convLayer = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(10).
    build()
opg4j> var predictionLayer = analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(16).
    build()
opg4j> var model = analyst.supervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("movie_year", "avg_rating",
    "movie_genres", // Movies features
    "user_occupation_label", "user_gender", "raw_user_age"). // Users
    features
    setEdgeTargetPropertyName("user_rating").
    setConvLayerConfigs(convLayer).
    setPredictionLayerConfigs(predictionLayer).
    setNumEpochs(10).
    setEmbeddingDim(32).
    setLearningRate(0.003).
    setStandardize(true).
    setNormalize(true).
    setSeed(0).
    setLossFunction(LossFunctions.MSE_LOSS).
    build()
opg4j> model.fit(trainGraph)

```

Java

```
import oracle.pgx.config.mllib.loss.LossFunctions;
GraphWiseConvLayerConfig convLayer = analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(10)
    .build();

GraphWisePredictionLayerConfig predictionLayer =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(16)
    .build();

SupervisedEdgeWiseModel model = analyst.supervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("movie_year", "avg_rating",
"movie_genres", // Movies features
    "user_occupation_label", "user_gender", "raw_user_age") // Users
features
    .setEdgeTargetPropertyName("user_rating")
    .setConvLayerConfigs(convLayer)
    .setPredictionLayerConfigs(predictionLayer)
    .setNumEpochs(10)
    .setEmbeddingDim(32)
    .setLearningRate(0.003)
    .setStandardize(true)
    .setNormalize(true)
    .setSeed(0)
    .setLossFunction(LossFunctions.MSE_LOSS)
    .build();

model.fit(trainGraph);
```

Python

```
from pypgx.api.mllib import MSELoss
conv_layer_config = dict(num_sampled_neighbors=10)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

pred_layer_config = dict(hidden_dim=16)

pred_layer = analyst.graphwise_pred_layer_config(**pred_layer_config)

params = dict(edge_target_property_name="labels",
    conv_layer_config=[conv_layer],
    pred_layer_config=[pred_layer],
    vertex_input_property_names=["movie_year", "avg_rating",
"movie_genres",
    "user_occupation_label", "user_gender", "raw_user_age"],
    edge_input_property_names=["user_rating"],
    num_epochs=10,
    layer_size=32,
    learning_rate=0.003,
    normalize=True,
    loss_fn=MSELoss(),
    seed=0)
```

```
model = analyst.supervised_edgewise_builder(**params)

model.fit(train_graph)
```

Since `EdgeWise` is inductive, you can infer the ratings for unseen edges:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var labels = model.infer(fullGraph, testEdges)
opg4j> labels.head().print()
```

Java

```
PgxFrame labels = model.infer(fullGraph, testEdges);
labels.head().print();
```

Python

```
labels = model.infer(full_graph, test_edges)
labels.print()
```

This returns the rating prediction for any edge as:

```
+-----+
| edgeId | value |
+-----+
| 68472  | 3.844510078430176 |
| 53436  | 3.5453758239746094 |
| 73364  | 3.688265085220337 |
| 12096  | 3.8873679637908936 |
| 78740  | 3.3845553398132324 |
| 27664  | 2.6601722240448 |
| 34844  | 4.108948230743408 |
| 74224  | 3.7714107036590576 |
| 33744  | 3.2331383228302 |
| 32812  | 3.8763082027435303 |
+-----+
```

You can also evaluate the performance of the model:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.evaluate(fullGraph, testEdges).print()
```

Java

```
model.evaluate(fullGraph, testEdges).print();
```

Python

```
model.evaluate(full_graph, test_edges).print()
```

This returns the following output:

```
+-----+
| MSE |
+-----+
| 0.9573243436116953 |
+-----+
```

19.4 Using the Unsupervised GraphWise Algorithm (Vertex Embeddings)

Unsupervised GraphWise is an unsupervised inductive vertex representation learning algorithm which is able to leverage vertex information. The learned embeddings can be used in various downstream tasks including vertex classification, vertex clustering and similar vertex search.

Unsupervised GraphWise is based on [Deep Graph Infomax \(DGI\)](#) by Velickovic et al.

Model Structure

A Unsupervised GraphWise model consists of graph convolutional layers followed by an embedding layer which defaults to a DGI Layer.

The forward pass through a convolutional layer for a vertex proceeds as follows:

1. A set of neighbors of the vertex is sampled.
2. The previous layer representations of the neighbors are mean-aggregated, and the aggregated features are concatenated with the previous layer representation of the vertex.
3. This concatenated vector is multiplied with weights, and a bias vector is added.

4. The result is normalized to such that the layer output has unit norm.

The DGI Layer consists of three parts enabling unsupervised learning using embeddings produced by the convolution layers.

1. **Corruption function:** Shuffles the node features while preserving the graph structure to produce negative embedding samples using the convolution layers.
2. **Readout function:** Sigmoid activated mean of embeddings, used as summary of a graph.
3. **Discriminator:** Measures the similarity of positive (unshuffled) embeddings with the summary as well as the similarity of negative samples with the summary from which the loss function is computed.

Since none of these contains mutable hyperparameters, the default DGI layer is always used and cannot be adjusted.

The second embedding layer available is the Dominant Layer.

Dominant is a model that detects anomalies based on the features and the neighbors' structure. Using GCNs to reconstruct the features in an autoencoder's settings, and the mask with the dot products of the embeddings.

The loss function is computed from the feature reconstruction loss and the structure reconstruction loss. The importance given to features or to the structure can be tuned with the alpha hyperparameter.

The following describes a few use cases where `UnsupervisedGraphWise` algorithm can be applied:

- **Fraud Detection in Financial Transactions:** To identify clusters of fraudulent activities by analyzing the transaction network and generating embeddings for accounts or transactions. This helps in detecting unknown patterns of fraud.
- **Network Optimization:** To optimize network performance in telecommunications by clustering the network nodes (such as routers or cell towers) based on traffic patterns. This helps to improve data flow and reduce latency.
- **Bioinformatics:** To analyze protein-protein interaction networks and discover new clusters or communities of proteins that might share similar functions. This helps in drug discovery and understanding biological processes.

The following describes the usage of the main functionalities of the implementation of DGI in PGX using the Cora graph as an example.

- [Loading a Graph](#)
- [Building a Minimal Unsupervised GraphWise Model](#)
- [Advanced Hyperparameter Customization](#)
- [Supported Property Types for Unsupervised GraphWise Model](#)
- [Building an Unsupervised GraphWise Model Using Partitioned Graphs](#)
- [Training an Unsupervised GraphWise Model](#)
- [Getting the Loss Value for an Unsupervised GraphWise Model](#)
- [Getting the Training Log for an Unsupervised GraphWise Model](#)
- [Inferring Embeddings for an Unsupervised GraphWise Model](#)
- [Classifying the Vertices Using the Obtained Embeddings](#)
- [Storing an Unsupervised GraphWise Model](#)

- [Loading a Pre-Trained Unsupervised GraphWise Model](#)
- [Destroying an Unsupervised GraphWise Model](#)
- [Explaining a Prediction for an Unsupervised GraphWise Model](#)

19.4.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst  
opg4j> import oracle.pgx.config.mllib.ActivationFunction  
opg4j> import oracle.pgx.config.mllib.WeightInitScheme
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.mllib.UnsupervisedGraphWiseModel;  
import oracle.pgx.api.frames.*;  
import oracle.pgx.config.mllib.ActivationFunction;  
import oracle.pgx.config.mllib.GraphWiseConvLayerConfig;  
import oracle.pgx.config.mllib.UnsupervisedGraphWiseModelConfig;  
import oracle.pgx.config.mllib.WeightInitScheme;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

-
2. Load the **graph**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",  
"<username>", "<password>".toCharArray())  
opg4j> var session=instance.createSession("mySession")  
opg4j> var graph =  
session.readGraphByName(" <graph_name>", GraphSource.PG_PGQL)
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://  
localhost:7007", "<username>", "<password>".toCharArray());  
PgxCSession session = instance.createSession("my-session");  
PgxCGraph graph =  
session.readGraphByName(" <graph_name>", GraphSource.PG_PGQL);
```

Python

```
instance = graph_server.get_instance("https://  
localhost:7007", "<username>", "<password>")  
session = instance.create_session("my_session")  
graph = session.read_graph_by_name("<graph_name>", "pg_pgql")
```

You do not need to use a test graph or test vertices, since the model is trained to be unsupervised.

19.4.2 Building a Minimal Unsupervised GraphWise Model

You can build an Unsupervised GraphWise model with only vertex properties, or only edge properties or both using the minimal configuration and default hyper-parameters.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.unsupervisedGraphWiseModelBuilder().  
    setVertexInputPropertyNames("features").  
    build()
```

Java

```
UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()  
    .setVertexInputPropertyNames("features")  
    .build();
```

Python

```
model =  
analyst.unsupervised_graphwise_builder(vertex_input_property_names=["features"]  
)
```

19.4.3 Advanced Hyperparameter Customization

You can build an Unsupervised GraphWise model using rich hyperparameter customization. Internally for each node, GraphWise applies an aggregation of the representation of neighbors. You can configure this operation through one of the following sub-config classes:

- `GraphWiseConvLayerConfig`: `GraphWiseConvLayer` is based on [Inductive Representation Learning on Large Graphs \(GraphSage\) by Hamilton et al.](#)
- `GraphWiseAttentionLayerConfig`: `GraphWiseAttentionLayer` is based on [Graph Attention Networks \(GAT\) by Velickovic et al.](#) which makes the aggregation smarter but comes with larger computation cost.

Also, you can enable or disable a graphics processing unit (GPU) by using the `enable_ml_accelerators` graph server (PGX) configuration parameter (see [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information). In addition, ensure that your system meets the following prerequisites to use the GPU support:

- You must have a GPU device with the CUDA (Compute Unified Device Architecture) toolkit installed.
- The following list of CUDA libraries are expected:
 - `libcuda.so.1`
 - `libnVRTC.so.12`
 - `libnvToolsExt.so.1`
 - `libcudart.so.12`

Note that the `enable_ml_accelerators` option is enabled by default. But if a GPU device is not detected and the CUDA toolkit is not installed, then this feature gets disabled and the CPU will be used for all the PgxML library operations.

The following code examples uses the `GraphWiseConvLayerConfig` class for the convolutional layer configuration. The examples specifies a weight decay parameter of 0.001 and dropout with dropping probability 0.5 for the GraphWise model to counteract overfitting. Also, it is recommended to disable normalization of embeddings when you intend to use them in downstream classification tasks. Note that the `setEnabledAccelerator` method is enabled to use any available GPU.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var weightProperty = analyst.pagerank(trainGraph).getName()
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.TANH).
    setWeightInitScheme(WeightInitScheme.XAVIER).
    setWeightedAggregationProperty(weightProperty).
    setDropoutRate(0.5).
    build()
opg4j> var dgiLayerConfig = analyst.graphWiseDgiLayerConfigBuilder().
    setCorruptionFunction(new PermutationCorruption()).
    setDiscriminator(GraphWiseDgiLayerConfig.Discriminator.BILINEAR).
    setReadoutFunction(GraphWiseDgiLayerConfig.ReadoutFunction.MEAN).
    build()
opg4j> var model = analyst.unsupervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setConvLayerConfigs(convLayerConfig).
    setDgiLayerConfig(dgiLayerConfig).

setLossFunction(UnsupervisedGraphWiseModelConfig.LossFunction.SIGMOID_CROSS_ENTROPY).

    setEmbeddingDim(256).
    setLearningRate(0.05).
    setNumEpochs(30).
    setSeed(42).
    setShuffle(false).
    setStandardize(true).
    setNormalize(false). // recommended
    setBatchSize(64).
    setEnableAccelerator(true). // Enable or disable GPU
    build()
```

Java

```
String weightProperty = analyst.pagerank(trainGraph).getName();
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.TANH)
    .setWeightInitScheme(WeightInitScheme.XAVIER)
    .setWeightedAggregationProperty(weightProperty)
    .setDropoutRate(0.5)
    .build();

GraphWiseDgiLayerConfig dgiLayerConfig =
analyst.graphWiseDgiLayerConfigBuilder()
    .setCorruptionFunction(new PermutationCorruption())
```

```

        .setDiscriminator(GraphWiseDgiLayerConfig.Discriminator.BILINEAR)
        .setReadoutFunction(GraphWiseDgiLayerConfig.ReadoutFunction.MEAN)
        .build();

UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setDgiLayerConfig(dgiLayerConfig)
    .setLossFunction(UnsupervisedGraphWiseModelConfig.LossFunction.SIGMOID_CROSS_ENTROPY)
    .setConvLayerConfigs(convLayerConfig)
    .setWeightDecay(0.001)
    .setEmbeddingDim(256)
    .setLearningRate(0.05)
    .setNumEpochs(30)
    .setSeed(42)
    .setShuffle(false)
    .setStandardize(true)
    .setNormalize(false) // recommended
    .setBatchSize(64)
    .setEnableAccelerator(true) // Enable or disable GPU
    .build();

```

Python

```

weightProperty = analyst.pagerank(train_graph).name

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        dropout_rate=0.5)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

dgi_layer_config = dict(corruption_function=None,
                       readout_function="mean",
                       discriminator="bilinear")
dgi_layer = analyst.graphwise_dgi_layer_config(**dgi_layer_config)

params = dict(conv_layer_config=[conv_layer],
              dgi_layer_config=dgi_layer,
              loss_fn="sigmoid_cross_entropy",
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              weight_decay=0.001,
              layer_size=256,
              learning_rate=0.05,
              num_epochs=30,
              seed=42,
              standardize=True,
              normalize=False, # recommended
              batch_size=64,
              enable_accelerator=True # Enable or disable GPU
            )

```

```
model = analyst.unsupervised_graphwise_builder(**params)
```

In the preceding example, you can replace `GraphWiseConvLayerConfig` with the `GraphWiseAttentionLayerConfig` class to build a graph attention network model. Also, note that if the number of sampled neighbors is set to -1 using `setNumSampledNeighbors`, then all the neighboring nodes will be sampled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseAttentionLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.LEAKY_RELU).
    setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM).
    setHeadAggregation(AggregationOperation.MEAN).
    setNumHeads(4).
    setDropoutRate(0.5).
    build()
```

Java

```
GraphWiseAttentionLayerConfig convLayerConfig =
analyst.graphWiseAttentionLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.LEAKY_RELU)
    .setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM)
    .setHeadAggregation(AggregationOperation.MEAN)
    .setNumHeads(4)
    .setDropoutRate(0.5)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
    activation_fn='leaky_relu',
    weight_init_scheme='xavier_uniform',
    aggregation_operation='mean',
    num_heads=4,
    dropout_rate=0.5)
```

See the Javadoc for more information.

19.4.4 Supported Property Types for Unsupervised GraphWise Model

The model supports two types of properties for both vertices and edges:

- `continuous properties` (boolean, double, float, integer, long)
- `categorical properties` (string)

For categorical properties, two categorical configurations are possible:

- **One-hot-encoding:** Each category is mapped to a vector, that is concatenated to other features (default)
- **Embedding table:** Each category is mapped to an embedding that is concatenated to other features and is trained along with the model

One-hot-encoding converts each category into an independent vector. This is useful if you want each category to be interpreted as an equally independent group. For instance, if there are categories ranging from A to E, where each alphabet has no specific meaning, then one-hot-encoding can be a good fit.

Embedding table is recommended if the semantics of the properties matter, and you want certain categories to be closer to each other than the others. For example, assume there is a `day` property with values ranging from *Monday* to *Sunday*. If you wish to preserve the idea that *Tuesday* is closer to *Wednesday* than *Saturday*, then by choosing the embedding table configuration, you can let the vectors that represent the categories to be learned during training, so that the vector that is mapped to *Tuesday* becomes close to that of *Wednesday*.

One advantage that the embedding table approach has over one-hot-encoding is that you can learn more suitable vectors to represent each category. However, this also means that a good amount of data is required to train the embedding table properly. The one-hot-encoding approach might be better for use-cases with limited training data.

When using the embedding table, users are allowed to set the out-of-vocabulary probability. With the given probability, the embedding will be set to the out-of-vocabulary embedding randomly during training, in order to make the model more robust to unseen categories during inference.

    ],
    vertex_input_property_configs=vertex_input_property_configs
)

model = analyst.supervised_graphwise_builder(**model_params)

```

19.4.5 Building an Unsupervised GraphWise Model Using Partitioned Graphs

You can build an Unsupervised GraphWise model using partitioned graphs which have different providers and features.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> analyst.unsupervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setVertexTargetPropertyName("target_property").
    build()

```

Java

```

UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",

```

```
"vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setVertexTargetPropertyName("target_property")
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"])
model = analyst.unsupervised_graphwise_builder(**params)
```

Also, you can select specific providers as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.unsupervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setTargetVertexLabels("provider1").
    build();
```

Java

```
UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setTargetVertexLabels("provider1")
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"],
              target_vertex_labels=["provider1"])
model = analyst.unsupervised_graphwise_builder(**params)
```

If you wish to control the flow of the embeddings at each layer, you can enable or disable the required connections. By default, all the connections are enabled.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    useVertexToVertexConnection(true).
    useEdgeToVertexConnection(true).
    useEdgeToEdgeConnection(false).
    useVertexToEdgeConnection(false).
    build()
opg4j> var model = analyst.unsupervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setTargetVertexLabels("provider1").
    build()
```

Java

```
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(10)
    .useVertexToVertexConnection(true)
    .useEdgeToVertexConnection(true)
    .useEdgeToEdgeConnection(false)
    .useVertexToEdgeConnection(false)
    .build();

UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setTargetVertexLabels("provider1")
    .setConvLayerConfigs(convLayerConfig)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
    activation_fn='tanh',
    weight_init_scheme='xavier',
    neighbor_weight_property_name=weightProperty,
    vertex_to_vertex_connection=True,
    edge_to_vertex_connection=True,
```

```
vertex_to_edge_connection=False,  
edge_to_edge_connection=False)  
  
conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)  
  
params = dict(vertex_input_property_names=["vertex_provider1_features",  
"vertex_provider2_features"],  
              edge_input_property_names=["edge_provider_features"],  
              target_vertex_labels=["provider1"],  
              conv_layer_config=[conv_layer])  
  
model = analyst.unsupervised_graphwise_builder(**params)
```

19.4.6 Training an Unsupervised GraphWise Model

You can train an Unsupervised GraphWise model on a graph as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(trainGraph)
```

Java

```
model.fit(trainGraph);
```

Python

```
model.fit(train_graph)
```

You can also add a validation step to the training. When training a model, the optimal number of training epochs is not known in advance and it is one of the key parameters that determines the model quality. Being able to monitor the training and validation losses helps you to identify a good value for the model parameters and gain visibility in the training process. The evaluation frequency can be specified in terms of epoch or step. To configure a validation step, create a `GraphWiseValidationConfig` and pass it to the model builder as shown:

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.EvaluationFrequencyScale;

opg4j> var validationConfig = analyst.graphWiseValidationConfigBuilder().
    setEvaluationFrequency(100).                                // set
the evaluation frequency (default: 1)
    setEvaluationFrequencyScale(EvaluationFrequencyScale.STEP). //
available options: EPOCH, STEP (default: EPOCH)
    build()
opg4j> var model = analyst.unsupervisedGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setValidationConfig(validationConfig).                      // configuring the
validation to be executed every 100 steps
    build()
```

Java

```
import oracle.pgx.config.mllib.GraphWiseValidationConfig;
import oracle.pgx.config.mllib.EvaluationFrequencyScale;

GraphWiseValidationConfig validationConfig =
analyst.graphWiseValidationConfigBuilder()
    .setEvaluationFrequency(100)                                // set the
evaluation frequency (default: 1)
    .setEvaluationFrequencyScale(EvaluationFrequencyScale.STEP) // available
options: EPOCH, STEP (default: EPOCH)
    .build();

UnsupervisedGraphWiseModel model = analyst.unsupervisedGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setValidationConfig(validationConfig) // configuring the validation to
be executed every 100 steps
    .build();
```

Python

```
validation_config = analyst.graphwise_validation_config(
    evaluation_frequency=100,          # set the evaluation frequency
    (default: 1)
    evaluation_frequency_scale="step", # available options: "epoch", "step"
    (default: "epoch")
)

params = dict(vertex_input_property_names=["vertex_features"],
              validation_config=validation_config, # configuring the
validation to be executed every 100 steps
              seed=17)

model = analyst.unsupervised_graphwise_builder(**params)
```

After configuring a validation step, you can then pass a graph for validation to the `fit` method together with the graph for training:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(trainGraph, valGraph)
```

Java

```
model.fit(trainGraph, valGraph);
```

Python

```
model.fit(train_graph, valGraph)
```

19.4.7 Getting the Loss Value for an Unsupervised GraphWise Model

You can fetch the training loss value for an Unsupervised GraphWise Model as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var loss = model.getTrainingLoss()
```

Java

```
double loss = model.getTrainingLoss();
```

Python

```
loss = model.get_training_loss()
```

19.4.8 Getting the Training Log for an Unsupervised GraphWise Model

If you configured a validation step (see [Training an Unsupervised GraphWise Model](#)) earlier, then you can fetch the training log that contains the training and validation loss information.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var trainingLog = model.getTrainingLog()
```

Java

```
PgxFrame trainingLog = model.getTrainingLog();
```

Python

```
training_log = model.get_training_log()
```

The output frame will be similar to the following example output:

step	training_loss	validation_loss
100	1.5059218406677246	0.41696539521217346
200	0.5052874088287354	0.3255307078361511
300	0.3264007568359375	0.44015955924987793

Also, note the following:

- The first column will be named according to the evaluation frequency scale that was set in the validation configuration ("epoch" or "step").
- The validation loss is the average of the losses evaluated on all batches of the validation graph, while the training loss is the loss value logged at that epoch or step (that is, the loss evaluated on the last batch).

- The training log will be overwritten if the `fit` method is called multiple times.

19.4.9 Inferring Embeddings for an Unsupervised GraphWise Model

You can use a trained model to infer embeddings for unseen nodes and store them in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexVectors = model.inferEmbeddings(fullGraph,
fullGraph.getVertices()).flattenAll()
opg4j> vertexVectors.write().
    db().
    name("vertex vectors").
    tablename("vertexVectors").
    overwrite(true).
    store()
```

Java

```
PgxFrame vertexVectors =
model.inferEmbeddings(fullGraph,fullGraph.getVertices()).flattenAll();
vertexVectors.write()
    .db()
    .name("vertex vectors")
    .tablename("vertexVectors")
    .overwrite(true)
    .store();
```

Python

```
vertex_vectors =
model.infer_embeddings(full_Graph,full_Graph.get_vertices()).flatten_all()
vertex_vectors.write().db().table_name("table_name").name("vertex_vectors").ov
erwrite(True).store()
```

The schema for the `vertexVectors` will be as follows without flattening (`flattenAll` splits the vector column into separate double-valued columns):

```
+-----+
| vertexId | embedding |
+-----+
```

Note

All the preceding examples assume that you are inferring the embeddings for a model in the current logged in database. If you must infer embeddings for the model in a different database then refer to the examples in [Inferring Embeddings for a Model in Another Database](#).

19.4.10 Classifying the Vertices Using the Obtained Embeddings

You can use the obtained embeddings in downstream vertex classification tasks.

The following code shows how you can train a multi-layer perceptron (MLP) classifier, which takes the embeddings as input. It is assumed that the vertex label information is stored under the vertex property `labels`.

- **Python**

Python

```
import pandas as pd
from sklearn.metrics import accuracy_score, make_scorer
from sklearn.model_selection import RepeatedStratifiedKFold, cross_val_score
from sklearn.neural_network import MLPClassifier
from sklearn.preprocessing import StandardScaler

# prepare input data
vertex_vectors_df = vertex_vectors.to_pandas().astype({"vertexId": int})
vertex_labels_df = pd.DataFrame([
    {"vertexId": v.id, "labels": properties}
    for v, properties in graph.get_vertex_property("labels").get_values()
]).astype(int)

vertex_vectors_with_labels_df = vertex_vectors_df.merge(vertex_labels_df,
on="vertexId")

feature_columns = [c for c in vertex_vectors_df.columns if
c.startswith("embedding")]
x = vertex_vectors_with_labels_df[feature_columns].to_numpy()
y = vertex_vectors_with_labels_df["labels"].to_numpy()

scaler = StandardScaler()
x = scaler.fit_transform(x)

# define an MLP classifier
model = MLPClassifier(
    hidden_layer_sizes=(6,),
    learning_rate_init=0.05,
    max_iter=2000,
    random_state=42,
)
```

```
# define a metric and evaluate with cross-validation
cv = RepeatedStratifiedKFold(n_splits=5, n_repeats=3, random_state=42)
scorer = make_scorer(accuracy_score, greater_is_better=True)
scores = cross_val_score(model, x, y, scoring=scorer, cv=cv, n_jobs=-1)
```

19.4.11 Storing an Unsupervised GraphWise Model

You can store models in database. The models get stored as a row inside a model store table.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.export().db().
           modelstore("modelstoretablename"). // name of the model store
table
           modelname("model").                // model name (primary key
of model store table)
           description("a model description"). // description to store
alongside the model
           store()
```

Java

```
model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();
```

Python

```
model.export().db(model_store="modeltablename",           # name of the
model store table
                    model_name="model",                   # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model
```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.4.12 Loading a Pre-Trained Unsupervised GraphWise Model

You can load models from a database.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.loadUnsupervisedGraphWiseModel().db().
        modelstore("modeltablename"). // name of the model store table
        modelname("model").           // model name (primary key of
model store table)
        load()
```

Java

```
UnsupervisedGraphWiseModel model =
analyst.loadUnsupervisedGraphWiseModel().db()
        .modelstore("modeltablename") // name of the model store table
        .modelname("model")           // model name (primary key of model store
table)
        .load();
```

Python

```
model = analyst.get_unsupervised_graphwise_model_loader(). \
        db(model_store="modelstoretablename", # name of the model
store table
        model_name="model")                  # model name (primary
key of model store table)
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.4.13 Destroying an Unsupervised GraphWise Model

You can destroy an Unsupervised GraphWise model as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.4.14 Explaining a Prediction for an Unsupervised GraphWise Model

In order to understand which features and vertices are important for a prediction of the Unsupervised GraphWise model, you can generate an `UnsupervisedGnnExplanation` using a technique similar to the [GNNExplainer](#) by Ying et al.

The explanation holds information related to:

- **Graph structure:** An importance score for each vertex
- **Features:** An importance score for each graph property

Note

The vertex being explained is always assigned importance 1. Further, the feature importances are scaled such that the most important feature has importance 1.

Additionally, an `UnsupervisedGnnExplanation` contains the inferred embedding. You can get explanations for a model's predictions by using the `UnsupervisedGnnExplainer` object. The object can be obtained using the `gnnExplainer` method. After obtaining the `UnsupervisedGnnExplainer` object, you can use the `inferAndExplain` method to request an explanation for a vertex.

The parameters of the explainer can be configured while the explainer is being created or afterwards using the relevant setter functions. The configurable parameters for the `UnsupervisedGnnExplainer` are as follows:

- **numOptimizationSteps**: Number of optimization steps used by the explainer.
- **learningRate**: Learning rate of the explainer.
- **marginalize**: Determines if the explainer loss is marginalized over features. This can help in cases where there are important features that take values close to zero. Without marginalization the explainer can learn to mask such features out even if they are important. Marginalization solves this by learning a mask for the deviation from the estimated input distribution.
- **numClusters**: Number of clusters to use in the explainer loss. The unsupervised explainer uses k-means clustering to compute the explainer loss that is optimized. If the approximate number of components in the graph is known, it is a good idea to set the number of clusters to this number.
- **numSamples**: Number of vertex samples to use to optimize the explainer. For the sake of performance, the explainer computes the loss on this number of randomly sampled vertices. Using more samples will be more accurate but will take longer and use more resources.

Note that, in order to achieve best results, the features should be centered around 0.

For example, assume a simple graph, `componentGraph` which contains *k* densely connect *components*, that is, there are many edges between vertices of the same component and few edges between any two components. By training an Unsupervised GraphWise model on this graph, you can expect a model that produces similar embeddings for vertices in a densely connected component.

The following example shows how to generate an explanation on an inference `componentGraph`. It is expected that vertices from the same component to have a higher importance than vertices from a different component. Note that the feature importances are not relevant in this example.

19.5 Using the Unsupervised EdgeWise Algorithm

UnsupervisedEdgeWise is an inductive edge representation learning algorithm which is able to leverage vertex and edge feature information. It can be applied to a wide variety of tasks, including unsupervised learning edge embeddings for edge classification.

Unsupervised EdgeWise is based on top of the **GraphWise** model, leveraging the source vertex embedding and the destination vertex embedding generated by the **GraphWise** model to generate inductive edge embeddings.

The training is based on [Deep Graph Infomax \(DGI\)](#) by Velickovic et al.

Model Structure

An **UnsupervisedEdgeWise** model consists of graph convolutional layers followed by an embedding layer which defaults to a DGI layer.

First, the source and destination vertices of the target edge are processed through the convolutional layers. The forward pass through a convolutional layer for a vertex proceeds as follows:

1. A set of neighbors of the vertex is sampled.
2. The previous layer representations of the neighbors are mean-aggregated, and the aggregated features are concatenated with the previous layer representation of the vertex.
3. This concatenated vector is multiplied with weights, and a bias vector is added.
4. The result is normalized such that the layer output has unit norm.

The edge embedding layer concatenates the source vertex embedding, the edge features and the destination vertex embedding, and then forwards it through a linear layer to get the edge embedding.

The DGI Layer consists of three parts enabling unsupervised learning using embeddings produced by the convolution layers.

1. **Corruption function:** Shuffles the node features while preserving the graph structure to produce negative embedding samples using the convolution layers.
2. **Readout function:** Sigmoid activated mean of embeddings, used as summary of a graph.
3. **Discriminator:** Measures the similarity of positive (unshuffled) embeddings with the summary as well as the similarity of negative samples with the summary from which the loss function is computed.

Since none of these contains mutable hyperparameters, the default DGI layer is always used and cannot be adjusted.

The second embedding layer available is the Dominant Layer.

Dominant is a model that detects anomalies based on the features and the neighbors' structure. Using GCNs to reconstruct the features in an autoencoder's settings, and the mask with the dot products of the embeddings.

The loss function is computed from the feature reconstruction loss and the structure reconstruction loss. The importance given to features or to the structure can be tuned with the alpha hyperparameter.

The following describes a few use cases where `UnsupervisedEdgeWise` algorithm can be applied:

- **Supply Chain Optimization:** To analyze relationships between different entities in a supply chain network. This helps to predict potential delays or disruptions, thereby optimizing logistics and inventory management.
- **Collaboration Network Analysis:** To understand collaboration patterns between individuals or departments in research or corporate environments. This helps to improve team structures and enhance productivity.
- **Recommendation in E-commerce:** To recommend products (using edge embeddings) that are frequently bought together by analyzing the relationship between different products in a purchasing network.

The following describes the usage of the main functionalities of `UnsupervisedEdgeWise` in PGX using the [Movielens](#) graph as an example.

19.5.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst  
opg4j> import oracle.pgx.config.mllib.ActivationFunction  
opg4j> import oracle.pgx.config.mllib.WeightInitScheme
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.mllib.UnsupervisedEdgeWiseModel;  
import oracle.pgx.api.filter.EdgeFilter;  
import oracle.pgx.api.frames.*;  
import oracle.pgx.config.mllib.ActivationFunction;  
import oracle.pgx.config.mllib.GraphWiseConvLayerConfig;  
import oracle.pgx.config.mllib.GraphWiseDgiLayerConfig;  
import oracle.pgx.config.mllib.corruption.PermutationCorruption;  
import oracle.pgx.config.mllib.UnsupervisedEdgeWiseModelConfig;  
import oracle.pgx.config.mllib.WeightInitScheme;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

-
2. Load the **graph**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var fullGraph =
session.readGraphByName("<movielens_graph>",GraphSource.PG_PGQL)
opg4j> var filter = EdgeFilter.fromPgqlResultSet(session.queryPgql("SELECT
e FROM movielens MATCH (v1) -[e]-> (v2) WHERE ID(e) % 4 > 0"), "e")
opg4j> var trainGraph = fullGraph.filter(filter)
opg4j> var testEdges = fullGraph.getEdges().
                        stream().
                        filter(e -> !trainGraph.hasEdge(e.getId())).
                        collect(Collectors.toList())

```

Java

```

ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxCSession session = instance.createSession("my-session");
PgxCGraph fullGraph =
session.readGraphByName("<movielens_graph>",GraphSource.PG_PGQL);
EdgeFilter filter = EdgeFilter.fromPgqlResultSet(session.queryPgql("SELECT
e FROM movielens MATCH (v1) -[e]-> (v2) WHERE ID(e) % 4 > 0"), "e");
PgxCGraph trainGraph = fullGraph.filter(filter);
List<PgxCEdge> testEdges = fullGraph.getEdges()
    .stream()
    .filter(e -> !trainGraph.hasEdge(e.getId()))
    .collect(Collectors.toList());

```

Python

```

from pypgx.api.filters import EdgeFilter
instance = graph_server.get_instance("https://
localhost:7007","<username>","<password>")
session = instance.create_session("my_session")
full_graph = session.read_graph_by_name("<movielens_graph>", "pg_pgql")
edge_filter = EdgeFilter.from_pgql_result_set(
    session.query_pgql("SELECT e FROM movielens MATCH (v1) -[e]-> (v2)
WHERE ID(e) % 4 > 0"), "e"
)
train_graph = full_graph.filter(edge_filter)
test_edges = []
train_edges = train_graph.get_edges()
for e in full_graph.get_edges():
    if(not train_edges.contains(e)):
        test_vertices.append(e)

```

19.5.2 Building a Minimal Unsupervised EdgeWise Model

You can build an `EdgeWise` model using the minimal configuration and default hyperparameters as described in the following code. Note that even though only one feature property is needed (either on vertices with `setVertexInputPropertyNames` or edges with `setEdgeInputPropertyNames`) for the model to work, you can specify as many as required.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    build()
```

Java

```
UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"])

model = analyst.unsupervised_edgewise_builder(**params)
```

19.5.3 Advanced Hyperparameter Customization

You can build an Unsupervised EdgeWise model using rich hyperparameter customization. Internally for each node, GraphWise applies an aggregation of the representation of neighbors. You can configure this operation through one of the following sub-config classes:

- `GraphWiseConvLayerConfig`: `GraphWiseConvLayer` is based on [Inductive Representation Learning on Large Graphs \(GraphSage\) by Hamilton et al.](#)
- `GraphWiseAttentionLayerConfig`: `GraphWiseAttentionLayer` is based on [Graph Attention Networks \(GAT\) by Velickovic et al.](#) which makes the aggregation smarter but comes with larger computation cost.

Also, you can enable or disable a graphics processing unit (GPU) by using the `enable_ml_accelerators` graph server (PGX) configuration parameter (see [Configuration](#)

[Parameters for the Graph Server \(PGX\) Engine](#) for more information). In addition, ensure that your system meets the following prerequisites to use the GPU support:

- You must have a GPU device with the CUDA (Compute Unified Device Architecture) toolkit installed.
- The following list of CUDA libraries are expected:
 - `libcuda.so.1`
 - `libnvrtc.so.12`
 - `libnvToolsExt.so.1`
 - `libcudart.so.12`

Note that the `enable_ml_accelerators` option is enabled by default. But if a GPU device is not detected and the CUDA toolkit is not installed, then this feature gets disabled and the CPU will be used for all the PgXML library operations.

The following code examples uses the `GraphWiseConvLayerConfig` class for the convolutional layer configuration. The examples also specifies a weight decay parameter of 0.001 and dropout with dropping probability 0.5 for the GraphWise model to counteract overfitting. Also, it is recommended to disable normalization of embeddings when you intend to use them in downstream classification tasks. Note that the `setEnabledAccelerator` method is enabled to use any available GPU.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var weightProperty = analyst.pagerank(trainGraph).getName()
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.TANH).
    setWeightInitScheme(WeightInitScheme.XAVIER).
    setWeightedAggregationProperty(weightProperty).
    setDropoutRate(0.5).
    build()
opg4j> var dgiLayerConfig = analyst.graphWiseDgiLayerConfigBuilder().
    setCorruptionFunction(new PermutationCorruption()).
    setDiscriminator(GraphWiseDgiLayerConfig.Discriminator.BILINEAR).
    setReadoutFunction(GraphWiseDgiLayerConfig.ReadoutFunction.MEAN).
    build()
opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setConvLayerConfigs(convLayerConfig).
    setDgiLayerConfig(dgiLayerConfig).
    setWeightDecay(0.001).
    setNormalize(false). // recommended
    setEnabledAccelerator(true). // Enable or disable GPU
    build()
```

Java

```

String weightProperty = analyst.pagerank(trainGraph).getName();
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.TANH)
    .setWeightInitScheme(WeightInitScheme.XAVIER)
    .setWeightedAggregationProperty(weightProperty)
    .setDropoutRate(0.5)
    .build();

GraphWiseDgiLayerConfig dgiLayerConfig =
analyst.graphWiseDgiLayerConfigBuilder()
    .setCorruptionFunction(new PermutationCorruption())
    .setDiscriminator(GraphWiseDgiLayerConfig.Discriminator.BILINEAR)
    .setReadoutFunction(GraphWiseDgiLayerConfig.ReadoutFunction.MEAN)
    .build();

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setConvLayerConfigs(convLayerConfig)
    .setDgiLayerConfigs(dgiLayerConfig)
    .setWeightDecay(0.001)
    .setNormalize(false) // recommended
    .setEnableAccelerator(true) // Enable or disable GPU
    .build();

```

Python

```

weightProperty = analyst.pagerank(train_graph).name

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        dropout_rate=0.5)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

dgi_layer_config = dict(corruption_function=None,
                       readout_function="mean",
                       discriminator="bilinear")

dgi_layer = analyst.graphwise_dgi_layer_config(**dgi_layer_config)

params = dict(conv_layer_config=[conv_layer],
              dgi_layer_config=dgi_layer,
              loss_fn="sigmoid_cross_entropy",
              vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              seed=17,
              normalize=False, # recommended
              weight_decay=0.001,

```

```
        enable_accelerator=True) # Enable or disable GPU
    )

model = analyst.unsupervised_edgewise_builder(**params)
```

In the preceding example, you can replace `GraphWiseConvLayerConfig` with the `GraphWiseAttentionLayerConfig` class to build a graph attention network model. Also, note that if the number of sampled neighbors is set to -1 using `setNumSampledNeighbors`, then all the neighboring nodes will be sampled.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseAttentionLayerConfigBuilder().
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.LEAKY_RELU).
    setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM).
    setHeadAggregation(AggregationOperation.MEAN).
    setNumHeads(4).
    setDropoutRate(0.5).
    build()
```

Java

```
GraphWiseAttentionLayerConfig convLayerConfig =
analyst.graphWiseAttentionLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.LEAKY_RELU)
    .setWeightInitScheme(WeightInitScheme.XAVIER_UNIFORM)
    .setHeadAggregation(AggregationOperation.MEAN)
    .setNumHeads(4)
    .setDropoutRate(0.5)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='leaky_relu',
                        weight_init_scheme='xavier_uniform',
                        aggregation_operation='mean',
                        num_heads=4,
                        dropout_rate=0.5)
```

See the Javadoc for more information.

19.5.4 Supported Property Types for Unsupervised EdgeWise Model

The model supports two types of properties for both vertices and edges:

- continuous properties (boolean, double, float, integer, long)
- categorical properties (string)

For categorical properties, two categorical configurations are possible:

- **One-hot-encoding:** Each category is mapped to a vector, that is concatenated to other features (default)
- **Embedding table:** Each category is mapped to an embedding that is concatenated to other features and is trained along with the model

One-hot-encoding converts each category into an independent vector. This is useful if you want each category to be interpreted as an equally independent group. For instance, if there are categories ranging from A to E, where each alphabet has no specific meaning, then one-hot-encoding can be a good fit.

Embedding table is recommended if the semantics of the properties matter, and you want certain categories to be closer to each other than the others. For example, assume there is a day property with values ranging from *Monday* to *Sunday*. If you wish to preserve the idea that *Tuesday* is closer to *Wednesday* than *Saturday*, then by choosing the embedding table configuration, you can let the vectors that represent the categories to be learned during training, so that the vector that is mapped to *Tuesday* becomes close to that of *Wednesday*.

One advantage that the embedding table approach has over one-hot-encoding is that you can learn more suitable vectors to represent each category. However, this also means that a good amount of data is required to train the embedding table properly. The one-hot-encoding approach might be better for use-cases with limited training data.

When using the embedding table, users are allowed to set the out-of-vocabulary probability. With the given probability, the embedding will be set to the out-of-vocabulary embedding randomly during training, in order to make the model more robust to unseen categories during inference.

- [Python](#)

JShell

```

opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider_features").
    setEdgeInputPropertyNames("edge_provider1_features",
"edge_provider2_features").
    build()

```

Java

```

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider_features")
    .setEdgeInputPropertyNames("edge_provider1_features",

```

```
"edge_provider2_features")  
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider_features"],  
              edge_input_property_names=["edge_provider1_features",  
              "edge_provider2_features"])  
  
model = analyst.unsupervised_edgewise_builder(**params)
```

You can select which providers you want to train or infer on:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().  
    setVertexInputPropertyNames("vertex_provider_features").  
    setEdgeInputPropertyNames("edge_provider1_features",  
    "edge_provider2_features").  
    setTargetEdgeLabels("provider1").  
    build();
```

Java

```
UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()  
    .setVertexInputPropertyNames("vertex_provider_features")  
    .setEdgeInputPropertyNames("edge_provider1_features",  
    "edge_provider2_features")  
    .setTargetEdgeLabels("provider1")  
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider_features"],  
              edge_input_property_names=["edge_provider1_features",  
              "edge_provider2_features"],  
              target_edge_labels=["provider1"])  
  
model = analyst.unsupervised_edgewise_builder(**params)
```

If you wish to control the flow of the embeddings at each graph convolutional layer of the underlying Graphwise model, then you can enable or disable the connections of interest. By default, all the connections are enabled.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    useVertexToVertexConnection(true).
    useEdgeToVertexConnection(true).
    useEdgeToEdgeConnection(false).
    useVertexToEdgeConnection(false).
    build()
opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    setEdgeInputPropertyNames("edge_provider_features").
    setTargetEdgeLabels("provider1").
    build()
```

Java

```
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(10)
    .useVertexToVertexConnection(true)
    .useEdgeToVertexConnection(true)
    .useEdgeToEdgeConnection(false)
    .useVertexToEdgeConnection(false)
    .build();

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .setEdgeInputPropertyNames("edge_provider_features")
    .setTargetEdgeLabels("provider1")
    .setConvLayerConfigs(convLayerConfig)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
    activation_fn='tanh',
    weight_init_scheme='xavier',
    neighbor_weight_property_name=weightProperty,
    vertex_to_vertex_connection=True,
```

```

        edge_to_vertex_connection=True,
        vertex_to_edge_connection=False,
        edge_to_edge_connection=False)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"],
              edge_input_property_names=["edge_provider_features"],
              target_edge_labels=["provider1"],
              conv_layer_config=[conv_layer])

model = analyst.unsupervised_edgewise_builder(**params)

```

19.5.6 Setting the Edge Combination Production Method

By default, the edge embedding is computed by combining the source vertex embedding, the destination vertex embedding and the edge features. You can manually set these by setting the `EdgeCombinationMethod` with booleans parameters:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethods

opg4j> var method =
EdgeCombinationMethods.concatEdgeCombinationMethod(useSourceVertex,
useDestinationVertex, useEdge)
opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setEdgeCombinationMethod(method).
    build()

```

Java

```

import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethod;
import oracle.pgx.config.mllib.edgecombination.EdgeCombinationMethods;

EdgeCombinationMethod method =
EdgeCombinationMethods.concatEdgeCombinationMethod(useSourceVertex,
useDestinationVertex, useEdge);

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")

```

```
.setEdgeInputPropertyNames("edge_features")  
.setEdgeCombinationMethod(method)  
.build();
```

Python

```
from pypgx.api.mllib import ConcatEdgeCombinationMethod  
  
method_config = dict(use_source_vertex=True,  
                     use_destination_vertex=False,  
                     use_edge=True)  
  
method = ConcatEdgeCombinationMethod(**method_config)  
  
params = dict(vertex_input_property_names=["vertex_features"],  
              edge_input_property_names=["edge_features"],  
              edge_combination_method=method,  
              seed=17)  
  
model = analyst.unsupervised_edgewise_builder(**params)
```

19.5.7 Training an Unsupervised EdgeWise Model

You can train an `UnsupervisedEdgeWiseModel` on a graph as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(trainGraph)
```

Java

```
model.fit(trainGraph);
```

Python

```
model.fit(train_graph)
```

You can also add a validation step to the training. When training a model, the optimal number of training epochs is not known in advance and it is one of the key parameters that determines

the model quality. Being able to monitor the training and validation losses helps you to identify a good value for the model parameters and gain visibility in the training process. The evaluation frequency can be specified in terms of epoch or step. To configure a validation step, create a `GraphWiseValidationConfig` and pass it to the model builder as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> import oracle.pgx.config.mllib.EvaluationFrequencyScale;

opg4j> var validationConfig = analyst.graphWiseValidationConfigBuilder().
    setEvaluationFrequency(100).                                // set
the evaluation frequency (default: 1)
    setEvaluationFrequencyScale(EvaluationFrequencyScale.STEP). //
available options: EPOCH, STEP (default: EPOCH)
    build()

opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setEdgeInputPropertyNames("edge_features").
    setValidationConfig(validationConfig). // configuring the
validation to be executed every 100 steps
    build()
```

Java

```
import oracle.pgx.config.mllib.GraphWiseValidationConfig;
import oracle.pgx.config.mllib.EvaluationFrequencyScale;

GraphWiseValidationConfig validationConfig =
analyst.graphWiseValidationConfigBuilder()
    .setEvaluationFrequency(100)                                // set the
evaluation frequency (default: 1)
    .setEvaluationFrequencyScale(EvaluationFrequencyScale.STEP) // available
options: EPOCH, STEP (default: EPOCH)
    .build();

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEdgeInputPropertyNames("edge_features")
    .setValidationConfig(validationConfig) // configuring the validation to
be executed every 100 steps
    .build();
```

Python

```
validation_config = analyst.graphwise_validation_config(
    evaluation_frequency=100,          # set the evaluation frequency
    (default: 1)
    evaluation_frequency_scale="step", # available options: "epoch", "step"
    (default: "epoch")
)

params = dict(vertex_input_property_names=["vertex_features"],
              edge_input_property_names=["edge_features"],
              validation_config=validation_config, # configuring the
validation to be executed every 100 steps
              seed=17)

model = analyst.unsupervised_edgewise_builder(**params)
```

After configuring a validation step, you can then pass a graph for validation to the `fit` method together with the graph for training:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(trainGraph, valGraph)
```

Java

```
model.fit(trainGraph, valGraph);
```

Python

```
model.fit(train_graph, valGraph)
```

19.5.8 Getting the Loss Value for an Unsupervised EdgeWise Model

You can fetch the training loss value for an Unsupervised EdgeWise Model as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var loss = model.getTrainingLoss()
```

Java

```
double loss = model.getTrainingLoss();
```

Python

```
loss = model.get_training_loss()
```

19.5.9 Getting the Training Log for an Unsupervised EdgeWise Model

If you configured a validation step (see [Training an Unsupervised EdgeWise Model](#)) earlier, then you can fetch the training log that contains the training and validation loss information.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var trainingLog = model.getTrainingLog()
```

Java

```
PgxFrame trainingLog = model.getTrainingLog();
```

Python

```
training_log = model.get_training_log()
```

The output frame will be similar to the following example output:

step	training_loss	validation_loss
100	1.5059218406677246	0.41696539521217346
200	0.5052874088287354	0.3255307078361511
300	0.3264007568359375	0.44015955924987793

19.5.10 Inferring Embeddings for an Unsupervised EdgeWise Model

You can use a trained model to infer embeddings for unseen nodes and store them in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var edgeVectors = model.inferEmbeddings(fullGraph,
testEdges).flattenAll()
opg4j> edgeVectors.write().
    db().
    name("edge vectors").
    tablename("edgeVectors").
    overwrite(true).
    store()
```

Java

```
PgxFrame edgeVectors = model.inferEmbeddings(fullGraph,
testEdges).flattenAll();
edgeVectors.write()
    .db()
    .name("edge vectors")
    .tablename("edgeVectors")
    .overwrite(true)
    .store();
```

Python

```
edge_vectors = model.infer_embeddings(full_graph, test_edges).flatten_all()
edge_vectors.write().db().table_name("table_name").name("edge_vectors").overwr
ite(True).store()
```

The schema for the `edgeVectors` will be as follows without flattening (`flattenAll` splits the vector column into separate double-valued columns):

```
+-----+
| edgeId                | embedding                |
+-----+
```

All the preceding examples assume that you are inferring the embeddings for a model in the current logged in database. If you must infer embeddings for the model in a different database, then you must additionally provide the database credentials such as `username`, `password`, and `jdbcUrl` to the `inferEmbeddings` method. Refer to [Inferring Embeddings for a Model in Another Database](#) for an example.

19.5.11 Classifying the Edges Using the Obtained Embeddings

You can use the obtained embeddings in downstream edge classification tasks.

The following code shows how you can train a multi-layer perceptron (MLP) classifier, which takes the embeddings as input. It is assumed that the edge label information is stored under the edge property `labels`.

- [Python](#)

Python

```
import pandas as pd
from sklearn.metrics import accuracy_score, make_scorer
from sklearn.model_selection import RepeatedStratifiedKFold, cross_val_score
from sklearn.neural_network import MLPClassifier
from sklearn.preprocessing import StandardScaler

# prepare input data
edge_vectors_df = edge_vectors.to_pandas().astype({"edgeId": int})
edge_labels_df = pd.DataFrame([
    {"edgeId": e.id, "labels": properties}
    for e, properties in graph.get_edge_property("labels").get_values()
]).astype(int)

edge_vectors_with_labels_df = edge_vectors_df.merge(edge_labels_df,
on="edgeId")

feature_columns = [c for c in edge_vectors_df.columns if
c.startswith("embedding")]
x = edge_vectors_with_labels_df[feature_columns].to_numpy()
y = edge_vectors_with_labels_df["labels"].to_numpy()

scaler = StandardScaler()
x = scaler.fit_transform(x)

# define an MLP classifier
model = MLPClassifier()
```

```

        hidden_layer_sizes=(6,),
        learning_rate_init=0.05,
        max_iter=2000,
        random_state=42,
    )

    # define a metric and evaluate with cross-validation
    cv = RepeatedStratifiedKFold(n_splits=5, n_repeats=3, random_state=42)
    scorer = make_scorer(accuracy_score, greater_is_better=True)
    scores = cross_val_score(model, x, y, scoring=scorer, cv=cv, n_jobs=-1)

```

19.5.12 Storing an Unsupervised EdgeWise Model

You can store models in the database. The models get stored as a row inside a model store table.

The following shows how to store a trained `UnsupervisedEdgeWise` model in the database in a specific model store table:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> model.export().db().
        modelstore("modelstoretablename"). // name of the model store
table
        modelname("model").                // model name (primary key
of model store table)
        description("a model description"). // description to store
alongside the model
        store()

```

Java

```

model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();

```

Python

```

model.export().db(model_store="modeltablename", # name of the model store
table

```

```

        model_name="model",                # model name
(primary key of model store table)
        model_description="a model description") # description to
store alongside the model

```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.5.13 Loading a Pre-Trained Unsupervised EdgeWise Model

You can load a pre-trained UnsupervisedEdgeWise model from a model store table in the database as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> var model = analyst.loadUnsupervisedEdgeWiseModel().db().
        modelstore("modeltablename"). // name of the model store table
        modelname("model").           // model name (primary key of
model store table)
        load()

```

Java

```

UnsupervisedEdgeWiseModel model = analyst.loadUnsupervisedEdgeWiseModel().db()
        .modelstore("modeltablename") // name of the model store table
        .modelname("model")           // model name (primary key of model store
table)
        .load();

```

Python

```

model = analyst.get_unsupervised_edgewise_model_loader(). \
        db("modeltablename",      # name of the model store table
        "model_name")            # model name (primary key of
model store table)

```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.5.14 Destroying an Unsupervised Anomaly Detection GraphWise Model

You can destroy an Unsupervised Anomaly Detection GraphWise model as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.5.15 Example: Computing Edge Embeddings on the Movielens Dataset

This section describes the usage of `UnsupervisedEdgeWise` in PGX using the [Movielens](#) graph as an example.

This data set consists of 100,000 ratings (1-5) from 943 users on 1682 movies, with simple demographic information for the users (age, gender, occupation) and movies (year, aggravating, genre). Users and movies are vertices, while ratings of users to movies are edges with a `rating` feature.

The following example predicts the ratings using the `UnsupervisedEdgeWise` model. You first build the model and fit it on the `trainGraph`.

-
- [JShell](#)
 - [Java](#)

- Python

JShell

```
opg4j> var convLayer = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(10).
    build()

opg4j> var model = analyst.unsupervisedEdgeWiseModelBuilder().
    setVertexInputPropertyNames("movie_year", "avg_rating",
"movie_genres", // Movies features
    "user_occupation_label", "user_gender", "raw_user_age"). // Users
features
    setEdgeInputPropertyNames("user_rating").
    setConvLayerConfigs(convLayer).
    setNumEpochs(10).
    setEmbeddingDim(32).
    setLearningRate(0.003).
    setStandardize(true).
    setNormalize(false). //recommended
    setSeed(0).
    build()
opg4j> model.fit(trainGraph)
```

Java

```
GraphWiseConvLayerConfig convLayer = analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(10)
    .build();

UnsupervisedEdgeWiseModel model = analyst.unsupervisedEdgeWiseModelBuilder()
    .setVertexInputPropertyNames("movie_year", "avg_rating",
"movie_genres", // Movies features
    "user_occupation_label", "user_gender", "raw_user_age") // Users
features
    .setEdgeInputPropertyNames("user_rating")
    .setConvLayerConfigs(convLayer)
    .setNumEpochs(10)
    .setEmbeddingDim(32)
    .setLearningRate(0.003)
    .setStandardize(true)
    .setNormalize(false) //recommended
    .setSeed(0)
    .build();

model.fit(trainGraph);
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=10)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

params = dict(conv_layer_config=[conv_layer],
```

```
vertex_input_property_names=["movie_year", "avg_rating",
"movie_genres",
    "user_occupation_label", "user_gender", "raw_user_age"],
edge_input_property_names=["user_rating"],
num_epochs=10,
embedding_dim=32,
learning_rate=0.003,
normalize=False, #recommended
seed=0)

model = analyst.unsupervised_edgewise_builder(**params)

model.fit(train_graph)
```

Since `EdgeWise` is inductive, you can infer the ratings for unseen edges:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var embeddings = model.inferEmbeddings(fullGraph, testEdges)
opg4j> embeddings.head().print()
```

Java

```
PgxFrame embeddings = model.inferEmbeddings(fullGraph, testEdges);
embeddings.head().print();
```

Python

```
embeddings = model.infer_embeddings(full_graph, test_edges)
embeddings.print()
```

19.6 Using the Unsupervised Anomaly Detection GraphWise Algorithm (Vertex Embeddings and Anomaly Scores)

UnsupervisedAnomalyDetectionGraphWise is an inductive vertex representation learning and anomaly detection algorithm which is able to leverage vertex and edge feature information. Although it can be applied to a wide variety of tasks, it is particularly suitable for unsupervised

learning of vertex embeddings for anomaly detection. After training this model, it is possible to infer anomaly scores or labels for unseen nodes.

Model Structure

A `UnsupervisedAnomalyDetectionGraphWise` model consists of graph convolutional layers followed by an embedding layer. There are two types of embedding layers - DGI layer and Dominant layer. Both the layers are for inductive vertex representation learning with different loss functions. The embedding layer defaults to the DGI layer.

The forward pass through a convolutional layer for a vertex proceeds as follows:

1. A set of neighbors of the vertex is sampled.
2. The previous layer representations of the neighbors are mean-aggregated, and the aggregated features are concatenated with the previous layer representation of the vertex.
3. This concatenated vector is multiplied with weights, and a bias vector is added.
4. The result is normalized to such that the layer output has unit norm.

The DGI Layer, which is based on ([Deep Graph Infomax \(DGI\)](#) by Velickovic et al.) consists of three parts that enable unsupervised learning using embeddings produced by the convolution layers.

1. **Corruption function:** Shuffles the node features while preserving the graph structure to produce negative embedding samples using the convolution layers.
2. **Readout function:** Sigmoid activated mean of embeddings, used as summary of a graph.
3. **Discriminator:** Measures the similarity of positive (unshuffled) embeddings with the summary as well as the similarity of negative samples with the summary from which the loss function is computed.

Since none of these contains mutable hyperparameters, the default DGI layer is always used and cannot be adjusted.

The Dominant layer enables unsupervised learning using a deep autoencoder. It uses the graph convolutional networks (GCNs) to reconstruct the features in the autoencoder setting, together with the reconstructed structure that is estimated using the dot products of the embeddings.

The loss function is computed from the feature reconstruction loss and the structure reconstruction loss. The importance given to features or to the structure can be tuned with the alpha hyperparameter.

The following describes a few use cases where `UnsupervisedAnomalyDetectionGraphWise` algorithm can be applied:

- **Cybersecurity:** To detect abnormal behavior in network traffic by analyzing the graph of connections between devices. Anomalous patterns might indicate security breaches, malware infections, or insider threats.
- **Credit Card Fraud Detection:** To identify suspicious credit card transactions by examining the relationships between transactions, users, and vendors, and scoring those that deviate from typical patterns.
- **Smart Grid Monitoring:** To monitor power grids to detect anomalies in electricity usage patterns that can indicate faults or unauthorized usage. This helps to ensure efficient and secure energy distribution.

The following describes the usage of the main functionalities of the implementation of **Dominant** in PGX. The example demonstrates a scenario to detect fraudulent vertices based on their features.

- [Loading a Graph](#)
- [Building a Minimal Unsupervised Anomaly Detection GraphWise Model](#)
- [Advanced Hyperparameter Customization](#)
- [Building an Unsupervised Anomaly Detection GraphWise Model Using Partitioned Graphs](#)
- [Training an Unsupervised Anomaly Detection GraphWise Model](#)
- [Getting the Loss Value for an Unsupervised Anomaly Detection GraphWise Model](#)

- [Inferring Anomalies](#)
- [Storing an Unsupervised Anomaly Detection GraphWise Model](#)
- [Loading a Pre-Trained Unsupervised Anomaly Detection GraphWise Model](#)
- [Destroying an Unsupervised Anomaly Detection GraphWise Model](#)

19.6.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst  
opg4j> import oracle.pgx.config.mllib.ActivationFunction  
opg4j> import oracle.pgx.config.mllib.WeightInitScheme
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.mllib.UnsupervisedAnomalyDetectionGraphWiseModel;  
import oracle.pgx.api.frames.*;  
import oracle.pgx.config.mllib.ActivationFunction;  
import oracle.pgx.config.mllib.GraphWiseConvLayerConfig;  
import  
oracle.pgx.config.mllib.UnsupervisedAnomalyDetectionGraphWiseModelConfig;  
import oracle.pgx.config.mllib.GraphWiseEmbeddingConfig;  
import oracle.pgx.config.mllib.corruption.PermutationCorruption;  
import oracle.pgx.config.mllib.WeightInitScheme;
```

Python

starting the Python shell will create an implicit session and analyst

2. Load the **graph**.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var graph =
session.readGraphByName("<graph_name>",GraphSource.PG_PGQL)
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxSession session = instance.createSession("my-session");
PgxGraph graph =
session.readGraphByName("<graph_name>",GraphSource.PG_PGQL);
```

Python

```
instance = graph_server.get_instance("https://
localhost:7007", "<username>", "<password>")
session = instance.create_session("my_session")
graph = session.read_graph_by_name("<graph_name>", "pg_pgql")
```

19.6.2 Building a Minimal Unsupervised Anomaly Detection GraphWise Model

You can build an Unsupervised Anomaly Detection GraphWise model using the minimal configuration and default hyper-parameters. Note that even though only one feature property is specified in the following example, you can specify arbitrarily many.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> var model =  
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder().  
    setVertexInputPropertyNames("features").  
    build()
```

Java

```
UnsupervisedAnomalyDetectionGraphWiseModel model =  
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder()  
    .setVertexInputPropertyNames("features")  
    .build();
```

Python

```
model =  
analyst.unsupervised_anomaly_detection_graphwise_builder(vertex_input_property  
_names=["features"])
```

19.6.3 Advanced Hyperparameter Customization

You can build an Unsupervised Anomaly Detection GraphWise model using rich hyperparameter customization.

This is implemented using the sub-config classes, `GraphWiseConvLayerConfig` and `GraphWiseEmbeddingConfig`.

Also, you can enable or disable a graphics processing unit (GPU) by using the `enable_ml_accelerators` graph server (PGX) configuration parameter (see [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information). In addition, ensure that your system meets the following prerequisites to use the GPU support:

- You must have a GPU device with the CUDA (Compute Unified Device Architecture) toolkit installed.
- The following list of CUDA libraries are expected:
 - `libcuda.so.1`
 - `libnvrtc.so.12`
 - `libnvToolsExt.so.1`
 - `libcudart.so.12`

Note that the `enable_ml_accelerators` option is enabled by default. But if a GPU device is not detected and the CUDA toolkit is not installed, then this feature gets disabled and the CPU will be used for all the PgxML library operations.

The following example specifies a weight decay parameter of 0.001 and dropout with dropping probability 0.5 for the model to counteract overfitting. The Dominant embedding layer's alpha value is specified as 0.6 to slightly increase the importance of the feature reconstruction. Also, note that the `setEnableAccelerator` method is enabled to use any available GPU.

- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var weightProperty = analyst.pagerank(trainGraph).getName()
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder(). //
customize convolutional layer config
    setNumSampledNeighbors(25).
    setActivationFunction(ActivationFunction.TANH).
    setWeightInitScheme(WeightInitScheme.XAVIER).
    setWeightedAggregationProperty(weightProperty).
    setDropoutRate(0.5). // set dropout rate to prevent overfitting
    build()

opg4j> var predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder().
    setHiddenDimension(8).
    setActivationFunction(ActivationFunction.RELU).
    build()

opg4j> var dominantConfig = analyst.graphWiseDominantLayerConfigBuilder(). //
customize embedding layer config
    setDecoderLayerConfigs(predictionLayerConfig).
    setAlpha(0.6). // increase the importance of feature reconstruction
    build()

opg4j> var model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_features").
    setConvLayerConfigs(convLayerConfig).
    setEmbeddingConfig(dominantConfig).
    setWeightDecay(0.001). // set weight decay to prevent overfitting
    setEmbeddingDim(256).
    setLearningRate(0.05).
    setNumEpochs(30).
    setSeed(42).
    setShuffle(false).
    setStandardize(true).
    setBatchSize(64).
    setEnableAccelerator(true). // Enable or disable GPU
    build()
```

Java

```
// customize convolutional layer config
String weightProperty = analyst.pagerank(trainGraph).getName()
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(25)
    .setActivationFunction(ActivationFunction.TANH)
    .setWeightInitScheme(WeightInitScheme.XAVIER)
    .setWeightedAggregationProperty(weightProperty)
    .setDropoutRate(0.5) // set dropout rate to prevent overfitting
    .build();

GraphWisePredictionLayerConfig predictionLayerConfig =
analyst.graphWisePredictionLayerConfigBuilder()
    .setHiddenDimension(8)
    .setActivationFunction(ActivationFunction.RELU)
    .build();

// customize embedding layer config
GraphWiseEmbeddingConfig dominantConfig =
analyst.graphWiseDominantLayerConfigBuilder()
    .setDecoderLayerConfigs(predictionLayerConfig)
    .setAlpha(0.6) // increase the importance of feature reconstruction
    .build();

// build the anomaly detection model
UnsupervisedAnomalyDetectionGraphWiseModel model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_features")
    .setEmbeddingConfig(dominantConfig)
    .setConvLayerConfigs(convLayerConfig)
    .setWeightDecay(0.001) // set weight decay to prevent overfitting
    .setEmbeddingDim(256)
    .setLearningRate(0.05)
    .setNumEpochs(30)
    .setSeed(42)
    .setShuffle(false)
    .setStandardize(true)
    .setBatchSize(64)
    .setEnableAccelerator(true) // Enable or disable GPU
    .build();
```

Python

```
# customize convolutional layer config
weightProperty = analyst.pagerank(train_graph).name

conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        dropout_rate=0.5) # set dropout rate to prevent
overfitting
conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)
```

```
# customize embedding layer config
dominant_config = dict(alpha=0.6) # increase the importance of feature
reconstruction

dominant_layer = analyst.graphwise_dominant_layer_config(**dominant_config)

# build the anomaly detection model
params = dict(conv_layer_config=[conv_layer],
              embedding_config=dominant_layer,
              vertex_input_property_names=["vertex_features"],
              weight_decay=0.001, # set weight decay to prevent overfitting
              layer_size=256,
              learning_rate=0.05,
              num_epochs=30,
              seed=42,
              standardize=true,
              batch_size=64,
              enable_accelerator=True # Enable or disable GPU
            )
model = analyst.unsupervised_anomaly_detection_graphwise_builder(**params)
```

19.6.4 Building an Unsupervised Anomaly Detection GraphWise Model Using Partitioned Graphs

You can build an Unsupervised Anomaly Detection GraphWise model using partitioned graphs which have different providers and features.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    build()
```

Java

```
UnsupervisedAnomalyDetectionGraphWiseModel model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
```

```
"vertex_provider2_features")
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"])
model = analyst.unsupervised_anomaly_detection_graphwise_builder(**params)
```

It is possible to select which providers you want to train or infer on:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    build()
```

Java

```
UnsupervisedAnomalyDetectionGraphWiseModel model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .build();
```

Python

```
params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"])
model = analyst.unsupervised_anomaly_detection_graphwise_builder(**params)
```

If you wish to control the flow of the embeddings at each layer, you can enable or disable the connections of interest. By default all the connections are enabled.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> var convLayerConfig = analyst.graphWiseConvLayerConfigBuilder().
    setNumSampledNeighbors(25).
    useVertexToVertexConnection(true).
    useEdgeToVertexConnection(true).
    useEdgeToEdgeConnection(false).
    useVertexToEdgeConnection(false).
    build()
opg4j> var model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder().
    setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features").
    build()
```

Java

```
GraphWiseConvLayerConfig convLayerConfig =
analyst.graphWiseConvLayerConfigBuilder()
    .setNumSampledNeighbors(10)
    .useVertexToVertexConnection(true)
    .useEdgeToVertexConnection(true)
    .useEdgeToEdgeConnection(false)
    .useVertexToEdgeConnection(false)
    .build();

UnsupervisedAnomalyDetectionGraphWiseModel model =
analyst.unsupervisedAnomalyDetectionGraphWiseModelBuilder()
    .setVertexInputPropertyNames("vertex_provider1_features",
"vertex_provider2_features")
    .setConvLayerConfigs(convLayerConfig)
    .build();
```

Python

```
conv_layer_config = dict(num_sampled_neighbors=25,
                        activation_fn='tanh',
                        weight_init_scheme='xavier',
                        neighbor_weight_property_name=weightProperty,
                        vertex_to_vertex_connection=True,
                        edge_to_vertex_connection=True,
                        vertex_to_edge_connection=False,
                        edge_to_edge_connection=False)

conv_layer = analyst.graphwise_conv_layer_config(**conv_layer_config)

params = dict(vertex_input_property_names=["vertex_provider1_features",
"vertex_provider2_features"],
              conv_layer_config=[conv_layer])
```

```
model = analyst.unsupervised_anomaly_detection_graphwise_builder(**params)
```

19.6.5 Training an Unsupervised Anomaly Detection GraphWise Model

You can train an Unsupervised Anomaly Detection GraphWise model on a graph as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.fit(graph)
```

Java

```
model.fit(graph);
```

Python

```
model.fit(graph)
```

19.6.6 Getting the Loss Value for an Unsupervised Anomaly Detection GraphWise Model

You can fetch the training loss value for an Unsupervised Anomaly Detection GraphWise model as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var loss = model.getTrainingLoss()
```

Java

```
double loss = model.getTrainingLoss();
```

Python

```
loss = model.get_training_loss()
```

19.6.7 Inferring Embeddings for an Unsupervised Anomaly Detection GraphWise Model

You can use a trained model to infer embeddings for unseen nodes and store them in the database as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var vertexVectors = model.inferEmbeddings(fullGraph,
fullGraph.getVertices()).flattenAll()
opg4j> vertexVectors.write().
    db().
    name("vertex vectors").
    tablename("vertexVectors").
    overwrite(true).
    store()
```

Java

```
PgxFrame vertexVectors =
model.inferEmbeddings(fullGraph,fullGraph.getVertices()).flattenAll();
vertexVectors.write()
    .db()
    .name("vertex vectors")
    .tablename("vertexVectors")
    .overwrite(true)
    .store();
```

Python

```
vertex_vectors =
model.infer_embeddings(full_Graph,full_Graph.get_vertices()).flatten_all()
```

```
vertex_vectors.write().db().table_name("table_name").name("vertex_vectors").overwrite(True).store()
```

The schema for the `vertexVectors` will be as follows without flattening (`flattenAll` splits the vector column into separate double-valued columns):

```
+-----+
| vertexId | embedding |
+-----+
```

Note

All the preceding examples assume that you are inferring the embeddings for a model in the current logged in database. If you must infer embeddings for the model in a different database then refer to the examples in [Inferring Embeddings for a Model in Another Database](#).

19.6.8 Inferring Anomalies

You can use a trained model to infer anomaly scores or labels for unseen nodes and store them in the database as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexScores = model.inferAnomalyScores(fullGraph,
fullGraph.getVertices()).flattenAll()
opg4j> vertexScores.write().
    db().
    name("vertex scores").
    tablename("vertexScores").
    overwrite(true).
    store()
```

Java

```
PgxFrame vertexScores =
model.inferAnomalyScores(fullGraph,fullGraph.getVertices()).flattenAll();
vertexScores.write()
    .db()
    .name("vertex scores")
    .tablename("vertexScores")
```

```
.overwrite(true)
.store();
```

Python

```
vertex_scores =
model.infer_anomaly_scores(full_Graph,full_Graph.get_vertices()).flatten_all()
vertex_scores.write().db().table_name("table_name").name("vertex_scores").over
write(True).store()
```

If you know the contamination factor of the data, you can use it to find a good threshold:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vertexLabels = model.inferAnomalyScores(fullGraph,
fullGraph.getVertices()).flattenAll()
opg4j> vertexLabels.write().
    db().
    name("vertex labels").
    tablename("vertexLabels").
    overwrite(true).
    store()
```

Java

```
PgxFrame vertexLabels =
model.inferAnomalyScores(fullGraph,fullGraph.getVertices()).flattenAll();
vertexLabels.write().
    .db().
    .name("vertex labels")
    .tablename("vertexLabels")
    .overwrite(true)
    .store();
```

Python

```
vertex_labels =
model.infer_anomaly_scores(full_Graph,full_Graph.get_vertices()).flatten_all()
vertex_labels.write().db().table_name("table_name").name("vertex_labels").over
write(True).store()
```

All the preceding examples assume that you are inferring anomalies for the model in the current logged in database. If you must infer anomalies in a different database, then you must additionally provide the database credentials such as `username`, `password`, and `jdbcUrl` to the `inferAnomalyScores` method.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> vertexScores.write().
    db().
    name("vertex scores").
    tablename("vertexScores").
    username("user").
    password("password").
    jdbcUrl("jdbcUrl").
    overwrite(true).
    store()
```

Java

```
vertexScores.write()
    .db()
    .name("vertex scores")
    .tablename("vertexScores")
    .username("user")
    .password("password")
    .jdbcUrl("jdbcUrl")
    .overwrite(true)
    .store();
```

Python

```
vertex_scores.write().db().table_name("table_name") \
    .name("vertex scores") \
    .username("user") \
    .password("password") \
    .jdbc_url("jdbc_url") \
    .overwrite(True) \
    .store()
```

19.6.9 Storing an Unsupervised Anomaly Detection GraphWise Model

You can store the trained models in a database. The models get stored as a row inside a model store table.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.export().db().  
        modelstore("modelstoretablename"). // name of the model store  
table  
        modelname("model").                // model name (primary key  
of model store table)  
        description("a model description"). // description to store  
alongside the model  
        store()
```

Java

```
model.export().db()  
    .modelstore("modelstoretablename") // name of the model store table  
    .modelname("model")                // model name (primary key of model  
store table)  
    .description("a model description") // description to store alongside the  
model  
    .store();
```

Python

```
model.export().db(model_store="modeltablename",           # name of the  
model store table  
                    model_name="model",                   # model name  
(primary key of model store table)  
                    model_description="a model description") # description to  
store alongside the model
```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.6.10 Loading a Pre-Trained Unsupervised Anomaly Detection GraphWise Model

You can load pre-trained models from a model store table in database as follows.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model =  
analyst.loadUnsupervisedAnomalyDetectionGraphWiseModel().db().  
    modelstore("modeltablename"). // name of the model store table  
    modelname("model").           // model name (primary key of  
model store table)  
    load()
```

Java

```
UnsupervisedAnomalyDetectionGraphWiseModel model =  
analyst.loadUnsupervisedAnomalyDetectionGraphWiseModel().db()  
    .modelstore("modeltablename") // name of the model store table  
    .modelname("model")           // model name (primary key of model store  
table)  
    .load();
```

Python

```
model = analyst.get_unsupervised_anomaly_detection_graphwise_model_loader(). \  
    db("modeltablename", # name of the model  
store table  
    "model_name") # model name (primary  
key of model store table)
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.6.11 Destroying an Unsupervised Anomaly Detection GraphWise Model

You can destroy an Unsupervised Anomaly Detection GraphWise model as described in the following code:

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.7 Using the Pg2vec Algorithm

Pg2vec learns representations of graphlets (partitions inside a graph) by employing edges as the principal learning units and thereby packing more information in each learning unit (as compared to employing vertices as learning units) for the representation learning task.

It consists of three main steps:

1. Random walks for each vertex (with pre-defined length per walk and pre-defined number of walks per vertex) are generated.
2. Each edge in this random walk is mapped as a `property.edge-word` in the created document (with the document label as the graph-id) where the `property.edge-word` is defined as the concatenation of the properties of the source and destination vertices.
3. The generated documents (with their attached document labels) are fed to a Doc2Vec algorithm which generates the vector representation for each document, which is a graph in this case.

Pg2vec creates graphlet embeddings for a specific set of graphlets and cannot be updated to incorporate modifications on these graphlets. Instead, a new Pg2vec model should be trained on these modified graphlets.

The following represents the memory consumption of Pg2vec model.

$$O(2(n+m)*d)$$

where:

- `n`: is the number of vertices in the graph
- `m`: is the number of graphlets in the graph
- `d`: is the embedding length

The following describes a few use cases where the Pg2vec algorithm can be applied:

- **Chemical Compound Analysis:** To represent chemical compounds as graphs and use Pg2vec to find similarities between compounds. This helps in drug discovery and chemical research.
- **Document Classification:** To represent documents as graphs of words or phrases (for example, using dependency parsing in NLP) and classify them into topics or genres based on their embeddings.
- **Network Comparison:** To compare different social or biological networks by generating embeddings for entire graphs. This can be used to study the evolution of networks over time or to compare different species' protein interaction networks in biology.

The following describes the usage of the main functionalities of the implementation of Pg2vec in PGX using [NCI109](#) dataset as an example with 4127 graphs in it:

- [Loading a Graph](#)
- [Building a Minimal Pg2vec Model](#)
- [Building a Customized Pg2vec Model](#)
- [Training a Pg2vec Model](#)
- [Getting the Loss Value For a Pg2vec Model](#)
- [Computing Similar Graphlets for a Given Graphlet](#)
- [Computing Similars for a Graphlet Batch](#)
- [Inferring a Graphlet Vector](#)
- [Inferring Vectors for a Graphlet Batch](#)
- [Storing a Trained Pg2vec Model](#)
- [Loading a Pre-Trained Pg2vec Model](#)
- [Destroying a Pg2vec Model](#)

19.7.1 Loading a Graph

The following describes the steps for loading a graph:

1. Create a **Session** and an **Analyst**.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
// starting the shell will create an implicit session and analyst
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.mllib.Pg2vecModel;
import oracle.pgx.api.frames.*;
```

Python

```
# starting the Python shell will create an implicit session and analyst
```

2. Load the **graph**.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var instance = GraphServer.getInstance("https://localhost:7007",
"<username>", "<password>".toCharArray())
opg4j> var session=instance.createSession("mySession")
opg4j> var graph =
session.readGraphByName("<graph_name>",GraphSource.PG_PGQL)
```

Java

```
ServerInstance instance = GraphServer.getInstance("https://
localhost:7007", "<username>", "<password>".toCharArray());
PgxSession session = instance.createSession("my-session");
PgxGraph graph =
session.readGraphByName("<graph_name>",GraphSource.PG_PGQL);
```

Python

```
instance = graph_server.get_instance("https://
localhost:7007", "<username>", "<password>")
session = instance.create_session("my_session")
graph = session.read_graph_by_name("<graph_name>", "pg_pgql")
```

19.7.2 Building a Minimal Pg2vec Model

You can build a Pg2vec model using the minimal configuration and default hyper-parameters as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.pg2vecModelBuilder().
        setGraphLetIdPropertyName("graph_id").
        setVertexPropertyNames(Arrays.asList("category")).
        setWindowSize(4).
        setWalksPerVertex(5).
        setWalkLength(8).
        build()
```

Java

```
Pg2vecModel model = analyst.pg2vecModelBuilder()
    .setGraphLetIdPropertyName("graph_id")
    .setVertexPropertyNames(Arrays.asList("category"))
    .setWindowSize(4)
    .setWalksPerVertex(5)
    .setWalkLength(8)
    .build();
```

Python

```
model = analyst.pg2vec_builder(
    graphlet_id_property_name="graph_id",
    vertex_property_names=["category"],
    window_size=4,
    walks_per_vertex=5,
    walk_length=8)
```

You can specify the property name to determine each graphlet using the `Pg2vecModelBuilder#setGraphLetIdPropertyName` operation and also employ the vertex properties in Pg2vec which are specified using the `Pg2vecModelBuilder#setVertexPropertyNames` operation.

You can also use the weakly connected component (WCC) functionality in PGX to determine the graphlets in a given graph.

19.7.3 Building a Customized Pg2vec Model

You can build a Pg2vec model using customized hyper-parameters as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.pg2vecModelBuilder().
    setGraphLetIdPropertyName("graph_id").
    setVertexPropertyNames(Arrays.asList("category")).
    setMinWordFrequency(1).
    setBatchSize(128).
    setNumEpochs(5).
    setLayerSize(200).
    setLearningRate(0.04).
    setMinLearningRate(0.0001).
    setWindowSize(4).
    setWalksPerVertex(5).
    setWalkLength(8).
    setUseGraphletSize(true).
    setGraphletSizePropertyName("<propertyName>").
    build()
```

Java

```
Pg2vecModel model= analyst.pg2vecModelBuilder()
    .setGraphLetIdPropertyName("graph_id")
    .setVertexPropertyNames(Arrays.asList("category"))
    .setMinWordFrequency(1)
    .setBatchSize(128)
    .setNumEpochs(5)
    .setLayerSize(200)
    .setLearningRate(0.04)
    .setMinLearningRate(0.0001)
    .setWindowSize(4)
    .setWalksPerVertex(5)
    .setWalkLength(8)
    .setUseGraphletSize(true)
    .setGraphletSizePropertyName("<propertyName>")
    .build();
```

Python

```
model = analyst.pg2vec_builder(
    graphlet_id_property_name="graph_id",
    vertex_property_names=["category"],
    min_word_frequency=1,
    batch_size=128,
    num_epochs=5,
    layer_size=200,
    learning_rate=0.04,
```

```
min_learning_rate=0.0001,  
window_size=4,  
walks_per_vertex=5,  
walk_length=8,  
use_graphlet_size=true,  
graphlet_size_property_name="<property_name>" )
```

See [Pg2vecModelBuilder](#) in Javadoc for more explanation for each builder operation along with the default values.

19.7.4 Training a Pg2vec Model

You can train a Pg2vec model with the specified default or customized settings as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.fit(graph)
```

Java

```
model.fit(graph);
```

Python

```
model.fit(graph)
```

19.7.5 Getting the Loss Value For a Pg2vec Model

You can fetch the training loss value as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var loss = model.getLoss()
```

Java

```
double loss = model.getLoss();
```

Python

```
loss = model.loss
```

19.7.6 Computing Similar Graphlets for a Given Graphlet

You can fetch the k most similar graphlets for a given graphlet as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var similars = model.computeSimilars(52, 10)
```

Java

```
PgxFrame similars = model.computeSimilars(52, 10);
```

Python

```
similars = model.compute_similars(52, 10)
```

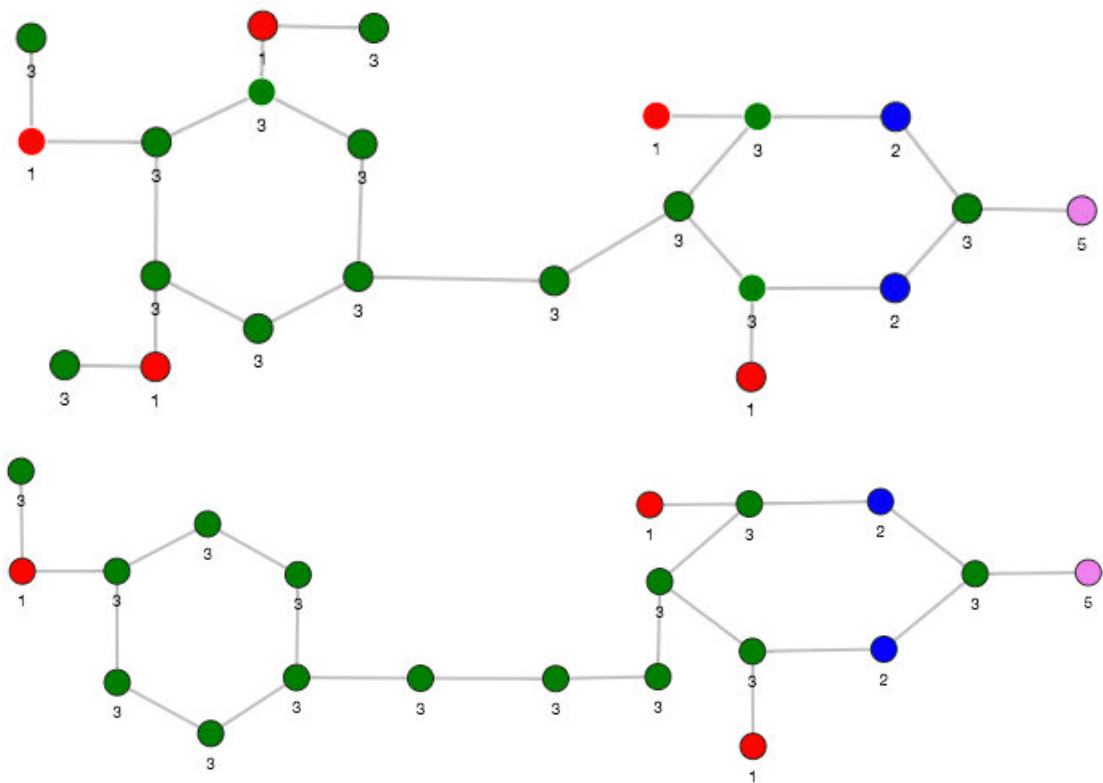

Searching for similar vertices for graphlet with ID = 52 using the trained model and printing it with `similars.print()`, will result in the following output:

```
+-----+
| dstGraphlet | similarity |
+-----+
| 52          | 1.0       |
| 10          | 0.8748674392700195 |
| 23          | 0.8551455140113831 |
+-----+
```

26	0.8493421673774719
47	0.8411962985992432
25	0.8281504511833191
43	0.8202780485153198
24	0.8179885745048523
8	0.796689510345459
9	0.7947834134101868

The following depicts the visualization of two similar graphlets (top: ID = 52 and bottom: ID = 10):

Figure 19-1 Pg2vec - Visualization of Two Similar Graphlets

19.7.7 Computing Similars for a Graphlet Batch

You can fetch the k most similar graphlets for a batch of input graphlets as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graphlets = new ArrayList()
opg4j> graphlets.add(52)
opg4j> graphlets.add(41)
opg4j> var batchedSimilars = model.computeSimilars(graphlets, 10)
```

Java

```
List graphlets = Arrays.asList(52,41);
PgxFram batchedSimilars = model.computeSimilars(graphlets,10);
```

Python

```
batched_similars = model.compute_similars([52,41],10)
```

Searching for similar vertices for graphlet with ID = 52 and ID = 41 using the trained model and printing it with `batched_similars.print()`, will result in the following output:

srcGraphlet	dstGraphlet	similarity
52	52	1.0
52	10	0.8748674392700195
52	23	0.8551455140113831
52	26	0.8493421673774719
52	47	0.8411962985992432
52	25	0.8281504511833191
52	43	0.8202780485153198
52	24	0.8179885745048523
52	8	0.796689510345459
52	9	0.7947834134101868
41	41	1.0
41	197	0.9653506875038147
41	84	0.9552277326583862
41	157	0.9465565085411072
41	65	0.9287481307983398
41	248	0.9177336096763611
41	315	0.9043129086494446
41	92	0.8998928070068359
41	297	0.8897411227226257
41	50	0.8810243010520935

19.7.8 Inferring a Graphlet Vector

You can infer the vector representation for a given new graphlet as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graphlet = session.readGraphByName("<graph>", GraphSource.PG_PGQL)
opg4j> var inferredVector = model.inferGraphletVector(graphlet)
opg4j> inferredVector.print()
```

Java

```
PgxGraph graphlet = session.readGraphByName("<graph>", GraphSource.PG_PGQL);
PgxFrame inferredVector = model.inferGraphletVector(graphlet);
inferredVector.print();
```

Python

```
graphlet = session.read_graph_by_name("<graph>", "pg_pgql")
inferred_vector = model.infer_graphlet_vector(graphlet)
inferred_vector.print()
```

The schema for the `inferredVector` will be similar to the following output:

```
+-----+
| graphlet                               | embedding |
+-----+
```

19.7.9 Inferring Vectors for a Graphlet Batch

You can infer the vector representations for multiple graphlets (specified with different graph-ids in a graph) as described in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graphlet = session.readGraphByName("<graph>", GraphSource.PG_PGQL)
opg4j> var inferredVectorBatched = model.inferGraphletVectorBatched(graphlets)
opg4j> inferredVectorBatched.print()
```

Java

```
PgxGraph graphlet = session.readGraphByName("<graph>", GraphSource.PG_PGQL);
PgxFram inferredVectorBatched = model.inferGraphletVectorBatched(graphlets);
inferredVector.print();
```

Python

```
graphlets = session.read_graph_by_name("<graph>", "pg_pgql")
inferred_vector_batched = model.infer_graphlet_vector_batched(graphlets)
inferred_vector_batched.print()
```

The schema is same as for `inferGraphletVector` but with more rows corresponding to the input graphlets.

19.7.10 Storing a Trained Pg2vec Model

You can store models in database. The models get stored as a row inside a model store table.

The following code shows how to store a trained Pg2vec model in database in a specific model store table:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> model.export().db().
           modelstore("modelstoretablename"). // name of the model store
table
           modelname("model").                // model name (primary key
of model store table)
           description("a model description"). // description to store
alongside the model
           store()
```

Java

```
model.export().db()
    .modelstore("modelstoretablename") // name of the model store table
    .modelname("model")                // model name (primary key of model
store table)
    .description("a model description") // description to store alongside the
model
    .store();
```

Python

```
model.export().db(model_store="modeltablename",           # name of the
model store table
                    model_name="model",                   # model name
(primary key of model store table)
                    model_description="a model description") # description to
store alongside the model
```

Note

All the preceding examples assume that you are storing the model in the current logged in database. If you must store the model in a different database then refer to the examples in [Storing a Trained Model in Another Database](#).

19.7.11 Loading a Pre-Trained Pg2vec Model

You can load models from a database.

You can load a pre-trained Pg2vec model from a model store table in database as described in the following:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var model = analyst.loadPg2vecModel().db().
        modelstore("modeltablename"). // name of the model store table
        modelname("model").           // model name (primary key of
model store table)
        load()
```

Java

```
Pg2vecModel model = analyst.loadPg2vecModel().db()
        .modelstore("modeltablename") // name of the model store table
        .modelname("model")           // model name (primary key of model store
table)
        .load();
```

Python

```
model = analyst.get_pg2vec_model_loader(). \
    db(model_store="modelstoretablename", # name of the model
    store table
        model_name="model")             # model name (primary
key of model store table)
```

Note

All the preceding examples assume that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the examples in [Loading a Pre-Trained Model From Another Database](#).

19.7.12 Destroying a Pg2vec Model

You can destroy a Pg2vec model as described in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> model.destroy()
```

Java

```
model.destroy();
```

Python

```
model.destroy()
```

19.8 Model Repository and Model Stores

A model store can be used to persist the trained graph server (PGX) machine learning models along with a model name (a unique identifier of the model in a particular model store) and a description.

The model repository API provides the following capabilities:

- Create a new model store
- List all the available model stores in the model repository
- Store a model in the model store
- List all the models in a given model store
- Load a model from the model store
- Get the model description for a model that is stored in the given model store
- Delete a model from the given model store
- Delete the existing model stores
- [Database-Backed Model Repository](#)

19.8.1 Database-Backed Model Repository

In a database-backed model repository, each model store corresponds to a table in the database. Internally, the tables are prefixed by 'GMLS_'. The following steps describe the usage of the model repository API with code examples.

1. Create a model repository object as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var mr = analyst.modelRepository().db().open()  
mr ==> oracle.pgx.api.mllib.DbModelRepository@5aac6f9f
```

Java

```
DbModelRepository mr = analyst.modelRepository().db().open();
```

Python

```
>>> mr = analyst.model_repository().db()  
>>> mr  
<pypgx.api.mllib._model_repo.ModelRepository object at 0x7f637496df60>
```

The preceding example assumes that you are creating the model repository from the current logged in database. If you must create the repository in a different database, then refer to the following example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var mr = analyst.modelRepository().db().
...>                               username("<username>").    // DB user to use
for storing the model
...>                               password("<password>").    // password of the
DB user
...>                               jdbcUrl("<jdbcUrl>").      // jdbc url to the
DB
...>                               open()
```

Java

```
DbModelRepository mr = analyst.modelRepository().db()
                               .username("<username>")    // DB user to use
for storing the model
                               .password("<password>")    // password of the
DB user
                               .jdbcUrl("<jdbcUrl>")      // jdbc url to the
DB
                               .open();
```

Python

```
>>> mr = analyst.model_repository().db(username = "<username>", # DB user
to use for storing the model
...                               password = "<password>", # password of
the DB user
...                               jdbc_url = "<jdbc_url>") # jdbc url to
the DB
```

-
2. Create a model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var modelstore = "modelstore"
modelstore ==> "modelstore"
opg4j> mr.create(modelstore)
```

Java

```
String modelstore = "modelstore";
mr.create(modelstore);
```

Python

```
>>> mr.create("modelstore")
```

-
3. List the model store as shown and verify that the model store is empty:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> mr.listModelStoresNames()
$4 ==> [DW, deepwalk_model, modelstore, modelstoretablename]
opg4j> mr.listModelStoresNamesMatching(modelstore)
$5 ==> [modelstore, modelstoretablename]
opg4j> mr.listModels(modelstore)
$6 ==> []
```

Java

```
mr.listModelStoresNames();
mr.listModelStoresNamesMatching(modelstore);
mr.listModels(modelstore);
```

Python

```
>>> mr.list_model_stores_names()
>>> mr.list_model_stores_names_matching("modelstore")
>>> mr.list_models("modelstore")
```

-
4. Create and fit a DeepWalk model as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var walkLength = 5
opg4j> var walksPerVertex = 4
opg4j> var embeddingSize = 20
opg4j> var batchSize = 128
opg4j> var model = analyst.deepWalkModelBuilder()
                                .setLayerSize(embeddingSize)
                                .setWalkLength(walkLength)
                                .setWalksPerVertex(walksPerVertex)
                                .setBatchSize(batchSize).build()
model ==> oracle.pgx.api.mllib.DeepWalkModel@34be7efb
opg4j> var smallGraphDeepWalk =
session.readGraphByName("<graph_name>", GraphSource.PG_PGQL)
smallGraphDeepWalk ==>
PgxGraph[name=BANK_GRAPH_2,N=1000,E=5001,created=1649075718843]
opg4j> model.fit(smallGraphDeepWalk)
```

Java

```
import oracle.pgx.api.mllib.DeepWalkModel;
int walkLength = 5;
int walksPerVertex = 4;
int embeddingSize = 20;
int batchSize = 128;
DeepWalkModel model = analyst.deepWalkModelBuilder()
                                .setLayerSize(embeddingSize)
                                .setWalkLength(walkLength)
                                .setWalksPerVertex(walksPerVertex)
                                .setBatchSize(batchSize).build();
PgxGraph smallGraphDeepWalk =
session.readGraphByName("<graph_name>", GraphSource.PG_PGQL);
model.fit(smallGraphDeepWalk);
```

Python

```
>>> model =
analyst.deepwalk_builder(window_size=3,walks_per_vertex=6,walk_length=4)
graph = session.read_graph_by_name("<graph_name>", 'pg_pgql')
>>> model.fit(graph)
```

-
5. Store the trained model in the model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var modelName = "DeepWalkModel"
opg4j> var modelStorer = model.export().db()
modelStorer ==> oracle.pgx.api.mllib.DbModelStorer@1e86b2d1
opg4j> modelStorer.modelstore(modelstore)
               .overwrite(true).modelName(modelName)
               .description("DeepWalk: model desc")
               .store()
```

Java

```
import oracle.pgx.api.mllib.DbModelStorer;
import oracle.pgx.api.mllib.DbModelLoader;

String modelName = "DeepWalkModel";
DbModelStorer<DeepWalkModel> modelStorer = model.export().db();
modelStorer.modelstore(modelstore)
               .overwrite(true).modelName(modelName)
               .description("DeepWalk: model desc")
               .store();
```

Python

```
>>> model.export().db(model_store = "modelstore", model_name =
"DeepWalkModel",
...               model_description = "DeepWalk model description")
```

-
6. Verify that the model is now stored in the model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> mr.listModels(modelstore)
$11 ==> [DeepWalkModel]
```

Java

```
mr.listModels(modelstore);
```

Python

```
>>> mr.list_models("modelstore")
```

-
7. Load the model from the model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var modelLoader = analyst.loadDeepWalkModel().db()  
opg4j> var reloadedModel = modelLoader.  
                                modelstore(modelstore).  
                                modelname(modelName).  
                                load()  
reloadedModel ==> oracle.pgx.api.mllib.DeepWalkModel@4248608d
```

Java

```
DbModelLoader<DeepWalkModel> modelLoader =  
analyst.loadDeepWalkModel().db();  
DeepWalkModel reloadedModel = modelLoader.modelstore(modelstore)  
                                .modelname(modelName)  
                                .load();
```

Python

```
>>> analyst.get_deepwalk_model_loader().db(model_store = "modelstore",  
                                           model_name = "DeepWalkModel")  
DeepWalkModel
```

The preceding example assumes that you are loading the model from the current logged in database. If you must load the model from a different database then refer to the example in [Loading a Pre-Trained Model From Another Database](#).

8. Get the model description from the model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> mr.getModelDescription(modelstore,modelName)
$14 ==> "DeepWalk: model desc"
```

Java

```
mr.getModelDescription(modelstore,modelName);
```

Python

```
>>> mr.get_model_description("modelstore","DeepWalkModel")
'DeepWalk model description'
```

-
9. Delete the model from the model store as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> mr.deleteModel(modelstore,modelName)
```

Java

```
mr.deleteModel(modelstore,modelName);
```

Python

```
>>> mr.delete_model("modelstore","DeepWalkModel")
```

-
10. Delete the model store as shown:
-

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> mr.deleteModelStore(modelstore)
```

Java

```
mr.deleteModelStore(modelstore);
```

Python

```
>>>      ("modelstore")
```

Executing PGQL Queries Against the Graph Server (PGX)

This section describes the Java APIs that are used to execute PGQL queries in the graph server (PGX).

- [Getting Started with PGQL](#)
Get started with PGQL in the graph server (PGX).
- [Creating Property Graphs Using Options](#)
Learn about the different options for graph optimization and for handling edges with missing vertices.
- [Supported PGQL Features and Limitations on the Graph Server \(PGX\)](#)
Learn about the supported and unsupported PGQL functionalities in the graph server (PGX).
- [Java APIs for Executing CREATE PROPERTY GRAPH Statements](#)
You can use the `PgxSession.executePgql(String statement)` method to execute a CREATE PROPERTY GRAPH statement.
- [Python APIs for Executing CREATE PROPERTY GRAPH Statements](#)
You can create a property graph by executing the CREATE PROPERTY GRAPH statement through the Python API.
- [Executing PGQL Queries Using the PGX JDBC Driver](#)
Starting from Graph Server and Client Release 24.1.0, you can use the PGX JDBC driver to access a PGX session and query graphs that are loaded in to the graph server (PGX).
- [Java APIs for Executing SELECT Queries](#)
This section describes the APIs to execute SELECT queries in the graph server (PGX).
- [Java APIs for Executing UPDATE Queries](#)
The UPDATE queries make changes to existing graphs using the INSERT, UPDATE, and DELETE operations.
- [Python APIs for Executing UPDATE Queries](#)
You can update a graph that is loaded into the graph server (PGX) using the Python APIs.
- [PGQL Queries with Partitioned IDs](#)
You can retrieve partitioned IDs using the `id()` function in PGQL.
- [Security Tools for Executing PGQL Queries](#)
To safeguard against query injection, bind variables can be used in place of literals while `printIdentifier(String identifier)` can be used in place of identifiers like graph names, labels, and property names.
- [Best Practices for Tuning PGQL Queries](#)
This section describes best practices regarding memory allocation, parallelism, and query planning.

20.1 Getting Started with PGQL

Get started with PGQL in the graph server (PGX).

This section provides an example on how to get started with PGQL. It assumes a database realm that has been previously set up (follow the steps in [Prepare the Graph Server for Database Authentication](#)). It also assumes that the user has `read` access to the HR schema.

First, create a graph with employees, departments, and employee works at department, by executing a `CREATE PROPERTY GRAPH` statement.

Example 20-1 Creating a graph in the graph server (PGX)

The following statement creates a graph in the graph server (PGX)

```
String statement =
    "CREATE PROPERTY GRAPH hr_simplified "
    + " VERTEX TABLES ( "
    + "     hr.employees LABEL employee "
    + "     PROPERTIES ARE ALL COLUMNS EXCEPT ( job_id, manager_id,
department_id ), "
    + "     hr.departments LABEL department "
    + "     PROPERTIES ( department_id, department_name ) "
    + " ) "
    + " EDGE TABLES ( "
    + "     hr.employees AS works_at "
    + "     SOURCE KEY ( employee_id ) REFERENCES employees (employee_id) "
    + "     DESTINATION departments "
    + "     PROPERTIES ( employee_id ) "
    + " )";
session.executePgql(statement);

/**
 * To get a handle to the graph, execute:
 */
PgxGraph g = session.getGraph("HR_SIMPLIFIED");

/**
 * You can use this handle to run PGQL queries on this graph.
 * For example, to find the department that "Nandita Sarchand" works for,
execute:
 */
String query =
    "SELECT dep.department_name "
    + "FROM MATCH (emp:Employee) -[:works_at]-> (dep:Department) "
    + "WHERE emp.first_name = 'Nandita' AND emp.last_name = 'Sarchand' "
    + "ORDER BY 1";
PgqlResultSet resultSet = g.queryPgql(query);
resultSet.print();
+-----+
| department_name |
+-----+
| Shipping        |
+-----+

/**
 * To get an overview of the types of vertices and their frequencies, execute:
 */
String query =
    "SELECT label(n), COUNT(*) "
    + "FROM MATCH (n) "
```

```

+ "GROUP BY label(n) "
+ "ORDER BY COUNT(*) DESC";
PgqlResultSet resultSet = g.queryPgql(query);
resultSet.print();

+-----+
| label(n) | COUNT(*) |
+-----+
| EMPLOYEE | 107      |
| DEPARTMENT | 27      |
+-----+

/**
 *To get an overview of the types of edges and their frequencies, execute:
 */
String query =
    "SELECT label(n) AS srcLbl, label(e) AS edgeLbl, label(m) AS dstLbl,
COUNT(*) "
    + "FROM MATCH (n) -[e]-> (m) "
    + "GROUP BY srcLbl, edgeLbl, dstLbl "
    + "ORDER BY COUNT(*) DESC";
PgqlResultSet resultSet = g.queryPgql(query);
resultSet.print();

+-----+
| srcLbl   | edgeLbl   | dstLbl     | COUNT(*) |
+-----+
| EMPLOYEE | WORKS_AT  | DEPARTMENT | 106      |
+-----+

```

20.2 Creating Property Graphs Using Options

Learn about the different options for graph optimization and for handling edges with missing vertices.

Using the **OPTIONS** clause in the `CREATE PROPERTY GRAPH` statement, you can specify any of the options explained in the following sections:

Using Graph Optimization Options

You can load a graph for querying and analytics or for performing update operations. Depending on your requirement, you can optimize the read or update performance using the **OPTIONS** clause in the `CREATE PROPERTY GRAPH` statement.

The following table describes the valid options that are supported in the **OPTIONS** clause:

Table 20-1 Graph Optimization Options

OPTIONS	Description
OPTIMIZED_FOR_READ	This can be used for read-intensive scenarios.
OPTIMIZED_FOR_UPDATES	This is the default option and can be used for fast updates.

Table 20-1 (Cont.) Graph Optimization Options

OPTIONS	Description
SYNCHRONIZABLE	This assures that the graph can be synchronized via Flashback Technology. However, exceptions are thrown if one of the edge keys is either composite or non-numeric. In these cases, the graph can normally still be loaded, but PGX generates a new (numeric and non-composite) edge key. Such edges can therefore not be synchronized with the database.

For example, the following graph is set using `OPTIMIZED_FOR_UPDATES` and `SYNCHRONIZABLE` options:

```
CREATE PROPERTY GRAPH hr
  VERTEX TABLES (
    employees LABEL employee, departments LABEL department
  )
  EDGE TABLES (
    departments AS managed_by
  )
  SOURCE KEY ( department_id ) REFERENCES departments (department_id)
  DESTINATION employees
  NO PROPERTIES
  ) OPTIONS (OPTIMIZED_FOR_UPDATES, SYNCHRONIZABLE)
```

Note

- `SYNCHRONIZABLE` option can be used in combination with `OPTIMIZED_FOR_UPDATES` and `OPTIMIZED_FOR_READ`. But, `OPTIMIZED_FOR_UPDATES` and `OPTIMIZED_FOR_READ` cannot be used together and in such a case an exception will be thrown.
- If you are creating a synchronizable graph, then ensure that the vertex and edge keys are numeric and non-composite.

Using Options to Handle Edges with Missing Vertices

If either the source or destination vertex or both are missing for an edge, then you can configure one of the following values in the **OPTIONS** clause in the `CREATE PROPERTY GRAPH` statement:

- `IGNORE EDGE ON MISSING VERTEX`: Specifies that the edge for a missing vertex must be ignored.
- `IGNORE EDGE AND LOG ON MISSING VERTEX`: Specifies that the edge for a missing vertex must be ignored and all ignored edges must be logged.
- `IGNORE EDGE AND LOG ONCE ON MISSING VERTEX`: Specifies that the edge for a missing vertex must be ignored and only the first ignored edge must be logged.
- `ERROR ON MISSING VERTEX` (default): Specifies that an error must be thrown for edges with missing vertices.

For example, the following graph is set using `ERROR ON MISSING VERTEX` option:

```
CREATE PROPERTY GRAPH region_graph
  VERTEX TABLES (
    regions KEY (region_id),
    countries KEY (country_id)
  )
  EDGE TABLES (
    countries AS countries_regions
    SOURCE KEY ( country_id ) REFERENCES countries(country_id)
    DESTINATION KEY (region_id) REFERENCES regions(region_id)
    NO PROPERTIES
  ) OPTIONS ( ERROR ON MISSING VERTEX)
```

On execution, the following error response is shown:

```
unknown vertex ID received in destination 4 of edge 5
```

When using `IGNORE EDGE AND LOG ON MISSING VERTEX` or `IGNORE EDGE AND LOG ONCE ON MISSING VERTEX` option, you must update the default Logback configuration file in `/etc/oracle/graph/logback.xml` and the graph server (PGX) logger configuration file in `/etc/oracle/graph/logback-server.xml` to log the `DEBUG` logs. Only then you can view the ignored edges in `/var/log/oracle/graph/pgx-server.log` file.

20.3 Supported PGQL Features and Limitations on the Graph Server (PGX)

Learn about the supported and unsupported PGQL functionalities in the graph server (PGX).

Table 20-2 Supported PGQL Functionalities and Limitations on the Graph Server (PGX)

Features	PGQL on the Graph Server (PGX)
CREATE PROPERTY GRAPH	Supported Limitations: <ul style="list-style-type: none"> No composite keys for vertices. Properties need to be column references; arbitrary property expressions are not supported unless the graph is first created in the database and then loaded into the graph server (PGX).
DROP PROPERTY GRAPH	Not Supported
Fixed-length pattern matching	Supported

Table 20-2 (Cont.) Supported PGQL Functionalities and Limitations on the Graph Server (PGX)

Features	PGQL on the Graph Server (PGX)
Variable-length pattern matching goals	Supported: <ul style="list-style-type: none"> • Reachability • Path search prefixes: <ul style="list-style-type: none"> – ANY – ANY SHORTEST – SHORTEST k – ALL SHORTEST – ANY CHEAPEST – CHEAPEST k – ALL • Path modes: <ul style="list-style-type: none"> – WALK – TRAIL – SIMPLE – ACYCLIC
Variable-length pattern matching quantifiers	Supported: <ul style="list-style-type: none"> • * • + • ? • { n } • { n, } • { n, m } • { , m } Limitations: <ul style="list-style-type: none"> • ? is only supported for reachability • In case of ANY CHEAPEST and TOP k CHEAPEST, only * is supported
Variable-length path unnesting	Supported: <ul style="list-style-type: none"> • ONE ROW PER VERTEX • ONE ROW PER STEP
OPTIONAL MATCH	Supported
GROUP BY	Supported
HAVING	Supported
Aggregations	Supported: <ul style="list-style-type: none"> • COUNT • MIN, MAX, AVG, SUM • LISTAGG • ARRAY_AGG Not Supported <ul style="list-style-type: none"> • JSON_ARRAYAGG
DISTINCT	Supported
<ul style="list-style-type: none"> • SELECT DISTINCT • Aggregation with DISTINCT (such as, COUNT(DISTINCT e.prop)) 	
SELECT v.*	Supported
ORDER BY (+ASC/DESC), LIMIT, OFFSET	Supported

Table 20-2 (Cont.) Supported PGQL Functionalities and Limitations on the Graph Server (PGX)

Features	PGQL on the Graph Server (PGX)
Data Types	Supported: <ul style="list-style-type: none"> • INTEGER (32-bit) • LONG (64-bit) • FLOAT (32-bit) • DOUBLE (64-bit) • STRING (no maximum length) • BOOLEAN • DATE • TIME • TIME WITH TIME ZONE • TIMESTAMP • TIMESTAMP WITH TIME ZONE
JSON	No built-in JSON support. However, JSON values can be stored as STRING and manipulated or queried through user-defined functions (UDFs) written in Java or JavaScript.
Operators	Supported: <ul style="list-style-type: none"> • Relational: +, -, *, /, %, - (unary minus) • Arithmetic: =, <>, <, >, <=, >= • Logical: AND, OR, NOT • String: (concat)
Functions and predicates	Supported: <ul style="list-style-type: none"> • IS NULL, IS NOT NULL • JAVA_REGEX_LIKE (based on CONTAINS) • LOWER, UPPER • SUBSTRING • ABS, CEIL/CEILING, FLOOR, ROUND • EXTRACT • ID, VERTEX_ID, EDGE_ID • LABEL, LABELS, IS [NOT] LABELED • ALL_DIFFERENT • IN_DEGREE, OUT_DEGREE • CAST • CASE • IN and NOT IN • MATCHNUM • ELEMENT_NUMBER • IS [NOT] SOURCE [OF], IS [NOT] DESTINATION [OF] • VERTEX_EQUAL, EDGE_EQUAL
User-defined functions	Supported: <ul style="list-style-type: none"> • Java UDFs • JavaScript UDFs
Subqueries: <ul style="list-style-type: none"> • Scalar subqueries • EXISTS and NOT EXISTS subqueries • LATERAL subquery 	Supported

Table 20-2 (Cont.) Supported PGQL Functionalities and Limitations on the Graph Server (PGX)

Features	PGQL on the Graph Server (PGX)
GRAPH_TABLE operator	Supported
INSERT/UPDATE/DELETE	Supported
INTERVAL literals and operations	Supported literals: <ul style="list-style-type: none"> • SECOND • MINUTE • HOUR • DAY • MONTH • YEAR Supported operations: <ul style="list-style-type: none"> • Add INTERVAL to datetime (+) • Subtract INTERVAL from datetime (-)

Also, the following explains certain supported and unsupported PGQL features:

- [Support for Selecting All Properties](#)
- [Unnesting of Variable-Length Path Queries](#)
- [Using INTERVAL Literals in PGQL Queries](#)
- [Using Path Modes with PGQL](#)
- [Support for PGQL Lateral Subqueries](#)
- [Support for PGQL GRAPH_TABLE Operator](#)
- [OPTIONAL MATCH Clause](#)
The OPTIONAL MATCH clause has the same set of capabilities as a regular MATCH clause, and can contain one or more path patterns followed by an optional WHERE clause.
- [Limitations on Quantifiers](#)
- [Limitations on WHERE and COST Clauses in Quantified Patterns](#)

20.3.1 Support for Selecting All Properties

You can use `SELECT v.*` to select all properties of the vertices or edges that bind to the variable `v`. For example:

```
SELECT label(n), n.* FROM MATCH (n) ORDER BY "number", "name"
```

On execution, the query output is as shown:

```
+-----+
| label(n) | number | name  |
+-----+
| Account  | 1001   | <null> |
| Account  | 2090   | <null> |
| Account  | 8021   | <null> |
| Account  | 10039  | <null> |
| Person   | <null> | Camille |
```

Person	<null>	Liam
Person	<null>	Nikita
Company	<null>	Oracle

You can use label expressions to select properties that belong to the specified vertex or edge labels. For example:

```
SELECT label(n), n.* FROM MATCH (n:Person) ORDER BY "name"
```

The preceding query retrieves all the properties for the specified `Person` label:

label(n)	name
Person	Camille
Person	Liam
Person	Nikita

You can also specify a `PREFIX` to avoid duplicate column names in cases where you select all properties using multiple variables. For example:

```
SELECT n.* PREFIX 'n_', e.* PREFIX 'e_', m.* PREFIX 'm_'
FROM MATCH (n:Account) -[e:transaction]-> (m:Account)
ORDER BY "e_amount"
```

The query output is as shown:

n_number	e_amount	m_number
10039	1000.0	8021
8021	1500.3	1001
8021	3000.7	1001
2090	9900.0	10039
1001	9999.5	2090

20.3.2 Unnesting of Variable-Length Path Queries

Unnesting of variable-length path queries (such as, `SHORTEST` or `CHEAPEST` paths) to obtain a separate row for each vertex or edge along a path is supported.

You can unnest a path aggregation using one of the following options:

- `ONE ROW PER MATCH` (default option)
- `ONE ROW PER VERTEX(vertex_variable)`
- `ONE ROW PER STEP(edge_source_variable,edge_variable,edge_destination_variable)`

For example, the following PGQL query uses the `ONE ROW PER STEP` option:

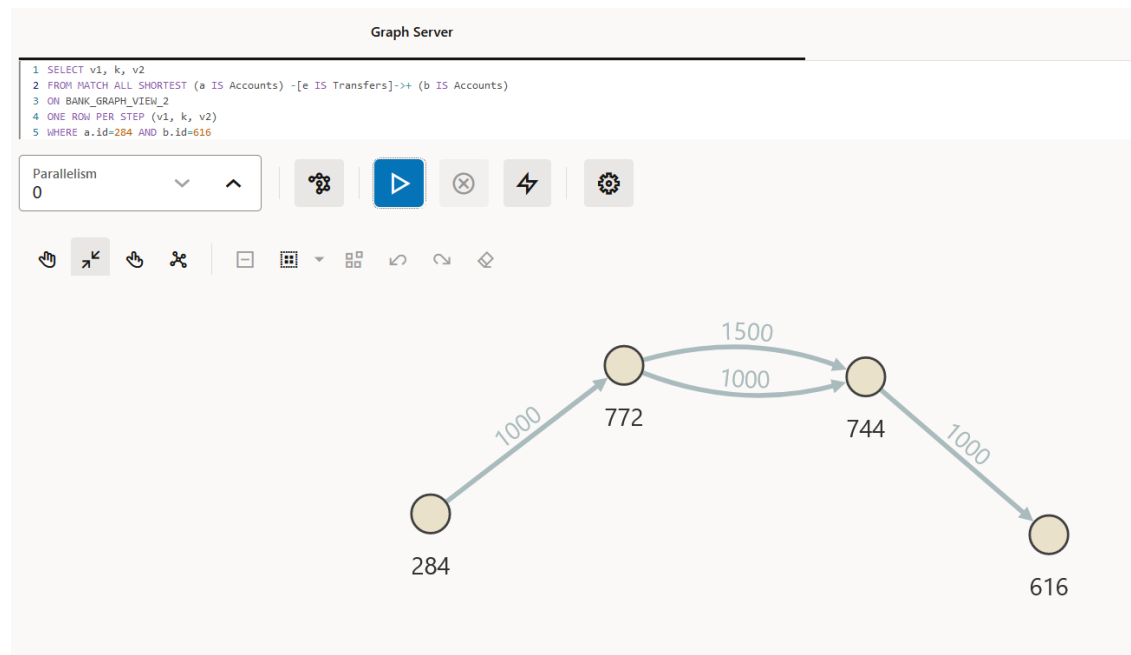

```
SELECT v1.ACCT_ID AS src_no, k.TXN_AMOUNT, v2.ACCT_ID AS dest_no
FROM MATCH ALL SHORTEST (a:Accounts) -[e:transfers]->+ (b:Accounts)
ONE ROW PER STEP( v1,k,v2 )
WHERE a.ACCT_ID = 284 AND b.ACCT_ID = 616
```

On execution, the preceding query retrieves one row for every edge on the path that is bound by the corresponding source and destination vertices:

src_no	TXN_AMOUNT	dest_no
744	1000.0	616
772	1000.0	744
284	1000.0	772
744	1000.0	616
772	1500.0	744
284	1000.0	772

You can also use the Graph Visualization tool to visualize edges using `ONE ROW PER STEP` along a path:

Figure 20-1 Visualizing Unnesting of Variable-Length Path Queries

Also, when using the `ONE ROW PER STEP` option, if the path is empty (that is, the path length is zero), then it has a single step such that the first vertex variable (`v1`) is bound but the edge variable (`e`) and the second vertex variable (`v2`) are unbound. Note that accessing the properties of unbound variables will result in `NULL` values.

An example for a query with the `ONE ROW PER VERTEX` option is as follows:

```
SELECT k.acct_id AS id, k.acct_name AS name
FROM MATCH ANY SHORTEST (a:Accounts) ((src:Accounts)-[e:transfers]->){1,3}
(b:Accounts)
ONE ROW PER VERTEX(k)
WHERE a.acct_id=284 AND b.acct_id=616
```

On execution, the preceding query retrieves one row per vertex along a path:

id	name
616	Account4
744	Account3
772	Account2
284	Account1

Built-in Function Support for Recursive Path Unnesting Queries

PGQL supports the following two built-in functions, which can be used in combination with any of the path unnesting option (`ONE ROW PER VERTEX`, `ONE ROW PER STEP` or `ONE ROW PER MATCH`):

- **MATCH_NUMBER(k)**: Returns a unique per-path identifier for each unnested path (that is, if two rows come from the same path, they have the same `MATCH_NUMBER(k)`).
- **ELEMENT_NUMBER(k)**: Returns the element number of a vertex or an edge along a path. Vertices are numbered with odd numbers, the leftmost vertex is numbered 1, the second 3, then 5 and so on. Edges are assigned with even numbers, starting with 2 for the leftmost edge, 4 for the next one, and so on.

For example, the following PGQL query uses the `MATCH_NUMBER(k)` and `ELEMENT_NUMBER(k)` functions with `ONE ROW PER VERTEX` option:

```
SELECT k.*, match_number(k), element_number(k)
FROM MATCH ANY SHORTEST (a:Accounts) -[e:transfers]->* (b:Accounts) ONE ROW
PER VERTEX ( k )
WHERE a.acct_id = 284 AND b.acct_id = 616
```

The preceding query produces the following output on execution. Note that the `element_number(k)` returned for the vertices are odd numbered values. Since the preceding query uses `ANY` path pattern, there is only one arbitrary path displayed in the output. Therefore `match_number(k)` is the same for all the rows in the path.

ACCT_ID	ACCT_NAME	match_number(k)	element_number(k)
616	Account	0	7
744	Account	0	5
772	Account	0	3
284	Account	0	1

The following example shows a PGQL query using `MATCH_NUMBER(k)` and `ELEMENT_NUMBER(k)` functions with `ONE ROW PER STEP` option:

```
SELECT v1.acct_id AS src_no,k.txn_amount,v2.acct_id AS dest_no,
match_number(k), element_number(k)
FROM MATCH ALL SHORTEST (a:Accounts) -[e:transfers]->+ (b:Accounts)
ONE ROW PER STEP( v1,k,v2 )
WHERE a.acct_id = 284 AND b.acct_id = 616
```

The preceding query output is as shown. Note that there are two paths identified by `match_number(k)` and the edges are displayed with even numbered `element_number(k)` values.

src_no	txn_amount	dest_no	match_number(k)	element_number(k)
744	1000.0	616	0	6
772	1000.0	744	0	4
284	1000.0	772	0	2
744	1000.0	616	1	6
772	1500.0	744	1	4
284	1000.0	772	1	2

20.3.3 Using INTERVAL Literals in PGQL Queries

You can use `INTERVAL` literals in PGQL queries to add or subtract intervals to or from PGQL temporal data types respectively.

See the [PGQL 1.5 Specification](#) for the supported temporal data types.

An `INTERVAL` type is a period of time, which consists of the keyword "INTERVAL" followed by a numeral and a temporal unit. For example, `INTERVAL '1' DAY`.

The following table shows the valid temporal units that are supported in `INTERVAL` values:

Table 20-3 Valid values for fields in `INTERVAL` values

Keyword	Supported Valid Values
YEAR	Unconstrained except by <interval leading field precision>
MONTH	Months (within years) (0-11)
DAY	Unconstrained except by <interval leading field precision>
HOURL	Hours (within days) (0-23)
MINUTE	Minutes (within hours) (0-59)
SECOND	Seconds (within minutes) (0-59.999...)

The following `INTERVAL` operations are supported on a temporal data type:

- `TEMPORAL TYPE + INTERVAL`
- `INTERVAL + TEMPORAL TYPE`
- `TEMPORAL TYPE - INTERVAL`

For example, the following PGQL query retrieves persons where `n.birthdate + INTERVAL '20' YEAR > TIMESTAMP '2000-01-01 00:00:00'`:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> graph.queryPgql("SELECT n.name, n.birthdate FROM MATCH (n:Person)
WHERE n.birthdate + INTERVAL '20' YEAR > TIMESTAMP '2000-01-01
00:00:00').print()
```

Java

```
graph.queryPgql("SELECT n.name, n.birthdate FROM MATCH (n:Person) WHERE
n.birthdate + INTERVAL '20' YEAR > TIMESTAMP '2000-01-01 00:00:00').print();
```

Python

```
graph.query_pgql("SELECT n.name, n.birthdate FROM MATCH (n:Person) WHERE
n.birthdate + INTERVAL '20' YEAR > TIMESTAMP '2000-01-01 00:00:00').print()
```

On execution, the query output is as shown:

```
+-----+
| name | birthdate |
+-----+
| Mary | 1982-09-25T00:00 |
| Alice | 1987-02-01T00:00 |
+-----+
```

20.3.4 Using Path Modes with PGQL

The following path modes are available in combination with `ANY`, `ALL`, `ANY SHORTEST`, `SHORTEST k`, and `ALL SHORTEST`:

- **WALK (default path mode):** A walk is traversing a graph through a sequence of vertices and edges. The vertices and edges visited in a walk can be repeated. Hence there is no filtering of paths in this default path mode.
- **TRAIL:** A trail is traversing a graph without repeating the edges. Therefore, path bindings with repeated edges are not returned.

```
SELECT CAST(a.number AS STRING) || ' -> ' || LISTAGG(x.number, ' -> ') AS
accounts_along_path
FROM MATCH ALL TRAIL PATHS (a IS account) (-[IS transaction]-> (x)){2,} (b
```

```
IS Account)
WHERE a.number = 8021 AND b.number = 1001
```

```
+-----+
| accounts_along_path |
+-----+
| 8021 -> 1001 -> 2090 -> 10039 -> 8021 -> 1001 |
| 8021 -> 1001 -> 2090 -> 10039 -> 8021 -> 1001 |
+-----+
```

In the preceding output, both the paths contain the vertices 8021 and 1001 twice but they are still valid trails as long as no edges are repeated.

- **ACYCLIC:** If the starting and ending vertex in a graph traversal are different, then this implies that there are no cycles in the path. In this case, the path bindings with repeated vertices are not returned.

```
SELECT CAST(a.number AS STRING) || ' -> ' || LISTAGG(x.number, ' -> ') AS
accounts_along_path
FROM MATCH SHORTEST 10 ACYCLIC PATHS (a IS account) (-[IS transaction]->
(x))+ (b)
WHERE a.number = 10039 AND b.number = 1001
```

```
+-----+
| accounts_along_path |
+-----+
| 10039 -> 8021 -> 1001 |
| 10039 -> 8021 -> 1001 |
+-----+
```

The preceding query requested 10 shortest paths. But only two are returned since all the other paths are cyclic.

- **SIMPLE:** A simple walk is traversing a graph without repeating the vertices. Therefore, path bindings with repeated vertices are not returned. The only exception is when the repeated vertex is the first and the last in a path.

```
SELECT CAST(a.number AS STRING) || ' -> ' || LISTAGG(x.number, ' -> ') AS
accounts_along_path
FROM MATCH ANY SIMPLE PATH (a IS account) (-[IS transaction]-> (x))+ (a)
WHERE a.number = 10039
```

```
+-----+
| accounts_along_path |
+-----+
| 10039 -> 8021 -> 1001 -> 2090 -> 10039 |
+-----+
```

The preceding query returns a cyclic path. This path is a valid simple path since it starts and ends in the same vertex and there is no other cycle in the path.

Note that the path modes are syntactically placed after ANY, ALL, ANY SHORTEST, SHORTEST k, ALL SHORTEST, CHEAPEST, and CHEAPEST k. The path mode is optionally followed by a PATH or PATHS keyword.

Note that using `TRAIL`, `ACYCLIC`, or `SIMPLE` matching path modes for all unbounded quantifiers guarantees that the result set of a graph pattern matching will be finite.

20.3.5 Support for PGQL Lateral Subqueries

You can use a `LATERAL` subquery to pass the output rows of one query into another.

For example, you can use the `ORDER BY` or `GROUP BY` clause on top of another `ORDER BY` or `GROUP BY` clause:

```
/* Find the top-5 largest transactions and return the account number
   that received the highest number of such large transactions */
SELECT recipient, COUNT(*) AS num_large_transactions
FROM LATERAL ( SELECT m.number AS recipient
                FROM MATCH (n:account) -[e:transaction]-> (m:account)
                ORDER BY e.amount DESC
                LIMIT 5 )
GROUP BY recipient
ORDER BY num_large_transactions DESC
LIMIT 1
```

Also, the `LATERAL` subquery in the `FROM` clause can be followed by one or more `MATCH` clauses. For example:

```
SELECT path_num, elem_num, owner.name
FROM LATERAL ( SELECT v, MATCHNUM(v) AS path_num, ELEMENT_NUMBER(v) AS
elem_num
                FROM MATCH SHORTEST 2 PATHS (a1:account) -[e:transaction]->*
                (a2:account)
                ONE ROW PER VERTEX ( v )
                WHERE a1.number = 10039 AND a2.number = 2090 )
, MATCH (v) -[:owner]-> (owner:Person|Company)
ORDER BY path_num, elem_num
```

Note that the `FROM` clause may contain any number of `MATCH` clauses and `LATERAL` subqueries.

Both, `MATCH` clause followed by a `LATERAL` subquery, or a `LATERAL` subquery followed by one or more `LATERAL` subqueries are supported.

Also, note the following:

- Variables exported from previous table expressions can be used in subsequent table expressions.
- Operators like `ORDER BY` and `LIMIT` can be used followed by additional pattern matching.
- Variables that are not projected from a `LATERAL` subquery cannot be accessed in the outer query.

The following example query first retrieves a list of companies. Then, it finds the respective accounts of the companies. Finally, it finds the top 2 transactions made to the account of each company in the initial list.

```
SELECT c.name, a.number, t.amount FROM
  LATERAL ( SELECT c FROM MATCH (c:Company) ORDER BY c.name LIMIT 1 ),
  MATCH (a:Account)->(c),
```

```
LATERAL (SELECT t FROM MATCH ()-[t:Transaction]->(a) ORDER BY t.amount DESC
LIMIT 2)
```

In the following query, the `LATERAL` subquery is followed by two other `LATERAL` subqueries. Each subquery builds upon the output from the previous clauses:

```
SELECT f.number as fundsAccount FROM
LATERAL ( SELECT p FROM MATCH (p:Person) WHERE p.name = 'Nikita'),
LATERAL ( SELECT a FROM MATCH (a)->(p)),
LATERAL ( SELECT f FROM MATCH (f)->(a))
```

20.3.6 Support for PGQL `GRAPH_TABLE` Operator

The `GRAPH_TABLE` operator in PGQL increases the interoperability between graphs loaded into the graph server (PGX) and the graphs on the database.

However, in order to comply with the SQL standard, ensure that the PGQL query syntax is aligned as shown:

- The label predicate in the graph pattern `MATCH` query must use the `IS` keyword.
- To limit the number of output rows, use the `FETCH [FIRST/NEXT] x [ROW/ROWS]` clause instead of the `LIMIT x` clause.
- To verify the orientation of the edge, use `v IS [NOT] SOURCE [OF] e/v IS [NOT] DESTINATION [OF] e` as the standard form instead of `[NOT] is_source_of(e, v) / [NOT] is_destination_of(e, v)`.
- To verify if the vertex or edge has the given label, use the `x IS [NOT] LABELED <label_string>` predicate as an alternative for `has_label(x, <label_string>)`.
- To match the `k` shortest paths, use `MATCH (n) -[e]->* (m) KEEP SHORTEST k` as the standard form of `MATCH TOP k SHORTEST (n) -[e]->* (m)`.
- `ALL` keyword optional in front of fixed-length path patterns.
`MATCH (n) -[e]->{1,4} (m)` as an alternative for `MATCH ALL (n) -[e]->{1,4} (m)`.
- `MATCH <path pattern> KEEP <path pattern prefix> <WHERE clause>` as an alternative for `MATCH <path pattern prefix> <path pattern> <WHERE clause>`

The following shows a few query examples using the `GRAPH_TABLE` operator:

Example 20-2 Aggregation Query Using `TRAIL` path mode with `ALL`

```
SELECT *
FROM GRAPH_TABLE ( financial_transactions
    MATCH ALL TRAIL (a IS account) -[e IS transaction]->* (b IS account)
    /* optional ONE ROW PER VERTEX/STEP clause here */
    WHERE a.number = 8021 AND b.number = 1001
    COLUMNS ( LISTAGG(e.amount, ', ' ) AS amounts )
)ORDER BY amounts
```

The preceding query produces the following output:

```
+-----+
| amounts |
+-----+
| 1500.3  |
```

```

| 1500.3, 9999.5, 9900.0, 1000.0, 3000.7 |
| 3000.7 |
| 3000.7, 9999.5, 9900.0, 1000.0, 1500.3 |
+-----+

```

Example 20-3 Aggregation Query Using **KEEP** Clause

```

SELECT *
FROM GRAPH_TABLE ( financial_transactions
    MATCH (a IS Account) -[e IS transaction]->+ (a)
    KEEP SIMPLE PATHS
    WHERE a.number = 10039
    COLUMNS ( LISTAGG(e.amount, ', ') AS amounts_along_path,
              SUM(e.amount) AS total_amount )
    )
ORDER BY total_amount DESC

```

The preceding query produces the following output:

```

+-----+
| amounts_along_path | total_amount |
+-----+
| 1000.0, 3000.7, 9999.5, 9900.0 | 23900.2 |
| 1000.0, 1500.3, 9999.5, 9900.0 | 22399.8 |
+-----+

```

20.3.7 OPTIONAL MATCH Clause

The **OPTIONAL MATCH** clause has the same set of capabilities as a regular **MATCH** clause, and can contain one or more path patterns followed by an optional **WHERE** clause.

Using **OPTIONAL MATCH** in a PGQL query is similar to a **LEFT OUTER JOIN** in a SQL query.

The **OPTIONAL** keyword can be applied to a **MATCH** clause in a PGQL query as shown:

```

SELECT * FROM MATCH (person), OPTIONAL MATCH ((person)->(address) WHERE
address.number=33)

```

The resulting query output lists all persons with and without `address.number=33`:

```

+-----+
| person | address |
+-----+
| Nikita | Greenwhich 33 |
| Camille | Silver St 33 |
| Liam | <null> |
| John | <null> |
+-----+

```

The following shows an example of an `OPTIONAL MATCH` clause containing multiple path patterns and a `WHERE` clause.

```
-- List all people as well as their addresses in zip code 12345
SELECT p.name, s.street_name, z.zip_code
FROM MATCH (p IS person),
      OPTIONAL MATCH ( (p) -[e1:has_address]-> (a:address),
                      (a) -[e2:street]-> (s:street),
                      (a) -[e3:zip_code]-> (z:zip_code)
                      WHERE z.zip_code = 12345 )
```

In the preceding query, note that the `WHERE` clause is present inside the parenthesis. This indicates that the filter is applied before the `OPTIONAL` binding is executed. The query output may appear as shown:

John P.	1st Street	12345	
Mary M.	NULL	NULL	<== NULL value means Mary M. has no address with zip 12345
Jane X.	NULL	NULL	<== NULL value means Jane X. has no address with zip 12345

If the `WHERE` clause is placed outside of the `OPTIONAL MATCH` clause, then the filter will be applied after the `OPTIONAL` clause, essentially removing all unbound variables added by the `OPTIONAL` clause.

```
-- List all people as well as their addresses, then filter out addresses that
do not have zip code 12345
SELECT p.name, s.street_name, z.zip_code
FROM MATCH (p IS person),
      OPTIONAL MATCH ( (p) -[e1:has_address]-> (a:address),
                      (a) -[e2:has_street]-> (s:street),
                      (a) -[e3:has_zip_code]-> (z:zip_code)
                      )
WHERE z.zip_code = 12345

John P.   1st Street   12345
```

`OPTIONAL MATCH` can be used in conjunction with `LATERAL` subqueries, scalar subqueries, `ORDER BY` or `GROUP BY` clauses. However, `OPTIONAL MATCH` is not supported with the `GRAPH_TABLE` operator.

20.3.8 Limitations on Quantifiers

Although all quantifiers such as `*`, `+`, and `{1,4}` are supported for reachability and shortest path patterns, the only quantifier that is supported for cheapest path patterns is `*` (zero or more).

20.3.9 Limitations on WHERE and COST Clauses in Quantified Patterns

The `WHERE` and `COST` clauses in quantified patterns, such as reachability patterns or shortest and cheapest path patterns, are limited to referencing a single variable only.

The following are examples of queries that are not supported because the `WHERE` or `COST` clauses reference two variables `e` and `x` instead of `zero` or `one`:

```
... PATH p AS (n) -[e]-> (m) WHERE e.prop > m.prop ...
... SHORTEST ( (n) (-[e]-> (x) WHERE e.prop + x.prop > 10)* (m) ) ...
... CHEAPEST ( (n) (-[e]-> (x) COST e.prop + x.prop )*(m) ) ...
```

The following query is supported because the subquery only references a single variable `a` from the outer scope, while the variable `c` does not count since it is newly introduced in the subquery:

```
... PATH p AS (a) -> (b)
      WHERE EXISTS ( SELECT * FROM MATCH (a) -> (c) ) ...
```

20.4 Java APIs for Executing CREATE PROPERTY GRAPH Statements

You can use the `PgxSession.executePgql(String statement)` method to execute a `CREATE PROPERTY GRAPH` statement.

The `PgxSession.executePgql(String statement)` Java API creates a property graph in graph server (PGX). Note that when using this API, the graph is not persisted in the database, it is only created in the graph server (PGX). To persist a graph in the database, you can create a graph in the database (see [Quick Starts for Using PGQL Property Graphs](#)), and then load the graph into the graph server (PGX).

Example 20-4 Executing a CREATE PROPERTY GRAPH statement

```
String statement =
    "CREATE PROPERTY GRAPH hr_simplified "
    + "  VERTEX TABLES ( "
    + "    hr.employees LABEL employee "
    + "    PROPERTIES ARE ALL COLUMNS EXCEPT ( job_id, manager_id,
department_id ), "
    + "    hr.departments LABEL department "
    + "    PROPERTIES ( department_id, department_name ) "
    + "  ) "
    + "  EDGE TABLES ( "
    + "    hr.employees AS works_at "
    + "    SOURCE KEY ( employee_id ) REFERENCES employees (employee_id) "
    + "    DESTINATION departments "
    + "    PROPERTIES ( employee_id ) "
    + "  );";

session.executePgql(statement);
PgxGraph g = session.getGraph("HR_SIMPLIFIED");

/**
 * Alternatively, one can use the prepared statement API, for example:
 */

PgxPreparedStatement stmtnt = session.preparePgql(statement);
stmtnt.execute();
```

```
stmt.close();
PgxGraph g = session.getGraph("HR_SIMPLIFIED");
```

20.5 Python APIs for Executing CREATE PROPERTY GRAPH Statements

You can create a property graph by executing the CREATE PROPERTY GRAPH statement through the Python API.

The `prepare_pgql(<pgql_query>).execute()` Python API creates a property graph in the graph server (PGX). Note that when using this API, the graph is not persisted in the database, it is only created in the graph server (PGX). If you wish to persist a graph in the database, then you can create the graph in the database (see [Quick Starts for Using PGQL Property Graphs](#)) and then load the graph into graph server (PGX).

Creating a Property Graph Using the Python Client

- Launch the Python client:

```
./bin/opg4py --base_url https://localhost:7007 --user customer_360
```

- Define and execute the CREATE PROPERTY GRAPH statement as shown:

```
statement = (
    "CREATE PROPERTY GRAPH "+ "<graph_name>" + " " +
    "VERTEX TABLES ( " +
    "bank_accounts " +
    "KEY(id) " +
    "LABEL Account PROPERTIES (id) " +
    ")" +
    "EDGE TABLES ( " +
    "bank_transfers " +
    "KEY (txn_id) " +
    "SOURCE KEY (src_acct_id) REFERENCES bank_accounts (id) " +
    "DESTINATION KEY (dst_acct_id) REFERENCES bank_accounts (id) " +
    "LABEL Transfer PROPERTIES(amount) " +
    ")" )
>>> session.prepare_pgql(statement).execute()
```

where `<graph_name>` is the name of the graph.

The graph gets created and you can verify through the `get_graph` method:

```
>>> graph = session.get_graph("<graph_name>")
>>> graph
PgxGraph(name:<graph_variable>, v: 1000, e: 5001, directed: True,
memory(Mb): 0)
```

20.6 Executing PGQL Queries Using the PGX JDBC Driver

Starting from Graph Server and Client Release 24.1.0, you can use the PGX JDBC driver to access a PGX session and query graphs that are loaded in to the graph server (PGX).

To use the PGX JDBC driver, note the following:

- Register the PGX JDBC driver with the DriverManager:

```
import java.sql.DriverManager;
import oracle.pgx.jdbc.PgxJdbcDriver;
...
DriverManager.registerDriver(new PgxJdbcDriver());
```

- Add the jdbc:oracle:pgx: prefix to the JDBC URL when obtaining a connection object as shown:

```
Connection conn =
DriverManager.getConnection("jdbc:oracle:pgx:@<graph_server_host>:<server_port>", "<username>", "<password>");
```

Example 20-5 Using the PGX JDBC Driver

The following example establishes a connection using the PGX JDBC driver, accesses the underlying PGX session to load the graph into the graph server (PGX), creates a statement, and runs a PGQL query on the graph.

```
import java.sql.*;
import oracle.pgx.jdbc.*;
import oracle.pgx.api.*;

public class PgxJdbcSample {

    public static void main(String[] args) throws Exception {

        String jdbcUrl = "jdbc:oracle:pgx:https://localhost:7007";
        String username = "graphuser";
        String password = "graph";

        DriverManager.registerDriver(new PgxJdbcDriver());
        try(Connection conn = DriverManager.getConnection(jdbcUrl, username,
password)) {
            if (conn.isWrapperFor(PgxSession.class)) {
                PgxSession session = conn.unwrap(PgxSession.class);
                session.readGraphByName("BANK_GRAPH_VIEW",
GraphSource.PG_PGQL);
            }
            Statement stmt = conn.createStatement();
            ResultSet rs = stmt.executeQuery("SELECT e.AMOUNT AS AMOUNT FROM
MATCH (a IS ACCOUNTS) -[e IS TRANSFERS]-> (b IS ACCOUNTS) ON BANK_GRAPH_VIEW
"+
                                           " WHERE a.ID = 179 AND b.ID =
688");
            while(rs.next()){
                System.out.println("AMOUNT = " + rs.getLong("AMOUNT"));
            }
        }
    }
}
```

The resulting output of the preceding code is as shown:

```
AMOUNT = 1000
```

Note that when running the preceding code, you must provide the PGX client JARs on the runtime classpath.

- [Limitations of the PGX JDBC Driver](#)
Review the limitations of the PGX JDBC driver.
- [PGX Data Type Compatibility and Casting](#)
You can configure a compatibility mode for the PGX JDBC driver to determine the data type returned when calling the `ResultSet#getObject()` method.

Related Topics

- [Using the PGX JDBC Driver when Graph Server \(PGX\) is Utilized as a Library](#)
When using the graph server (PGX) as a library, you can use the PGX JDBC driver to query graphs that are loaded from files.

20.6.1 Limitations of the PGX JDBC Driver

Review the limitations of the PGX JDBC driver.

- The following PGX data types are not supported to be returned by the PGX JDBC driver:
 - VERTEX
 - EDGE
 - POINT2D
- Accessing the labels of a vertex or an edge is not supported.
- Multi-dimensional properties such as vectors, and lists are not supported.

20.6.2 PGX Data Type Compatibility and Casting

You can configure a compatibility mode for the PGX JDBC driver to determine the data type returned when calling the `ResultSet#getObject()` method.

The PGX JDBC driver supports the following compatibility modes:

- **PGX (default):** By default, the PGX JDBC driver will use the PGX compatibility mode to return the PGX native types.
- **ORACLE_JDBC19:** This mode enables the driver to return data types that are compatible with Oracle Database 19c.
- **ORACLE_JDBC23:** This mode enables the driver to return data types that are compatible with Oracle Database 23ai.

The following table describes the data types returned by the driver for the different compatibility modes.

Table 20-4 Data Type Compatibility

PGX Type	PGX (Default)	ORACLE_JDBC19	ORACLE_JDBC23
BOOLEAN	BOOLEAN	java.math.BigDecimal 1	Boolean

Table 20-4 (Cont.) Data Type Compatibility

PGX Type	PGX (Default)	ORACLE_JDBC19	ORACLE_JDBC23
INTEGER/LONG/FLOAT/DOUBLE	INTEGER/LONG/FLOAT/DOUBLE	java.math.BigDecimal	java.math.BigDecimal
LOCAL_DATE	java.sql.Date	java.sql.Timestamp	java.sql.Timestamp
TIME	java.sql.Time	Not supported	Not supported
TIME_WITH_TIMEZONE	java.time.OffsetTime	Not supported	Not supported
TIMESTAMP	java.sql.Timestamp	oracle.sql.TIMESTAMP	oracle.sql.TIMESTAMP
TIMESTAMP_WITH_TIMEZONE	java.time.OffsetDateTime	oracle.sql.TIMESTAMPZ	oracle.sql.TIMESTAMPZ

Setting the Compatibility Mode in the PGX JDBC Driver

If you wish to use a different compatibility mode (other than the default PGX mode), then this can be set as part of the properties as shown:

```
import static oracle.pgx.jdbc.CONNECTION_PROPERTY_COMPATIBILITY_MODE;
import static oracle.pgx.jdbc.ORACLE_JDBC19;
...
Properties properties = new Properties();
properties.put(...);
properties.put(CONNECTION_PROPERTY_COMPATIBILITY_MODE, ORACLE_JDBC19); // set
compatibility mode
Connection connection = DriverManager.getConnection("<jdbc_url>", properties);
```

Data Type Conversions through Casting

The PGX JDBC driver allows casting of one type into another (regardless of the compatibility mode) as shown in the following table.

Table 20-5 Additional Supported Types through Casting

PGX Type	Default Mapping (PGX Compatibility)	Additional Supported Types (through Casting)
BOOLEAN	BOOLEAN	String, BigDecimal
INTEGER	INTEGER	String, BigDecimal, Long, Float, Double
FLOAT	FLOAT	String, BigDecimal, Double
LONG	LONG	String, BigDecimal, Double
DOUBLE	DOUBLE	String, BigDecimal
LOCAL_DATE	java.sql.Date	String, java.time.LocalDate, java.sql.Timestamp
TIME	java.sql.Time	String, java.time.LocalTime
TIME_WITH_TIMEZONE	java.time.OffsetTime	String
TIMESTAMP	java.sql.Timestamp	String, java.time.LocalDateTime, oracle.sql.TIMESTAMP

Table 20-5 (Cont.) Additional Supported Types through Casting

PGX Type	Default Mapping (PGX Compatibility)	Additional Supported Types (through Casting)
TIMESTAMP_WITH_TIMEZONE	java.time.OffsetDateTime	String, oracle.sql.TIMESTAMPZ

Data Type Conversions for PreparedObject#setObject(int index, Object o)

The following table describes the data type conversions when calling the PreparedObject#setObject(int index, Object o) method.

Table 20-6 Data Type Conversions for setObject Method

Given Object Type	PGX Type
BOOLEAN	BOOLEAN
INTEGER/FLOAT/LONG/DOUBLE	INTEGER/FLOAT/LONG/DOUBLE
BIGDECIMAL	DOUBLE
java.sql.Date, java.time.LocalDate	LOCAL_DATE
java.sql.Time, java.time.LocalTime	TIME
java.time.OffsetTime	TIME_WITH_TIMEZONE
java.sql.Timestamp, java.time.LocalDateTime, oracle.sql.TIMESTAMP	TIMESTAMP
java.time.OffsetDateTime, oracle.sql.TIMESTAMPZ	TIMESTAMP_WITH_TIMEZONE

20.7 Java APIs for Executing SELECT Queries

This section describes the APIs to execute SELECT queries in the graph server (PGX).

- [Executing SELECT Queries Against a Graph in the Graph Server \(PGX\)](#)
The PgxGraph.queryPsql(String query) method executes the query in the current session. The method returns a PsqlResultSet.
- [Executing SELECT Queries Against a PGX Session](#)
The PgxSession.queryPsql(String query) method executes the given query in the session and returns a PsqlResultSet.
- [Iterating Through a Result Set](#)
There are two ways to iterate through a result set: in a JDBC-like manner or using the Java Iterator interface.
- [Printing a Result Set](#)
The following methods of PsqlResultSet (package oracle.pgx.api) are used to print a result set:

20.7.1 Executing SELECT Queries Against a Graph in the Graph Server (PGX)

The `PgxGraph.queryPgql(String query)` method executes the query in the current session. The method returns a `PgqlResultSet`.

The `ON` clauses inside the `MATCH` clauses can be omitted since the query is executed directly against a PGX graph. For the same reason, the `INTO` clauses inside the `INSERT` clauses can be omitted. However, if you want to explicitly specify graph names in the `ON` and `INTO` clauses, then those graph names have to match the actual name of the graph (`PgxGraph.getName()`).

20.7.2 Executing SELECT Queries Against a PGX Session

The `PgxSession.queryPgql(String query)` method executes the given query in the session and returns a `PgqlResultSet`.

The `ON` clauses inside the `MATCH` clauses, and the `INTO` clauses inside the `INSERT` clauses, must be specified and cannot be omitted. At this moment, all the `ON` and `INTO` clauses of a query need to reference the same graph since joining data from multiple graphs in a single query is not yet supported.

20.7.3 Iterating Through a Result Set

There are two ways to iterate through a result set: in a JDBC-like manner or using the Java Iterator interface.

For JDBC-like iterations, the methods in `PgqlResultSet` (package `oracle.pgx.api`) are similar to the ones in `java.sql.ResultSet`. A noteworthy difference is that PGQL's result set interface is based on the new date and time library that was introduced in Java 8, while `java.sql.ResultSet` is based on the legacy `java.util.Date`. To bridge the gap, PGQL's result set provides `getLegacyDate(...)` for applications that still use `java.util.Date`.

A `PgqlResultSet` has a cursor that is initially set before the first row. Then, the following methods are available to reposition the cursor:

- `next() : boolean`
- `previous() : boolean`
- `beforeFirst()`
- `afterLast()`
- `first() : boolean`
- `last() : boolean`
- `absolute(long row) : boolean`
- `relative(long rows) : boolean`

After the cursor is positioned at the desired row, the following getters are used to obtain values:

- `getObject(int columnIndex) : Object`
- `getObject(String columnName) : Object`
- `getString(int columnIndex) : String`
- `getString(String columnName) : String`

- `getInteger(int columnIdx) : Integer`
- `getInteger(String columnName) : Integer`
- `getLong(int columnIdx) : Long`
- `getLong(String columnName) : Long`
- `getFloat(int columnIdx) : Float`
- `getFloat(String columnName) : Float`
- `getDouble(int columnIdx) : Double`
- `getDouble(String columnName) : Double`
- `getBoolean(int columnIdx) : Boolean`
- `getBoolean(String columnName) : Boolean`
- `getVertexLabels(int columnIdx) : Set<String>`
- `getVertexLabels(String columnName) : Set<String>`
- `getDate(int columnIdx) : LocalDate`
- `getDate(String columnName) : LocalDate`
- `getTime(int columnIdx) : LocalTime`
- `getTime(String columnName) : LocalTime`
- `getTimestamp(int columnIdx) : LocalDateTime`
- `getTimestamp(String columnName) : LocalDateTime`
- `getTimeWithTimezone(int columnIdx) : OffsetTime`
- `getTimeWithTimezone(String columnName) : OffsetTime`
- `getTimestampWithTimezone(int columnIdx) : OffsetDateTime`
- `getTimestampWithTimezone(String columnName) : OffsetDateTime`
- `getLegacyDate(int columnIdx) : java.util.Date`
- `getLegacyDate(String columnName) : java.util.Date`
- `getVertex(int columnIdx) : PgxVertex<ID>`
- `getVertex(String columnName) : PgxVertex<ID>`
- `getEdge(int columnIdx) : PgxEdge`
- `getEdge(String columnName) : PgxEdge`

See the [Java Documentation](#) for more details.

Finally, there is a `PgqlResultSet.close()` which releases the result set's resources, and there is a `PgqlResultSet.getMetaData()` through which the column names and column count can be retrieved.

An example for result set iteration is as follows:

```
PgqlResultSet resultSet = g.queryPgql(
    "    SELECT owner.name AS account_holder, SUM(t.amount) AS
total_transacted_with_Nikita "
    + "    FROM MATCH (p:Person) -[:ownerOf]-> (account1:Account) "
    + "    , MATCH (account1) -[t:transaction]- (account2) "
```

```

+ "          , MATCH (account2:Account) <-[:ownerOf]- (owner:Person|Company) "
+ "      WHERE p.name = 'Nikita' "
+ " GROUP BY owner");

while (resultSet.next()) {
    String accountHolder = resultSet.getString(1);
    long totalTransacted = resultSet.getLong(2);
    System.out.println(accountHolder + ": " + totalTransacted);
}

resultSet.close();

```

The output of the above example will look like:

```

Oracle: 4501
Camille: 1000

```

In addition, the `PgqlResultSet` is also iterable via the Java Iterator interface. An example of a “for each loop” over the result set is as follows:

```

for (PgxResult result : resultSet) {
    String accountHolder = result.getString(1);
    long totalTransacted = result.getLong(2);
    System.out.println(accountHolder + ": " + totalTransacted);
}

```

The output of the above example will look like:

```

Oracle: 4501
Camille: 1000

```

Note that the same getters that are available for `PgqlResultSet` are also available for `PgxResult`.

20.7.4 Printing a Result Set

The following methods of `PgqlResultSet` (package `oracle.pgx.api`) are used to print a result set:

- `print() : PgqlResultSet`
- `print(long numResults) : PgqlResultSet`
- `print(long numResults, int from) : PgqlResultSet`
- `print(PrintStream printStream, long numResults, int from) : PgqlResultSet`

For example:

```

g.queryPgql("SELECT COUNT(*) AS numPersons FROM MATCH
(n:Person)").print().close()
+-----+
| numPersons |
+-----+

```

```
| 3 |
+-----+
```

Another example:

```
PgqlResultSet resultSet = g.queryPgql(
    " SELECT owner.name AS account_holder, SUM(t.amount) AS
total_transacted_with_Nikita "
+ "      FROM MATCH (p:Person) -[:ownerOf]-> (account1:Account) "
+ "      , MATCH (account1) -[t:transaction]- (account2) "
+ "      , MATCH (account2:Account) <-[:ownerOf]- (owner:Person|Company) "
+ "      WHERE p.name = 'Nikita' "
+ "      GROUP BY owner")
```

```
resultSet.print().close()
+-----+
| account_holder | total_transacted_with_Nikita |
+-----+
| Camille       | 1000.0                       |
| Oracle        | 4501.0                       |
+-----+
```

20.8 Java APIs for Executing UPDATE Queries

The UPDATE queries make changes to existing graphs using the INSERT, UPDATE, and DELETE operations.

Note that INSERT allows you to insert new vertices and edges into a graph, UPDATE allows you to update existing vertices and edges by setting their properties to new values, and DELETE allows you to delete vertices and edges from a graph.

- [Updatability of Graphs Through PGQL](#)
Graph data that is loaded from the Oracle RDBMS or from CSV files into the PGX is not updatable through PGQL right away.
- [Executing UPDATE Queries Against a Graph in the Graph Server \(PGX\)](#)
To execute UPDATE queries against a graph, use the `PgxGraph.executePgql(String query)` method.
- [Executing UPDATE Queries Against a PGX Session](#)
You can also execute UPDATE queries against a `PgxSession`.
- [Altering the Underlying Schema of a Graph](#)
The INSERT operations can only insert vertices and edges with known labels and properties. Similarly, UPDATE operations can only set values of known properties. Thus, new data must always conform to the existing schema of the graph.

20.8.1 Updatability of Graphs Through PGQL

Graph data that is loaded from the Oracle RDBMS or from CSV files into the PGX is not updatable through PGQL right away.

First, you need to create a copy of the data through the `PgxGraph.clone()` method. The resulting graph is fully updatable.

Consider the following example:

```
// load a graph from the RDBMS or from CSV
PgxGraph g1 = session.readGraphByName("<graph>", GraphSource.PG_PGQL);

// create an updatable copy of the graph
PgxGraph g2 = g1.clone("new_graph_name");

// insert an additional vertex into the graph
g2.executePgql("INSERT VERTEX v " +
    "          LABELS ( Person ) " +
    "          PROPERTIES ( v.firstName = 'Camille', " +
    "                        v.lastName = ' Mullins' )");
```

Additionally, there is also a `PgxGraph.cloneAndExecutePgql(String query, String graphName)` method that combines the last two steps from above example into a single step:

```
// create an updatable copy of the graph while inserting a new vertex
PgxGraph g2_copy = g1.cloneAndExecutePgql(
    "INSERT VERTEX v " +
    "          LABELS ( Person ) " +
    "          PROPERTIES ( v.firstName = 'Camille', " +
    "                        v.lastName = ' Mullins' ) "
    , "new_graph_name");
```

Note that graphs that are created through `PgxGraph.clone()` are local to the session. However, they can be shared with other sessions through the `PgxGraph.publish(...)` methods but then they are no longer updatable through PGQL. Only session-local graphs are updatable but persistent graphs are not.

20.8.2 Executing UPDATE Queries Against a Graph in the Graph Server (PGX)

To execute UPDATE queries against a graph, use the `PgxGraph.executePgql(String query)` method.

The following is an example of INSERT query:

```
g.executePgql("INSERT VERTEX v " +
    "          LABELS ( Person ) " +
    "          PROPERTIES ( v.firstName = 'Camille', " +
    "                        v.lastName = ' Mullins' ) ");
```

Note that the `INTO` clause of the `INSERT` can be omitted. If you use an `INTO` clause, the graph name in the `INTO` clause must correspond to the name of the PGX graph (`PgxGraph.getName()`) that the query is executed against.

The following is an example of UPDATE query:

```
// set the date of birth of Camille to 2014-11-15
g.executePgql("UPDATE v SET ( v.dob = DATE '2014-11-14' ) " +
```

```
"FROM MATCH (v:Person) " +
"WHERE v.firstName = 'Camille' AND v.lastName = 'Mullins' ");
```

The following is an example of DELETE query:

```
// delete Camille from the graph
g.executePsql("DELETE v " +
"FROM MATCH (v:Person) " +
"WHERE v.firstName = 'Camille' AND v.lastName = 'Mullins' ");
```

20.8.3 Executing UPDATE Queries Against a PGX Session

You can also execute UPDATE queries against a `PgxSession`.

The following example clones a graph and runs UPDATE queries against the `PgxSession`.

```
//Loads the graph into the graph server (PGX)
PgxGraph g1 = session.readGraphByName("BANK_GRAPH_VIEW",GraphSource.PG_PGQL);
//Clones the graph
PgxGraph g2 = g1.clone("BANK_GRAPH_NEW");
//Get the graph
session.getGraph("BANK_GRAPH_NEW");
//Insert vertices and an edge connecting the vertices into the graph
session.executePsql(
    "INSERT INTO BANK_GRAPH_NEW "+
    "    VERTEX v1 LABELS (Accounts) PROPERTIES (v1.id=1001, v1.name='New account-1') "+
    "    , VERTEX v2 LABELS (Accounts) PROPERTIES (v2.id=1002, v2.name='New account-2') "+
    "    , EDGE e1 BETWEEN v1 AND v2 LABELS (Transfers) PROPERTIES (e1.amount=3000) "
);
//Query the graph to verify the newly added edge
session.executePsql(
    "SELECT e.amount FROM MATCH (v1:Accounts) -[e:Transfers]-> (v2:Accounts) "
    "ON BANK_GRAPH_NEW "
    "WHERE v1.id=1001 AND v2.id=1002"
);
```

20.8.4 Altering the Underlying Schema of a Graph

The INSERT operations can only insert vertices and edges with known labels and properties. Similarly, UPDATE operations can only set values of known properties. Thus, new data must always conform to the existing schema of the graph.

However, some PGX APIs exist for updating the schema of a graph: while no APIs exist for adding new labels, new properties can be added through the `PgxGraph.createVertexProperty(PropertyType type, String name)` and `PgxGraph.createEdgeProperty(PropertyType type, String name)` methods. The new properties are attached to each vertex/edge in the graph, irrespective of their labels. Initially the properties are assigned a default value but then the values can be updated through the UPDATE statements.

Consider the following example:

```
// load a graph from the RDBMS or from CSV
PgxFgraph g = session.readGraphByName("<graph>", GraphSource.PG_PGQL);

// add a new property to the graph
g.createVertexProperty(PropertyType.LOCAL_DATE, "dob");

// set the date of birth of Camille to 2014-11-15
g.executePgql("UPDATE v SET ( v.dob = DATE '2014-11-14' ) " +
              "FROM MATCH (v:Person) " +
              "WHERE v.firstName = 'Camille' AND v.lastName = ' Mullins' ");
```

20.9 Python APIs for Executing UPDATE Queries

You can update a graph that is loaded into the graph server (PGX) using the Python APIs.

However, prior to updating the graph, you must first clone the graph. You can perform update operations only on the cloned graph and not on the original graph.

The following example shows the steps for running UPDATE queries against a graph in the graph server (PGX) using the Python APIs.

1. Load the PGQL property graph into the graph server (PGX).

```
>>> g1 = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
```

2. Clone the graph for the update operation.

```
>>> g2 = g1.clone(name="BANK_GRAPH_NEW")
```

3. Update the cloned graph as required.

For example:

- **Adding one or more vertices with properties**

```
>>> g2.execute_pgql(
...     "INSERT VERTEX v1 LABELS (Accounts) PROPERTIES (v1.id=1001,
...     v1.name='New account-1') "
...     "      , VERTEX v2 LABELS (Accounts) PROPERTIES (v2.id=1002,
...     v2.name='New account-2') "
... )
```

- **Inserting a new edge with properties**

The new edge gets added between all vertices that match the WHERE clause.

```
>>> g2.execute_pgql(
...     "INSERT EDGE e1 BETWEEN v1 AND v2 "
...     "LABELS (Transfers) "
...     "PROPERTIES (e1.from_acct_id=1001, e1.amount=3000,
...     e1.description='Transaction-A', e1.to_acct_id=1002) "
...     "FROM MATCH (v1:Accounts), MATCH (v2:Accounts) "
...     "WHERE v1.id=1001 AND v2.id=1002"
... )
```

Optionally, query the graph to verify that the new edge is added.

```
>>> g2.execute_pgql(
...     "SELECT e.* FROM MATCH (v1:Accounts) -[e:Transfers]->
(v2:Accounts) "
...     "WHERE v1.id=1001 AND v2.id=1002"
... ).print()
+-----+
| FROM_ACCT_ID | TO_ACCT_ID | DESCRIPTION | AMOUNT |
+-----+
| 1001          | 1002       | Transaction-A | 3000.0 |
+-----+
```

- **Updating one or more vertex property**

The vertex properties get updated for all vertices that match the `WHERE` clause.

```
>>> g2.execute_pgql(
...     "UPDATE v SET (v.name='Account-1001') "
...     "FROM MATCH (v:Accounts) "
...     "WHERE v.id=1001"
... )
```

- **Updating one or more edge property**

The edge properties get updated for the edge that connects the vertices in the `WHERE` clause.

```
>>> g2.execute_pgql(
...     "UPDATE e SET (e.amount=5000) "
...     "FROM MATCH (v1:Accounts) -[e:Transfers]-> (v2:Accounts) "
...     "WHERE v1.id=1001 AND v2.id=1002"
... )
```

Optionally, query the graph to verify the updated edge property.

```
>>> g2.execute_pgql(
...     "SELECT e.amount FROM MATCH (v1:Accounts) -[e:Transfers]->
(v2:Accounts) "
...     "WHERE v1.id=1001 AND v2.id=1002"
... ).print()
+-----+
| amount |
+-----+
| 5000.0 |
+-----+
```

- **Deleting a vertex**

Note that when you delete a vertex, all edges that connect the vertex are also removed.

```
>>> g2.execute_pgql("DELETE v FROM MATCH (v:Accounts) WHERE v.id=1001")
```

Alternatively, you can combine step-2 and step-3 by using the `clone_and_execute_pgql()` method as shown:

```
>>> g2 = g1.clone_and_execute_pgql(
...     "INSERT VERTEX v1 LABELS (Accounts) PROPERTIES (v1.id=1001,
v1.name='New account-1') "
...     ", VERTEX v2 LABELS (Accounts) PROPERTIES (v2.id=1002, v2.name='New
account-2') "
...     ", EDGE e1 BETWEEN v1 AND v2 LABELS (Transfers) PROPERTIES
(e1.amount=3000) "
... )
```

Optionally, query the graph to verify the newly added edge.

```
>>> g2.execute_pgql(
...     "SELECT e.amount FROM MATCH (v1:Accounts) -[e:Transfers]->
(v2:Accounts) "
...     "WHERE v1.id=1001 AND v2.id=1002"
... ).print()
+-----+
| amount |
+-----+
| 3000.0 |
+-----+
```

Executing UPDATE Queries Against a `PgxSession`

You can also run UPDATE queries against a `PgxSession` as shown:

```
>>> g1 = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
>>> g2 = g1.clone(name="BANK_GRAPH_NEW")
>>> session.execute_pgql(
...     "INSERT INTO BANK_GRAPH_NEW VERTEX v1 LABELS (Accounts) PROPERTIES
(v1.id=1001, v1.name='New account-1') "
...     ", VERTEX v2 LABELS (Accounts) PROPERTIES (v2.id=1002, v2.name='New
account-2') "
...     ", EDGE e1 BETWEEN v1 AND v2 LABELS (Transfers) PROPERTIES
(e1.amount=3000) "
... )
>>> session.execute_pgql(
...     "SELECT e.amount FROM MATCH (v1:Accounts) -[e:Transfers]->
(v2:Accounts) ON BANK_GRAPH_NEW "
...     "WHERE v1.id=1001 AND v2.id=1002"
... ).print()
+-----+
| amount |
+-----+
| 3000.0 |
+-----+
```

20.10 PGQL Queries with Partitioned IDs

You can retrieve partitioned IDs using the `id()` function in PGQL.

PGQL SELECT Queries

The following are a few examples to retrieve partitioned IDs using PGQL `SELECT` queries:

```
g.queryPqql("SELECT id(n) FROM MATCH(n)").print().close()
```

This prints an output similar to:

```
+-----+
| id(n) |
+-----+
| Accounts(2) |
| Accounts(4) |
| Accounts(6) |
+-----+
```

```
g.queryPqql("SELECT n.name FROM MATCH(n) WHERE id(n) =
'Accounts(1)']").print().close()
```

The output is printed as shown:

```
+-----+
| name |
+-----+
| User1 |
+-----+
```

```
g.queryPqql("SELECT LABEL(n), n.name from MATCH(n) WHERE n.id =
1").print().close()
```

The output is printed as shown:

```
+-----+
| label(n) | name |
+-----+
| Accounts | User1 |
+-----+
```

PGX automatically creates a unique index for keys so that queries with predicates such as `WHERE id(n) = 'Accounts(1)'` and `WHERE n.id = 1` can be efficiently processed by retrieving the vertex in constant time.

Using Bind Variables

Partitioned IDs can also be passed as bind values into a `PgxPreparedStatement`.

For example:

```
PgxPreparedStatement statement = g.preparePgql("SELECT n.name FROM MATCH (n)
WHERE id(n)= ?")
statement.setString(1, "Accounts(1)")
statement.executeQuery().print().close()
```

This prints the output as shown:

```
+-----+
| name  |
+-----+
| User1 |
+-----+
```

PGQL INSERT Queries

In **INSERT** queries, you must provide a value for the key property if a key property exists. The value is then used for the vertex or edge key.

For example you can execute an **INSERT** as shown:

```
g.executePgql("INSERT VERTEX v LABELS (Accounts) PROPERTIES (v.id = 1001,
v.name = 'User1001')")
```

The inserted values can be verified as shown:

```
g.queryPgql("SELECT id(n), n.name FROM MATCH(n) WHERE n.id =
1001").print().close()
```

This prints the output:

```
+-----+
| id(n)      | name      |
+-----+
| Accounts(1001) | User1001 |
+-----+
```

20.11 Security Tools for Executing PGQL Queries

To safeguard against query injection, bind variables can be used in place of literals while `printIdentifier(String identifier)` can be used in place of identifiers like graph names, labels, and property names.

- [Using Bind Variables](#)
There are two reasons for using bind variables:
- [Using Identifiers in a Safe Manner](#)
When you create a query through string concatenation, not only literals in queries pose a security risk, but also identifiers like graph names, labels, and property names do. The only problem is that bind variables are not supported for such identifier. Therefore, if these identifiers are variable from the application's perspective, then it is recommended to

protect against query injection by passing the identifier through the `oracle.pgql.lang.ir.PgqlUtils.printIdentifier(String identifier)` method.

20.11.1 Using Bind Variables

There are two reasons for using bind variables:

- It protects against query injection.
- It speeds up query execution because the same bind variables can be set multiple times without requiring recompilation of the query.

To create a prepared statement, use one of the following two methods:

- `PgxGraph.preparePgql(String query) : PgxPreparedStatement`
- `PgxSession.preparePgql(String query) : PgxPreparedStatement`

The `PgxPreparedStatement` (package `oracle.pgx.api`) returned from these methods have setter methods for binding the bind variables to values of the designated data type.

```
PreparedStatement stmtnt = g.preparePgql(
    "SELECT v.id, v.dob " +
    "FROM MATCH (v) " +
    "WHERE v.firstName = ? AND v.lastName = ?");
stmtnt.setString(1, "Camille");
stmtnt.setString(2, "Mullins");
ResultSet rs = stmtnt.executeQuery();
```

Each bind variable in the query needs to be set to a value using one of the following setters of `PgxPreparedStatement`:

- `setBoolean(int parameterIndex, boolean x)`
- `setDouble(int parameterIndex, double x)`
- `setFloat(int parameterIndex, float x)`
- `setInt(int parameterIndex, int x)`
- `setLong(int parameterIndex, long x)`
- `setDate(int parameterIndex, LocalDate x)`
- `setTime(int parameterIndex, LocalTime x)`
- `setTimestamp(int parameterIndex, LocalDateTime x)`
- `setTimeWithTimezone(int parameterIndex, OffsetTime x)`
- `setTimestampWithTimezone(int parameterIndex, OffsetDateTime x)`
- `setArray(int parameterIndex, List<?> x)`

Once all the bind variables are set, the statement can be executed through:

- `PgxPreparedStatement.executeQuery()`
 - For SELECT queries only
 - Returns a `ResultSet`
- `PgxPreparedStatement.execute()`

- For any type of statement
- Returns a Boolean to indicate the form of the result: true in case of a `SELECT` query, false otherwise
- In case of `SELECT`, the `ResultSet` can afterwards be accessed through `PgxPreparedStatement.getResultSet()`

In PGQL, bind variables can be used in place of literals of any data type, including array literals. An example query with a bind variable to is set to an instance of a `String` array is:

```
List<String> countryNames = new ArrayList<String>();
countryNames.add("Scotland");
countryNames.add("Tanzania");
countryNames.add("Serbia");
```

```
PreparedStatement stmt = g.preparePgql(
    "SELECT n.name, n.population " +
    "FROM MATCH (c:Country) " +
    "WHERE c.name IN ?");
```

```
ResultSet rs = stmt.executeQuery();
```

Finally, if a prepared statement is no longer needed, it is closed through `PgxPreparedStatement.close()` to free up resources.

20.11.2 Using Identifiers in a Safe Manner

When you create a query through string concatenation, not only literals in queries pose a security risk, but also identifiers like graph names, labels, and property names do. The only problem is that bind variables are not supported for such identifier. Therefore, if these identifiers are variable from the application's perspective, then it is recommended to protect against query injection by passing the identifier through the `oracle.pgql.lang.ir.PgqlUtils.printIdentifier(String identifier)` method.

Given an identifier string, the method automatically adds double quotes to the start and end of the identifier and escapes the characters in the identifier appropriately.

Consider the following example:

```
String graphNamePrinted = printIdentifier("my graph name with \" special %
characters ");
PreparedStatement stmt = g.preparePgql(
    "SELECT COUNT(*) AS numVertices FROM MATCH (v) ON " + graphNamePrinted);
```

20.12 Best Practices for Tuning PGQL Queries

This section describes best practices regarding memory allocation, parallelism, and query planning.

- [Memory Allocation](#)
The graph server (PGX) has on-heap and off-heap memory, the earlier being the standard JVM heap while the latter being a separate heap that is managed by PGX. Just like graph data, intermediate and final results of PGQL queries are partially stored on-heap and partially off-heap. Therefore, both heaps are needed.

- [Parallelism](#)
By default, all available processor threads are used to process PGQL queries. However, if needed, the number of threads can be limited by setting the `parallelism` option of the graph server (PGX).
- [Query Plan Explaining](#)
The `PgxGraph.explainPgql(String query)` method is used to get insight into the query plan of the query. The method returns an instance of `Operation` (package `oracle.pgx.api`) which has the following methods:

20.12.1 Memory Allocation

The graph server (PGX) has on-heap and off-heap memory, the earlier being the standard JVM heap while the latter being a separate heap that is managed by PGX. Just like graph data, intermediate and final results of PGQL queries are partially stored on-heap and partially off-heap. Therefore, both heaps are needed.

In case of the on-heap memory, the default maximum is chosen upon startup of the JVM, but it can be overwritten through the `-Xmx` option.

In case of the off-heap, there is no maximum set by default and the off-heap memory usage, therefore, keeps increasing automatically until it depletes the system resources, in which case the operation is canceled, its memory is released, and an appropriate exception is passed to the user. If needed, a maximum off-heap size can be configured through the `max_off_heap_size` option in the graph server (PGX).

A ratio of 1:1 for on-heap versus off-heap is recommended as a good starting point to allow for the largest possible graphs to be loaded and queried. See [Configuring On-Heap Limits](#) for the steps to configure the on-heap memory size.

20.12.2 Parallelism

By default, all available processor threads are used to process PGQL queries. However, if needed, the number of threads can be limited by setting the `parallelism` option of the graph server (PGX).

See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information on the graph server configuration parameters.

20.12.3 Query Plan Explaining

The `PgxGraph.explainPgql(String query)` method is used to get insight into the query plan of the query. The method returns an instance of `Operation` (package `oracle.pgx.api`) which has the following methods:

- `print()`: for printing the operation and its child operations
- `getOperationType()`: for getting the type of the operation
- `getPatternInfo()`: for getting a string representation of the operation
- `getCostEstimate()`: for getting the cost of the operation
- `getTotalCostEstimate()`: for getting the cost of the operations and its child operations
- `getCardinalityEstimate()`: for getting the expected number of result rows
- `getChildren()`: for accessing the child operations

Consider the following example:

```
g.explainPgql("SELECT COUNT(*) FROM MATCH (n) -[e1]-> (m) -[e2]->
(o)").print()
\--- GROUP BY GroupBy {"cardinality":"42", "cost":"42",
"accumulatedCost":"58.1"}
  \--- (m) -[e2]-> (o) NeighborMatch {"cardinality":"3.12", "cost":"3.12",
"accumulatedCost":"16.1"}
    \--- (n) -[e1]-> (m) NeighborMatch {"cardinality":"5", "cost":"5",
"accumulatedCost":"13"}
      \--- (n) RootVertexMatch {"cardinality":"8", "cost":"8",
"accumulatedCost":"8"}
```

In the above example, the `print()` method is used to print the query plan.

If a query plan is not optimal, it is often possible to rewrite the query to improve its performance. For example, a `SELECT` query may be split into an `UPDATE` and a `SELECT` query as a way to improve the total runtime.

Note that the graph server (PGX) does not provide a hint mechanism.

Also, printing the query plan shows the filters used in the query. For example:

```
g.explainPgql("SELECT id(n) FROM MATCH (n)-[e]->(m) WHERE " +
...> "id(n) > 500 " +
...> "AND id(n) < 510 " +
...> "AND id(n) <> 509 " +
...> "AND id(n) <> 507 ").print()
\--- Projection {"cardinality":"146", "cost":"0", "accumulatedCost":"175"}
  \--- (n) -[e]-> (m) NeighborMatch {"cardinality":"146", "cost":"146",
"accumulatedCost":"175"}
    \--- (n) RootVertexMatch {"cardinality":"29.2", "cost":"29.2",
"accumulatedCost":"29.2"}
      WHERE $filter1
filter1: (id(n) <> 509) AND
        (id(n) <> 507) AND
        (id(n) > 500) AND
        (id(n) < 510)
```

In the preceding example, since the query has filters that spans more than three lines, the filters are shown displayed below the query plan. If the filters are less than three lines, then the filters are shown directly within the query plan tree as shown:

```
g.explainPgql("SELECT id(n) FROM MATCH (n)-[e]->(m) WHERE " +
...> "id(n) > 500 " +
...> "AND id(n) < 510 ").print()
\--- Projection {"cardinality":"162", "cost":"0", "accumulatedCost":"194"}
  \--- (n) -[e]-> (m) NeighborMatch {"cardinality":"162", "cost":"162",
"accumulatedCost":"194"}
    \--- (n) RootVertexMatch {"cardinality":"32.4", "cost":"32.4",
"accumulatedCost":"32.4"}
      WHERE (id(n) > 500) AND
        (id(n) < 510)
```

21

REST Endpoints for the Graph Server

This chapter describes the graph server REST API endpoints.

The graph server REST API supports two different versions.

Note

The version 1 (v1) endpoints of the API is deprecated. It is recommended that you use version 2 (v2) of the API ([Graph Server REST API Version 2](#)).

- [Graph Server REST API Version 2](#)
Learn about the graph server REST API version 2 (v2).
- [Graph Server REST API Version 1](#)
Learn about the graph server REST API version 1 (v1).

21.1 Graph Server REST API Version 2

Learn about the graph server REST API version 2 (v2).

This API version supports a token-based authentication for the REST endpoints. Therefore, you must first obtain an access token which can be used in the subsequent REST API requests.

- [Get an Authentication Token](#)
- [Refresh an Authentication Token](#)
- [Get Graphs](#)
- [Run a PGQL Query](#)
- [Get the Database Version](#)
- [Get User](#)
- [Asynchronous REST Endpoints](#)

21.1.1 Get an Authentication Token

POST <https://localhost:7007/auth/token>

Get an authentication token which can be used to authenticate the REST API requests.

Request

Request Header

- **Accept:** application/json; charset=UTF-8
- **Content-Type:** application/json

Table 21-1 Request Body Parameters

Parameter	Type	Description	Required
username	string	Name of the user	Yes
password	string	Password for the user	Yes
createSession	boolean	To determine if a session needs to be created	Optional. Set it to <code>true</code> if you want to run queries against the graph server (PGX).
source	string	A descriptive string identifying the client	Optional. Ensure to enter the source value without spaces (for example, "commandLine", "shellWithJava", and so on).
sessionId	string	To reuse an existing session when connecting to the graph server	Optional. Set it to an existing session ID if you want to reuse that session.

Sample Request Body

```
{
  "username": "graphuser",
  "password": "<password_for_graphuser>",
  "createSession": true,
  "source": "<source-value-for-pgx-session>",
  "sessionId": "<session-id>"
}
```

Response

- **201 Created**
- **Content-Type:** application/json

Sample Response Body

```
{
  "access_token": "<token>",
  "token_type": "bearer",
  "expires_in": 3600
}
```

cURL Example

```
curl --location 'https://localhost:7007/auth/token' \
--header 'Content-Type: application/json' \
--data '{
  "username": "graphuser",
  "password": "<password_for_graphuser>",
  "createSession": true,
  "source": "commandLine",
  "sessionId": "<session-id>"
}'
```

21.1.2 Refresh an Authentication Token

PUT `https://localhost:7007/auth/token`
Refresh a valid access token.

Request

Request Header

- **Accept:** `application/json; charset=UTF-8`
- **Content-Type:** `application/json`

Table 21-2 Request Body Parameters

Parameter	Type	Description	Required
token	string	Access token value	Yes
createSession	boolean	Flag to determine if a session needs to be created	Optional. Set it to <code>true</code> if you want to run queries against the graph server (PGX).
sessionId	string	To reuse an existing session when connecting to the graph server	Optional. Set it to an existing session ID if you want to reuse that session.

Sample Request Body

```
{
  "token": "<token>",
  "createSession": true,
  "sessionId": "<session-id>"
}
```

Response

- **201 Created**
- **Content-Type:** `application/json`

Sample Response Body

```
{
  "access_token": "<token>",
  "token_type": "bearer",
  "expires_in": 3600
}
```

cURL Example

```
curl --location --request PUT 'https://localhost:7007/auth/token' \
--header 'Content-Type: application/json' \
--data '{
  "token": "<token_value>",
  "createSession": true,
```

```
"sessionId": "<session-id>"  
},
```

21.1.3 Get Graphs

GET `https://localhost:7007/v2/graphs`

Get the list of graphs for the specified driver.

Version: v2

Request

Request Header

- **Accept:** `application/json; charset=UTF-8`
- **Header:** `Authorization: Bearer <token>`
- **Content-Type:** `application/json`

Request Query Parameter

- **driver (required):** Specifies the PGQL driver value. This is a mandatory parameter. Supported values are as follows:
 - **GRAPH_SERVER_PGX:** Graphs loaded into the graph server (PGX)
 - **PGQL_IN_DATABASE:** PGQL property graphs in the database
 - **SQL_IN_DATABASE:** SQL property graphs in the database

Response

- **200 OK**
- **Content-Type:** `application/json`

Sample Response Body

```
[  
  {  
    "schema": <value>,  
    "graphName": <value>  
  }  
]
```

Note that the `schema` parameter will be `NULL` for graphs created in the graph server (PGX).

cURL Example

```
curl --location --request GET 'https://localhost:7007/v2/graphs?  
driver=<driver-value>' \  
--header 'Authorization: Bearer <token>'
```

21.1.4 Run a PGQL Query

POST `https://localhost:7007/v2/runQuery`

Run one or multiple statements for the specified driver.

Version: v2

Request

Request Header

- **Accept:** `application/json; charset=UTF-8`
- **Header:** `Authorization: Bearer <token>`
- **Content-Type:** `application/json`

Table 21-3 Request Body Parameters

Parameter	Type	Description	Required
statements	string []	One or multiple statements	Yes
driver	string	Specifies the PGQL driver. The supported values are: <ul style="list-style-type: none">• GRAPH_SERVER_PG X: To run PGQL queries against the graph server (PGX)• PGQL_IN_DATABAS E: To run PGQL statements or queries against the database• SQL_IN_DATABASE: To run graph queries against the database	Yes
formatter	string	The supported values are: <ul style="list-style-type: none">• DATASTUDIO• GVT Note: Starting from Graph Server and Client Release 24.4, the <code>formatter</code> parameter is deprecated.	Yes

Table 21-3 (Cont.) Request Body Parameters

Parameter	Type	Description	Required
parameters	object <ul style="list-style-type: none"> dynamicSampling : integer parallel: integer start: integer size: integer 	Parameters include: <ul style="list-style-type: none"> Dynamic Sampling Value Degree of Parallelism Fetch size (= the number of rows) of the query result 	Parameters are all optional. <ul style="list-style-type: none"> Default value for dynamic sampling is 2. Default value for parallelism depends on the driver. Default value for start is 0. Default value for size is 100.
visualize	boolean	Flag to set visualization	Optional. Default value is true.

Sample Request Body

```
{
  "statements": [
    "DROP PROPERTY GRAPH TEST_GRAPH",
    "CREATE PROPERTY GRAPH TEST_GRAPH VERTEX TABLES( Male KEY (id) LABEL Male
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender), Female KEY (id) LABEL Female
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender) ) EDGE TABLES( knowsmm KEY (id)
    SOURCE KEY (sid) REFERENCES Male DESTINATION KEY (did) REFERENCES Male LABEL
    knows PROPERTIES (mval, firstMetAt, since), knowsmf KEY (id) SOURCE KEY (sid)
    REFERENCES Male DESTINATION KEY (did) REFERENCES Female LABEL knows

```

21.1.5 Get the Database Version

GET <https://localhost:7007/v2/dbVersion>

Get the database version to which the graph server is connected.

Version: v2

Request

Request Header

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Response

- **200 OK**
- **Content-Type:** application/json

Sample Response Body

```
{
  "dbVersion": "23.0"
}
```

cURL Example

```
curl --location --request GET 'https://localhost:7007/v2/dbVersion' \
--header 'Authorization: Bearer <token>'
```

21.1.6 Get User

GET https://localhost:7007/v2/user

Get the username that is currently connected to the graph server (username is attached to the token).

Version: v2

Request**Request Header**

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Response

- **200 OK**
- **Content-Type:** application/json

Sample Response Body

```
{
  "username": "graphuser"
}
```

cURL Example

```
curl --location --request GET 'https://localhost:7007/v2/user' \
--header 'Authorization: Bearer <token>'
```

21.1.7 Asynchronous REST Endpoints

The graph server REST endpoints support cancellation of queries.

In order to be able to cancel queries, you need to send the query using the following asynchronous REST endpoints:

- [Run an Asynchronous PGQL Query](#)
- [Check Asynchronous Query Completion](#)
- [Retrieve Asynchronous Query Result](#)
- [Cancel an Asynchronous Query Execution](#)

21.1.7.1 Run an Asynchronous PGQL Query

POST <https://localhost:7007/v2/runQueryAsync>

Run a PGQL query asynchronously on a property graph.

Version: v2

Request

Request Header

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Request Query Parameters: See [Table 21-3](#) for details.

Sample Request Body

```
{
  "statements": [
    "DROP PROPERTY GRAPH TEST_GRAPH",
    "CREATE PROPERTY GRAPH TEST_GRAPH VERTEX TABLES( Male KEY (id) LABEL Male
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender), Female KEY (id) LABEL Female
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender) ) EDGE TABLES( knowsmm KEY (id)
    SOURCE KEY (sid) REFERENCES Male DESTINATION KEY (did) REFERENCES Male LABEL
    knows PROPERTIES (mval, firstMetAt, since), knowsmf KEY (id) SOURCE KEY (sid)
    REFERENCES Male DESTINATION KEY (did) REFERENCES Female LABEL knows
    PROPERTIES (mval, firstMetAt, since), knowsfm KEY (id) SOURCE KEY (sid)
    REFERENCES Female DESTINATION KEY (did) REFERENCES Male LABEL knows
    PROPERTIES (mval, firstMetAt, since), knowsff KEY (id) SOURCE KEY (sid)
    REFERENCES Female DESTINATION KEY (did) REFERENCES Female LABEL knows
    PROPERTIES (mval, firstMetAt, since), friendofmm KEY (id) SOURCE KEY (sid)
    REFERENCES Male DESTINATION KEY (did) REFERENCES Male LABEL friendof
    PROPERTIES (strength), friendofmf KEY (id) SOURCE KEY (sid) REFERENCES Male
    DESTINATION KEY (did) REFERENCES Female LABEL friendof PROPERTIES (strength),
    friendoffm KEY (id) SOURCE KEY (sid) REFERENCES Female DESTINATION KEY (did)
    REFERENCES Male LABEL friendof PROPERTIES (strength), friendofff KEY (id)
    SOURCE KEY (sid) REFERENCES Female DESTINATION KEY (did) REFERENCES Female
    LABEL friendof PROPERTIES (strength) ) OPTIONS ( pg_pgql )",
    "SELECT v FROM MATCH (v) ON TEST_GRAPH LIMIT 1"
```

```

],
"driver": "PGQL_IN_DATABASE",
"formatter": "GVT",
"parameters": {
  "dynamicSampling": 2,
  "parallel": 8,
  "start": 0,
  "size": 100
},
"visualize": true

```

Response

- **202 OK**
- **Content-Type:** application/json

Sample Response Body

```

{
  "message": "Query execution started.",
  "result_id": 0
}

```

cURL Example

```

curl --location --request POST 'https://localhost:7007/v2/runQueryAsync' \
--header 'Content-Type: application/json' \
--header 'Authorization: Bearer <token>' \
--data '{
  "statements": [
    "DROP PROPERTY GRAPH TEST_GRAPH",
    "CREATE PROPERTY GRAPH TEST_GRAPH VERTEX TABLES( Male KEY (id) LABEL Male
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender), Female KEY (id) LABEL Female
    PROPERTIES ARE ALL COLUMNS EXCEPT (gender) ) EDGE TABLES( knowsmm KEY (id)
    SOURCE KEY (sid) REFERENCES Male DESTINATION KEY (did) REFERENCES Male LABEL
    knows PROPERTIES (mval, firstMetAt, since), knowsmf KEY (id) SOURCE KEY (sid)
    REFERENCES Male DESTINATION KEY (did) REFERENCES Female LABEL knows
    PROPERTIES (mval, firstMetAt, since), knowsfm KEY (id) SOURCE KEY (sid)
    REFERENCES Female DESTINATION KEY (did) REFERENCES Male LABEL knows
    PROPERTIES (mval, firstMetAt, since), knowsff KEY (id) SOURCE KEY (sid)
    REFERENCES Female DESTINATION KEY (did) REFERENCES Female LABEL knows
    PROPERTIES (mval, firstMetAt, since), friendOfmm KEY (id) SOURCE KEY (sid)
    REFERENCES Male DESTINATION KEY (did) REFERENCES Male LABEL friendOf
    PROPERTIES (strength), friendOfmf KEY (id) SOURCE KEY (sid) REFERENCES Male
    DESTINATION KEY (did) REFERENCES Female LABEL friendOf PROPERTIES (strength),
    friendOffm KEY (id) SOURCE KEY (sid) REFERENCES Female DESTINATION KEY (did)
    REFERENCES Male LABEL friendOf PROPERTIES (strength), friendOfff KEY (id)
    SOURCE KEY (sid) REFERENCES Female DESTINATION KEY (did) REFERENCES Female
    LABEL friendOf PROPERTIES (strength) ) OPTIONS ( pg_pgql )",
    "SELECT v FROM MATCH (v) ON TEST_GRAPH LIMIT 1"
  ],
  "driver": "PGQL_IN_DATABASE",
  "formatter": "GVT",
  "parameters": {
    "dynamicSampling": 2,

```

```
    "parallel": 8,  
    "start": 0,  
    "size": 100  
  },  
  "visualize": true  
}'
```

21.1.7.2 Check Asynchronous Query Completion

GET https://localhost:7007/v2/isAsyncQueryExecutionComplete/<result_id>

Check if an asynchronous query execution is completed.

Version: v2

Request Header

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Request Path Parameter:

- **result_id:** PGQL query execution result id.

Response

- **200 OK**
- **Content-Type:** application/json

Sample Response Body

```
true
```

cURL Example

```
curl --location --request GET 'https://localhost:7007/v2/  
isAsyncQueryExecutionComplete/<result-id>' \  
--header 'Authorization: Bearer <token>'
```

21.1.7.3 Retrieve Asynchronous Query Result

GET https://localhost:7007/v2/runQueryAsync/<result_id>

Retrieve the result of an asynchronous query.

Version: v2

Request

Request Header

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Request Path Parameter:

- `result_id`: PGQL query execution result id.

Response

- **200 OK**
- **Content-Type:** application/json

Sample Response Body

```
{
  "results": [
    {
      "pgqlStatement": "DROP PROPERTY GRAPH TEST_GRAPH",
      "result": "Graph successfully dropped",
      "success": true,
      "error": null,
      "started": 1689656429130,
      "ended": 1689656429198
    },
    {
      "pgqlStatement": "CREATE PROPERTY GRAPH TEST_GRAPH VERTEX

        "ended": 1689656430029  
      }  
    ]  
  }  
}
```

cURL Example

```
curl --location --request GET 'https://localhost:7007/v2/runQueryAsync/  
<result-id>' \  
--header 'Authorization: Bearer <token>'
```

21.1.7.4 Cancel an Asynchronous Query Execution

DELETE `https://localhost:7007/v2/runQueryAsync/<result_id>`

Cancel the execution of an asynchronous query.

Version: v2

Request

Request Header

- **Accept:** application/json; charset=UTF-8
- **Header:** Authorization: Bearer <token>
- **Content-Type:** application/json

Request Path Parameter:

- `result_id`: PGQL query execution result id.

Response

- **200 Accepted**
- **Content-Type:** application/json

cURL Example

```
curl --location --request DELETE 'https://localhost:7007/v2/runQueryAsync/  
<result-id>' /  
--header 'Authorization: Bearer <token>'
```

21.2 Graph Server REST API Version 1

Learn about the graph server REST API version 1 (v1).

Note

The version 1 (v1) endpoints of the API is deprecated. It is recommended that you use [Graph Server REST API Version 2](#).

- [Login](#)
- [Get Graphs](#)
- [Run a PGQL Query](#)
- [Get User](#)
- [Logout](#)
- [Asynchronous REST Endpoints](#)

21.2.1 Login

POST `https://localhost:7007/ui/v1/login/`

Login to the graph server.

Version: v1

Authentication: Uses cookie-based authentication.

Table 21-4 Parameters

Parameter	Parameter Type	Value	Required
Content-type	Header	application/json	Yes
username	Body	<username>	Yes
password	Body	<password>	Yes
baseUrl	Body	<baseUrl> to point to the graph server (PGX) or the database	Optional. If empty, the <code>pgx.base_url</code> parameter value in the <code>web.xml</code> file in <code>/opt/oracle/graph/pgx/server/graph-server-webapp-25.3.0.war</code> will be used.
pgqlDriver	Body	Valid PGQL driver configuration values are: <ul style="list-style-type: none"> • <code>pgxDriver</code>: for PGQL on the graph server (PGX) • <code>pgqlDriver</code>: for PGQL on Oracle Database 	Yes
sessionId	Body	sessionId from graph server (PGX)	Optional

Request

The following `curl` command signs the user in to the graph server:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -c cookie.txt -X POST -H
"Content-Type: application/json" -d '{"username": "<username>", "password":
```

```
"<password>", "pgqlDriver": "<pgqlDriver>","baseUrl": "<baseUrl>",
"sessionId": "<sessionId>" }' https://localhost:7007/ui/v1/login/
```

Response: The username used for the login. For example:

```
"oracle"
```

On successful login, the server session cookie is stored in a cookie file, `cookie.txt`. Use this cookie file, in the subsequent calls to the API.

21.2.2 Get Graphs

GET `https://localhost:7007/ui/v1/graphs`

Get the list of all graphs that belong to a user.

Version: v1

Request

The following `curl` command lists all the graphs that belong to the user:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://
localhost:7007/ui/v1/graphs'
```

Response: The list of graphs available for the current user. For example:

```
[
  {
    "schema": "HR",
    "graphName": "MY_GRAPH"
  }
]
```

Also, note that the `schema` parameter will be `NULL` for graphs created in the graph server (PGX).

21.2.3 Run a PGQL Query

POST `https://localhost:7007/ui/v1/query`

Run a PGQL Query on a property graph.

Version: v1

Table 21-5 Request Query Parameters

Parameter	Description	Values	Required
<code>pgql</code>	PGQL query string	<code><PGQL_query></code>	Yes
<code>graph</code>	Name of the graph	<code><graph_name></code>	Optional, only if the <code>pgql</code> query parameter contains the graph name. Otherwise, it is required.

Table 21-5 (Cont.) Request Query Parameters

Parameter	Description	Values	Required
parallelism	Degree of Parallelism	<parallelism_value>	Optional. Default value depends on the PGQL driver configuration: <ul style="list-style-type: none"> pgxDriver: <number-of-cpus> See parallelism in Table 25-1. pgqlDriver: 1
size	Fetch size (= the number of rows) of the query result	<size_value>	Optional. Default size value is 100.
formatter	Formatter of the graph	<formatter_value>	Optional. Supported formatter options are: <ul style="list-style-type: none"> datastudio gvt Default value is datastudio.

Request

The following `curl` command executes PGQL Query on a property graph:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://localhost:7007/ui/v1/query?pgql=SELECT%20e%0AMATCH%20( )-%5Be%5D-%3E( )%0ALIMIT%205&graph=hr&size=100'
```

Response: The PGQL query result in JSON format.

```
{
  "name": "bank_graph_analytics_2",
  "resultSetId": "pgql_14",
  "graph": {
    "idType": "number",
    "vertices": [
      {

          "s": false
        }
      ],
      "l": [
        "Transfers"
      ],
      "g": [
        "e"
      ],
      "s": "1",
      "d": "418",
      "u": false
    }
  ],
  "paths": [],
  "totalNumResults": 2

```

```
    },  
    "table":  
    "e\nPgxEde[provider=Transfers,ID=0]\nPgxEdg[provider=Transfers,ID=1]"  
  }  
}
```

21.2.4 Get User

GET `https://localhost:7007/ui/v1/user`

Get the name of the current user.

Version: v1

Request

The following `curl` command gets the name of the current user:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://  
localhost:7007/ui/v1/user'
```

Response: The name of the current user. For example:

```
"oracle"
```

21.2.5 Logout

POST `https://localhost:7007/ui/v1/logout/`

Log out from the graph server.

Version: v1

Request

The following `curl` command is to successfully log out from the graph server.

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt -X POST  
'https://localhost:7007/ui/v1/logout/'
```

Response: None

On successful logout, the server returns HTTP status code 200 and the session token from the `cookie.txt` file will no longer be valid.

21.2.6 Asynchronous REST Endpoints

The graph server REST endpoints support cancellation of queries.

In order to be able to cancel queries, you need to send the query using the following asynchronous REST endpoints:

- [Run an Asynchronous PGQL Query](#)
- [Check Asynchronous Query Completion](#)
- [Retrieve Asynchronous Query Result](#)

- [Cancel an Asynchronous Query Execution](#)

21.2.6.1 Run an Asynchronous PGQL Query

GET `https://localhost:7007/ui/v1/async-query`

Run a PGQL query asynchronously on a property graph.

Version: 1

See [Table 21-5](#) for more information on query parameters.

Request

The following `curl` command executes a PGQL query asynchronously on a property graph:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://localhost:7007/ui/v1/async-query?pgql=SELECT%20e%0AMATCH%20()-%5Be%5D-%3E()%0ALIMIT%205&graph=hr&parallelism=&size=100'
```

Response: None.

Note

An error message will be returned in case the query is malformed or if the graph does not exist.

21.2.6.2 Check Asynchronous Query Completion

GET `https://localhost:7007/ui/v1/async-query-complete`

Checks if an asynchronous query execution is completed.

Version: v1

Request

The following `curl` command checks if the PGQL query execution is completed:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://localhost:7007/ui/v1/async-query-complete'
```

Response: A boolean that indicates if the query execution is completed. For example,

true

Note

You do not have to specify any request ID, as the currently executing query is attached to your HTTP session. You can only have one query executing per session. For concurrent query execution, create multiple HTTP sessions by logging in multiple times.

21.2.6.3 Retrieve Asynchronous Query Result

GET `https://localhost:7007/ui/v1/async-result`

Retrieve the result of an asynchronous query.

Version: v1

Note

The endpoint, GET `https://localhost:7007/ui/v1/async-result` to retrieve a query result is deprecated:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt  
'https://localhost:7007/ui/v1/async-result?  
pgql=SELECT%20e%0AMATCH%20()-%5Be%5D-%3E()  
%0ALIMIT%205&graph=hr&parallelism=&size=100'
```

Request

The following `curl` command retrieves the result of a successfully completed query:

```
curl --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt 'https://  
localhost:7007/ui/v1/async-result'
```

Response: The PGQL query result in JSON format.

```
{

21.2.6.4 Cancel an Asynchronous Query Execution

DELETE `https://localhost:7007/ui/v1/async-query`

Cancels the execution of an asynchronous query.

Version: 1

Request

The following `curl` command cancels a currently executing PGQL Query on a property graph:

```
curl -X DELETE --cacert /etc/oracle/graph/ca_certificate.pem -b cookie.txt  
'https://localhost:7007/ui/v1/async-query'
```

Response: Confirmation of the cancellation or an error message if the query has already completed execution.

Part VI

Graph Visualization Application

The Graph Visualization application enables interactive exploration and visualization of property graphs. You can visualize graphs that are loaded into the graph server(PGX) and the graphs stored in the database.

- [About the Graph Visualization Application](#)
The Graph Visualization application is a single-page web application that works with the graph server (PGX).
- [Using the Graph Visualization Application](#)
The Graph Visualization application is based on the graph visualization library. Using this interface, you can run PGQL queries on graphs in the graph server (PGX) and SQL or PGQL queries on graphs in the database.
- [Embedding the Graph Visualization Library in a Web Application](#)
You can integrate the graph visualization component in a web application to visualize graph data.

About the Graph Visualization Application

The Graph Visualization application is a single-page web application that works with the graph server (PGX).

The graph server can be deployed in embedded mode or in Apache Tomcat or Oracle WebLogic Server. Graph Visualization application takes PGQL queries or SQL graph queries (in case of SQL property graphs which are supported only in Oracle Database Release 23ai) as input and renders the result visually. A rich set of client-side exploration and visualization features can reveal new insights into your graph data.

Graph Visualization application works with the graph server (PGX). It can visualize graphs that are have been loaded into the graph server (PGX) at run-time by a client application and made available through the `graph.publish()` API.

① See Also

- [Running the Graph Visualization Web Client](#)
- [REST Endpoints for the Graph Server](#)

Using the Graph Visualization Application

The Graph Visualization application is based on the graph visualization library. Using this interface, you can run PGQL queries on graphs in the graph server (PGX) and SQL or PGQL queries on graphs in the database.

See Also

[Property Graph Visualization Developer's Guide and Reference](#)

The Graph Visualization application is made up of the following three tabs:

- **Database (SQL Property Graphs):** To visualize SQL property graphs. This tab option is supported only with Oracle Database 23ai.
- **Graph Server:** To visualize graphs loaded into the graph server (PGX).
- **Database (PGQL Property Graphs):** To visualize PGQL property graphs in the database.

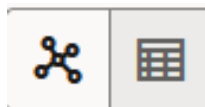

Each tab comprises a query editor at the top and a graph visualization panel at the bottom of the interface. The toolbar following the query editor supports the following options:

Figure 23-1 Supported Actions

- **Parallelism:** You can specify the degree of parallelism to be used for query operations. This option is not supported in **Database (SQL Property Graphs)** tab.
- **Get graphs list:** You can view the list of graphs to which you have access in a specific tab.
- **Run query:** To run the query entered in the query editor. You can choose to view the results of the graph visualization query as a graph or in tabular format using the **Display graph view** (default) or **Display table view** mode options which are displayed in the right of the graph visualization panel:

Figure 23-2 Display Views

- **Run table-only query:** To run the query entered in the query editor and view the results in tabular format only. If you run the query using this option, then the **Display graph view** mode (shown in the preceding figure) will be disabled.

- **Cancel query execution:** To cancel the execution of a regular or table-only query.
- **Load graph into memory:** This option is supported only in the **Graph Server** tab. See [Loading or Unloading a Database Property Graph Into or From the Graph Server \(PGX\) Memory](#) for more information.
- **Open settings:** To configuring the settings for visualizing the output. See [Graph Visualization Settings](#) for more information.
- [Visualizing Graph Queries on SQL Property Graphs](#)
You can query and visualize a SQL property graph in the database in the **Database (SQL Property Graphs)** tab of the Graph Visualization application.
- [Visualizing PGQL Queries on Graphs Loaded Into the Graph Server \(PGX\)](#)
You can create or load a graph into the graph server (PGX), and then run PGQL graph queries in the **Graph Server** tab of the Graph Visualization application.
- [Visualizing PGQL Queries on PGQL Property Graphs](#)
You can visualize PGQL queries on PGQL property graphs in the database in the **Database (PGQL Property Graphs)** tab of the Graph Visualization application.
- [Graph Visualization Modes and Graph Legends](#)
Learn about the graph visualization toolbar, supported graph visualization modes and graph legend if you are viewing the results of the query in graph format.
- [Managing the Display Size of the Graph](#)
You can use the **Display Size** visualization setting to control the number of graph elements (vertices and edges) to be displayed in the Graph Visualization panel.
- [Graph Visualization Settings](#)
You can click the **Settings** gear icon to open the Graph Visualization settings window.

23.1 Visualizing Graph Queries on SQL Property Graphs

You can query and visualize a SQL property graph in the database in the **Database (SQL Property Graphs)** tab of the Graph Visualization application.

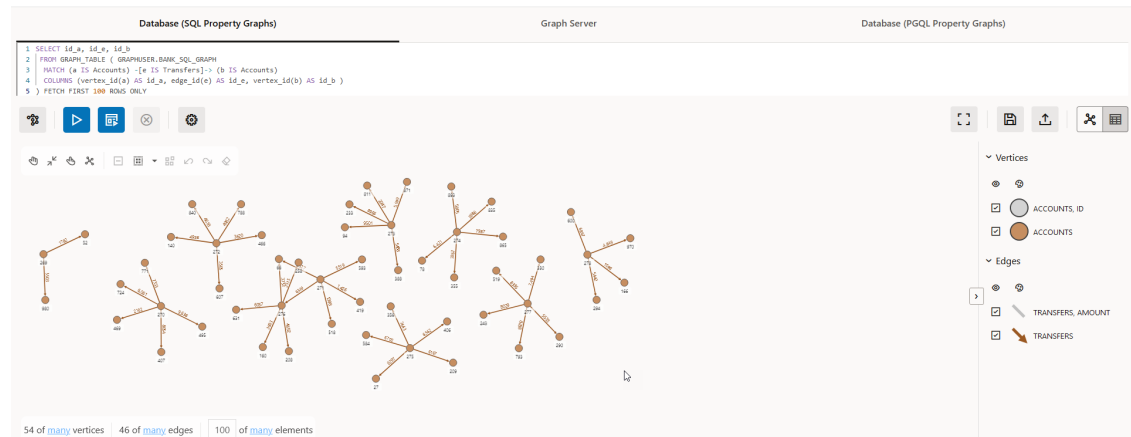

However, in order to visualize the vertices and edges of a `GRAPH_TABLE` query together with their IDs and all their labels and properties, the query must return the vertex ID, or edge ID, or both.

For example, the following figure shows the visualization of a SQL `GRAPH_TABLE` query on a SQL property graph. Note that the `COLUMNS` clause in the query uses the `VERTEX_ID` and `EDGE_ID` functions.

Note

The Graph Visualization application supports only `SELECT` graph queries.

Figure 23-3 Graph Query on a SQL Property Graph

The name of the graph must be provided in the SQL graph query. You can click the **List of available graphs** icon (shown highlighted in the preceding figure) to view the list of SQL property graphs to which you have access.

- [Visualizing the Schema of a SQL Property Graph](#)
Starting from Graph Server and Client Release 25.3, you can visualize the underlying schema of a SQL property graph.

See Also

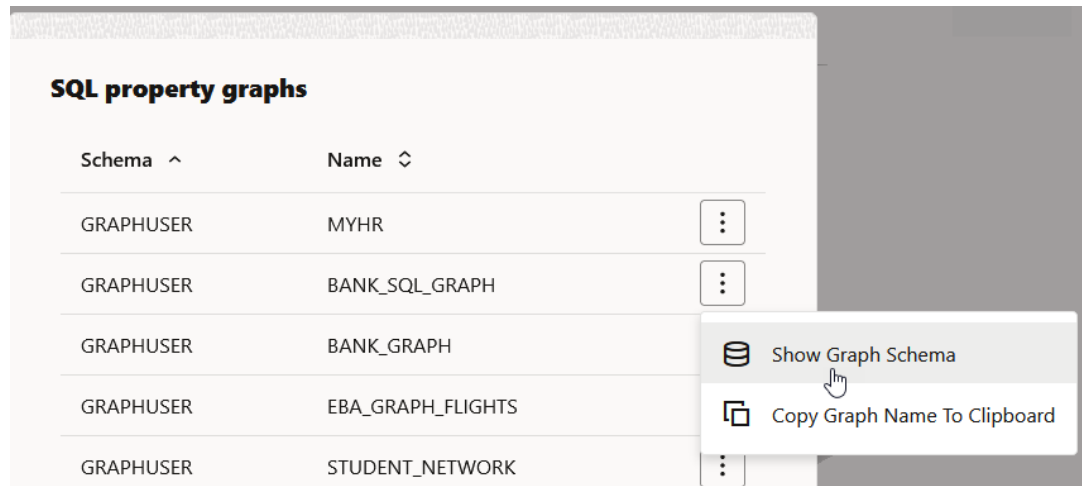

[SQL Graph Queries](#) for more information

23.1.1 Visualizing the Schema of a SQL Property Graph

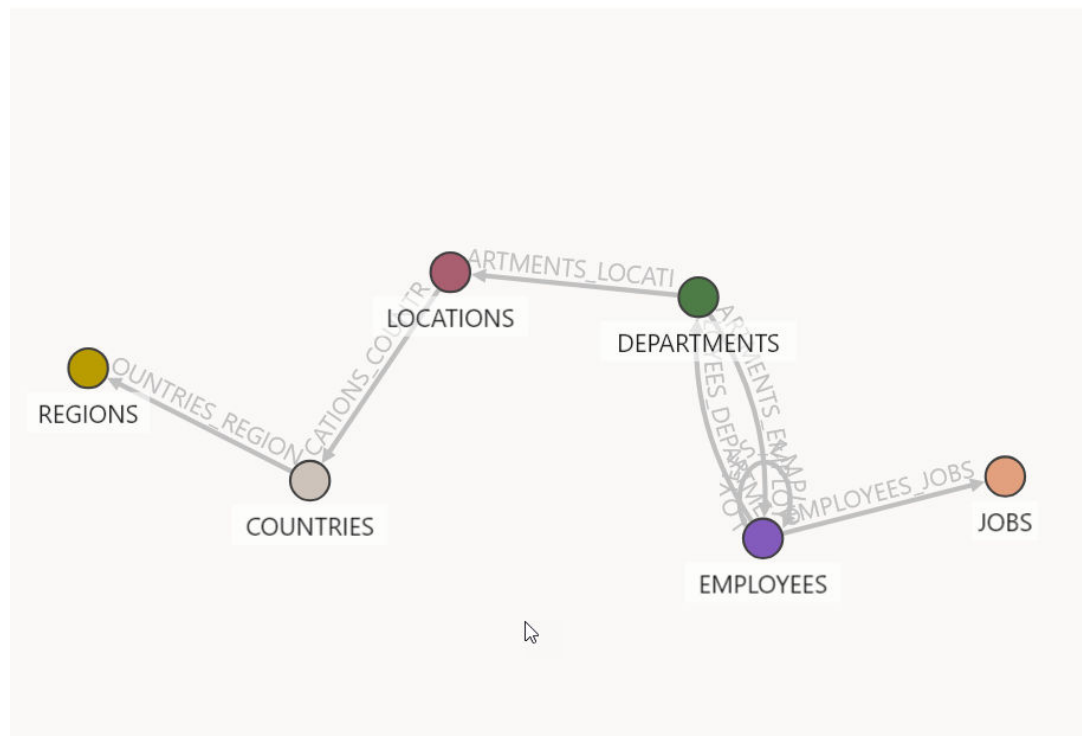

Starting from Graph Server and Client Release 25.3, you can visualize the underlying schema of a SQL property graph.

Perform the following steps to visualize the schema of a SQL property graph.

1. Click **Get Graphs List** in the SQL property graph tab.
2. Click the options menu against the desired graph and select **Show Graph Schema**.

Figure 23-4 Show Graph Schema Option

The schema of the graph is displayed as shown:

Figure 23-5 Graph Schema Visualization

If you proceed to run a SQL graph query, then the schema visualization will be replaced with graph visualization.

23.2 Visualizing PGQL Queries on Graphs Loaded Into the Graph Server (PGX)

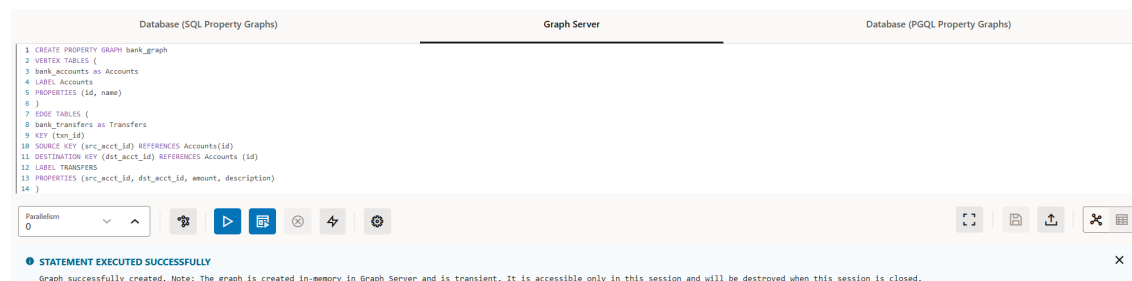

You can create or load a graph into the graph server (PGX), and then run PGQL graph queries in the **Graph Server** tab of the Graph Visualization application.

The following sections describe in detail the various actions that you can perform in the **Graph Server** tab.

Creating a Property Graph in the Graph Server (PGX)

You can run the `CREATE PROPERTY GRAPH` PGQL statement to create a graph in the graph server (PGX). For example:

Figure 23-6 Creating a Property Graph in the Graph Server Memory

The graph gets created and loaded into the graph server memory (PGX). Note that this is a transient graph which will be destroyed at the end of the session.

You can click the **Get Graphs List** icon (shown highlighted in the preceding figure) to view all the graphs that are loaded into the graph server memory.

Loading or Unloading a Database Property Graph Into or From the Graph Server (PGX) Memory

You can also load or unload any existing PGQL or SQL property graph into or from the graph server (PGX) memory by performing the following steps:

1. Click the  **Load graph into memory** icon in the **GraphServer** tab.
The list of database graphs to which you have access are displayed as shown:

Figure 23-7 List of Database Graphs

Available graphs for loading into memory				
Schema	Name	Type	Status	Actions
GRAPHUSER	BANK_GRAPH	SQL Property Graph	Memory	
GRAPHUSER	BANK_GRAPH_PGQL_2	PGQL Property Graph	Database	
GRAPHUSER	BANK_GRAPH_PGQL	PGQL Property Graph	Database	
				<button>Close</button>

Note that the SQL property graphs get listed only if you are connected to Oracle Database 23ai.

2. Click the **Load graph into memory** icon against the graph you wish to load into memory. The confirmation dialog for loading the graph into memory opens.

Figure 23-8 Loading Graph Into Memory Confirmation

Do you want to load GRAPHUSER.BANK_GRAPH into memory?

This operation will load the graph into memory. The graph will remain in memory as long as it is in use by a session. The graph will be released from memory when there is a period of **non-use**.

▼ Advanced Options

Ignore Invalid Edges Errors

☐

Ignore edges that do not connect to a vertex and continue graph load into memory

Synchronizable

☐

Adds extra checks during loading process to verify the graph is synchronizable

Optimized For

Use update if you want to optimize the loading process for updates using the synchronizer/changeSet

☒ Read

☐ Update

Parallelism

0

▼ ▲

 Load graph into memory

Cancel

- a. Optionally, click to expand the **Advanced Options** configuration. The following advanced options can be configured:
 - **Ignore Invalid Edges Errors:** Switch ON this toggle to ignore all edges that do not connect to a vertex.
 - **Synchronizable:** Switch ON this toggle to verify that the graph can be synchronized.

- **Optimized For:** Select one of the following graph optimization strategies:
 - **READ:** To optimize for read-intensive scenarios.
 - **UPDATE:** To optimize for update-intensive scenarios.
 - **Parallelism:** To specify the degree of parallelism.
- b. Click **Load graph into memory**.
The **In Progress** status against the graph indicates that the graph loading process is initiated and once the graph is successfully loaded into memory, the status gets updated to **Memory**.
 - c. Click **Close** and click the **Get Graphs List** icon to verify that the graph is loaded into memory.
3. Optionally, click the **Unload graph from memory** icon against the graph you wish to unload from memory.
The confirmation dialog for unloading the graph from memory opens as shown:

Figure 23-9 Unloading Graph from Memory Confirmation

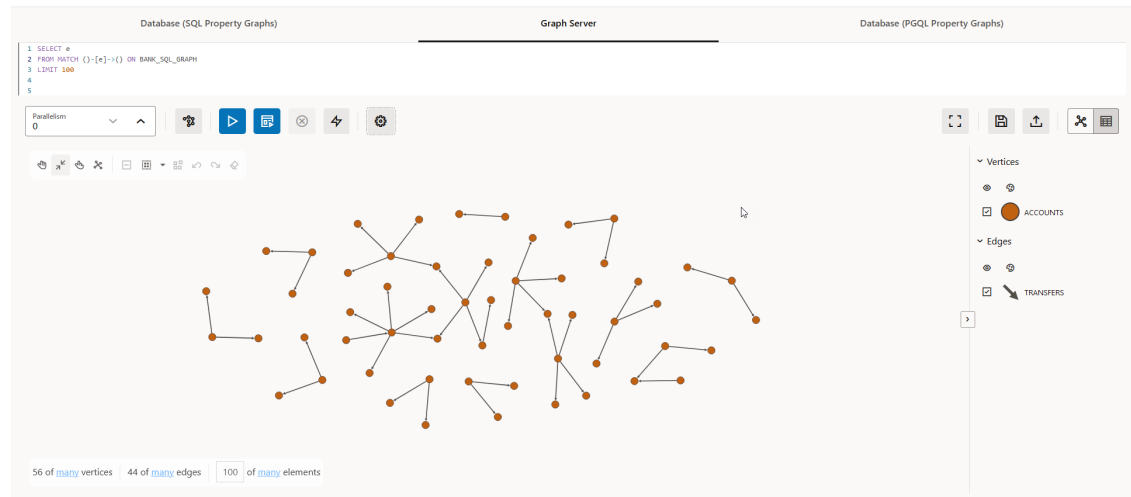

Click **Unload graph from memory**. The **Memory** status gets updated to **Database** once the graph is unloaded from memory.

Running PGQL queries on the graph

You can enter a PGQL query on the desired graph and click **Run Query** to execute the query. On successful execution, the graph visualization result (including nodes and their connections) is displayed in the bottom panel. You can right-click a node or connection to display tooltip information, and you can drag the nodes around.

The following figure shows a sample query visualization identifying all edges that are directed edges from any vertex in the graph to any other vertex.

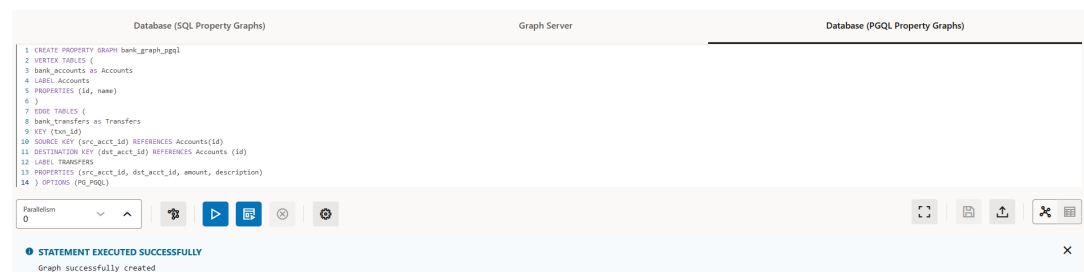

Figure 23-10 Visualizing a PGQL Query

23.3 Visualizing PGQL Queries on PGQL Property Graphs

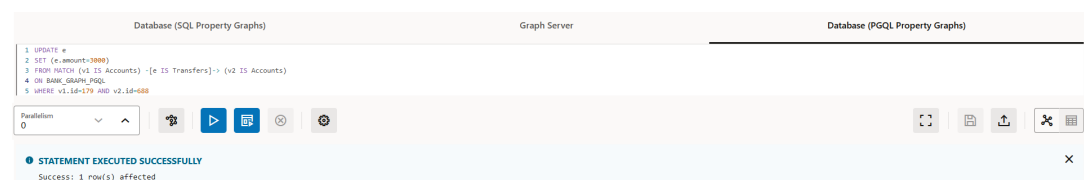

You can visualize PGQL queries on PGQL property graphs in the database in the **Database (PGQL Property Graphs)** tab of the Graph Visualization application.

You can create, query, modify and visualize PGQL property graphs in the database using the Graph Visualization application. The following PGQL operations are supported:

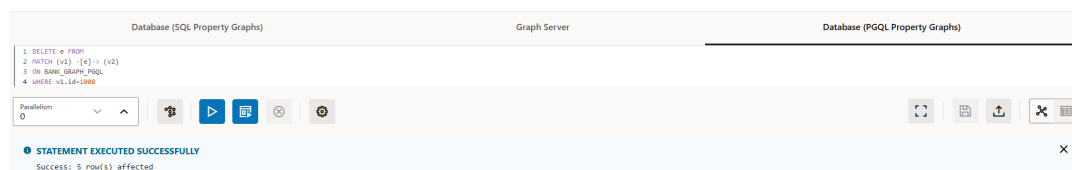

- **CREATE PROPERTY GRAPH:** To create a new PGQL property graph as shown:

Figure 23-11 Creating a PGQL property graph

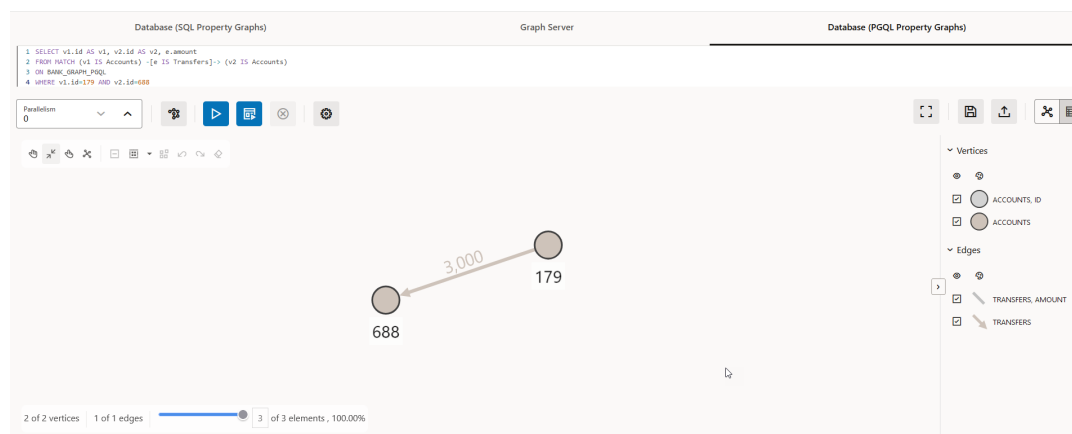

- **INSERT, UPDATE and DELETE:** To modify an existing PGQL property graph. For example:

Figure 23-12 Updating an Edge in a PGQL property graph

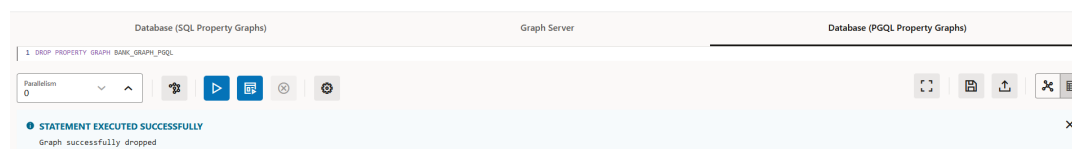

Note that you must provide the graph name in the PGQL query. You can click the **List of available graphs** icon to view the list of PGQL property graphs to which you have access.

Figure 23-13 Deleting an Edge in a PGQL property graph

- **SELECT:** To query a PGQL property graph as shown:

Figure 23-14 Querying a PGQL property graph

- **DROP PROPERTY GRAPH:** To delete a PGQL property graph as shown:

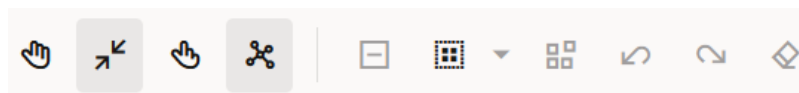

Figure 23-15 Dropping a PGQL property graph

23.4 Graph Visualization Modes and Graph Legends

Learn about the graph visualization toolbar, supported graph visualization modes and graph legend if you are viewing the results of the query in graph format.

Graph Visualization Toolbar

The graph visualization toolbar is displayed on the left of the graph visualization panel as shown:

Figure 23-16 Graph Visualization Toolbar

The toolbar supports the following graph visualization modes:

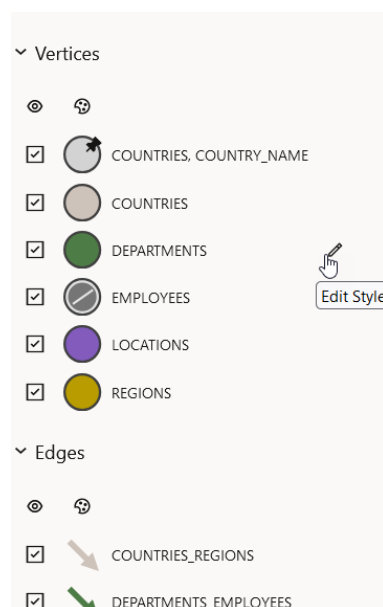

- **Move/Zoom:** This mode allows you to zoom in and out, as well as to move to another part of the visualization.
- **Fit to Screen:** This mode fits the resulting graph in the graph visualization view.
- **Toggles Sticky Mode:** This mode allows you to cancel the action of dragging the nodes around.
- **Activate Network Evolution:** This allows you to activate or deactivate network evolution.
- **Graph Manipulation:** This mode allows you to interact with your graph visualization. Supported actions are:
 - **Drop:** To remove selected vertices from the visualization. Can also be executed from the tooltip.
 - **Group:** To group selected multiple vertices and collapse them into a single one.
 - **Ungroup:** To select a group of collapsed vertices and ungroup them.
 - **Undo:** To undo the last action.
 - **Redo:** To redo the last action.
 - **Reset:** To reset the visualization to the original state after the query.

In addition,  **Toggle fullscreen mode** is available on the right of the graph visualization panel.

Graph Visualization Legends

The graph visualization legend panel appears on the right of the graph visualization panel and displays the legend items that represent vertices and edges of the graph, vertex and edge captions, and customized vertex and edge styles. The following figure shows a sample legend panel:

Figure 23-17 Graph Legends

You can perform the following actions in the legend panel:

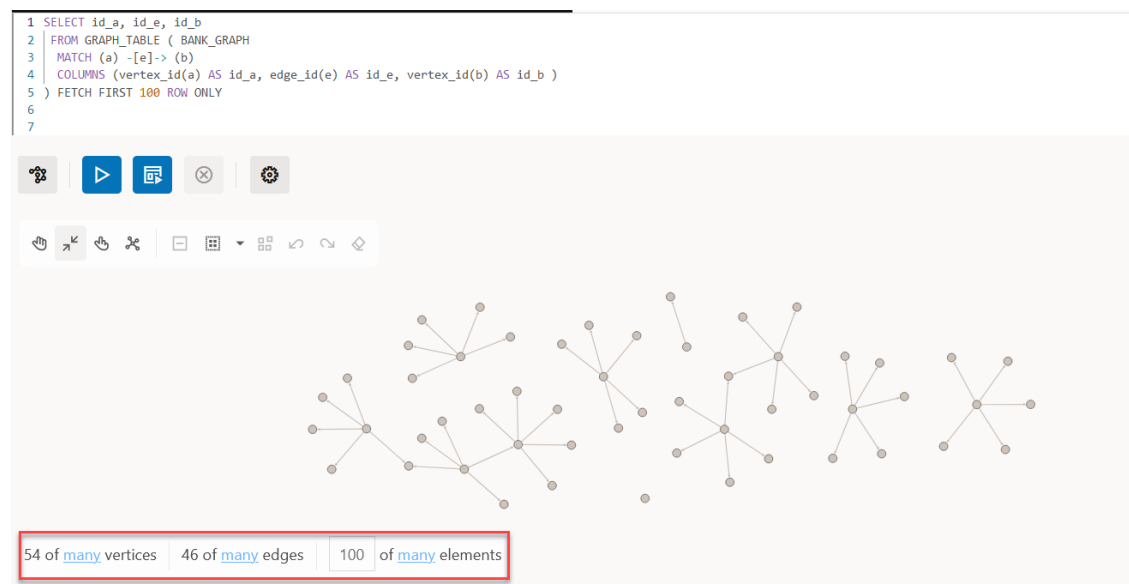

- Edit the style of a legend item.
- Reorder the legend items through drag and drop.
- Enable or disable a style by clicking on the legend item symbol.
- Enable or disable the visibility of the vertices or edges using the visibility checkbox.

23.5 Managing the Display Size of the Graph

You can use the **Display Size** visualization setting to control the number of graph elements (vertices and edges) to be displayed in the Graph Visualization panel.

The default **Display Size** value is 100. For instance, consider the following example visualization:

Figure 23-18 Default Display Size

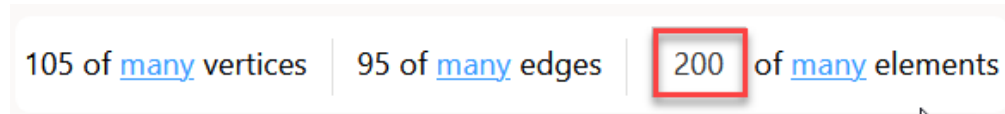

In the preceding figure:

- *54 of many vertices*: This indicates 54 vertices are displayed and *many* indicates the total number of vertices in the graph.
- *46 of many edges*: This indicates 46 edges are displayed and *many* indicates the total number of edges in the graph.
- *100 of many elements*: This indicates 100 elements are displayed and *many* indicates the total number of graph elements.

Also, the following actions are supported for customizing the graph display size:

- You can dynamically change the total number of graph elements (shown highlighted in the following figure) to be displayed in the graph.

Figure 23-19 Dynamically Updating Display Size

- You can click `many` to view the total number of vertices, edges, and graph elements in the graph.
A progress bar showing the percentage of the graph that is displayed in the panel appears along with the percentage value.

Figure 23-20 Progress Slider to Control Graph Display

- You can move the slider to dynamically change the number of vertices or edges that you wish to display for visualization.

23.6 Graph Visualization Settings

You can click the **Settings** gear icon to open the Graph Visualization settings window.

The **Visualization settings** window comprises the **General**, **Graph Exploration**, and **Styles** tab.

Configuring General Settings

You can add vertex and edge captions, set the graph layout and page size in the **General** of the **Graph Visualization** settings:

Figure 23-21 General Tab Configuration

Legend Area

Visibility Toggle Mode

[List Icon] [Grid Icon]

- **Vertex Caption Orientation:** Determines where the selected vertex property will be displayed.
- **Vertex Caption:** Determines the property to be displayed for a vertex. Click **+ Add more** to add a vertex caption and select the required vertex **Label** and vertex **Property**.
- **Edge Caption:** Determines the property to be displayed for an edge. Click **+ Add more** to add an edge caption and select the required edge **Label** and edge **Property**.
- **Maximum Visible Caption Length:** Maximum caption length before truncating.
- **Layout:** Computes the position of the nodes and determines the visual structure of the graph.
Supported layouts are: *Circle*, *Concentric*, *Force (default)*, *Grid*, *Hierarchical*, *Preset*, *Radial*, *Random*, and *Geographical*.

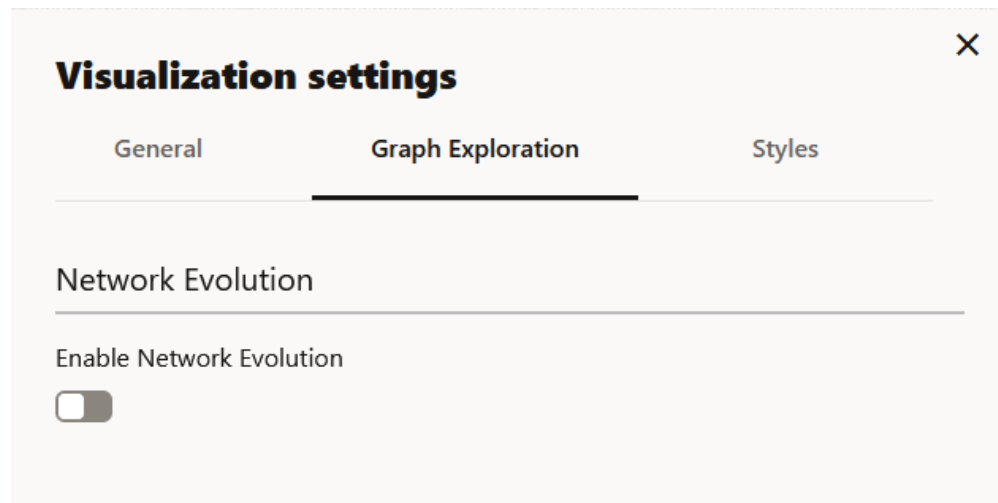

The *Force* layout also supports a clustering option, which allows you to visualize a graph with clustered vertices. See [Enabling Cluster Option in Graph Visualization](#) for more information.

- **Display Size:** Determines the number of graph elements to be visualized on a page from the result set.
- **Visibility Toggle Mode:** Enables you to customize the visibility toggle behaviour of the legend items through settings:
 - **Enable hide when any unchecked:** Vertex and edge elements will be hidden when one of the legend items that affect them has its visibility turned off.
 - **Enable hide when all unchecked:** Vertex and edge elements will only be hidden when all the legend items that affect them have their visibility turned off.

Configuring Graph Exploration Settings

You can enable and configure **Network Evolution** in the **Graph Exploration** tab of the **Graph Visualization** settings. See [Using Network Evolution in Graph Visualization](#) for more information.

Figure 23-22 Graph Exploration Tab Configuration

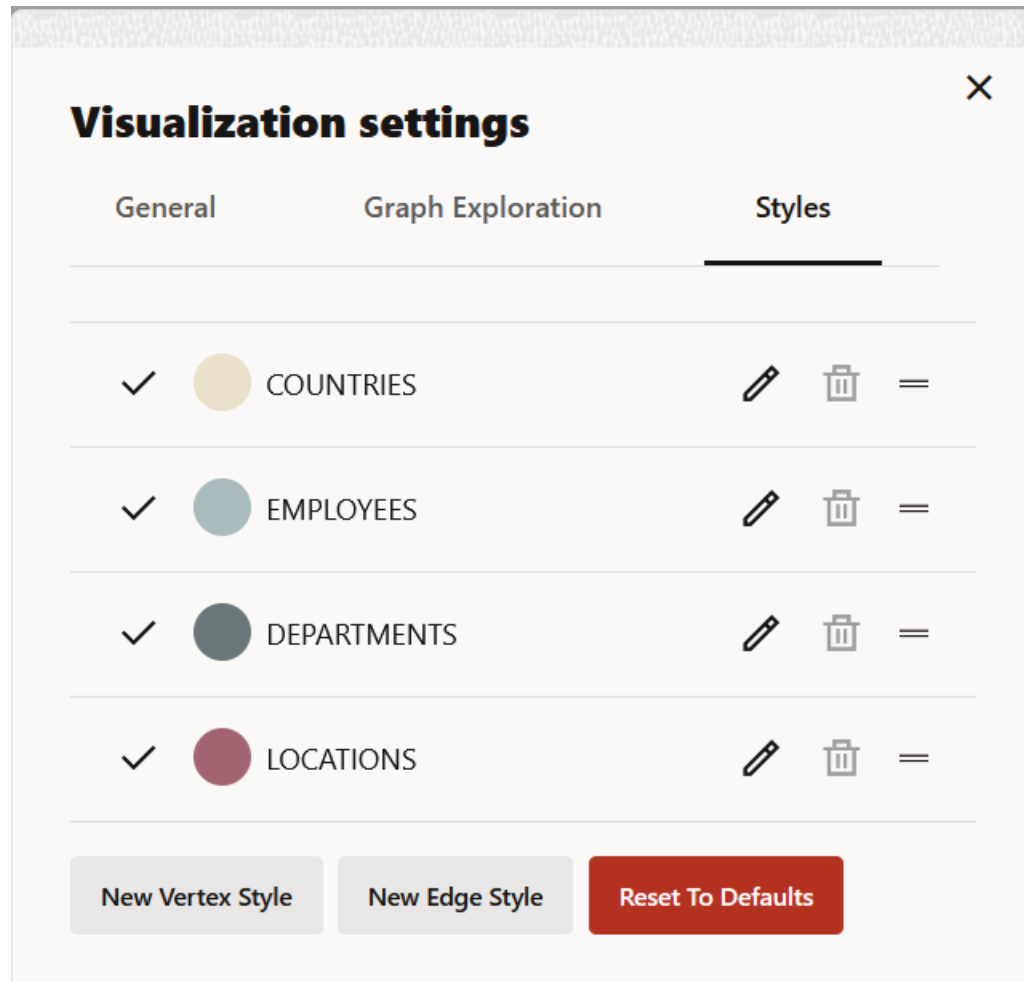

Configuring Vertex and Edge Styles

You can configure and manage vertex and edge styles to customize the appearance of vertices and edges in the graph. The **Styles** tab of the **Graph Visualization** settings displays both the default and custom vertex and edge styles.

You can perform the following actions in this tab:

- Add a new custom vertex style.
- Add a new custom edge style.
- Edit the default styling of a vertex or an edge element.
- Edit or delete the custom styling of a vertex or an edge element.
- Restore the default style settings.

Figure 23-23 Vertex and Edge Styles Configuration

To add a new vertex or edge style, click **New vertex style** or **New edge style** as appropriate and configure the following values:

- **Name:** Name of the style
- **Conditions:** Click + to add a condition for an element (vertex or edge) and provide the following values:
 - **Property** of the vertex or edge element.
 - **Operator** to be applied. The following operators are supported:
 - * = (equal to)
 - * < (less than)
 - * <= (less than or equal to)
 - * > (greater than)
 - * >= (greater than or equal to)
 - * != (not equal to)
 - * ~ (filter is a regular expression)
 - * * (any: like a wildcard, can match to anything)

- **Value** that needs to be fulfilled for the property and the operator

You can add as many conditions as required. For all elements that meet the conditions, you can configure any of the following styling highlights:

- **Size**: Size of the vertex or edge
- **Color**: Color of the vertex or edge
- **Caption**: Caption for the vertex or edge
- **Animations**: Animation (*Pulsating* or *Flashing*) and duration of the animation cycle
- **Icon**: Image for the vertex (does not apply for edges)

The following example shows a sample vertex style configuration.

Figure 23-24 Adding a Vertex Style

- [Enabling Cluster Option in Graph Visualization](#)
You can enable the cluster option with *Force* layout to group vertices by labels or by any specific vertex property in your graph visualization.
- [Using the Geographical Layout](#)
You can use the Geographical layout to show the graph (vertices and edges) on a global map in the Graph Visualization application.
- [Using Network Evolution in Graph Visualization](#)
You can visualize the evolution of a graph over time using the **Network Evolution** feature in the Graph Visualization application.
- [Importing and Exporting Graph Visualization Settings](#)
You can import and export the graph visualization settings as a JSON file.

23.6.1 Enabling Cluster Option in Graph Visualization

You can enable the cluster option with *Force* layout to group vertices by labels or by any specific vertex property in your graph visualization.

This is very useful when you are visualizing a graph with a lot of interconnected vertices. Perform the following steps to apply clustering of vertices in your graph visualization:

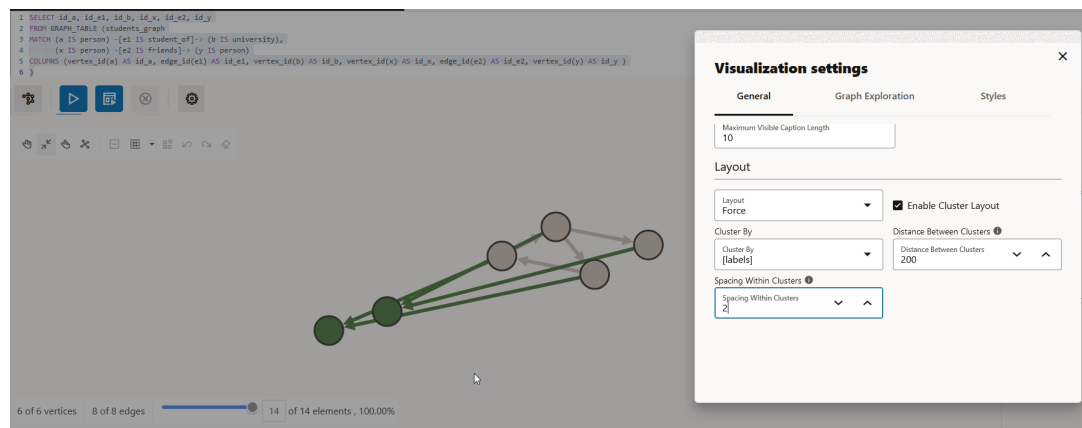

1. Click the **Settings** gear icon to open the graph **Visualization settings** dialog.
2. Click the **General** tab.
3. Select **Force Layout** in the **Layout** section.
4. Click the **Enable Cluster Layout** checkbox.
5. Select the **Cluster By** option.

You can choose to cluster the vertices by *labels* (default) or by any specific vertex *property*. If you choose to cluster by a vertex property, then note that the clusters are created around property values that are identical. For instance, when querying a graph after running a community detection algorithm, you can use the vertex property containing the community ID value as a *Cluster By* option. This will create clusters that contain vertices with the same community ID.

6. Optionally, adjust **Distance Between Clusters** to set the distance between the clusters.
7. Optionally, adjust **Spacing** to set the distance between vertices inside clusters.
8. Close the **Visualization settings** dialog.

The vertices in the graph are clustered together based on the selected clustering option. For example, the following figure shows clustering of vertices based on labels:

Figure 23-25 Cluster-Based Layout

23.6.2 Using the Geographical Layout

You can use the Geographical layout to show the graph (vertices and edges) on a global map in the Graph Visualization application.

In order to view your vertices on a map, they must include a geographical location, in the form of a pair of properties that contain the longitude and latitude coordinates for that vertex. You

can use any name for the longitude and latitude properties (such as `x` and `y`, or `long` and `lat`). For example:

US_CITY	CITY_LAT	CITY_LON
Binghamton	42.1014	-75.9093
Utica	43.0961	-75.226
New Rochelle	40.9305	-73.7836
Saratoga Springs	43.0674	-73.7775
New York	40.6943	-73.9249

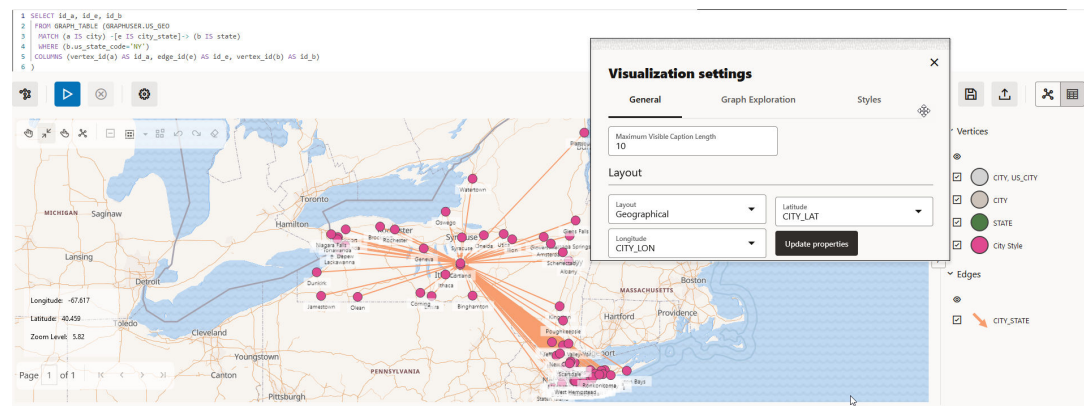

However, you must ensure that the longitude and latitude pair are in the WGS84 system (GPS coordinates), and the coordinates are expressed in decimal degrees.

Perform the following steps to apply geographical layout:

1. Click the **Settings** gear icon to open the graph **Visualization settings** dialog.
2. Click the **General** tab.
3. Select **Geographical Layout** in the **Layout** section.
4. Select the **Latitude** and **Longitude** properties.
5. Click **Update properties**.
6. Close the **Visualization settings** dialog.

The following shows an example graph rendered on a geographical layout in the Graph Visualization application.

Figure 23-26 Geographical Layout

23.6.3 Using Network Evolution in Graph Visualization

You can visualize the evolution of a graph over time using the **Network Evolution** feature in the Graph Visualization application.

In order to visualize a dynamic graph, it is important that the graph contains date or time properties. It can either be a vertex or an edge property.

Perform the following steps for configuring network evolution:

1. Click **Settings** in the graph visualization panel to open the graph **Visualization settings**.

2. Click the **Graph Exploration** tab.
3. Switch on the **Enable Network Evolution** toggle.
4. Select a graph element from the **Based On** drop-down list.

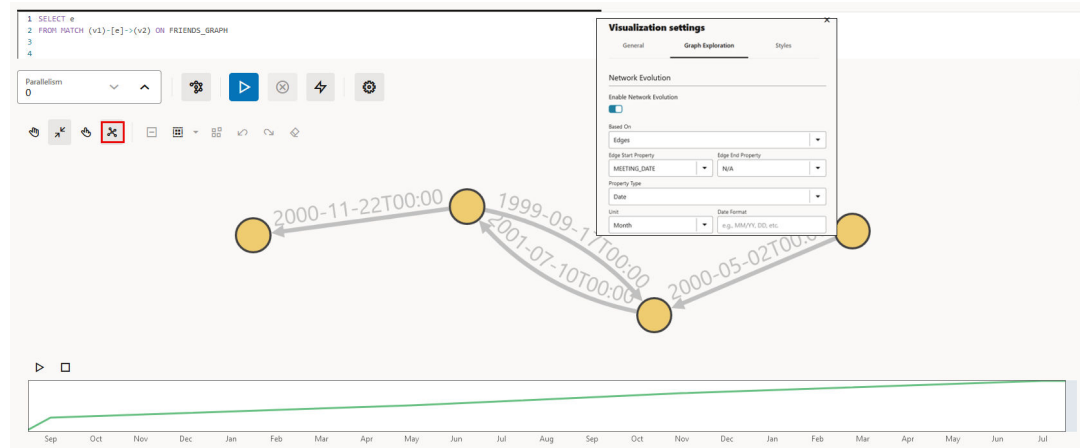

You can configure the network evolution to be based on vertices, or edges, or both.

Depending on your selection, you must select one or more of the following properties:

- **Vertex Start Property:** Select the name of the property to use for the vertex filtering. The time frame for the graph will be after the *Vertex Start Property*.
 - **Vertex End Property:** Optionally, select the name of the property to use for the vertex filtering. The time frame for the graph will be before the *Vertex End Property*.
 - **Edge Start Property:** Select the name of the property to use for the edge filtering. The time frame for the graph will be after the *Edge Start Property*.
 - **Edge End Property:** Optionally, select the name of the property to use for the edge filtering. The time frame for the graph will be before the *Edge End Property*.
5. Select the data type from the **Property Type** drop-down list.
Supported property type values are *Integer* and *Date*.
 6. Optionally, select the **Unit** of time for the increment and the **Date Format** if the **Property Type** is *Date*.
 7. Optionally, enable **Advanced Settings** if you want to explore advanced network evolution features and select one or more of the following options:
 - **Height:** Select a value to specify the height of the network evolution chart.
 - **Chart Type:** Select the type of the chart to be used to show the network evolution.
 - **Granularity:** Specify the aggregation granularity for the input unit.
 - **Exclude Values:** Specify one or more values to be excluded.
 - **Playback Step:** Specify a value to determine how often does the playback advance in ms.
 - **Playback Timeout:** Specify a value to determine how many steps are taken per time out during playback.
 8. Close the **Settings** dialog.

The chart displaying the evolution of the graph data gets displayed at the bottom of the graph visualization. You can view the graph animation by clicking the **Play Network Evolution** button. The animation shows the changes in the graph network over time.

The following figure shows an example for network evolution of graph data using line chart in the graph visualization panel:

Figure 23-27 Dynamic Graph Visualization

Also, you can activate and deactivate network evolution by clicking the **Activate Network Evolution** icon which is show highlighted in the preceding figure.

23.6.4 Importing and Exporting Graph Visualization Settings

You can import and export the graph visualization settings as a JSON file.

The options to import and export the settings are available on the right of the graph visualization panel:

Figure 23-28 Importing and Exporting Settings

- To import the graph visualization settings, perform the following steps:

1. Click  **Import settings**.

The **Import settings** dialog opens.

2. Choose the JSON file to be imported from your local system either by selecting the file or through drag and drop action.

Ensure that the settings in the JSON file to be imported matches the graph used in the visualization query. Also, the file must not be larger than five MB.

3. Click **Import** to import the file.

- To export the graph visualization settings, click  **Export settings**.

The settings get exported as a JSON file in your local system.

Embedding the Graph Visualization Library in a Web Application

You can integrate the graph visualization component in a web application to visualize graph data.

The Oracle Graph Server and Client deployment contains a JavaScript library for the Graph Visualization component in the `oracle-graph-visualization-library-25.3.0.zip` file.

The Graph Visualization interface in the library supports:

- Custom vertex and edge styling based on its properties
- Interactive actions for graph exploration
- Tooltip with vertex and edge details
- Automatic legend
- Multiple graph layouts
- Schema View

See the [Property Graph Visualization Developer's Guide and Reference](#) for more information.

You can download the `oracle-graph-visualization-library-25.3.0.zip` file from [Oracle Software Delivery Cloud](#) and integrate the library in you web application.

See the [demo](#) application on GitHub for an example.

Part VII

Graph Server (PGX) Advanced User Guide

Part II provides in-depth information on using the graph server (PGX) for advanced users.

Part II contains the following chapters:

- [Graph Server \(PGX\) Configuration Options](#)
Learn about the various configuration options for the graph server (PGX).
- [Memory Consumption by the Graph Server \(PGX\)](#)
The graph server (PGX) loads the graph into main memory in order to carry out analysis on the graph and its properties.
- [Deploying Oracle Graph Server Behind a Load Balancer](#)
You can deploy multiple graph servers (PGX) behind a load balancer and connect clients to the servers through the load balancer.
- [Namespaces and Sharing](#)
The graph server (PGX) supports separate namespaces that help you to organize your entities.
- [PGX Programming Guides](#)
You can avail all the PGX functionalities through asynchronous Java APIs. Each asynchronous method has a synchronous equivalent, which blocks the caller thread until the server produces a response.
- [Working with Files Using the Graph Server \(PGX\)](#)
This chapter describes in detail about working with different file formats to perform various actions like loading, storing, or exporting a graph using the Graph Server (PGX).
- [Log Management in the Graph Server \(PGX\)](#)
The graph server (PGX) internally uses the SLF4J interface with Logback as the default logger implementation.

Graph Server (PGX) Configuration Options

Learn about the various configuration options for the graph server (PGX).

- [Configuration Parameters for the Graph Server \(PGX\) Engine](#)
You can configure the graph server (PGX) engine parameters in the `/etc/oracle/graph/pgx.conf` JSON file.
- [Configuration Parameters for Connecting to the Graph Server \(PGX\)](#)
You can configure the graph server (PGX) parameters in the `/etc/oracle/graph/server.conf` JSON file.

25.1 Configuration Parameters for the Graph Server (PGX) Engine

You can configure the graph server (PGX) engine parameters in the `/etc/oracle/graph/pgx.conf` JSON file.

During startup, the graph server (PGX) picks up the settings in the `/etc/oracle/graph/pgx.conf` file, by default.

The following tables describe the different graph server (PGX) runtime configuration options.

Graph Server (PGX) Engine Parameters

The graph server (PGX) engine parameters are described in the following table:

Table 25-1 Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
<code>admin_request_cache_timeout</code>	integer	After how many seconds admin request results get removed from the cache. Requests which are not done or not yet consumed are excluded from this timeout. Note: This is only relevant if PGX is deployed as a webapp.	60
<code>allow_idle_timeout_overwrite</code>	boolean	If true, sessions can overwrite the default idle timeout.	true
<code>allow_lazy_loading_for_database_graphs</code>	boolean	If true, the graph server (PGX) will automatically load the graphs from the database when they are first referenced in the graph queries.	false
<code>allow_override_scheduling_information</code>	boolean	If true, allow all users to override scheduling information like task weight, task priority, and number of threads	true
<code>allow_task_timeout_overwrite</code>	boolean	If true, sessions can overwrite the default task timeout.	true

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
allow_user_auto_refresh	boolean	If true, users may enable auto refresh for graphs they load. If false, only graphs mentioned in <code>preload_graphs</code> can have auto refresh enabled.	false
allowed_remote_loading_locations	array of string	Allow loading graphs into the PGX engine from remote locations (http, https, ftp, ftps, s3). If empty, as by default, no remote location is allowed. If "*" is specified in the array, all remote locations are allowed. Only the value "*" is currently supported. Note that pre-loaded graphs are loaded from any location, regardless of the value of this setting. Note that this parameter reduces security and therefore use it only when needed.	[]
authorization	array of object	Mapping of users and roles to resources and permissions for authorization.	[]
authorization_session_create_allow_all	boolean	If true allow all users to create a PGX session regardless of permissions granted to them.	false
basic_scheduler_config	object	Configuration parameters for the fork join pool backend.	null
bfs_iterate_que_task_size	integer	Task size for BFS iterate QUE phase.	128
bfs_threshold_parent_read_based	number	Threshold of BFS traversal level items to switch to parent-read-based visiting strategy.	0.05
bfs_threshold_read_based	integer	Threshold of BFS traversal level items to switch to read-based visiting strategy.	1024
bfs_threshold_single_threaded	integer	Until what number of BFS traversal level items vertices are visited single-threaded.	128
character_set	string	Standard character set to use throughout PGX. UTF-8 is the default. Note: Some formats may not be compatible.	utf-8
cni_diff_factor_default	integer	Default diff factor value used in the common neighbor iterator implementations.	8
cni_small_default	integer	Default value used in the common neighbor iterator implementations, to indicate below which threshold a subarray is considered small.	128

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
<code>cni_stop_recursion_default</code>	integer	Default value used in the common neighbor iterator implementations, to indicate the minimum size where the binary search approach is applied.	96
<code>data_memory_limits</code>	object	Memory limits configuration parameters.	null
<code>dfs_threshold_large</code>	integer	Value that determines at which number of visited vertices the DFS implementation will switch to data structures that are optimized for larger numbers of vertices.	4096
<code>enable_csrf_token_checks</code>	boolean	If true, the PGX webapp will verify the Cross-Site Request Forgery (CSRF) token cookie and request parameters sent by the client exist and match. This is to prevent CSRF attacks.	true
<code>enable_gm_compiler</code>	boolean	If true, enable dynamic compilation of PGX Algorithm API (or Green-Marl code) during runtime.	true
<code>enable_graph_loading_cache</code>	boolean	If true, activate the graph loading cache that will accelerate loading of graphs that were previously loaded (can only be disabled in embedded mode).	true
<code>enable_graph_sharing</code>	boolean	Indicates if a user is allowed to grant read permission on its published graphs to other users. This flag is only relevant for a remote server.	true
<code>enable_memory_limits_checks</code>	boolean	If true the graph server will enforce the configured memory limits.	true
<code>enable_ml_accelerators</code>	boolean	If true, the graph server will utilize the available ML accelerators to run faster machine learning trainings.	true
<code>enable_shutdown_cleanup_hook</code>	boolean	If true, PGX will add a JVM shutdown hook that will automatically shutdown PGX at JVM shutdown. Notice: Having the shutdown hook deactivated and not explicitly shutting down PGX may result in pollution of your temp directory.	true
<code>enable_snapshot_properties_publish_state_propagation</code>	boolean	If true, properties in a new snapshot will inherit the publishing state of properties in the parent snapshot.	true

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
enterprise_scheduler_config	object	Configuration parameters for the enterprise scheduler. See Table 25-3 and Table 25-4 for more information.	null
enterprise_scheduler_flags	object	<i>[relevant for enterprise_scheduler]</i> Enterprise scheduler-specific settings.	null
explicit_spin_locks	boolean	true means spin explicitly in a loop until lock becomes available. false means using JDK locks which rely on the JVM to decide whether to context switch or spin. Setting this value to true usually results in better performance.	true
file_locations	array of object	The file locations that can be used in the authorization-config.	[]
graph_algorithm_language	enum[GM, JAVA]	Front-end compiler to use.	JAVA
graph_sharing_option	enum[allow_data_sharing, disallow_data_sharing, allow_traceable_data_sharing_for_same_user]	This is to manage if a graph can be published and shared with other users.	allow_data_sharing
graph_validation_level	enum[low, high]	Level of validation performed on newly loaded or created graphs.	low
ignore_incompatible_backend_operations	boolean	If true, only log when encountering incompatible operations and configuration values in RTS or FJ pool. If false, throw exceptions.	false
in_place_update_consistency_model	enum[ALLOW_INCONSISTENCIES, CANCEL_TASKS]	Consistency model used when in-place updates occur. Only relevant if in-place updates are enabled. Currently updates are only applied in place if the updates are not structural (Only modifies properties). Two models are currently implemented, one only delays new tasks when an update occurs, the other also delays running tasks.	ALLOW_INCONSISTENCIES
init_pgql_on_startup	boolean	If true PGQL is directly initialized on start-up of PGX. Otherwise, it is initialized during the first use of PGQL.	true
interval_to_poll_max	integer	Exponential backoff upper bound (in ms), which once reached, the job status polling interval is fixed	1000

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
java_home_dir	string	The path to Java's home directory. If set to <system-java-home-dir>, use the java.home system property.	<system-java-home-dir>
large_array_threshold	integer	Threshold when the size of an array is too big to use a normal Java array. This depends on the used JVM. (Defaults to Integer.MAX_VALUE - 3)	2147483644
max_active_sessions	integer	Maximum number of sessions allowed to be active at a time.	1024
max_distinct_strings_per_pool	integer	<i>[only relevant if string_pooling_strategy is indexed]</i> Number of distinct strings per property after which to stop pooling. If the limit is reached, an exception is thrown.	65536
max_http_client_request_size	long	Maximum size in bytes of any http request sent to the PGX server over the REST API. Setting it to -1 allows requests of any size.	10485760
max_off_heap_size	integer	Maximum amount of off-heap memory (in megabytes) that PGX is allowed to allocate before an OutOfMemoryError will be thrown. Note that this limit is not guaranteed to never be exceeded, because of rounding and synchronization trade-offs. It only serves as threshold when PGX starts to reject new memory allocation requests.	<available-physical-memory>
max_on_heap_memory_usage_ratio	number	Maximum ratio of on-heap memory that PGX is allowed to use, between 0 and 1.	0.9
max_queue_size_per_session	integer	The maximum number of pending tasks allowed to be in the queue, per session. If a session reaches the maximum, new incoming requests of that session get rejected. A negative value means infinity or unlimited..	-1

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
max_snapshot_count	integer	Number of snapshots that may be loaded in the engine at the same time. New snapshots can be created via auto or forced update. If the number of snapshots of a graph reaches this threshold, no more auto-updates will be performed, and a forced update will result in an exception until one or more snapshots are removed from memory. A value of zero indicates to support an unlimited amount of snapshots.	0
memory_cleanup_interval	integer	Memory cleanup interval in seconds.	5
min_array_compaction_threshold	number	Minimum value (<i>only relevant for graphs optimized for updates</i>) that can be used for the array_compaction_threshold value in graph configuration. If a graph configuration attempts to use a value lower than the one specified by min_array_compaction_threshold, it will use min_array_compaction_threshold instead.	0.2
min_fetch_interval_sec	integer	For delta-refresh (<i>only relevant if the graph format supports delta updates</i>), the lowest interval at which a graph source is queried for changes. You can tune this value to prevent PGX from hanging due to too frequent graph delta-refreshing.	2
min_update_interval_sec	integer	For auto-refresh, the lowest interval after which a new snapshot is created, either by reloading the entire graph or if the format supports delta-updates, out of the cached changes (<i>only relevant if the format supports delta updates</i>). You can tune this value to prevent PGX from hanging due to too frequent graph auto-refreshing.	2
ms_bfs_frontier_type_strategy	enum[auto_grow, short, int]	The type strategy to use for MS-BFS frontiers.	auto_grow
num_spin_locks	integer	Number of spin locks each generated app will create at instantiation. Trade-off: a small number implies less memory consumption; a large number implies faster execution (if algorithm uses spin locks).	1024

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
parallelism	integer	Number of worker threads to be used in thread pool. Note: If the caller thread is part of another thread-pool, this value is ignored and the parallelism of the parent pool is used.	<number-of-cpus>
pattern_matching_supernode_cache_threshold	integer	Minimum number of a node's neighbor to be a supernode. This is for the pattern matching engine.	1000
permission_checks_interval	integer	Interval in seconds to perform permission checks on source graphs.	60
pgx_realm	object	Configuration parameters for the realm. See Table 25-2 .	null
pgx_server_base_url	string	This is used when deploying the graph server behind a load balancer to make clients before 21.3 backward compatible. The value should be set to the load balancer address.	null
pooling_factor	number	<i>[only relevant if string_pooling_strategy is on_heap]</i> This value prevents the string pool to grow as big as the property size, which could render the pooling ineffective.	0.25
preload_graphs	array of object	List of graph configs to be registered at start-up. Each item includes path to a graph config, the name of the graph and whether it should be published.	[]
random_generator_strategy	enum[non_deterministic, deterministic]	Method of generating random numbers in PGX.	non_deterministic
random_seed	long	<i>[relevant for deterministic random number generator only]</i> Seed for the deterministic random number generator used in pgx. The default is -24466691093057031.	-24466691093057031
readiness_memory_usage_ratio	number	Memory limit ratio that should be considered to detect if PGX server is ready. This is used by isReady API and the default value is 1.0	1.0

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
release_memory_threshold	number	Threshold percentage (decimal fraction) of used memory after which the engine starts freeing unused graphs. Examples: A value of 0.0 means graphs get freed as soon as their reference count becomes zero. That is, all sessions which loaded that graph were destroyed/timed out. A value of 1.0 means graphs never get freed, and the engine will throw OutOfMemoryErrors as soon as a graph is needed which does not fit in memory anymore. A value of 0.7 means the engine keeps all graphs in memory as long as total memory consumption is below 70% of total available memory, even if there is currently no session using them. When consumption exceeds 70% and another graph needs to get loaded, unused graphs get freed until memory consumption is below 70% again.	0.0
revisit_threshold	integer	Maximum number of matched results from a node to be cached.	4096
running_memory_usage_ratio	number	Memory limit ratio that should be considered to detect if PGX server is running. This is used by isRunning API and the default value is 1.0	1.0
scheduler	enum[basic_scheduler, enterprise_scheduler, low_latency_scheduler]	<p>The scheduler to use.</p> <ul style="list-style-type: none"> • basic_scheduler: uses a scheduler with basic features • enterprise_scheduler: uses a scheduler with advanced enterprise features for running multiple tasks concurrently and providing better performance • low_latency_scheduler: uses a scheduler that privileges latency of tasks over throughput or fairness across multiple sessions. The low_latency_scheduler is only available in embedded mode. 	enterprise_scheduler
session_idle_timeout_secs	integer	Timeout of idling sessions in seconds. Zero (0) means infinity or no timeout.	14400

Table 25-1 (Cont.) Runtime Parameters for the Graph Server (PGX) Engine

Parameter	Type	Description	Default
session_task_timeout_secs	integer	Timeout in seconds to interrupt long-running tasks submitted by sessions (algorithms, I/O tasks). Zero (0) means infinity or no timeout.	0
small_task_length	integer	Task length if the total amount of work is smaller than default task length (only relevant for task-stealing strategies).	128
strict_mode	boolean	If true, exceptions are thrown and logged with ERROR level whenever the engine encounters configuration problems, such as invalid keys, mismatches, and other potential errors. If false, the engine logs problems with ERROR/WARN level (depending on severity) and makes best guesses and uses sensible defaults instead of throwing exceptions.	true
string_pooling_strategy	enum[indexed, on_heap, none]	The string pooling strategy to use.	on_heap
task_length	integer	Default task length (only relevant for task-stealing strategies). Should be between 100 and 10000. Trade-off: a small number implies more fine-grained tasks are generated, higher stealing throughput; a large number implies less memory consumption and GC activity.	4096
tmp_dir	string	Temporary directory to store compilation artifacts and other temporary data. If set to <system-tmp-dir>, uses the standard tmp directory of the underlying system (/tmp on Linux).	"/tmp"
udf_config_directory	string	Directory path containing UDF config files.	null
use_index_for_reachability_queries	enum[auto, off]	Create index for reachability queries.	auto
use_memory_mapper_for_reading_pgb	boolean	If true, use memory mapped files for reading graphs in PGB format if possible; if false, always use a stream-based implementation.	true
use_memory_mapper_for_storing_pgb	boolean	If true, use memory mapped files for storing graphs in PGB format if possible; if false, always use a stream-based implementation.	true

The default values of the runtime configuration fields are optimized to deliver the best performance across a wide set of algorithms. Depending on your workload you may be able to improve performance further by experimenting with different strategies, sizes, and thresholds.

Advanced Access Configuration

The following table lists the fields in the `pgx_realm` object that can be used to customize login behavior.

Table 25-2 Advanced Access Configuration Options

Parameters	Type	Description	Default
<code>token_expiration_seconds</code>	integer	After how many seconds the generated bearer token will expire.	3600 (1 hour)
<code>refresh_time_before_token_expiry_seconds</code>	integer	After how many seconds a token is automatically refreshed before it expires. Note that this value must always be less than the <code>token_expiration_seconds</code> value.	1800
<code>connect_timeout_milliseconds</code>	integer	After how many milliseconds an connection attempt to the specified JDBC URL will time out, resulting in the login attempt being rejected.	10000
<code>max_pool_size</code>	integer	Maximum number of JDBC connections allowed per user. If the number is reached, attempts to read from the database will fail for the current user. Starting from 23.4 onwards, a new dedicated pool with one connection is provided for token refresh. This new dedicated pool does not affect the <code>max_pool_size</code> value.	64
<code>max_num_users</code>	integer	Maximum number of active, signed in users to allow. If this number is reached, the graph server will reject login attempts.	512
<code>max_num_token_refresh</code>	integer	Maximum amount of times a token can be automatically refreshed before requiring a login again.	24

Enterprise Scheduler Parameters

The following parameters are relevant only if the advanced scheduler is used. (They are ignored if the basic scheduler is used.)

Table 25-3 Enterprise Scheduler Parameters

Parameter	Type	Description	Default
analysis_task_config	object	Configuration for analysis tasks	weight <no-of-CPU> priority MEDIUM max_threads <no-of-CPU>
fast_analysis_task_config	object	Configuration for fast analysis tasks	weight 1 priority HIGH max_threads <no-of-CPU>
max_num_concurrent_io_tasks	integer	Maximum number of concurrent I/O tasks at a time	3
num_io_threads_per_task	integer	Number of I/O threads to use per task	<no-of-cpus>

Basic Scheduler Parameters

The following parameters are relevant only if the basic scheduler is used. (They are ignored if the advanced scheduler is used.)

Table 25-4 Basic Scheduler Parameters

Field	Type	Description	Default
num_workers_analysis	integer	This specifies how many worker threads to use for analysis tasks.	<no-of-cpus>
num_workers_fast_track_analysis	integer	This specifies how many worker threads to use for fast-track analysis tasks.	1

Table 25-4 (Cont.) Basic Scheduler Parameters

Field	Type	Description	Default
num_workers_io	integer	This specifies how many worker threads to use for I/O tasks (load/refresh/write from/to disk). This value does not impact file-based loaders, as they are always single-threaded. Database loaders will open a new connection for each I/O worker.	<no-of-cpus>

Example 25-1 Minimal Graph Server (PGX) Configuration

The following example causes the graph server (PGX) to initialize its analysis thread pool with 32 workers. (Default values are used for all other parameters.)

```
{
  "enterprise_scheduler_config": {
    "analysis_task_config": {
      "max_threads": 32
    }
  }
}
```

Example 25-2 Two Pre-loaded Graphs

This example sets more fields and specifies two fixed graphs for loading into memory during the graph server (PGX) startup.

```
{
  "enterprise_scheduler_config": {
    "analysis_task_config": {
      "max_threads": 32
    },
    "fast_analysis_task_config": {
      "max_threads": 32
    }
  },
  "memory_cleanup_interval": 600,
  "max_active_sessions": 1,
  "release_memory_threshold": 0.2,
  "preload_graphs": [
    {
      "path": "graph-configs/my-graph.bin.json",
      "name": "my-graph"
    },
    {
      "path": "graph-configs/my-other-graph.adj.json",
      "name": "my-other-graph",
      "publish": false
    }
  ],
  "authorization": [{
```

```
"pgx_role": "GRAPH_DEVELOPER",
"pgx_permissions": [{
  "preloaded_graph": "my-graph",
  "grant": "read"
},
{
  "preloaded_graph": "my-other-graph",
  "grant": "read"
}]
},
....
]
```

Relative paths in parameter values are always resolved relative to the parent directory of the configuration file in which they are specified. For example, if the preceding JSON is in `/pgx/conf/pgx.conf`, then the file path `graph-configs/my-graph.bin.json` inside that file would be resolved to `/pgx/conf/graph-configs/my-graph.bin.json`.

25.2 Configuration Parameters for Connecting to the Graph Server (PGX)

You can configure the graph server (PGX) parameters in the `/etc/oracle/graph/server.conf` JSON file.

See [Configuring the Graph Server \(PGX\)](#)

Memory Consumption by the Graph Server (PGX)

The graph server (PGX) loads the graph into main memory in order to carry out analysis on the graph and its properties.

The memory consumed by the graph server for a graph is split between the memory to store the topology of the graph (the information to indicate what are the vertices and edges in the graph without their attached properties), and the memory for the properties attached to the vertices and edges. Internally, the graph server (PGX) stores the graph topology in compressed sparse row (CSR) format, a data structure which has minimal memory footprint while providing very fast read access.

- [Memory Management](#)

26.1 Memory Management

The graph server (PGX) requires both on-heap and off-heap memory to store graph data.

The allocation of memory for the graph data is as shown:

- Graph indexes and graph topology are stored off-heap.
- All primitive properties (integer, long, double, float, boolean, date, local_date, timestamp, time, point2d) are stored off-heap.
- String properties are stored on-heap.

Default Configuration of Memory Limits

You can configure both on-heap and off-heap memory limits. In case of the on-heap, if you don't explicitly set a maximum then it will default to the maximum on-heap size determined by Java Hotspot, which is based on various factors, including the total amount of physical memory available.

You can set the `max_on_heap_memory_usage_ratio` configuration field to decide on the ratio of the total JAVA heap memory that the graph server (PGX) is allowed to use (for example a value of 0.8 would mean that the graph server(PGX) is allowed to use 80% of JAVA heap memory). The default value of this parameter is 1.0 which lets the JVM handle any out of memory errors. It is recommended to set this parameter to 0.9 to avoid the graph server (PGX) from using the full on heap memory as this may cause the server to slowdown or crash.

In case of the off-heap, if you don't explicitly set a maximum then it will default to the total physical available memory on the machine.

- [Configuring On-Heap Limits](#)
- [Configuring Off-Heap Limits](#)

26.1.1 Configuring On-Heap Limits

The on-heap memory limits for the graph server (PGX) can be configured by updating the `systemd` configuration file for the PGX service. However, there is a risk of losing the updates to the configuration file, the next time you upgrade the graph server (PGX). Therefore, it is recommended that you provide the on-heap memory configuration in a drop-in file. All directives in the drop-in file are dynamically merged with the directives in the main configuration file (`/etc/systemd/system/pgx.service`) during the graph server (PGX) startup.

Note

The graph server (PGX) periodically checks the on-heap memory size. If the memory usage grows above the threshold defined in the `max_on_heap_memory_usage_ratio` field (default value is 0.9) in the `/etc/oracle/graph/pgx.conf` file, then the graph server will throw an exception and cancel the current running task (which is unable to allocate memory). This eliminates the possibility of unexpected server crashes when the heap memory is full. It is recommended that you configure the `max_on_heap_memory_usage_ratio` option to be less than one, so that the used on-heap memory value remains lesser than the JVM `-Xmx` value to ensure a safe buffer for heap memory allocation.

You can perform the following steps to create a drop-in file and configure the on-heap memory size:

1. Navigate to the `/etc/systemd/system/pgx.service.d` directory. If the `pgx.service.d` directory does not exist in the file path, then create one.
2. Create a drop-in file (`.conf` file) with any name in `/etc/systemd/system/pgx.service.d`. Skip this step, if one already exists.
3. Edit the drop-in file as a `root` user or with `sudo` command and add the on-heap memory option in the `[Service]` section as shown:

```
sudo vi /etc/systemd/system/pgx.service.d/setup.conf
```

The following example displays the added on-heap memory setting in the `setup.conf` file:

```
[Service]
# Java on-heap memory setting
Environment="JAVA_TOOL_OPTIONS=-Xms1G -Xmx2G"
```

This option sets the initial heap space to 1GB and allows it to grow up to 2GB.

The supported options for configuring the on-heap memory are:

- `-Xmx`: to set the maximum on-heap size of the JVM.
- `-Xms`: to set the initial on-heap size of the JVM.
- `-XX:NewSize`: to set the initial size of the young generation
- `-XX:MaxNewSize`: to set the maximum size of the young generation

See the `java` command [documentation](#) for more information on these options.

4. Add the `JAVA_HOME` environment variable to ensure that the graph server (PGX) is using the appropriate JDK.

```
[Service]
# JAVA_HOME variable
Environment=JAVA_HOME=/usr/java/jdk-15.0.1/
# Java on-heap memory setting
Environment="JAVA_TOOL_OPTIONS=-Xms1G -Xmx2G"
```

Note that the comments begin with `#` and you can optionally comment any specific option in order to test your configuration.

5. Reload the PGX service to use the updated settings by running the following command:

```
sudo systemctl daemon-reload
```

6. Restart the graph server (PGX):

```
sudo systemctl restart pgx
```

7. Verify that the service restarted with the new memory settings:

```
systemctl status pgx
```

You may see a similar output:

```
● pgx.service - Oracle Graph In-Memory Server
   Loaded: loaded (/etc/systemd/system/pgx.service; enabled; vendor
  preset: disabled)
   Drop-In: /etc/systemd/system/pgx.service.d
            └─setup.conf
   Active: active (running) since Wed 2023-04-12 14:50:49 CEST; 5 days ago
 Main PID: 1209 (bash)
    CGroup: /system.slice/pgx.service
            └─1209 /bin/bash start-server
              └─1469 /usr/java/jdk-11.0.6/bin/java -
Dlogback.configurationFile=/etc/oracle/graph/logback-server.xml
               -Doracle.jdbc.fanEnabled=false -cp /opt/oracle/
graph/pgx/bin/../../../../pgx/server/lib/activatio...
```

Review the **Drop-In** unit file as shown highlighted in the preceding output. This confirms that `systemd` found the drop-in file and applied the required customizations.

8. Finally, use the server-state REST endpoint to confirm the new memory usage. For example:

```
BASE_URL=https://localhost:7007
USERNAME=graph
PASSWORD=graph
PGX_RESPONSE=`curl -s -k -X POST -H 'Content-Type: application/json' -d
'{"username": "${USERNAME}", "password": "${PASSWORD}"}' $
{BASE_URL}/auth/token`
PGX_ACCESS_TOKEN=`echo $PGX_RESPONSE | jq -r '.access_token'`
curl -s -k -H 'Authorization: Bearer "${PGX_ACCESS_TOKEN}"' $BASE_URL/
control/v1/serverState|jq '.entity.memory'
```

Note that the preceding example uses the `jq` tool to fetch and format the output.

26.1.2 Configuring Off-Heap Limits

You can specify the off-heap limit by setting the `max_off_heap_size` field in the graph server (PGX) configuration. See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information on the `max_off_heap_size` parameter. Note that the off-heap limit is not guaranteed to never be exceeded because of rounding and synchronization trade-offs.

Deploying Oracle Graph Server Behind a Load Balancer

You can deploy multiple graph servers (PGX) behind a load balancer and connect clients to the servers through the load balancer.

Using Session Persistence with a Load Balancer

You can use the Load Balancer sticky cookie feature since the graph server (PGX) is not stateless. This implies that when you configure load balancer cookie stickiness, the load balancer inserts a cookie to identify the server and the client requests are always directed to the same backend server.

The graph client supports all sessions that belong to a `serverInstance` to be sent to the same server. You must set the cookie name as `PGX_INSTANCE_STICKY_COOKIE`.

You can use one of the following options to deploy different graph servers behind a load balancer:

- [Using HAProxy for PGX Load Balancing and High Availability](#)
HAProxy is a high-performance TCP/HTTP load balancer and proxy server that allows multiplexing incoming requests across multiple web servers.
- [Deploying Graph Server \(PGX\) Using OCI Load Balancer](#)
You can deploy multiple graph servers (PGX) behind a load balancer using Oracle Cloud Infrastructure (OCI) Load Balancing Service.
- [Health Check in the Load Balancer](#)

27.1 Using HAProxy for PGX Load Balancing and High Availability

HAProxy is a high-performance TCP/HTTP load balancer and proxy server that allows multiplexing incoming requests across multiple web servers.

You can use HAProxy with multiple instances of the graph server (PGX) for high availability. The following example uses the OPG4J shell to connect to PGX.

The following instructions assume you have already installed and configured the graph server (PGX), as explained in [Starting the Graph Server \(PGX\)](#).

1. If HAProxy is not already installed on Big Data Appliance or your Oracle Linux distribution, run this command:

```
yum install haproxy
```

2. Start the graph server instances.
For example, if you want to load balance PGX across 4 nodes (such as bda02, bda03, bda04, and bda05) in the Big Data Appliance, start PGX on each of these nodes. Configure PGX to listen for connections on port 7007.

3. Configure HAProxy:

- a. Locate the `haproxy.cfg` file in `/etc/haproxy` directory on the host where you installed HAProxy.
- b. Add a frontend section with the following parameters:

- **bind:** to set the listening IP address and port
- **mode:** `http` or `https`
- **default_backend:** to set the name of the backend to be used

For example, the following frontend configuration receives HTTP traffic on all IP addresses assigned to the server at port 7008:

```
frontend graph_server_front
    bind *:7008
    mode http
    default_backend graph_server
```

- c. Add a backend section with the following parameters:

- **mode:** `http` or `https`
- **cookie:** name of the cookie to be used for session persistence
- **server:** list of servers running behind the load balancer

For example, the following backend configuration uses the `PGX_INSTANCE_STICKY_COOKIE`:

```
backend graph_server
    mode http
    cookie PGX_INSTANCE_STICKY_COOKIE insert indirect nocache
    server graph_server_1 host_name_graph_server_1:port check cookie
graph_server_1 # Notice that the name at the end must be the same as
the server name
    server graph_server_2 host_name_graph_server_2:port check cookie
graph_server_2
    option httpchk GET /isReady
    http-check expect string true
```

In the preceding configuration file, the option `httpchk` clause instructs the load balancer to check the readiness of the server. The `http-check` clause specifies that the load balancer must expect a `true` response in order to determine that the server is healthy and capable of handling more requests. See [Health Check in the Load Balancer](#) for supported health check endpoints.

4. Start the load balancer.
Start HAProxy using `systemctl`:

```
sudo systemctl start haproxy
```

5. Test the load balancer.

From any host you can test connectivity to the HAProxy server by passing in the host and port of the server running HAProxy as the `base_url` parameter to the graph client shell CLI. For example:

```
cd /opt/oracle/graph
./bin/opg4j --base_url http://localhost:7008 -u <username>
```

Note

The PGX in-memory state is lost if the server goes down. HAProxy will route commands to another server, but the client must reload all graph data.

It is recommended that you run a series of PGX commands to test routing. Stop the server and restart the graph shell CLI to confirm that HAProxy redirects the request to a new server.

27.2 Deploying Graph Server (PGX) Using OCI Load Balancer

You can deploy multiple graph servers (PGX) behind a load balancer using Oracle Cloud Infrastructure (OCI) Load Balancing Service.

You can enable cookie-based session persistence with a load balancer to direct all requests from a single client to a specific backend server.

You can perform the following steps to deploy multiple graph servers using the OCI load balancer.

As a prerequisite requirement, you must ensure that two or more graph servers are running on different machines on the same port (7007 by default).

1. Sign in to OCI console using your Oracle Cloud Account.
2. Open the navigation menu, click **Networking** and then **Load Balancers**.
3. Click **Create Load Balancer**.

The **Select Load Balancer Type** window opens.

4. Select **Load Balancer** and click **Create Load Balancer**.

The **Add Details** page opens as shown:

Figure 27-1 Configuring Load Balancer Details

5. Optionally, edit the following details:
 - **Load Balancer Name**
 - **Choose visibility type**
 - **Choose IP address type**
6. Under **Choose Networking** section, select the **Virtual Cloud Network** where the graph server instances are running.
7. Accept the default values for all other fields and click **Next**.
The **Choose Backends** page opens.
8. Select **Weighted Round Robin** as the Load Balancing Policy.
9. Click **Add Backends** to add the backend servers.
The **Add Backends** slider opens as shown.

Figure 27-2 Adding Backends to Load Balancer

IP Address	Port	Weight	Offline	Backup	Drain Status	Health
100.101.188.13	7007	1	False	False	---	OK
100.101.188.42	7007	1	False	False	---	OK

10. Select as many backend graph server instances as available and click **Add Selected Backends**.
The selected backend set appear in the **Select Backend Servers** table.
11. Specify the following values for the parameters under **Specify Health Check Policy**:
 - **Protocol:** HTTP
 - **Port:** backend port used by all the graph servers
 - **Interval in milliseconds:** default value
 - **Timeout in milliseconds:** default value
 - **Number of Retries:** default value

- **Status Code:** 200
- **URL Path:** /isReady
See [Health Check in the Load Balancer](#) for supported health check endpoints.
- **Response Body RegEx:** true

12. Click **Next**.

The **Configure Listener** page opens as shown:

Figure 27-3 Configuring a Listener for the Load Balancer

13. Optionally, edit the **Listener Name**.
14. Specify **HTTPS** or **HTTP** as the type of traffic handled by the listener.
15. Specify the listener port value to either **443** or **80**.
16. Upload **SSL Certificate** if you specified **HTTPS** communication.
17. Click **Next**.

The **Manage Logging** page opens as shown.

18. Accept all the default values on this page and click **Submit**.

The load balancer is provisioned and it appears on the table in the **Load Balancers** page.

19. Click on the provisioned load balancer to view the **Load Balancer Details**.
20. Click **Backend Sets** under **Resources**.
21. Click the backend set you want to edit.

The **Backend Set Details** page opens.

22. Click **Edit**.

The **Edit Backend Set** dialog opens as shown:

Figure 27-4 Enabling Session Persistence

Load Balancer: [graphserver_loadbalancer](#)
% of Backend Set Drained: 0%

Session Persistence

To enable cookie-based session persistence, specify whether the cookie is generated by your application server or by the load balancer. Learn more about [session persistence](#).

☐ Disable Session Persistence
☐ Enable application cookie persistence
☒ Enable load balancer cookie persistence

Cookie Name *Optional*

PGX_INSTANCE_STICKY_COOKIE

If blank, the default cookie name is X-Oracle-BMC-LBS-Route.

☐ Disable Fallback
Disable fallback to other servers when the original server is unavailable.

Domain Name *Optional*

Specify the domain in which the cookie is valid.

Date *Optional*

Save Changes Cancel

23. Select **Enable load balancer cookie persistence**.
24. Set the **Cookie Name** to PGX_INSTANCE_STICKY_COOKIE and click **Save Changes**.

Your work request gets submitted.

You can now send requests to the load balancer and your session will be persisted on the respective server to which you are logged in.

27.3 Health Check in the Load Balancer

To configure health check in the load balancer, the graph server(PGX) exposes the `isReady` and `isRunning` endpoints.

Note

By default, the `isReady` and `isRunning` endpoints are unprotected. See [Public Health Endpoint Security](#) to enable protection for the health check API.

The load balancer can check the following health status of the graph servers:

- **Readiness of the graph server:** The `isReady` endpoint detects if the graph server (PGX) is capable of handling more requests. See the `readiness_memory_usage_ratio` system parameter in [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more details.

- **Liveness of the graph server:** The `isRunning` endpoint detects if the graph server (PGX) is running and alive. See the `running_memory_usage_ratio` system parameter in [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more details.

By default, both the endpoints do not require authentication. If the server is running or ready, they return `true` in the HTTP body with HTTP status code 200. If the server is **not** running or ready, they return `false` with HTTP status code 503.

28

Namespaces and Sharing

The graph server (PGX) supports separate namespaces that help you to organize your entities.

Each client session has its own session-private namespace and can choose any name without affecting other sessions. There is also a public namespace for published graphs (for example, published via the [publishWithSnapshots\(\)](#) or the [publish\(\)](#) methods).

Similarly, each published graph defines a public namespace for published properties as well as a private namespace per session. So different sessions can create properties with the same name on a published graph.

- [Defining Graph Names](#)
- [Retrieving Graphs by Name](#)
- [Checking Used Names](#)
- [Property Name Resolution and Graph Mutations](#)

28.1 Defining Graph Names

Graphs that are created in a session either through loading or through mutations will take up a name in the session-private namespace. A graph will be placed in the public namespace only through publishing (that is, when calling the [publishWithSnapshots\(\)](#) or the [publish\(\)](#) methods). Publishing a graph will move its name from the session-private namespace to the public namespace.

There can only be one graph with a given name in a given namespace, but a name can be used in different namespaces to refer to different graphs. An operation that creates a new graph will fail if the chosen name of the new graph already exists in the session-private namespace. Publishing a graph fails if there is already a graph in the public namespace with the same name.

28.2 Retrieving Graphs by Name

You can retrieve a graph by name by the following two ways:

- [getGraph\(Namespace, String\)](#): with explicitly mentioning the namespace
- [getGraph\(String\)](#): without explicitly mentioning the namespace

With [getGraph\(Namespace, String\)](#), you need to provide the namespace (either session private or public). In this case, the graph will be looked up in the given namespace only.

With [getGraph\(String\)](#), the provided name will be first looked up in the private namespace. If no graph with the given name is found there, then the graph name will be looked up in the public namespace. In other words, if a graph with the same name is defined in both the public and the private namespaces, [getGraph\(String\)](#) will return the private graph and you need to use [getGraph\(Namespace, String\)](#) to get hold of the public graph with that name.

28.3 Checking Used Names

To see the currently used names in a namespace you can use the [PgxFSession.getGraphs\(Namespace\)](#) method, which will list all the names in the given namespace. The names in the returned collection can be used in a [getGraph\(Namespace, String\)](#) call to retrieve the corresponding `PgxGraph`.

28.4 Property Name Resolution and Graph Mutations

Property names behave in a similar way as graph names. All property names of a non-published graph are in the session-private namespace. Once a graph is published with [PgxFGraph.publishWithSnapshots\(\)](#) or the [PgxFGraph.publish\(\)](#) methods, its properties are published as well and their names move into the public namespace.

Once a graph is published, newly created properties will still be private to the session and their names will be in the private namespace. Those properties can be published individually with the [Property.publish\(\)](#) method, as long as no other property with the same name is already published for that graph.

Additionally, new private properties can be created with the same name of an already-published properties (since the names are part of separate namespaces). To handle such situations and retrieve the correct property, the PGX API offers the [getVertexProperty\(Namespace, String\)](#) and the [getEdgeProperty\(Namespace, String\)](#) methods, which allow specifying the namespace where the property name should be looked up.

Similar to graphs, if you search a property without specifying the namespace, the private namespace is searched first and if the property is not found, the search proceeds to the public namespace. This case applies for [getVertexProperty\(String\)](#) or the [getEdgeProperty\(String\)](#) methods and for PGQL queries.

Likewise, when a mutation on a graph reads or writes a property referred to by name and two properties exist with the same name, the property in the private namespace is selected. To override the default selection, some mutation mechanisms accept a collection of specific [Property](#) objects to be copied into the mutated graph.

PGX Programming Guides

You can avail all the PGX functionalities through asynchronous Java APIs. Each asynchronous method has a synchronous equivalent, which blocks the caller thread until the server produces a response.

These APIs may perform one or any combination of:

- Complex, non-blocking Java applications on top of PGX
- Simple, sequential Java scripts executed by JShell
- ShellPerforming interactive graph analysis in the JShell

Layers of PGX API

The PGX API is composed of a few different Java interfaces. Each interface provides a distinct layer of abstraction for PGX, as shown in the following table:

Table 29-1 PGX API Interface

Interface	Description
ServerInstance	The <code>ServerInstance</code> class encapsulates access to a PGX server instance and can be used to create sessions, start and stop the PGX engine, monitor the engine status and perform other administrative tasks. If the instance points to a remote instance, access to the administrative functions requires special authorization on the HTTP level by default.
PgxSession	A <code>PgxSession</code> represents an active user currently connected to an instance. Each session gets its own workspace on the server side which can be used to read graphs, create in-memory data structures, hold analysis results and custom algorithms. The <code>PgxSession</code> class provides various methods to create new transient data (currently collections). If a session is idling for too long, the PGX engine will automatically destroy it to ensure no resources are wasted.
PgxGraph	A <code>PgxGraph</code> represents a client-side handle to the graph data managed by the graph server (PGX). A graph may contain an arbitrary amount of properties of type <code>VertexProperty</code> and/or <code>EdgeProperty</code> . <code>PgxGraph</code> class provides various methods to create new transient data (including maps and collections) as well as graph mutation operations, such as undirecting, sorting and filtering.
Analyst	The <code>Analyst</code> API contains all of the built-in algorithms PGX provides. <code>Analyst</code> objects keep track of all the transient data they created during algorithm invocations to hold analysis results. Once an <code>Analyst</code> gets destroyed, all the results it created get freed on the server-side automatically.
CompiledProgram	The <code>CompiledProgram</code> class (PGX Algorithm API) encapsulates runtime-compiled custom algorithms and allows invocation of those algorithms using PGX data objects, such as <code>PgxGraph</code> or <code>VertexProperty</code> , as arguments.

Please see the [oracle.pgx.api](#) package in the Javadoc for more details.

29.1 Design of the Graph Server (PGX) API

This guide focuses on the design of the graph server (PGX) API.

The design of the PGX API reflects consideration of the following situations:

- Multiple clients may concurrently be accessing a single running instance of PGX, sharing its resources. Each client needs to maintain its own isolated workspace (session).
- Graph and property data can be large in size and therefore that data only resides on the server side.
- Some graph analysis may take a significant amount of time.
- Clients may not reside in the same address space (JVM) as PGX. Actually, clients may not even be Java applications.

Client Sessions

In PGX, each client maintains its own session, an isolated, private workspace. Therefore, clients first have to obtain a `PgxSession` object from a PGX `ServerInstance` before they can perform any analysis.

Asynchronous Execution

The PGX API is designed for asynchronous execution. That means that each computationally intensive method in the PGX API *immediately* returns a `PgxFuture` object without waiting for the request to finish. The `PgxFuture` class implements the [Future](#) interface, which can be used to retrieve the result of a computation at some point in the future.

Note

The asynchronous execution aspect of this design facilitates multiple (remote) clients submitting requests to a single server. A request from one client may be queued up to wait until PGX resources become available. The asynchronous API allows the client (or calling thread) to work on other tasks until PGX completes the request.

No Direct References

The PGX API does not return objects with direct reference to PGX internal objects (such as the graph or its properties) to the client. This is because:

- The client might not be in the same JVM as the server
- The graph instance might be shared by multiple clients

Instead, the PGX API only returns lightweight, stateless pointer objects to those objects. These pointer objects only holds the `ID(name)` of the server-side object to which they are pointing.

Resource Management Considerations

The graph server (PGX), being an *in-memory* analytic engine, might allocate large amounts of memory to hold the graph data of clients. Therefore, it is important that client sessions clean up their resources once they have ended. The PGX API supports several features to make this easier:

- Every object returned by the PGX API pointing to a server-side resource implements the `Destroyable` interface, which means all memory-consuming client-side objects can be destroyed the same way. For example:

```
PgxGraph myGraph = ...
myGraph.destroyAsync(); // request destruction of myGraph, don't wait for
response
try {
    myGraph.destroy(); // blocks caller thread until destruction was done
} catch (ExecutionException e) {
    // destruction failed
}
```

- `Destroyable` extends [AutoClosable](#), so users can leverage Java's built-in resource management syntax:

```
try (PgxGraph myGraph = session.readGraphWithProperties(config)) {  
    // do something with myGraph  
}  
// myGraph is destroyed
```

- **Session time out.** In some cases, the PGX server will remove the session and all its data automatically. This can occur when a client fails to destroy either the data or its session, or if it does not hear from the session after a configurable timeout. See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information to configure timeout parameters.

29.2 Data Types and Collections in the Graph Server (PGX)

This guide provides you the list of the supported data types and collections in the graph server (PGX).

Primitive Data Types

The following section explains the primitive data types supported by the graph server (PGX) and their limitations.

PGX supports the following primitive data types.:

- **Numeric Types:** `integer`, `long`, `float`, and `double`. These types have the same size, range and precision of the corresponding Java primitive data type.
- **Boolean Type:** The `boolean` data type has only two possible values, `true` and `false`. As with Java and C++, its size is not precisely defined.
- **String:** `String` is a primitive data type in PGX. PGX follows the Java conventions for `String` representation.
- **Datetime Types:** `date`, `time`, `timestamp`, `time with time zone`, and `timestamp with time zone`. These types correspond to the Java types shown in [Table 29-2](#) from the standard library package `java.util.time`.
- **Vertex and Edge:** The type `vertex` or `edge` of the graph itself is a proper type in PGX.

Note

- `vertex` and `edge` is itself a valid primitive data type. For instance, in a path-finding algorithm, each `vertex` can have a temporary property `predecessor` that stores which incoming neighbor is the predecessor vertex in the path. Such a property would have the type `vertex`.
- `local_date` must be used instead of `date` in the graph configuration file. See [Using Datetime Data Types](#) for more examples on usage of datetime data types.

All properties and scalar variables must be one of the above preceding data types. See [Managing Transient Data](#) for more information on handling transient properties and scalar variables.

The following table presents the overview of the supported data types, their integration in different languages and APIs and their minimum and maximum value limitations.

① Note

- For float and double types, the smallest absolute value is included in the table, the minimum value is the negative of maximum value for these types.
- For string values, PGX supports arbitrary long strings.

Table 29-2 Overview of Data types

Data Type	Loading & Storing	PGX Java API	PGQL and Filter Expression	Minimum Value Limitation	Maximum Value Limitation
string	string	String	STRING	-	-
int/integer	int/integer	int	INT/INTEGER	-2147483648	2147483647
long	long	long	LONG	-9223372036854775808	9223372036854775807
float	float	float	FLOAT	1.4E-45	3.4028235e+38
double	double	double	DOUBLE	4.9E-324	1.7976931348623157E308
boolean	boolean	boolean	BOOLEAN	-	-
date	local_date	LocalDate	DATE	-5877641-06-23	5881580-07-11
time	time	LocalTime	TIME	00:00:00.000	23:59:59.999
timestamp	timestamp	LocalDateTime	TIMESTAMP	-292275055-05-17 00:00:00.000	292278994-08-17 07:12:55.807
time with time zone	time_with_timezone	OffsetTime	TIME WITH TIME ZONE	00:00:00.000+18:00	23:59:59.999-18:00
timestamp with time zone	timestamp_with_timezone	OffsetDateTime	TIMESTAMP WITH TIME ZONE	-292275055-05-17 00:00:00.000+18:00	292278994-08-17 07:12:55.807-18:00
vertex	-	PgxVertex	-	-	-
edge	-	PgxEdge	-	-	-

Collections

The graph server (PGX) supports three different collection types: `sequence`, `set` and `order`. All of these collections can contain values of the `vertex` type, but each has different semantics regarding uniqueness and preserving the order of its elements:

- **Sequence:** a `sequence` works basically like a list. It preserves the order of the elements added to it, and the same element can appear multiple times.
- **Set:** a `set` can contain the same value once at the most. Adding a value that is already in the `set` will have no effect. `set` does not preserve the order of the elements it contains.
- **Order:** just like the `set`, the `order` collection will contain each element once at the most. But the `order` preserves the order of the elements inserted into it (that is, it is a FIFO data structure).

See [Collection Data Types](#) for examples on creation and usage of the different collections.

Immutable Collections

Some operations, like `PgxGraph.getVertices()` and `PgxGraph.getEdges()` return immutable collections. These collections behave like normal collections, but cannot be modified by operations like `addAll` or `removeAll` and `clear`.

An immutable collection can be transformed into a mutable collection by using the `toMutable` method, which returns a mutable copy of the collection. If `toMutable` is called on a collection that is already mutable, the method has the same result as the method `clone`.

To check if a collection is mutable, use the `isMutable` method.

Maps

PGX provides the following two kinds of maps:

- Graph-bound maps can hold mappings between types in `PropertyType`. This is the kind of maps to use if the key or value types are graph-related like `VERTEX` and `EDGE` otherwise using session-bound maps is recommended.
- Session-bound maps can map between non graph-related types and are directly bound to the session.

See [Map Data Types](#) for examples on creation and usage of maps.

- [Using Collections and Maps](#)
- [Using Datetime Data Types](#)

29.2.1 Using Collections and Maps

This section explains with examples, the creation and usages of collections and maps.

You must first create a session before getting started with the collection and map data types.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j> // starting the shell will create an implicit session
```

Java

```
import oracle.pgx.api.*;  
...  
PgxSession session=Pgx.createSession("<session_name>");
```

Python

```
from pypgx import get_session
session = get_session(session_name="<session_name>")
```

-
- [Collection Data Types](#)
 - [Map Data Types](#)

29.2.1.1 Collection Data Types

The graph server (PGX) defines two types of collections:

- **Graph-bound collections:** such as vertex and edge collections. These collections belong to the graph.
- **Session-bound collections:** belong to the session.
- [Graph-Bound Collections](#)
- [Session-Bound Collections](#)

29.2.1.1.1 Graph-Bound Collections

The following describes the usage of graph-bound collections.

You must first load the graph to work with vertex and edge collections as shown in [Reading Graphs from Oracle Database into the Graph Server \(PGX\)](#).

Vertex Collections

You can create a vertex collection as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
v0 = graph.getVertex(100) // 'graph' is the loaded graph object. '100' ->
'103' are vertex ids that supposedly
v1 = graph.getVertex(101) // exist in the graph
v2 = graph.getVertex(102)
v3 = graph.getVertex(103)

myVertexSet = graph.createVertexSet("myVertexSet") // A name is
automatically generated if none given
myVertexSet.add(v0) // Adds vertex 'v0' to
the set
```

```
myVertexSet.addAll([v1, v2, v3])           // Supports variadic  
parameter as well: myVertexSet.addAll(v1, v2, v3)
```

Java

```
import java.util.Arrays;  
import oracle.pgx.api.*;  
...  
PgxVertex v0 = graph.getVertex(100);  
PgxVertex v1 = graph.getVertex(101);  
PgxVertex v2 = graph.getVertex(102);  
PgxVertex v3 = graph.getVertex(103);  
  
VertexSet myVertexSet = graph.createVertexSet("myVertexSet"); // A name is  
automatically generated if none given  
myVertexSet.add(v0);  
myVertexSet.addAll(Arrays.asList(v1, v2, v3));
```

Python

```
...  
v0 = graph.get_vertex(100)  
v1 = graph.get_vertex(101)  
v2 = graph.get_vertex(102)  
v3 = graph.get_vertex(103)  
  
my_vertex_set = graph.create_vertex_set("myVertexSet")  
my_vertex_set.add(v0)  
my_vertex_set.add_all([v1,v2,v3])
```

Edge Collections

You can create an edge collection as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
e0 = graph.getEdge(100) // 'graph' is the loaded graph object. '100' -> '103'  
are edge ids that supposedly  
e1 = graph.getEdge(101) // exist in the graph  
e2 = graph.getEdge(102)  
e3 = graph.getEdge(103)
```

```
myEdgeSequence = graph.createEdgeSequence("myEdgeSequence")
myEdgeSequence.add(e0)
myEdgeSequence.addAll([e1, e2, e3])
```

Java

```
import java.util.Arrays;
import oracle.pgx.api.*;
...
PgxEde e0 = graph.getEdge(100);
PgxEde e1 = graph.getEdge(101);
PgxEde e2 = graph.getEdge(102);
PgxEde e3 = graph.getEdge(103);

EdgeSequence myEdgeSequence = graph.createEdgeSequence("myEdgeSequence");
myEdgeSequence.add(e0);
myEdgeSequence.addAll(Arrays.asList(e1, e2, e3));
```

Python

```
e0 = graph.get_edge(100)
e1 = graph.get_edge(101)
e2 = graph.get_edge(102)
e3 = graph.get_edge(103)

my_edge_sequence = graph.create_edge_sequence("my_edge_sequence")
my_edge_sequence.add(e0)
my_edge_sequence.add_all([e1, e2, e3])
```

29.2.1.1.2 Session-Bound Collections

You can create and manipulate collections directly in the session without the need for a graph. Session-bound collections can be further passed as parameters to graph algorithms or used like any other collection object. The following sub-sections describe the currently supported types for these collections.

Scalar Collections

Scalar collections contain simple data types like Integer, Long, Float, Double and Boolean. They can be managed by the `PgxSession` APIs:

Creation of a Scalar Collection

You can use `createSet()` and `createSequence()` methods to create a scalar collection as shown in the following code:

-
- [JShell](#)
 - [Java](#)

JShell

```
myIntSet = session.createSet(PropertyType.INTEGER, "myIntSet")
myDoubleSequence = session.createSequence(PropertyType.DOUBLE) // A name
will be automatically generated if none is provided.
println myDoubleSequence.getName() // Display
the generated name.
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.common.types.*;
...
ScalarSet myIntSet = session.createSet(PropertyType.INTEGER, "myIntSet");
ScalarSequence myDoubleSequence = session.createSequence(PropertyType.DOUBLE);
System.out.println(myDoubleSequence.getName());
```

Run Operations on a Scalar Collection

You can run several operations on a scalar collection as shown in the following code:

- [JShell](#)
- [Java](#)

JShell

```
myIntSet.add(10)
myIntSet.addAll([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
myIntSet.addAll([0,1,2]) // Element uniqueness. This operation
has no effect on the set.
println myIntSet

myIntSet.contains(1) // Checks the presence of an element.
This code returns `true`.
myIntSet.remove(10)
myIntSet.removeAll([4, 5, 6, 7, 8, 9]) // Leaves only elements `0, 1, 2, 3`.
println myIntSet
```

Java

```
import java.util.Arrays;
import oracle.pgx.api.*;
...
myIntSet.add(10);
myIntSet.addAll(Arrays.asList(0, 1, 2, 3, 4, 5, 6, 7, 8, 9));
myIntSet.addAll(Arrays.asList(0, 1, 2));

myIntSet.contains(1); // Returns `true`.
```

```
myIntSet.remove(10);  
myIntSet.removeAll(Arrays.asList(4, 5, 6, 7, 8, 9));
```

Traversal of a Scalar Collection

You can traverse a scalar collection either using an iterator or using the new [Stream](#) API. You can add elements of a sequence to a set, traverse a sequence and filter out elements not required, and then add the rest to another scalar collection.

-
- [JShell](#)
 - [Java](#)

JShell

```
myIntSet.forEach({x -> print x + "\n"})  
myIntSet.stream().filter({x -> x % 2 == 0}).forEach({x ->  
myDoubleSequence.add(x)})  
println myDoubleSequence
```

Java

```
import java.util.Iterator;  
import java.util.stream.Stream;  
import oracle.pgx.api.*;  
...  
myIntSet.forEach(x -> System.out.println(x));  
myIntSet.stream().filter(x -> x % 2 == 0).forEach(myDoubleSequence::add);
```

29.2.1.2 Map Data Types

The graph server (PGX) defines two types of maps:

- **Graph-bound maps:** These maps support any key or value type and are created using a graph object.
- **Session-bound maps:** Keys or values in these maps are of any type except from graph-related types (that is, vertices or edges). These maps belong to the session.
- [Graph-Bound Maps](#)
- [Session-Bound Maps](#)

29.2.1.2.1 Graph-Bound Maps

Some data types like `VERTEX` or `EDGE` depend on the graph. Consequently, mappings involving these data types also depend on the graph. PGX provides `PgxGraph` and `PgxMap` APIs to manage such maps.

The following describes the usage of graph-bound maps.

You must first load the graph to work with vertex and edge maps.

You can create a graph-bound map using vertices as keys as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
v0 = graph.getVertex(100)
v1 = graph.getVertex(101)
v2 = graph.getVertex(102)
v3 = graph.getVertex(103)

vertexToLongMap = graph.createMap(PropertyType.VERTEX, PropertyType.LONG,
"vertexToLongMap")
vertexToLongMap.put(v0, v0.getDegreeAsync().get())
vertexToLongMap.put(v1, v1.getDegreeAsync().get())
vertexToLongMap.put(v2, v2.getDegreeAsync().get())
vertexToLongMap.put(v3, v3.getDegreeAsync().get())
```

Java

```
import java.util.Arrays;
import oracle.pgx.api.*;
...
PgxVertex v0 = graph.getVertex(100);
PgxVertex v1 = graph.getVertex(101);
PgxVertex v2 = graph.getVertex(102);
PgxVertex v3 = graph.getVertex(103);

PgxMap<PgxVertex, Long> vertexToLongMap =
graph.createMap(PropertyType.VERTEX, PropertyType.LONG, "vertexToLongMap");
vertexToLongMap.put(v0, v0.getDegree());
vertexToLongMap.put(v1, v1.getDegree());
vertexToLongMap.put(v2, v2.getDegree());
vertexToLongMap.put(v3, v3.getDegree());
```

Python

```
v0 = graph.get_vertex(100)
v1 = graph.get_vertex(101)
v2 = graph.get_vertex(102)
v3 = graph.get_vertex(103)

vertex_to_long_map = graph.create_map("vertex", "long", "vertex_to_long_map")
```

```
vertex_to_long_map.put(v0, v0.degree)
vertex_to_long_map.put(v1, v1.degree)
vertex_to_long_map.put(v2, v2.degree)
vertex_to_long_map.put(v3, v3.degree)
```

You can create graph-bound maps using edges as keys as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
e0 = graph.getEdge(100)
e1 = graph.getEdge(101)
e2 = graph.getEdge(102)
e3 = graph.getEdge(103)

edgeToVertexMap = graph.createMap(PropertyType.EDGE, PropertyType.VERTEX,
"edgeToVertexMap")
edgeToVertexMap.put(e0, e0.getSource())
edgeToVertexMap.put(e1, e1.getSource())
edgeToVertexMap.put(e2, e2.getSource())
edgeToVertexMap.put(e3, e3.getSource())
```

Java

```
import java.util.Arrays;
import oracle.pgx.api.*;
...
PgxEde e0 = graph.getEdge(100);
PgxEde e1 = graph.getEdge(101);
PgxEde e2 = graph.getEdge(102);
PgxEde e3 = graph.getEdge(103);

PgxMap<PgxEde, PgxVertex> edgeToVertexMap =
graph.createMap(PropertyType.EDGE, PropertyType.VERTEX, "edgeToVertexMap");
edgeToVertexMap.put(e0, e0.getSource());
edgeToVertexMap.put(e1, e1.getSource());
edgeToVertexMap.put(e2, e2.getSource());
edgeToVertexMap.put(e3, e3.getSource());
```

Python

```
e0 = graph.get_edge(100)
e1 = graph.get_edge(101)
e2 = graph.get_edge(102)
```

```
e3 = graph.get_edge(103)

edge_to_long_map = graph.create_map("edge", "long", "edge_to_long_map")
edge_to_long_map.put(e0, e0.source)
edge_to_long_map.put(e1, e1.source)
edge_to_long_map.put(e2, e2.source)
edge_to_long_map.put(e3, e3.source)
```

① Note

If you destroy the graph you will lose the map. Consider using a session-bound maps instead if your map does not involve any graph-related key or value type.

29.2.1.2.2 Session-Bound Maps

You can directly create maps in the session. But, you cannot use any graph-related data type as the map key or value type. Session-bound maps can be further passed as parameters to graph algorithms or used like any other map object. They are managed by `PgxSession` and `PgxMaps` APIs.

Scalar collections contain simple data types like `Integer`, `Long`, `Float`, `Double` and `Boolean`. They can be managed by the `PgxSession` APIs.

Creation of a Session-bound Map

You can use `createMap()` method and its overloads to create a session-bound map.

- [JShell](#)
- [Java](#)

JShell

```
intToDouble = session.createMap(PropertyType.INTEGER, PropertyType.DOUBLE,
    "intToDouble")
intToTime = session.createMap(PropertyType.INTEGER, PropertyType.TIME) // A
name will be automatically generated.
println intToTime.getName()
println intToTime.getSessionId()
println intToTime.getGraph() //
`null`: Not bound to a graph.
println intToTime.getKeyType()
println intToTime.getValueType()
```

Java

```
import java.time.LocalDateTime;
import oracle.pgx.api.*;
import oracle.pgx.common.types.*;
```

```

...
PgxMap<Integer, Double> intToDouble = session.createMap(PropertyType.INTEGER,
PropertyType.DOUBLE, "intToDouble");
PgxMap<Integer, LocalTime> intToTime =
session.createSequence(PropertyType.INTEGER, PropertyType.TIME);
System.out.println(intToTime.getName());
System.out.println(intToTime.getSessionId());
System.out.println(intToTime.getGraph()); // `null`: Not bound to a graph.
System.out.println(intToTime.getKeyType());
System.out.println(intToTime.getValueType());

```

Run Operations on a Session-bound Map

You can run important operations such as setting, removing and checking existence of entries on a session-bound map as shown in the following code:

-
- [JShell](#)
 - [Java](#)

JShell

```

intToDouble.put(0, 0.314)
intToDouble.put(1, 3.14)
intToDouble.put(2, 31.4)
intToDouble.put(3, 314)

println intToDouble.size()           // 4
println intToDouble.get(1)
println intToDouble.get(3)
println intToDouble.get(10)         // null

println intToDouble.containsKey(0)  // `true`
intToDouble.remove(0)
println intToDouble.containsKey(0)  // `false`
println intToDouble.containsKey(10) // `false`
intToDouble.remove(10)
println intToDouble.containsKey(10) // `false`

println intToDouble.put(1, 999)      // previous mapped value (`3.14`) is
replaced by `999`
intToDouble.destroy()

```

Java

```

import java.util.Arrays;
import oracle.pgx.api.*;

...

```

```
intToDouble.put(0, 0.314);
intToDouble.put(1, 3.14);
intToDouble.put(2, 31.4);
intToDouble.put(3, 314);

System.out.println(intToDouble.size());           // 4
System.out.println(intToDouble.get(1));
System.out.println(intToDouble.get(3));
System.out.println(intToDouble.get(10));          // null

System.out.println(intToDouble.containsKey(0));   // `true`
intToDouble.remove(0);
System.out.println(intToDouble.containsKey(0));   // `false`
System.out.println(intToDouble.containsKey(10));  // `false`
intToDouble.remove(10);
System.out.println(intToDouble.containsKey(10));  // `false`

System.out.println(intToDouble.put(1, 999));      // previous mapped value
(`3.14`) is replaced by `999`
intToDouble.destroy();
```

Traversal of a Session-bound Map

You can traverse a session-bound map, using `entries()` method to get an iterable of map entries and `keys()` method to get an iterable of map keys.

-
- [JShell](#)
 - [Java](#)

JShell

```
intToDouble.entries().forEach {it -> println (it)}
intToDouble.keys().forEach {it -> println (it)}
```

Java

```
import java.util.Iterable;
import java.util.stream.Stream;
import oracle.pgx.api.*;
...
Iterable<Map.Entry> entries = intToDouble.entries();
entries.forEach(System.out::println);
Iterable<Map.Entry> keys = intToDouble.keys();
keys.forEach(System.out::println);
```

29.2.2 Using Datetime Data Types

This section explains in detail working of datetime data types such as date, time and timestamp.

Overview of Datetime Data Types in Graph Server (PGX)

[Table 29-3](#) presents the overview of the five datetime data types supported by PGX along with example values.

Note

PGX also supports custom format specification when loading data into PGX.

Table 29-3 Overview of Datetime Data Types in PGX

Data Type	Loading and Storing	PGX Java API	PGQL and Filter Expression	Example Value-1	Example Value-1
date	local_date	LocalDate	DATE	2001-01-29	2018-10-08
time	time	LocalTime	TIME	10:15	10:30:01.000
timestamp	timestamp	LocalDateTime	TIMESTAMP	2001-01-29 10:15	2018-10-08 10:30:01.000
time with time zone	time_with_timezone	OffsetTime	TIME WITH TIME ZONE	10:15+01:00	10:30:01.000-08:00
timestamp with time zone	timestamp_with_timezone	OffsetDateTime	TIMESTAMP WITH TIME ZONE	2001-01-29 10:15+01:00	2018-10-08 10:30:01.000-08:00

- [Loading Datetime Data](#)
- [Specifying Custom Datetime Formats](#)
- [APIs for Accessing Datetime Data](#)
- [Querying Datetime Data Using PGQL](#)
- [Accessing Datetimes from PGQL Result Sets](#)

29.2.2.1 Loading Datetime Data

You must first load a graph to work with datetime data. See [Reading Graphs from Oracle Database into the Graph Server \(PGX\)](#) for more information on graph loading.

The following example shows how to load a graph that has three vertices representing persons and zero edges.

Example 29-1 Loading Datetime Data

1. Create an EDGE_LIST file `persons.edge_list` as shown:

```
1*Judy,1989-01-15,1989-01-15 10:15-08:00
2*Klara,2001-01-29,2001-01-29 21:30-08:00
3*Pete,1995-08-01,1995-08-01 03:00-08:00
```

2. Create a corresponding graph configuration file `persons.edge_list.json` as shown:

```
{
  "format": "edge_list",
  "uri": "persons.edge_list",
  "vertex_id_type": "long",
  "vertex_props": [
    {
      "name": "name",
      "type": "string"
    },
    {
      "name": "date_of_birth",
      "type": "local_date"
    },
    {
      "name": "timestamp_of_birth",
      "type": "timestamp_with_timezone",
      "format": ["yyyy-MM-dd H[H]:m[m]:s[s]][XXX]"
    }
  ],
  "edge_props": [
  ],
  "separator": ", "
}
```

3. You can now load the data as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var graph = session.readGraphWithProperties("persons.edge_list.json",
"people_graph")
```

Java

```
import oracle.pgx.api.*;
...
PgxGraph graph =
session.readGraphWithProperties("persons.edge_list.json", "people_graph");
```

Python

```
graph =
session.read_graph_with_properties("persons.edge_list.json", graph_name="people
_graph")
```

29.2.2.2 Specifying Custom Datetime Formats

You can also manually specify the datetime format(s) of your data.

By default, PGX tries to parse datetime values using a set of predefined formats. If this fails, an exception like the following is thrown:

```
property timestamp_of_birth: could not parse value at line 1 for property of
temporal type OffsetDateTime using any of the given formats
```

In such a case, you can custom format the datetime data.

There are two ways of specifying datetime formats:

- on a *per-property* basis
- on a *per-type* basis

Property-Specific Datetime format:

You can custom format the property `timestamp_of_birth` used in [Example 29-1](#) to the format `yyyy-MM-dd H[H]:m[m][:s[s]][XXX]` as shown:

Example 29-2 Specifying Property-Specific Datetime format:

```
{
  "name": "timestamp_of_birth",
  "type": "timestamp_with_timezone",
  "format": [ "yyyy-MM-dd H[H]:m[m][:s[s]][XXX]" ]
}
```

where `yyyy-MM-dd H[H]:m[m][:s[s]][XXX]` specifies that the timestamp values consist of:

- a four-digit year
- a hyphen followed by a two-digit month
- a hyphen followed by a two-digit day
- a space
- an hour, specified as either one or two digits
- a colon followed by a minute, specified as either one or two digits
- an *optional* part that consists of a colon followed by a second that is specified as either one or two digits
- an *optional* timezone

Note

- `H[H]:m[m]` allows the value `01:15` as well as the value `1:15`.
- `yyyy-MM-dd` allows the value `1989-01-15` but not the value `1989-1-15`. However, if two-digit months and days are needed, a format like `yyyy-M[M]-d[d]` can be used.

Also the format specification takes a *list* of formats. In the preceding example, the list contains only a single format, but you may specify any number of formats. If more than one format is specified, then when parsing the datetime data, the formats are tried from left to right until parsing succeeds. In this way, you can even load data that contains a mixture of values in different formats.

Type-Specific Datetime format:

You can also specify datetime formats on a *per-type* basis. This is useful in cases when there are multiple properties that have the same type as well as the same format because you will only need to specify the datetime format only once.

In case of the per-type specification, the format is used for each vertex or edge property that has the particular type.

The following example shows two type-specific formats (`local_date_format` and `timestamp_with_timezone_format`):

Example 29-3 Specifying Type-Specific Datetime format:

```
...
    "edge_props": [
    ],
    "separator": ",",
    "local_date_format": ["yyyy-MM-dd"],
    "timestamp_with_timezone_format": ["yyyy-MM-dd H[H]:m[m][:s[s]][XXX]"]
}
```

In the example, properties of type `date` (`local_date`) have the format `yyyy-MM-dd` while properties of type `timestamp with time zone` (`timestamp_with_timezone`) have the format `yyyy-MM-dd H[H]:m[m][:s[s]][XXX]`.

Note

Property-specific formats always overrides type-specific formats. If you specify a type-specific format, and the property of the particular type also has a property-specific format, then only the property-specific format is used to parse the datetime data.

29.2.2.3 APIs for Accessing Datetime Data

The graph server (PGX) uses the new [Java 8 temporal data types](#) for accessing datetime data through the Java API:

- `date` in PGX maps to `LocalDate` in Java
- `time` in PGX maps to `LocalTime` in Java
- `timestamp` in PGX maps to `LocalDateTime` in Java
- `time with time zone` in PGX maps to `OffsetTime` in Java
- `timestamp with time zone` in PGX maps to `OffsetDateTime` in Java

You can retrieve a date as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var dateOfBirthProperty = graph.getVertexProperty("date_of_birth")
opg4j> var birthdayOfJudy = dateOfBirthProperty.get(1)
```

Java

```
import java.time.LocalDate;
import oracle.pgx.api.*;
...
VertexProperty<LocalDate> dateOfBirthProperty =
graph.getVertexProperty("date_of_birth");
LocalDate birthdayOfJudy = dateOfBirthProperty.get(1);
```

Python

```
date_of_birth_property = graph.get_vertex_property("date_of_birth")
birthday_of_judy = date_of_birth_property.get(1)
```

29.2.2.4 Querying Datetime Data Using PGQL

You can perform various operations such as *extracting* values from datetimes, *comparing* datetime values, and, *converting* between different datetime types. on datetime data using PGQL.

The following are example PGQL queries that show different operations that involve datetime data:

Retrieving Datetime Properties

The following query retrieves the `date_of_birth` and `timestamp_of_birth` properties from the all the persons in the graph.

```
SELECT n.name AS name, n.date_of_birth AS birthday, n.timestamp_of_birth AS
timestamp
FROM MATCH (n) ON people_graph
ORDER BY birthday
```

The result of the query is as follows:

```
+-----+
| name  | birthday  | timestamp                |
+-----+
| Judy  | 1989-01-15 | 1989-01-15T10:15-08:00 |
```

Pete	1995-08-01	1995-08-01T03:00-08:00
Klara	2001-01-29	2001-01-29T21:30-08:00

Comparing Datetime Values

The following query provides an overview of persons who are older than other persons in the graph:

```
SELECT n.name AS person1, 'is older than' AS relation, m.name AS person2
      FROM MATCH (n) ON people_graph, (m) ON people_graph
      WHERE n.date_of_birth > m.date_of_birth
      ORDER BY person1, person2
```

The result of the query is as follows:

person1	relation	person2
Klara	is older than	Judy
Klara	is older than	Pete
Pete	is older than	Judy

Extracting Values from Datetimes

The following query extracts the year, month, and day from the `date_of_birth` values:

```
SELECT n.name AS name
      , n.date_of_birth AS dob
      , EXTRACT(YEAR FROM n.date_of_birth) AS year
      , EXTRACT(MONTH FROM n.date_of_birth) AS month
      , EXTRACT(DAY FROM n.date_of_birth) AS day
      FROM MATCH (n) ON people_graph
      ORDER BY name
```

The result of the query is as follows:

name	dob	year	month	day
Judy	1989-01-15	1989	1	15
Klara	2001-01-29	2001	1	29
Pete	1995-08-01	1995	8	1

Converting Between Different Types of Datetime Values

The following query converts the `timestamp_of_birth` property into values of the following three datetime types:

- a timestamp (without time zone)
- a time with time zone

- a time (without time zone)

```
SELECT n.name AS name
      , n.timestamp_of_birth AS original_timestamp
      , CAST(n.timestamp_of_birth AS TIMESTAMP) AS utc_timestamp
      , CAST(n.timestamp_of_birth AS TIME WITH TIME ZONE) AS timezoned_time
      , CAST(n.timestamp_of_birth AS TIME) AS utc_time
  FROM MATCH (n) ON people_graph
 ORDER BY original_timestamp
```

The result of the query is as follows:

```
+-----+
--+
| name | original_timestamp      | utc_timestamp      | timezoned_time |
| utc_time |
+-----+
--+
| Judy | 1989-01-15T10:15-08:00 | 1989-01-15T18:15  | 10:15-08:00    |
| 18:15 |
| Pete | 1995-08-01T03:00-08:00 | 1995-08-01T11:00  | 03:00-08:00    |
| 11:00 |
| Klara | 2001-01-29T21:30-08:00 | 2001-01-30T05:30  | 21:30-08:00    |
| 05:30 |
+-----+
--+
```

29.2.2.5 Accessing Datetimes from PGQL Result Sets

You can use the following APIs for retrieving datetime values from PGQL result sets.

```
LocalDate getDate(int elementIdx)
LocalDate getDate(String variableName)
LocalTime getTime(int elementIdx)
LocalTime getTime(String variableName)
LocalDateTime getTimestamp(int elementIdx)
LocalDateTime getTimestamp(String variableName)
OffsetTime getTimeWithTimezone(int elementIdx)
OffsetTime getTimeWithTimezone(String variableName)
OffsetDateTime getTimestampWithTimezone(int elementIdx)
OffsetDateTime getTimestampWithTimezone(String variableName)
```

The following example prints the birthdays of all the persons in the graph is as follows:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var resultSet = session.queryPgql("""
    SELECT n.name, n.date_of_birth
    FROM MATCH (n) ON people_graph
ORDER BY n.name
""")
opg4j> while (resultSet.next()) {
...> System.out.println(resultSet.getString(1) + " has birthday " +
resultSet.getDate(2));
...> }
opg4j> resultSet.close()
```

Java

```
import java.time.LocalDate;
import oracle.pgx.api.*;
...
PgqlResultSet resultSet = session.queryPgql(
    " SELECT n.name, n.date_of_birth\n" +
    "     FROM MATCH (n) ON people_graph\n" +
    "ORDER BY n.name");

while (resultSet.next()) {
    System.out.println(resultSet.getString(1) + " has birthday " +
resultSet.getDate(2));
}

resultSet.close();
```

The result of the query is as follows:

```
Judy has birthday 1989-01-15
Klara has birthday 2001-01-29
Pete has birthday 1995-08-01
```

In addition to the Java types from the new `java.time` package, the legacy `java.util.Date` is also supported through the following APIs:

```
Date getLegacyDate(int elementIdx)
Date getLegacyDate(String variableName)
```

Note

The legacy `java.util.Date` can store dates, times, as well as timestamps, so these two APIs can be used for accessing values of any of the five datetime types.

29.3 Handling Asynchronous Requests in Graph Server (PGX)

This guide explains in detail the asynchronous methods supported by the PGX API.

The PGX API is designed to be asynchronous. This means that all of its core methods ending with *Async* **do not** block the caller thread until the request is completed. Instead, a `PgxFuture` object is instantly returned.

You can perform the following three actions on the returned `PgxFuture` object:

- Block
- Chain
- Cancel
- [Blocking Operation](#)
- [Chaining Operation](#)
- [Cancelling Operation](#)
- [Handling Concurrent Asynchronous Operations](#)

29.3.1 Blocking Operation

You can easily get the result by calling the `get()` method on the `PgxFuture`. The `get()` blocks the caller thread until the result is available:

```
PgxFuture<PgxSession> sessionPromise = instance.createSessionAsync("my-session");
try {
    // block caller thread
    PgxSession session = sessionPromise.get();
    // do something with session
    ...
} catch (InterruptedException e) {
    // caller thread was interrupted while waiting for result
} catch (ExecutionException e) {
    // an exception was thrown during asynchronous computation
    Throwable cause = e.getCause(); // the actual exception is nested
}
```

PGX provides blocking convenience methods for every *Async* method, which calls the `get()` method. Typically, those methods have the same name as the asynchronous method they wrap, but without the *Async* suffix. For example, the preceding code snippet is equal to:

```
try {
    // block caller thread
    PgxSession session = instance.createSession("my-session");
    // do something with session
    ...
} catch (InterruptedException e) {
    // caller thread was interrupted while waiting for result
} catch (ExecutionException e) {
    // an exception was thrown during asynchronous computation
}
```

```
        Throwable cause = e.getCause(); // the actual exception is nested
    }
}
```

29.3.2 Chaining Operation

The graph server (PGX) ships a version of Java 8's `CompletableFuture` named `PgxFuture`, an enhancement of the `Future` interface.

The `CompletableFuture` allows chaining of asynchronous computations without polling or the need of deeply nested callbacks (also known as callback hell). All `PgxFuture` instances returned by PGX APIs are instances of `CompletableFuture` and can be chained without the need of Java 8.

```
import java.util.concurrent.CompletableFuture

...

final GraphConfig graphConfig = ...
instance.createSessionAsync("my-session")
    .thenCompose(new Fun<PgxSession, CompletableFuture<PgxGraph>>() {
        @Override
        public CompletableFuture<PgxGraph> apply(PgxSession session) {
            return session.readGraphWithPropertiesAsync(graphConfig);
        }
    }).thenAccept(new Action<PgxGraph>() {
        @Override
        public void accept(PgxGraph graph) {
            // do something with loaded graph
        }
    });
```

The asynchronous chaining in the preceding example is explained as follows:

- The first line in the code makes an asynchronous call to `createSessionAsync()` to create a session. Once the promise is resolved, it returns a `PgxFuture` object, which is the newly created `PgxSession`.
- The code then calls the `.thenCompose()` handler by passing a function which takes the `PgxSession` object as an argument. Inside the function, there is another asynchronous `readGraphWithPropertiesAsync()` request which return another `PgxFuture` object.
The outer `PgxFuture` object returned by `.thenCompose()` gets resolved when the `readGraphWithPropertiesAsync()` request completes.
- This is followed by the `.thenAccept()` handler. The function that is passed to `.thenAccept()` does not return anything. Therefore, the future return type of `.thenAccept()` is `PgxFuture<Void>`.

Blocking Versus Chaining

For most use cases, you can block the caller thread. However, blocking can quickly lead to poor performance or deadlocks once things get more complex. As a rule, use blocking to quickly analyze selected graphs in a sequential manner, for example, in shell scripts or during interactive analysis using the interactive PGX shell.

Use chaining for applications built on top of PGX.

29.3.3 Cancelling Operation

You can cancel a pending request by invoking the [cancel](#) method of the returned `PgxFuture` instance.

For example:

```
PgxFuture<Object> promise=...  
// do something else  
promise.cancel(); // will cancel computation
```

Any subsequent calls to `promise.get()` will result in a [CancellationException](#) being thrown.

Note

Due to Java's cooperative threading model, it might take some time before PGX actually stops the computation.

29.3.4 Handling Concurrent Asynchronous Operations

Using the `PgxSession#runConcurrently` API provided by the graph server (PGX), you can submit a list of suppliers of asynchronous APIs to run concurrently in the PGX server.

For example:

```
import oracle.pgx.api.*;  
  
Supplier<PgxFuture<?>> asyncRequest1 = () ->  
session.readGraphWithPropertiesAsync(...);  
Supplier<PgxFuture<?>> asyncRequest2 = () ->  
session.getAvailableSnapshotsAsync(...);  
  
List<Supplier<PgxFuture<?>>> supplierList = Arrays.asList(asyncRequest1,  
asyncRequest2);  
  
//executing the async requests with the enabled optimization feature  
List<?> results = session.runConcurrently(supplierList);  
  
//the supplied requests are mapped to their results and orderly collected  
PgxGraph graph = (PgxGraph) results.get(0);  
Deque<GraphMetaData> metaData = (Deque<GraphMetaData>) results.get(1);
```

29.4 Graph Client Sessions

The graph server (PGX) assumes there may be multiple concurrent clients, and each client submits request to the shared PGX server independently.

Each session has its own workspace in PGX and is isolated from other sessions.

You can share graphs or properties among sessions.

The following topics describe the different session actions:

- [Creating a Session](#)
You can create a session using the `ServerInstance#createSession` methods.
- [Updating Session Idle Timeout](#)
You can configure the idle timeout value for a session.
- [Destroying a Session](#)

29.4.1 Creating a Session

You can create a session using the `ServerInstance#createSession` methods.

-
- [Java](#)
 - [Python](#)

Java

```
PgxSession createSession(String source)
PgxSession createSession(String source, long idleTimeout, long taskTimeout,
    TimeUnit unit)
```

Python

```
session = create_session(source, idle_timeout=None, task_timeout=None,
    time_unit='milliseconds')
```

The preceding methods accept the following arguments:

- `source` is any arbitrary string that describes the client. Currently, this string is only used for logging purposes.
- The user can specify the idle timeout (`idleTimeout`) and task timeout (`taskTimeout`) when creating a new session. If these values are not specified, default values are used. See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information on graph server (PGX) configuration options.

29.4.2 Updating Session Idle Timeout

You can configure the idle timeout value for a session.

The session idle timeout determines how long a session remains active without submitting any tasks to the graph server (PGX). The `idleTimeout` value is set during session creation. If no value is provided, then the server uses the `session_idle_timeout_secs` value specified in the `pgx.conf` configuration file. The default value for the `session_idle_timeout_secs` configuration is zero. This implies that timeout is deactivated and the session can remain active indefinitely as long as the server is running.

You can use the `setSessionIdleTimeout` API to override the session `idleTimeout` value that was set at the time of session creation. When you change the session `idleTimeout` to any positive non-zero value, then the timeout job gets reactivated.

All regular graph users having the `PGX_SESSION_SET_IDLE_TIMEOUT` permission can update the timeout value of the current session using the `PgxSession#setSessionIdleTimeout` API as shown in the following example.

Note

The `PGX_SESSION_SET_IDLE_TIMEOUT` permission is granted by default to the `GRAPH_DEVELOPER` role. See [Basic Steps for Using an Oracle Database for Authentication](#) for more information.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> session.setSessionIdleTimeout(10L, TimeUnit.SECONDS)
```

Java

```
session.setSessionIdleTimeout(10L, TimeUnit.SECONDS);
```

Python

```
session.set_session_idle_timeout(10, "seconds")
```

If you are a graph server administrator having the `PGX_SERVER_MANAGE` permission, then you can update the timeout value of other sessions using the `PgxInstance#setSessionIdleTimeout` API as shown.

Note

The `PGX_SERVER_MANAGE` permission is granted by default to the `GRAPH_ADMINISTRATOR` role. See [Basic Steps for Using an Oracle Database for Authentication](#) for more information.

- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> instance.setSessionIdleTimeout("<session_id>", 10L, TimeUnit.SECONDS)
```

Java

```
instance.setSessionIdleTimeout(session_id, 10L, TimeUnit.SECONDS);
```

Python

```
instance.set_session_idle_timeout('session_id', 10, 'seconds')
```

29.4.3 Destroying a Session

To destroy a session, simply call:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.destroy()
```

Java

```
session.destroy();
```

Python

```
session.destroy()
```

Administrators can destroy sessions by ID using the following code:

```
instance.killSession(sessionId);
```

Note

Calling administrative methods by default requires special authorization in client/server mode.

When a session is destroyed, PGX reclaims all of the resources associated with the session. Specifically, all transient data is destroyed immediately. See [Managing Transient Data](#) for more information on transient data.

However, PGX may choose to keep the loaded graph instance in memory for caching purposes, especially if a graph instance is shared by multiple clients. In summary, every graph remains in memory until no client is using it.

Note

A session can be destroyed automatically via the session time-out mechanism. See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for more information on graph server (PGX) configuration options.

29.5 Graph Mutation and Subgraphs

This guide discusses the several methods provided by the graph server (PGX) for mutating graph instances.

You can use the mutation and subgraph methods that are defined in the `PgxGraph` class, to mutate a graph.

Note

All of the mutating methods create a new graph or snapshot instance as the mutated version of the original graph, rather than mutating the original graph directly.

- [Altering Graphs](#)
- [Simplifying and Copying Graphs](#)
- [Transposing Graphs](#)
- [Undirecting Graphs](#)
- [Advanced Multi-Edge Handling](#)
- [Creating a Bipartite Subgraph](#)
- [Creating a Sparsified Subgraph](#)

29.5.1 Altering Graphs

This section explains the graph alteration mutation used to add or remove vertex and edge providers of a graph.

You can add or remove vertex and edge providers in a graph that has been loaded or created previously. Providers can be added from existing datasources, or new empty providers can be

created. The mutation can either create a new independent graph, or create a new snapshot for the graph.

The following topics explain in detail on adding and removing vertex and edge providers:

You must first create a graph-alteration builder to start altering an existing graph. For example, the following code shows how to start a graph alteration on a graph that is stored in a variable `graph`:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg-jshell> var alterationBuilder = graph.alterGraph()
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.graphalteration.GraphAlterationBuilder;

GraphAlterationBuilder alterationBuilder = graph.alterGraph();
```

Python

```
alteration_builder = graph.alter_graph()
```

-
- [Loading Or Removing Additional Vertex or Edge Providers](#)

29.5.1.1 Loading Or Removing Additional Vertex or Edge Providers

You can alter your graph by adding or removing vertex or edge providers from a specific datasource. Alternatively you can also add empty vertex or edge providers.

Keys in Additionally Loaded Providers

The vertex and edge providers that are loaded must provide the respective keys in accordance with the vertex ID and edge ID strategy of the graph being altered. If the ID strategy is `KEYS_AS_IDS`, the provider must create a key mapping. But, if the ID strategy is `UNSTABLE_GENERATED_IDS`, it must not create the key mapping.

- [Loading Vertex Providers](#)
- [Loading Edge Providers](#)
- [Adding Additional Empty Vertex or Edge Providers](#)
- [Removing Vertex or Edge Providers](#)

- [Applying the Alteration and Building a Graph or Snapshot](#)

29.5.1.1.1 Loading Vertex Providers

You can add a vertex provider by calling

```
alterationBuilder.addVertexProvider(EntityProviderConfig vertexProviderConfig).
```

`vertexProviderConfig` is a vertex provider configuration and it provides configuration details such as:

- location of the datasource to load from
- the stored format
- properties of the vertex provider

Adding a Vertex Provider from a JSON Configuration

You can add the provider by calling `alterationBuilder.addVertexProvider(String pathToVertexProviderConfig)` where `pathToVertexProviderConfig` points to a file accessible from the client that contains a JSON representation of a vertex provider configuration.

For example, a vertex provider configuration can be stored in a JSON file as shown:

```
{
  "name": "Accounts",
  "format": "rdbms",
  "database_table_name": "BANK_ACCOUNTS",
  "key_column": "ID",
  "key_type": "integer",
  "props": [
    {
      "name": "ID",
      "type": "integer"
    },
    {
      "name": "NAME",
      "type": "string"
    }
  ]
}
```

You can then add the vertex provider as shown in the following example:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
// Loading by indicating the path to the JSON file
opg4j> alterationBuilder.addVertexProvider("<path-to-vertex-provider-configuration>")
```

```
$9 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@48d464cf

// Or by first loading the content of a JSON file into an
EntityProviderConfig object
opg4j> var vertexProviderConfig = new
AnyFormatEntityProviderConfigFactory().fromPath("<path-to-vertex-provider-
configuration>")
vertexProviderConfig ==>
{"format":"rdbms","name":"Accounts","database_table_name":"BANK_ACCOUNTS","loa
ding":{"create_key_mapping":true},"key_type":"integer","props":
[{"type":"integer","name":"ID"},
{"type":"string","name":"NAME"}],"key_column":"ID"}
opg4j> alterationBuilder.addVertexProvider(vertexProviderConfig)
$15 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@77e2a5d3
```

Java

```
// Loading by indicating the path to the JSON file
alterationBuilder.addVertexProvider("<path-to-vertex-provider-
configuration>");

// Or by first loading the content of a JSON file into an
EntityProviderConfig object
EntityProviderConfig vertexProviderConfig = new
AnyFormatEntityProviderConfigFactory().fromPath("<path-to-vertex-provider-
configuration>");
alterationBuilder.addVertexProvider(vertexProviderConfig);
```

Python

```
# Loading by indicating the path to the JSON file
alterationBuilder.add_vertex_provider("<path-to-vertex-provider-
configuration>");
```

Adding a Vertex Provider Programmatically Using an API

Alternatively, the vertex provider configuration can be built programmatically:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var vertexProviderConfigBuilder = new
RdbmsEntityProviderConfigBuilder().
...> setName("Accounts").
```

```

...>      setKeyColumn("ID").
...>      setDatabaseTableName("BANK_ACCOUNTS").
...>      addProperty("ID", PropertyType.INTEGER)
vertexProviderConfigBuilder ==>
oracle.pgx.config.RdbmsEntityProviderConfigBuilder@8ff4d2b

opg4j> var vertexProviderConfig = vertexProviderConfigBuilder.build()
vertexProviderConfig ==> {"error_handling":
{"format":"rdbms","name":"Accounts","database_table_name":"BANK_ACCOUNTS","l
oading":{"create_key_mapping":true},"attributes":{"key_type":"long","props":
[{"dimension":0,"type":"integer","name":"ID"}],"key_column":"ID"}

opg4j> alterationBuilder.addVertexProvider(vertexProviderConfig)
$24 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@7b303608

```

Java

```

RdbmsEntityProviderConfigBuilder vertexProviderConfigBuilder = new
RdbmsEntityProviderConfigBuilder()
    .setName("Accounts")
    .setKeyColumn("ID")
    .setDatabaseTableName("BANK_ACCOUNTS")
    .addProperty("ID", PropertyType.INTEGER);
EntityProviderConfig vertexProviderConfig =
vertexProviderConfigBuilder.build();
alterationBuilder.addVertexProvider(vertexProviderConfig);

```

29.5.1.1.2 Loading Edge Providers

You can add an edge provider by calling

`alterationBuilder.addEdgeProvider(EntityProviderConfig edgeProviderConfig)` where `edgeProviderConfig` is an edge provider configuration and it provides configuration details such as:

- location of the datasource to load from
- the stored format
- properties of the edge provider

The source and destination vertex providers to which it is linked must either be already in the base graph (and not removed in the alteration), or added with the alteration.

Adding an Edge Provider from a JSON Configuration

You can also add the provider by calling `alterationBuilder.addEdgeProvider(String pathToEdgeProviderConfig)` where `pathToEdgeProviderConfig` points to a file accessible from the client that contains a JSON representation of an edge provider configuration.

For example, an edge provider configuration can be stored in a JSON file as shown:

```

{
  "name": "Transfers",

```

```

    "format": "rdbms",
    "database_table_name": "BANK_EDGES_AMT",
    "key_column": "ID",
    "source_column": "SRC_ID",
    "destination_column": "DEST_ID",
    "source_vertex_provider": "Accounts",
    "destination_vertex_provider": "Accounts",
    "props": [
      {
        "name": "AMOUNT",
        "type": "float"
      }
    ]
  }
}

```

You can then add the edge provider as shown in the following example:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

// Loading by indicating the path to the JSON file
opg4j> alterationBuilder.addEdgeProvider("<path-to-edge-provider-configuration>")
$10 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@48d464cf

// Or by first loading the content of a JSON file into an
EntityProviderConfig object
opg4j> EntityProviderConfig edgeProviderConfig = new
AnyFormatEntityProviderConfigFactory().fromPath("<path-to-edge-provider-configuration>")
edgeProviderConfig ==>
{"format":"rdbms","source_vertex_provider":"Accounts","name":"Transfers","data
base_table_name":"BANK_EDGES_AMT","loading":
{"create_key_mapping":false},"source_column":"SRC_ID","destination_column":
"DEST_ID","key_type":"long","destination_vertex_provider":"Accounts","props":
[{"type":"float","name":"AMOUNT"}],"key_column":"ID"}

opg4j> alterationBuilder.addEdgeProvider(edgeProviderConfig)
$26 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@7b303608

```

Java

```

// Loading by indicating the path to the JSON file
alterationBuilder.addEdgeProvider("<path-to-edge-provider-configuration>");

```

```
// Or by first loading the content of a JSON file into an
EntityProviderConfig object
EntityProviderConfig edgeProviderConfig = new
AnyFormatEntityProviderConfigFactory().fromPath("<path-to-edge-provider-
configuration>");
alterationBuilder.addEdgeProvider(edgeProviderConfig);
```

Python

```
# Loading by indicating the path to the JSON file
alterationBuilder.add_edge_provider("<path-to-edge-provider-configuration>");
```

Adding an Edge Provider Programmatically Using an API

Alternatively, the edge provider configuration can be built programmatically:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> RdbmsEntityProviderConfigBuilder edgeProviderConfigBuilder = new
RdbmsEntityProviderConfigBuilder().
...>                                     setName("Transfers").
...>                                     setKeyColumn("id").
...>                                     setSourceColumn("src_id").
...>
setDestinationColumn("dest_id").
...>
setSourceVertexProvider("Accounts").
...>
setDestinationVertexProvider("Accounts").
...>                                     createKeyMapping(true).
...>
setDatabaseTableName("bank_txns").
...>                                     addProperty("from_acct_id",
PropertyType.LONG).
...>                                     addProperty("to_acct_id",
PropertyType.LONG).
...>                                     addProperty("amount",
PropertyType.LONG)
edgeProviderConfigBuilder ==>
oracle.pgx.config.RdbmsEntityProviderConfigBuilder@5a5f65b9

opg4j> EntityProviderConfig edgeProviderConfig =
edgeProviderConfigBuilder.build()
edgeProviderConfig ==> {"error_handling":
{"attributes":{"destination_column":"dest_id","key_type":"long","destination
_vertex_provider":"Accounts","key_column":"id","format":"rdbms","source_vertex
```

```

_provider":
"Accounts", "name": "Transfers", "database_table_name": "bank_txns", "loading":
{"create_key_mapping": true}, "source_column": "src_id", "props":
[{"dimension": 0, "type": "long", "name": "from_acct_id"},
{"dimension": 0, "type": "long",
"name": "to_acct_id"}, {"dimension": 0, "type": "long", "name": "amount"}]]

opg4j> alterationBuilder.addEdgeProvider(edgeProviderConfig)
$30 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationBuilderImpl@441ccfd7

```

Java

```

RdbmsEntityProviderConfigBuilder edgeProviderConfigBuilder = new
RdbmsEntityProviderConfigBuilder()
.setName("Transfers")
.setKeyColumn("id")
.setSourceColumn("src_id")
.setDestinationColumn("dest_id").
.setSourceVertexProvider("Accounts")
.setDestinationVertexProvider("Accounts")
.createKeyMapping(true)
.setDatabaseTableName("bank_txns")
.addProperty("from_acct_id", PropertyType.LONG)
.addProperty("to_acct_id", PropertyType.LONG)
.addProperty("amount", PropertyType.LONG);

EntityProviderConfig edgeProviderConfig = edgeProviderConfigBuilder.build();
alterationBuilder.addEdgeProvider(edgeProviderConfig);

```

29.5.1.1.3 Adding Additional Empty Vertex or Edge Providers

You can also add empty vertex or edge providers, without having the providers connected to any specific datasource.

The names and types of the properties of each empty provider can be specified programmatically. Similarly, you can also specify if a key mapping for the providers needs to be created.

Adding Additional Empty Vertex Providers

You can add an empty vertex provider by calling `alterationBuilder.addEmptyVertexProvider(String vertexProviderName)`. You can then add properties, specify the key column, create the key mapping programmatically as shown in the following example.

See the **GraphAlterationEmptyVertexProviderBuilder** Interface in the Javadoc for more details.

- [JShell](#)

- [Java](#)

JShell

```
opg4j> alterationBuilder.addEmptyVertexProvider("AccountsProvider").
...>         setLabel("Accounts").
...>         createKeyMapping(true).
...>         addProperty("NAME", PropertyType.STRING)
$14 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationEmptyVertexProviderBuilderImpl@4b3ea082
```

Java

```
alterationBuilder.addEmptyVertexProvider("AccountsProvider")
    .setLabel("Accounts")
    .createKeyMapping(true)
    .addProperty("NAME", PropertyType.STRING);
```

Adding Additional Empty Edge Providers

You can add an empty edge provider by calling

`alterationBuilder.addEmptyEdgeProvider(String providerName, String sourceProvider, String destProvider)`. You can then add properties, specify the key column, create the key mapping programmatically as shown in the following example.

See the **GraphAlterationEmptyEdgeProviderBuilder** Interface in the Javadoc for more details.

-
- [JShell](#)

- [Java](#)

JShell

```
opg4j> alterationBuilder.addEmptyEdgeProvider("TransactionProvider",
"Accounts", "Accounts").
...>         setLabel("Transfers").
...>         createKeyMapping(false). // set to false if no keys are needed
...>         addProperty("Description", PropertyType.STRING)
$26 ==>
oracle.pgx.api.graphalteration.internal.GraphAlterationEmptyEdgeProviderBuilderImpl@54720caf
```

Java

```
alterationBuilder.addEmptyEdgeProvider("TransactionProvider", "Accounts",
"Accounts")
    .setLabel("Transfers")
```

```
.createKeyMapping(false)
.addProperty("Description", PropertyType.STRING);
```

29.5.1.1.4 Removing Vertex or Edge Providers

You can remove an edge provider by calling `alterationBuilder.removeEdgeProvider(String edgeProviderName)`, where `edgeProviderName` is the name of the edge provider to be removed from the graph.

Similarly, calling `alterationBuilder.removeVertexProvider(String vertexProviderName)` will result in the graph to not contain that specific vertex provider. If that vertex provider was the source or destination provider for some edge providers in the base graph, those edge providers should also be removed before the application of the alteration or an exception will be thrown.

It is possible to indicate that the edge providers associated to a removed vertex provider should be automatically removed by calling

```
alterationBuilder.cascadeEdgeProviderRemovals(boolean
cascadeEdgeProviderRemovals) with cascadeEdgeProviderRemovals set to true.
```

29.5.1.1.5 Applying the Alteration and Building a Graph or Snapshot

You must call `alterationBuilder.build()`, once the different vertex and edge providers have been added or removed in the alteration to actually apply the operation. By calling `alterationBuilder.build()`, a new graph is created and that graph contains all the providers of the base graph excluding the removed providers, and the additionally loaded providers.

You can also call `alterationBuilder.buildNewSnapshot()`, in which case, a new snapshot for the base graph is created and that snapshot contains all the providers of the base graph excluding the removed providers, and the additionally loaded providers.

29.5.2 Simplifying and Copying Graphs

You can create a simplified version of the graph by calling the `simplify()` method.

- [Java](#)
- [Python](#)

Java

```
PgxGraph simplify(Collection<VertexProperty<?, ?>> vertexProps,
                  Collection<EdgeProperty<?>> edgeProps, MultiEdges multiEdges,
                  SelfEdges selfEdges, TrivialVertices trivialVertices,
                  Mode mode, String newGraphName)
```

Python

```
simplify(self, vertex_properties=True, edge_properties=True, keep_multi_edges=False,
          keep_self_edges=False, keep_trivial_vertices=False, in_place=False,
          name=None)
```

The first two arguments (`vertexProps` and `edgeProps`) list which properties will be copied into the newly created simplified graph instance. PGX provides convenience constants `VertexProperty.ALL`, `EdgeProperty.ALL` and `VertexProperty.NONE`, `EdgeProperty.NONE` to specify all properties or none properties to be stored, respectively.

The next three arguments determine which operations will be performed to simplify the graph.

- `multiEdges`: if `MultiEdges.REMOVE_MULTI_EDGES`, eliminate multiple edges between a source vertex and a destination vertex, that is, leave at most one edge between two vertices. `MultiEdges.KEEP_MULTI_EDGES` indicates to keep them. By default, PGX picks one edge out of the multi-edges and takes its properties. See [Advanced Multi-Edge Handling](#) for more fine-grained control over the edge properties during simplification.
- `selfEdges`: if `SelfEdges.REMOVE_SELF_EDGES`, eliminate every edge whose source and destination are the same vertex. `SelfEdges.KEEP_MULTI_EDGES` indicates to keep them.
- `trivialVertices`: if `TrivialVertices.REMOVE_TRIVIAL_VERTICES`, eliminate all the vertices that have neither incoming edges nor outgoing edges. `TrivialVertices.KEEP_TRIVIAL_VERTICES` indicates to keep them.

The `mode` argument, if set to `Mode.MUTATE_IN_PLACE`, requests that the mutation occurs directly on the specified graph instance without creating a new one. If set to `Mode.CREATE_COPY`, the method will create a new graph instance with the new name in `newGraphName`. If `newGraphName` is omitted (or `null`), PGX will generate a unique graph name.

The return value of this method is the simplified `PgxGraph` instance.

The `Mode.MUTATE_IN_PLACE` option is only applicable if the graph is marked as mutable. Every graph is immutable by default when loaded into PGX. To make a `PgxGraph` mutable, the client should create a private copy of the graph first, using one of the following methods:

- [Java](#)
- [Python](#)

Java

```
PgxGraph clone()
PgxGraph clone(String newGraphName)
PgxGraph clone(Collection<VertexProperty<?, ?>> vertexProps,
Collection<EdgeProperty<?>> edgeProps, String newGraphName)
```

Python

```
clone(self, vertex_properties=True, edge_properties=True, name=None)
```

As with `simplify()`, the user can specify optional properties of the graph to copy with `vertexProps` and `edgeProps`. If no properties are specified, all of the original graph's properties will be copied into the new graph instance. The user can specify the name of the newly created graph instance with `newGraphName`.

29.5.3 Transposing Graphs

Note

Starting from Graph Server and Client Release 25.1, transposed graphs are deprecated.

You can create a transposed version of the graph.

- [Java](#)
- [Python](#)

Java

```
PgxGraph transpose(Collection<VertexProperty<?, ?>> vertexProps,  
                  Collection<EdgeProperty<?>> edgeProps,  
                  Map<String, String> edgeLabelMapping,  
                  Mode mode, String newGraphName)
```

Python

```
transpose(self, vertex_properties=True, edge_properties=True,  
          edge_label_mapping=None, in_place=False,  
          name=None)
```

The `edgeLabelMapping` argument can be used to rename edge labels. If any key in the given map does not exist as an edge label, it will be ignored.

`edgeLabelMapping` argument can also be an empty Map or null.

- `null`: if argument is `null`, edge labels from source graph will be removed on transposed graph. (default behavior when using convenience methods).
- `empty Map`: if argument is an empty Map, edge labels from source graph will be neither removed or renamed. Instead, it will be kept as it is in source graph.

See [Simplifying and Copying Graphs](#) for the meaning of the other parameters.

Additionally, the graph server (PGX) provides the following convenience methods from the `PgxGraph` class for the common operation of copying all vertex and edge properties into the transposed graph instance:

- [`transpose\(Mode mode, String newGraphName\)`](#)
- [`transpose\(String newGraphName\)`](#)
- [`transpose\(Mode mode\)`](#)

29.5.4 Undirecting Graphs

Note

Starting from Graph Server and Client Release 25.1, undirected graphs are deprecated.

The following methods create the undirected version of a graph instance:

- [Java](#)
- [Python](#)

Java

```
PgxGraph undirect()  
PgxGraph undirect(String newGraphName)  
PgxGraph undirect(MultiEdges multiEdges, SelfEdges selfEdges, TrivialVertices  
trivialVertices, Mode mode, String newGraphName)  
PgxGraph undirect(Collection<VertexProperty<?, ?>> vertexProps,  
Collection<EdgeProperty<?>> edgeProps, MultiEdges multiEdges, SelfEdges  
selfEdges, Mode mode, String newGraphName)
```

Python

```
undirect(self, vertex_properties=True, edge_properties=True,  
keep_multi_edges=True, keep_self_edges=True,  
keep_trivial_vertices=True, in_place=False, name=None)
```

The first two methods create an undirected version of the graph while copying all of the vertex properties. `newGraphName` is an optional argument to specify the name of the newly created graph instance.

In contrast, the third and fourth methods concurrently perform *undirecting* and *simplifying* of a graph. See [Simplifying and Copying Graphs](#) for the meaning of each parameter.

All methods return an object of the undirected `PgxGraph` type.

An undirected graph has some restrictions. Some algorithms are only supported on directed graphs or are not yet supported for undirected graphs. Further, PGX does not support to store undirected graphs nor reading from undirected formats. Since the edges do not have a direction anymore, the behavior of `pgxEdge.getSource()` or `pgxEdge.getDestination()` can be ambiguous. In order to provide deterministic results, PGX will always return the vertex with the smaller internal id as source and the other as destination vertex.

29.5.5 Advanced Multi-Edge Handling

Both `simplify()` and `undirect()` support the removal of multi-edges using `MultiEdges.REMOVE_MULTI_EDGES`. If this parameter is set, all multi-edges in this graph are removed, that is, collapsed. Whenever several multi-edges with edge properties are collapsed into one edge, you can choose one of the following two strategies supported by the graph server (PGX) to decide how to treat the corresponding properties:

- Picking
- Merging

If you choose picking, the graph server (PGX) picks one edge out of every set of multi-edges and copies all its properties including the edge label and key into the new graph. In the case of merging, the graph server (PGX) creates a completely new edge out for every set of multi-edges. PGX determines the properties of these new edges by applying a `MergingFunction` on every property of the multi-edges.

If there are no multi-edges between two vertices, that is, zero or only one edge, the chosen strategy does not have an effect on the outcome. The edge is kept with all its properties as it is.

- [Picking](#)
- [Merging](#)
- [StrategyBuilder in General](#)

29.5.5.1 Picking

This strategy can be used to pick an edge out of multi-edges. The graph server (PGX) allows the user to define several picking criteria. You can pick by:

- Property
- Label
- Edge-ID

Every picking criteria has to be combined with a `PickingStrategyFunction`. PGX supports either `PickingStrategyFunction.MIN` and `PickingStrategyFunction.MAX`, which picks the edge whose property/label/id is either minimal or maximal. If one does not specify a picking criteria, PGX will non-deterministically pick an edge out of the multi-edges.

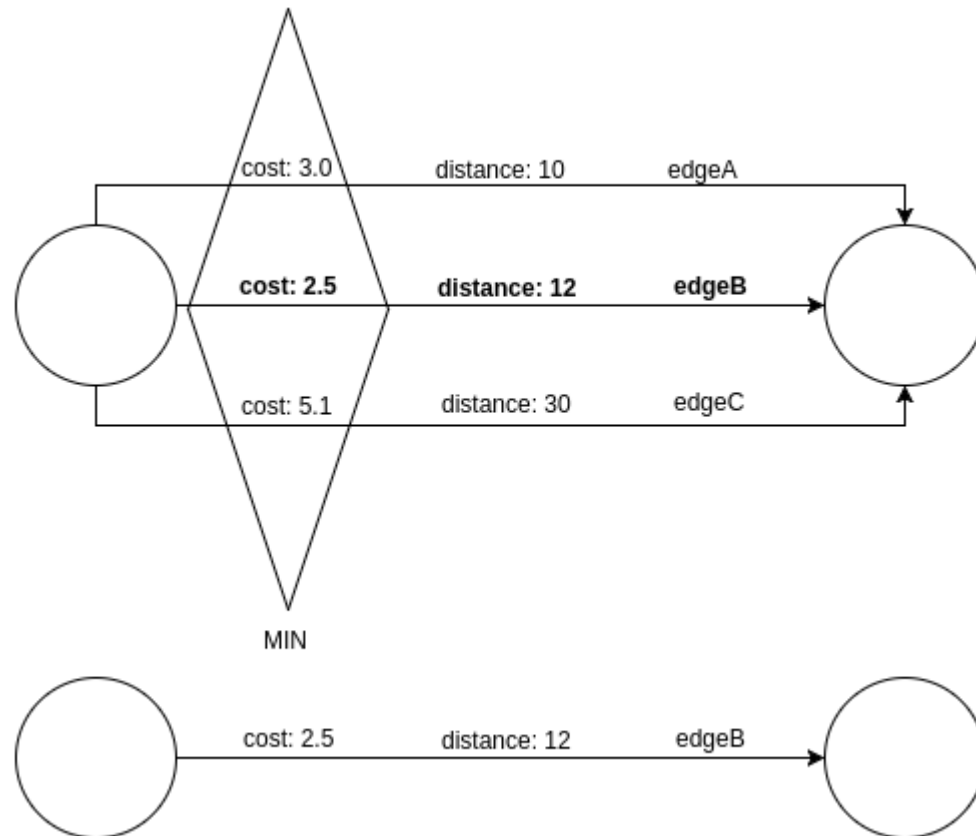

A `PickingStrategy` can be created using a `PickingStrategyBuilder`, which can be retrieved by calling `createPickingStrategyBuilder()` on the target graph.

You can call one of the following functions as per your chosen picking criteria:

```
PickingStrategyBuilder setPickByEdgeId(PickingStrategyFunction pickingStrategyFunction)
PickingStrategyBuilder setPickByLabel(PickingStrategyFunction pickingStrategyFunction)
PickingStrategyBuilder setPickByProperty(EdgeProperty edgeProperty,
PickingStrategyFunction pickingStrategyFunction)
PickingStrategyBuilder setPickByProperty(String propertyName, PickingStrategyFunction
pickingStrategyFunction)
```

The following figure shows how PGX picks the edge with the *minimal* cost and takes all its properties.

Figure 29-1 Picking Strategy

29.5.5.2 Merging

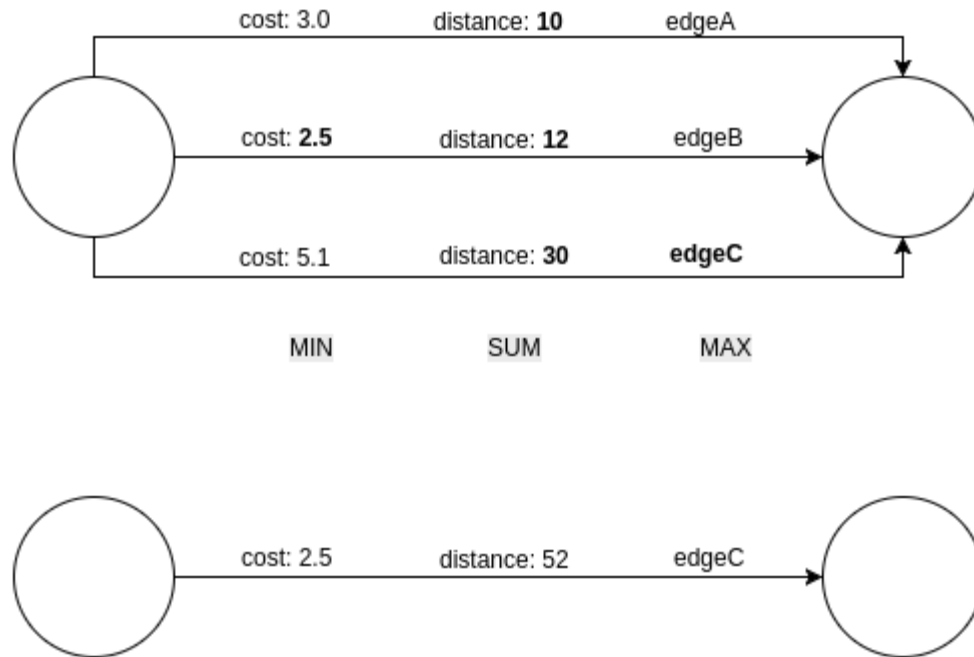

This strategy can be used to merge the properties of multi-edges. The graph server (PGX) allows the user to define a `MergingFunction` for every property. Currently, PGX supports the following functions:

- `MergingFunction.MIN`
- `MergingFunction.MAX`
- `MergingFunction.SUM`

Note

SUM is only defined on numeric properties.

The following figure shows how the graph server (PGX) merges the different edge properties and labels. It takes the *minimal* cost, the *sum* of distances and the *maximal* edge label.

Figure 29-2 Merging Strategy

29.5.5.3 StrategyBuilder in General

By default, both the StrategyBuilders use the same values as in the convenience methods of `simplify()` and `undirect()`. This includes that all properties are kept by default. If one wants to drop specific properties, one can either use the `dropVertexProperty()` or `dropEdgeProperty()` functions.

```
MutationStrategyBuilder setNewGraphName(String newGraphName)
MutationStrategyBuilder setCopyMode(Mode mode)
MutationStrategyBuilder setTrivialVertices(TrivialVertices trivialVertices)
MutationStrategyBuilder setSelfEdges(SelfEdges selfEdges)
MutationStrategyBuilder setMultiEdges(MultiEdges multiEdges)
MutationStrategyBuilder dropVertexProperties(Collection<VertexProperty<?, ?>>
vertexProperty)
MutationStrategyBuilder dropEdgeProperties(Collection<EdgeProperty<?>>
edgeProperty)
MutationStrategyBuilder dropVertexProperty(VertexProperty<?, ?>
vertexProperty)
MutationStrategyBuilder dropEdgeProperty(EdgeProperty<?> edgeProperty)
MutationStrategy build()
```

`Simplify()` and `undirect()` can be called using a `MutationStrategy` as follows:

```
MutationStrategy strategy = strategyBuilder.build()
PgxGraph simplifiedGraph = graph.simplify(strategy)
//OR
PgxGraph undirectedGraph = graph.undirect(strategy)
```

29.5.6 Creating a Bipartite Subgraph

The graph server (PGX) enables the client to create a bipartite subgraph. The following methods return the created `BipartiteGraph` instance:

- [Java](#)
- [Python](#)

Java

```
BipartiteGraph bipartiteSubGraphFromLeftSet(VertexSet<?> vertexSet)
BipartiteGraph bipartiteSubGraphFromLeftSet(VertexSet<?> vertexSet, String
newGraphName)
BipartiteGraph bipartiteSubGraphFromLeftSet(Collection<VertexProperty<?, ?>>
vertexProps, Collection<EdgeProperty<?>> edgeProps, VertexSet<?> vertexSet,
String newGraphName)
BipartiteGraph bipartiteSubGraphFromLeftSet(Collection<VertexProperty<?, ?>>
vertexProps, Collection<EdgeProperty<?>> edgeProps, VertexSet<?> vertexSet,
String newGraphName, String isLeftPropName)
```

Python

```
bipartite_sub_graph_from_left_set(self, vset, vertex_properties=True,
edge_properties=True, name=None, is_left_name=None)
```

These methods require an additional argument `vertexSet`, which points to a set of vertices (see [Using Collections and Maps](#) for more information) whose elements (vertices) would contain the left vertices (that is, vertices on the left side of the bipartite graph that have only edges to vertices on the right side) in the resulting bipartite graph.

When creating the bipartite subgraph, PGX automatically inserts an additional boolean vertex property `isLeft`. The value of this property is set `true` for the left vertices and `false` for the right vertices in the bipartite subgraph. The name of the `isLeft` vertex property can be obtained with `getIsLeftPropertyAsync()` on the returned `BipartiteGraph` object.

The user has the option to specify a name for the newly created graph (`newGraphName`) as well as a custom name for the Boolean left-vertex indicating property (`isLeftPropName`). The user can also specify the vertex and edge properties to be copied into the newly created graph instance (`vertexProps` and `edgeProps`).

29.5.7 Creating a Sparsified Subgraph

The graph server (PGX) supports creating a sparsified subgraph of a graph:

- [Java](#)

- [Python](#)

Java

```
PgxGraph sparsify(double e)
PgxGraph sparsify(double e, String newGraphName)
PgxGraph sparsify(Collection<VertexProperty<?, ?>> vertexProps,
Collection<EdgeProperty<?>> edgeProps, double e, String newGraphName)
```

Python

```
sparsify(self, sparsification, vertex_properties=True, edge_properties=True,
name=None)
```

The double argument `e` is the sparsification coefficient with a value between 0.0 and 1.0.

The user again has the option to specify the name for the newly created graph (`newGraphName`) as well as the vertex and edge properties to be copied into the newly created graph instance (`vertexProps` and `edgeProps`).

The returned `PgxGraph` object represents a sparsified subgraph which has fewer edges than the original graph.

29.6 Graph Builder and Graph Change Set

This guide explains the `createGraphBuilder` API used for creating partitioned graphs and the `GraphChangeSet` interface used for modifying loaded graphs.

- [Creating a Partitioned Graph Using the GraphBuilder Interface](#)
The `createGraphBuilder()` API supports the creation of partitioned graphs.
- [Modifying Loaded Graphs Using ChangeSet](#)

29.6.1 Creating a Partitioned Graph Using the GraphBuilder Interface

The `createGraphBuilder()` API supports the creation of partitioned graphs.

The graph partitioning strategy is based on labels. Each vertex and edge in the graph can have only one label. Vertices with the same label will be grouped together into the same vertex provider. The name of the vertex provider will be same as the vertex label. Similarly, edges with the same label, source provider, and destination provider are grouped into a single edge provider. The edge provider name is constructed by concatenating the edge label, source provider name, and destination provider name as shown in the following format:

```
edgeLabel_sourceProviderName_destinationProviderName
```

Every element within the same provider will have the same list of properties. If the properties do not have a specific value, then a default value will be used.

The two important configuration options that impact how vertices and edges are processed when using the `GraphBuilder` API are:

- **ID Generation Strategy:** This determines how IDs are generated for vertices and edges during graph construction. The `GraphBuilder` supports two ID generation strategies:

- **USER_IDS**: As a user, you can provide the IDs for vertices and edges. Note that the user-provided IDs must be unique for vertices and edges. This implies that you cannot add two vertices or edges with the same ID, even if they belong to different partitions. This uniqueness constraint is enforced regardless of the ID strategy to be adopted later by the created graph.
- **AUTO_GENERATED**: The system automatically generates the IDs for vertices and edges.
- **ID Strategy**: This determines how the graph manages and accesses vertex and edge IDs after creation. This ID strategy is independent of how the IDs were generated during graph creation (either autogenerated (**AUTO_GENERATED**) or specified by you (**USER_IDS**)). You can then choose to retain these IDs or not in the final graph for both vertices and edges by using the `setRetainVertexIds` or `setRetainEdgeIds` API respectively. Depending on whether the vertex and edge IDs are preserved or not, the final graph strategy for vertex and edge IDs will be one of the following:
 - **KEYS_AS_IDS**
 - **PARTITIONED_IDS**
 - **UNSTABLE_GENERATED_IDS**

It is important to note that the ID strategy is implicitly determined by the GraphBuilder's configuration and you cannot explicitly choose the ID strategy for vertices or edges when creating a graph with the GraphBuilder.

The following topics explain the different ID strategies in detail:

- [KEYS_AS_IDS Strategy](#)
KEYS_AS_IDS strategy implies that IDs are based on user-provided keys. In this case, IDs must be globally unique across the entire graph.
- [PARTITIONED_IDS Strategy](#)
PARTITIONED_IDS strategy implies that IDs are constructed by combining the label name with user-provided keys or auto-generated keys. Therefore, the uniqueness requirement for IDs applies at the label level once the graph is built.
- [UNSTABLE_GENERATED_IDS Strategy](#)
UNSTABLE_GENERATED_IDS strategy implies that the IDs are system-generated and may change. These IDs are not guaranteed to be stable.

29.6.1.1 KEYS_AS_IDS Strategy

KEYS_AS_IDS strategy implies that IDs are based on user-provided keys. In this case, IDs must be globally unique across the entire graph.

The following example creates a partitioned graph using the `createGraphBuilder` API with **USER_IDS** generation strategy for vertices and edges. Also, the graph is configured to retain vertex and edge IDs without partitioning them.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```

opg4j> var builder = session.createGraphBuilder()

opg4j>
builder.setVertexIdGenerationStrategy(IdGenerationStrategy.USER_IDS). //
Using user-provided IDs for vertices

setEdgeIdGenerationStrategy(IdGenerationStrategy.USER_IDS). //
Using user-provided IDs for edges

setRetainVertexIds(true). //
Retain user-provided vertex IDs (enabled by default).

setRetainEdgeIds(true). //
Retain user-provided edge IDs (enabled by default).

partitionedVertexIds(false). // Do
not partition vertex IDs (disabled by default).

partitionedEdgeIds(false) // Do
not partition edge IDs (disabled by default).

opg4j> builder.addVertex(1).addLabel("Persons").setProperty("name", "Alice")
opg4j> builder.addVertex(2).addLabel("Persons").setProperty("name", "Bob")
opg4j> builder.addEdge(1, 1, 2).setLabel("Knows") // (edge ID, source
vertex ID, destination vertex ID)

opg4j> var graph = builder.build("Graph_KeysAsIds")

```

Java

```

GraphBuilder<Integer> builder = session.createGraphBuilder();

    builder.setVertexIdGenerationStrategy(IdGenerationStrategy.USER_IDS) //
Using user-provided IDs for vertices
    .setEdgeIdGenerationStrategy(IdGenerationStrategy.USER_IDS) //
Using user-provided IDs for edges
    .setRetainVertexIds(true) //
Retain user-provided vertex IDs (enabled by default)
    .setRetainEdgeIds(true) //
Retain user-provided edge IDs (enabled by default)
    .partitionedVertexIds(false) // Do
not partition vertex IDs (disabled by default)
    .partitionedEdgeIds(false); // Do
not partition edge IDs (disabled by default)

    builder.addVertex(1).addLabel("Person").setProperty("name", "Alice");
    builder.addVertex(2).addLabel("Person").setProperty("name", "Bob");
    builder.addEdge(1, 1, 2).setLabel("Knows"); // (edge ID, source vertex
ID, destination vertex ID)

    PgxGraph graph = builder.build("Graph_KeysAsIds");

```

Python

```
>>> builder =
session.create_graph_builder(vertex_id_generation_strategy='user_ids',
...
edge_id_generation_strategy='user_ids')
>>> builder.set_retain_vertex_ids(True)
>>> builder.set_retain_edge_ids(True)
>>> builder.partitioned_edge_ids(False)
>>> builder.partitioned_vertex_ids(False)
>>> builder.add_vertex(1).add_label("Persons").set_property("name", "Alice")
>>> builder.add_vertex(2).add_label("Persons").set_property("name", "Bob")
>>> builder.add_edge(1, 2, 1).set_label("knows") #(source vertex ID,
destination vertex ID, edge ID)
>>> graph = builder.build(name="Graph_KeysAsIds")
```

As seen in the preceding example, the vertex IDs 1 and 2 are globally unique across the graph. Also, the edge ID is 1, which is unique in the graph.

The following shows an example for querying the graph created in the previous example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var alice = graph.getVertex(1) // Retrieves the vertex with ID 1
(Alice)
opg4j> var knows = graph.getEdge(1)   // Retrieves the edge with ID 1
```

Java

```
PgxVertex<Integer> alice = graph.getVertex(1); // Retrieves the vertex with
ID 1 (Alice)
PgxEdge<Integer> knows = graph.getEdge(1);      // Retrieves the edge with ID
1
```

Python

```
graph.get_vertex(1) # Retrieves the vertex with ID 1 (Alice)
graph.get_edge(1)   # Retrieves the edge with ID 1
```

29.6.1.2 PARTITIONED_IDS Strategy

PARTITIONED_IDS strategy implies that IDs are constructed by combining the label name with user-provided keys or auto-generated keys. Therefore, the uniqueness requirement for IDs applies at the label level once the graph is built.

However, note that the `GraphBuilder` API enforces all IDs (user-provided keys or auto-generated keys) to be unique at the time of graph creation.

The following example creates a partitioned graph using the `createGraphBuilder` API with `USER_IDS` generation strategy for vertices and edges. Also, the graph is configured to retain and partition vertex and edge IDs.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var builder = session.createGraphBuilder()

opg4j>
builder.setVertexIdGenerationStrategy(IdGenerationStrategy.USER_IDS). //
Using user-provided IDs for vertices

setEdgeIdGenerationStrategy(IdGenerationStrategy.USER_IDS).          //
Using user-provided IDs for edges

setRetainVertexIds(true).                                              //
Retain user-provided vertex IDs (enabled by default)

setRetainEdgeIds(true).                                              //
Retain user-provided edge IDs (enabled by default)

partitionedVertexIds(true).                                           //
Partition vertex IDs

partitionedEdgeIds(true)                                              //
Partition edge IDs
opg4j> builder.addVertex(1).addLabel("Person").setProperty("name", "Alice")
opg4j> builder.addVertex(2).addLabel("Account").setProperty("IBAN", "12345")
opg4j> builder.addEdge(1, 1, 2).setLabel("Owns") // (edge ID, source vertex
ID, destination vertex ID)

opg4j> var graph = builder.build("Graph_PartitionedIds")
```

Java

```
GraphBuilder<Integer> builder = session.createGraphBuilder();
```

```

    builder.setVertexIdGenerationStrategy(IdGenerationStrategy.USER_IDS) //
Using user-provided IDs for vertices
    .setEdgeIdGenerationStrategy(IdGenerationStrategy.USER_IDS)          //
Using user-provided IDs for edges
    .setRetainVertexIds(true)                                              //
Retain user-provided vertex IDs (enabled by default)
    .setRetainEdgeIds(true)                                              //
Retain user-provided edge IDs (enabled by default)
    .partitionedVertexIds(true)                                          //
Partition vertex IDs
    .partitionedEdgeIds(true);                                           //
Partition edge IDs

    builder.addVertex(1).addLabel("Person").setProperty("name", "Alice");
    builder.addVertex(2).addLabel("Account").setProperty("IBAN", "12345");
    builder.addEdge(1, 1, 2).setLabel("Owns");                          // (edge
ID, source vertex ID, destination vertex ID)

    PgxGraph graph = builder.build("Graph_PartitionedIds");

```

Python

```

>>> builder =
session.create_graph_builder(vertex_id_generation_strategy='user_ids',
...
edge_id_generation_strategy='user_ids')
>>> builder.set_retain_vertex_ids(True)
>>> builder.set_retain_edge_ids(True)
>>> builder.partitioned_edge_ids(True)
>>> builder.partitioned_vertex_ids(True)
>>> builder.add_vertex(1).add_label("Person").set_property("name", "Alice")
>>> builder.add_vertex(2).add_label("Account").set_property("IBAN", "12345")
>>> builder.add_edge(1, 2, 1).set_label("Owns") # (source vertex ID,
destination vertex ID, edge ID)
>>> graph = builder.build(name="Graph_PartitionedIds")

```

As seen in the preceding example, the vertex IDs 1 and 2 are globally unique across the graph. Also, the edge ID 1 is unique in the graph.

The following shows an example for retrieving the vertices and edges using a combination of the label name and the ID.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var alice = graph.getVertex("Person(1)")           // Retrieves Alice
opg4j> var account = graph.getVertex("Account(2)")        // Retrieves the
Account
opg4j> var owns = graph.getEdge("Owns_Person_Account(1)") // Retrieves the
edge
```

Java

```
PgxVertex<String> alice = graph.getVertex("Person(1)");    // Retrieves Alice
PgxVertex<String> account = graph.getVertex("Account(2)"); //
Retrieves the Account
PgxEdge<String> owns = graph.getEdge("Owns_Person_Account(1)"); // Retrieves
the edge
```

Python

```
>>> graph.get_vertex("Person(1)")
>>> graph.get_vertex("Account(2)")
>>> graph.get_edge("Owns_Person_Account(1)")
```

29.6.1.3 UNSTABLE_GENERATED_IDS Strategy

UNSTABLE_GENERATED_IDS strategy implies that the IDs are system-generated and may change. These IDs are not guaranteed to be stable.

The following example creates a partitioned graph using the `createGraphBuilder` API with `USER_IDS` generation strategy for vertices and edges. Also, the graph is configured not to retain the IDs. Therefore, system-generated IDs are used.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var builder = session.createGraphBuilder()
opg4j>
builder.setVertexIdGenerationStrategy(IdGenerationStrategy.USER_IDS). //
Using user-provided IDs for vertices

setEdgeIdGenerationStrategy(IdGenerationStrategy.USER_IDS).           //
Using user-provided IDs for edges

setRetainVertexIds(false).                                              // Do
not retain user-provided vertex IDs
```

```

setRetainEdgeIds(false)                                // DO
not retain user-provided edge IDs
opg4j> builder.addVertex(1).addLabel("Person").setProperty("name", "Alice")
opg4j> builder.addVertex(2).addLabel("Person").setProperty("name", "Bob")
opg4j> builder.addEdge(1, 1, 2).setLabel("Knows")        // Edge from Alice to
Bob with ID 1

opg4j> var graph = builder.build("Graph_UnstableIds")

```

Java

```

GraphBuilder<Integer> builder = session.createGraphBuilder();
builder.setVertexIdGenerationStrategy(USER_IDS) // Using user-provided IDs
for vertices
    .setEdgeIdGenerationStrategy(USER_IDS)      // Using user-provided IDs
for edges
    .setRetainVertexIds(false)                   // Do not retain user-
provided vertex IDs
    .setRetainEdgeIds(false)                     // Do not retain user-
provided edge IDs
builder.addVertex(1).addLabel("Person").setProperty("name", "Alice");
builder.addVertex(2).addLabel("Person").setProperty("name", "Bob");
builder.addEdge(1, 1, 2).setLabel("Knows");      // Edge from Alice to Bob
with ID 1

PgxGraph graph = builder.build("Graph_UnstableIds");

```

Python

```

>>> builder =
session.create_graph_builder(vertex_id_generation_strategy='user_ids',
...
edge_id_generation_strategy='user_ids')
>>> builder.set_retain_vertex_ids(False)
>>> builder.set_retain_edge_ids(False)
>>> builder.add_vertex(1).add_label("Person").set_property("name", "Alice")
>>> builder.add_vertex(2).add_label("Person").set_property("name", "Bob")
>>> builder.add_edge(1, 1, 2).set_label("Knows")
>>> graph = builder.build(name="Graph_UnstableIds")

```

In the preceding example, regardless of the ID generation strategy used by the GraphBuilder (USER_IDS or AUTO_GENERATED), the graph server (PGX) will automatically regenerate the IDs since the IDs provided by the GraphBuilder API are not retained.

As these IDs may not be stable, you can retrieve the elements by obtaining their IDs at runtime or by iterating over the graph. In this case, it is recommended to use properties as identifiers to locate vertices and edges.

29.6.2 Modifying Loaded Graphs Using ChangeSet

This guide explains how to add and remove vertices and edges from already loaded graphs.

As a prerequisite, you must have a graph already loaded into the graph server (PGX). See [Reading Graphs from Oracle Database into the Graph Server \(PGX\)](#) for more information.

You can now use the `GraphChangeSet` interface to modify the loaded graphs.

Note

Modifying undirected graphs is not supported in graph server (PGX) 21.3.

- [Modifying Vertices](#)
- [Adding Edges](#)
- [GraphChangeSet with Partitioned IDs](#)
- [Error Handling when Using a ChangeSet](#)

29.6.2.1 Modifying Vertices

You can add, remove and modify vertices using the `GraphChangeSet` object.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var changeSet = graph.<Integer>createChangeSet()

opg4j> changeSet.addVertex(42).setProperty("prop", 23)
opg4j> changeSet.updateVertex(128).setProperty("prop", 5)
opg4j> changeSet.removeVertex(1908)

opg4j> var updatedGraph = changeSet.build()

opg4j> updatedGraph.hasVertex(42) // Evaluates to: true
opg4j> updatedGraph.hasVertex(1908) // Evaluates to: false
```

Java

```
import oracle.pgx.api.*;

GraphChangeSet<Integer> changeSet = graph.createChangeSet();

changeSet.addVertex(42).setProperty("prop", 23);
changeSet.updateVertex(128).setProperty("prop", 5);
```

```
changeSet.removeVertex(1908);

PgxGraph updatedGraph = changeSet.build();
```

Python

```
from pypgx.api import *

change_set = graph.create_change_set()

change_set.add_vertex(42).set_property("prop", 23)
changeSet.update_vertex(128).set_property("prop", 5)
changeSet.remove_vertex(1908)

updated_graph = change_set.build()
```

29.6.2.2 Adding Edges

You can also add edges to a graph using `GraphChangeSet`.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var changeSet2 = updatedGraph.<Integer>createChangeSet()

opg4j> changeSet2.addEdge(333, 42).setProperty("cost", 42.3)
opg4j> changeSet2.addEdge(42, 99)

opg4j> var updatedGraph2 = changeSet2.build()
```

Java

```
import oracle.pgx.api.*;

GraphChangeSet<Integer> changeSet2 = graph.createChangeSet();

changeSet2.addEdge(333, 42).setProperty("cost", 42.42);
changeSet2.addEdge(42, 99);

PgxGraph updatedGraph2 = changeSet2.build();
```

Python

```
from pypgx.api import *

change_set_2 = graph.create_change_set()
changeSet2.add_edge(333, 42).set_property("cost", 42.42)
changeSet2.add_edge(42, 99)
updated_graph_2 = change_set_2.build()
```

Note that by calling `changeSet2.build()`, you created a brand new graph with a unique name assigned by the graph server (PGX). If need be, you can specify a name argument to the `build()` method.

Additionally, you can create a new snapshot on top of the current graph with the `buildNewSnapshot()` method. See [Creating a Snapshot via ChangeSet](#) for more information.

29.6.2.3 GraphChangeSet with Partitioned IDs

You can use the `GraphChangeSet` API with graph with partitioned IDs. Ensure to set both the vertex ID generation strategy as well as the edge ID generation strategy to `IdGenerationStrategy.USER_IDS`. Furthermore, make sure to set the vertex ID type to `String`. An edge ID type does not need to be specified.

You can add, update and remove vertices and edges as shown in the following examples:

-
- [Java](#)
 - [Python](#)

Java

```
GraphChangeSet<String> changeSet =
g.createChangeSet(IdGenerationStrategy.USER_IDS,
IdGenerationStrategy.USER_IDS);
changeSet.addVertex("Accounts(1002)").setProperty("NAME", "User1002");
changeSet.updateVertex("Accounts(4)").setProperty("NAME", "User4");
changeSet.removeVertex("Accounts(3)");
changeSet.addEdge("Transfers(5002)", "Accounts(5)",
"Accounts(6)").setProperty("AMOUNT", 12.50);
changeSet.updateEdge("Transfers(5)").setProperty("DESCRIPTION", "Transfer
from User");
changeSet.removeEdge("Transfers(5001)");
PgxGraph g1 = changeSet.build();
```

Python

```
change_set = graph.create_change_set(vertex_id_generation_strategy =
'user_ids', edge_id_generation_strategy = 'user_ids')
change_set.add_vertex("Accounts(1002)").set_property("NAME", "User1002")
change_set.update_vertex("Accounts(4)").set_property("NAME", "User4")
```

```
change_set.remove_vertex("Accounts(3)")
change_set.remove_edge("Transfers(5001)")
PgxGraph g1 = change_set.build()
```

Note

You cannot use the `setLabel()` API when IDs are partitioned. The vertex or edge will be labelled automatically based on the label attached to the provider (for which the name is provided as part of the ID). Similarly, you cannot set the vertex or edge key properties through the `setProperty()` API as the value is already extracted from the vertex or edge ID.

29.6.2.4 Error Handling when Using a ChangeSet

Error handling while populating a `ChangeSet` or while applying a `ChangeSet` to the existing graph can be configured by setting the `InvalidChangePolicy`. The options are:

- `OnInvalidChange.ERROR`: throws an exception (This is the default configuration)
- `OnInvalidChange.IGNORE`: ignores the issue and continues
- `OnInvalidChange.IGNORE_AND_LOG`: ignores the issue, logs in `DEBUG` log level and continues
- `OnInvalidChange.IGNORE_AND_LOG_ONCE`: only logs the first occurrence of each issue type

Issues that can be ignored with `InvalidChangePolicy` include trying to remove a vertex or an edge that does not exist in the graph, property type mismatch, updates to non existing properties, providing a vertex ID with wrong type or invalid vertex or edge providers.

The following example, tries to remove vertex 9032 which does not exist in the graph. By configuring `IGNORE_AND_LOG`, this action will be ignored while the property value update for vertex 99 will be applied successfully.

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var changeSet3 = updatedGraph2.<Integer>createChangeSet()
opg4j> changeSet3.setInvalidChangePolicy(OnInvalidChange.IGNORE_AND_LOG)

opg4j> changeSet3.removeVertex(9032)
opg4j> changeSet3.updateVertex(99).setProperty("prop1", 17)
opg4j> var updatedGraph3 = changeSet3.build() // will log that a vertex
removal was ignored

opg4j> var prop1Val = updatedGraph3.getVertex(99).getProperty("prop1") //
evaluates to 17
```

Java

```
import oracle.pgx.api.*;

GraphChangeSet<Integer> changeSet3 = graph.createChangeSet();
changeSet3.setInvalidChangePolicy(OnInvalidChange.IGNORE_AND_LOG);
changeSet3.removeVertex(9032);
changeSet3.updateVertex(99).setProperty("prop1", 17);
PgxGraph updatedGraph3 = changeSet3.build(); // will log that a vertex
removal was ignored

int prop1Val = updatedGraph3.getVertex(99).getProperty("prop1"); // evaluates
to 17
```

Note

When connecting to a remote graph server (PGX), error handling log messages will not be relayed to the client. In such a case, you need access to the server logs to determine which issues have been ignored. For this, you must update the default Logback configuration file in `/etc/oracle/graph/logback.xml` and the graph server (PGX) logger configuration file in `/etc/oracle/graph/logback-server.xml` to log the DEBUG logs. You can then view the ignored issues in `/var/opt/log/pgx-server.log` file.

Add Existing Edges and Vertices

The error handling for adding a vertex or an edge where its ID is already used in the graph or in an incompatible ChangeSet action can be configured with `AddExistingVertexPolicy` and `AddExistingEdgePolicy`.

Note

The default setting for `AddExistingVertexPolicy` and `AddExistingEdgePolicy` is `IGNORE`. This is different from `InvalidChangePolicy` where the default is `ERROR`.

29.7 Managing Transient Data

This guide discusses how to handle transient properties and collections.

The graph server (PGX) allows each client to maintain its own isolated workspace, called session. Clients may create additional data objects in their own session, which they can then use for analysis.

- [Managing Transient Properties](#)
- [Managing Collections and Scalars](#)

29.7.1 Managing Transient Properties

The graph server (PGX) adopts the Property Graph data model. Once a graph is loaded into PGX, the graph instance itself and its original properties are set as immutable. However, the client can create and attach additional properties to the graph dynamically. These extra properties are referred to as *transient* properties and are mutable by the client

The methods for creating transient properties are available in `PgxGraph`:

-
- [Java](#)
 - [Python](#)

Java

```
VertexProperty<ID, V> createVertexPropertyAsync(PropertyType type)
VertexProperty<ID, V> createVertexPropertyAsync(PropertyType type, String
name)
EdgeProperty<V> createEdgePropertyAsync(PropertyType type)
EdgeProperty<V> createEdgePropertyAsync(PropertyType type, String name)
```

In the preceding code:

- `PropertyType`: is an enum for the data type of the property, which must be one of the primitive types supported by PGX.
- `name`: is an optional argument to assign a unique name to the newly created property. If no name is specified, PGX will assign one to the client.

Note

Names must be unique. There cannot be two different vertex or edge properties for the same graph and with the same name.

Python

```
create_vertex_property(self, data_type, name=None)
```

All methods return a `Property` object, which represent the newly created transient property. Both of the underlying classes, `VertexProperty<ID, V>` and `EdgeProperty<V>`, are parametrized with the value type `v` the property holds. `v` matches the given `PropertyType`. `VertexProperty<ID, V>` is additionally parametrized with the vertex ID type. This is due to PGX support of several types of vertex identifiers. See our graph configuration chapter on how to specify the vertex ID type of a graph. `EdgeProperty<V>` is not parametrized with the edge ID type, because PGX only supports edge identifiers of type `long`.

- [Java](#)
- [Python](#)

Java

```
GraphConfig config = GraphConfigBuilder.forFileFormats(...)
...
.setVertexIdType(IdType.LONG)
...
.build();

PgxGraph G = session.readGraphWithProperties(config);
VertexProperty<Long, String> p1 = G.createVertexProperty(PropertyType.STRING);
EdgeProperty<Double> p2 = G.createEdgeProperty(PropertyType.DOUBLE);
```

Python

```
G = session.read_graph_with_properties(config)
p1 = G.create_vertex_property("string")
p2 = G.create_edge_property("double")
```

To delete a transient property from the session, call `destroyAsync()` (or `destroy()`) on the property object.

29.7.2 Managing Collections and Scalars

The client can create graph-bound vertex and edge collections to use during the analysis with the following methods in `PgxGraph`:

-
- [Java](#)
 - [Python](#)

Java

```
VertexSequence<E> createVertexSequence()
VertexSequence<E> createVertexSequence(String name)
VertexSet<E> createVertexSet()
VertexSet<E> createVertexSet(String name)
EdgeSequence createEdgeSequence()
EdgeSequence createEdgeSequence(String name)
EdgeSet createEdgeSet()
EdgeSet createEdgeSet(String name)
```

Python

```
create_edge_sequence(self, name=None)
create_vertex_sequence(self, name=None)
create_edge_set(self, name=None)
create_edge_sequence(self, name=None)
```

PGX also supports scalar collections such as `set` and `sequence`. Each of these collections can hold elements of various primitive data types like `INTEGER`, `LONG`, `FLOAT`, `DOUBLE` or `BOOLEAN`. Scalar collections are session-bound and can be created with the following methods in `PgxSession`:

```
ScalarSet<T> createSet(PropertyType contentType, String name)
ScalarSequence<T> createSequence(PropertyType contentType, String name)
ScalarSet<T> createSet(PropertyType contentType)
ScalarSequence<T> createSequence(PropertyType contentType)
```

In the preceding code, the optional argument (`name`) specifies the name of the newly created collection. If omitted, PGX chooses a name for the client. As with properties, the collections holding vertices are parametrized with the `ID` type of the vertices. Refer to graph configuration chapter to learn how to specify the vertex ID type of a graph.

The return value is the collection object which points to the newly created empty collection.

To drop a collection from the session, call `destroy()` on the collection object.

To check which collections are currently allocated for a graph you can use the following method:

-
- [Java](#)
 - [Python](#)

Java

```
Map<String, PgxCollection<? extends PgxEntity<?>, ?>> getCollections()
```

Python

```
get_collections(self)
```

The returned map contains the names of the collections as keys and the collections as values. The collections can be casted to the matching collection subclass.

PGX supports special `Map` collection types and allows users to map between different data types (`oracle.pgx.common.types.PropertyType`). Maps can be created using `PgxGraph` or

PgxSession APIs, the difference is that the latter supports only non graph-related types, and that the created maps directly depend on the session:

```
PgxMap<K, V> createMap(PropertyType keyType, PropertyType valType)
PgxMap<K, V> createMap(PropertyType keyType, PropertyType valType, String
mapName)
```

Similarly, scalar variables can be created in the client session using the following methods:

-
- [Java](#)
 - [Python](#)

Java

```
Scalar<T> createScalar(PropertyType type, String newScalarName)
Scalar<T> createScalar(PropertyType type)
```

Python

```
create_scalar(self, data_type, name=None)
```

These collections and scalar variables can then be passed as arguments to graph algorithms. See [Using Custom PGX Graph Algorithms](#) for more information.

29.8 Graph Versioning

This guide describes the different ways to work with graph snapshots.

A graph can have multiple snapshots associated with it, reflecting different versions of the graph. All snapshots of a graph have the same graph configuration associated.

The following topics explain the various operations you can perform on graph snapshots:

- [Configuring the Snapshots Source](#)
- [Creating a Snapshot via Refreshing](#)
- [Creating a Snapshot via ChangeSet](#)
- [Checking Out the Latest Snapshots of a Graph](#)
- [Checking Out Different Snapshots of a Graph](#)
- [Directly Loading a Specific Snapshot of a Graph](#)

29.8.1 Configuring the Snapshots Source

Snapshots can be created from two sources: **Refreshing** and **ChangeSet**.

Refreshing is available for graphs that are read from a persistent data source, that is, a file. When the data source has changed with respect to the version stored in the graph server

(PGX), it can be read again manually by calling the `PgxSession.readGraphWithProperties()` method. Similarly, if auto-refresh is set for the graph, the graph server (PGX) automatically reads the data source and creates new snapshots when the data source has changed.

Instead, a `ChangeSet` is a set of changes to a graph that the user creates and populates via the PGX `ChangeSet` API. Once a `ChangeSet` is created and populated with the desired changes, the user can simply call `GraphChangeSet.buildNewSnapshot()` to create a new snapshot for the graph. In this way, you are empowered to integrate changes coming from any source into the graph and build snapshots out of them.

Only one source of snapshots is allowed for a single graph and is chosen during graph configuration via the `snapshots_source` option, which can be set to either `REFRESH` or `CHANGE_SET`. In case the `snapshots_source` option is not explicitly set by the user, the following default settings apply:

- If the graph is from a persistent data source, the default value is `REFRESH`, so that snapshots can be created only by calling `PgxSession.readGraphWithProperties()` (or via auto-refresh, if configured).
- If the graph is transient, that is, built from a graph builder, the default value is `CHANGE_SET`, since the graph is not backed by a persistent data source from which changes can be read. It is for this reason, `CHANGE_SET` is the only admissible value for transient graphs.

Additionally, the following restrictions apply:

- If auto-refresh is enabled, then snapshots come from reading the backing data source and hence only `REFRESH` is admissible for the `snapshots_source` option.
- If the user attempts to create snapshots in a way that is different from the configuration (for example, by calling `GraphChangeSet.buildNewSnapshot()` when the graph's `snapshots_source` is `REFRESH`), the operation is invalid and an exception is thrown.

29.8.2 Creating a Snapshot via Refreshing

You can create a snapshot via refreshing by performing the following steps:

1. Create a session and load the graph into memory.
2. Check the available snapshots of the graph with `PgxSession.getAvailableSnapshots()` method.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> session.getAvailableSnapshots(G)
==> GraphMetaData [getNumVertices()=4, getNumEdges()=4, memoryMb=0,
dataSourceVersion=1453315103000, creationRequestTimestamp=1453315122669
(2016-01-20 10:38:42.669), creationTimestamp=1453315122685 (2016-01-20
10:38:42.685), vertexIdType=integer, edgeIdType=long]
```

Java

```
Deque<GraphMetaData> snapshots = session.getAvailableSnapshots(G);
for( GraphMetaData metaData : snapshots ) {
    System.out.println( metaData );
}
```

Python

```
snapshots = session.get_available_snapshots(G)
for metadata in snapshots:
    print(metadata)
```

-
3. Edit the source file to contain an additional vertex and an additional edge or insert two rows in the database.
 4. Reload the updated graph within the same session as you loaded the original graph. A new snapshot is created.
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var G = session.readGraphWithProperties( G.getConfig(), true )
==> PGX Graph named 'sample_2' bound to PGX session 'a1744e86-65fb-4bd1-
b2dc-5458b20954a9' registered at PGX Server Instance running in embedded
mode
opg4j> session.getAvailableSnapshots(G)
==> GraphMetaData [getNumVertices()=4, getNumEdges()=4, memoryMb=0,
dataSourceVersion=1453315103000, creationRequestTimestamp=1453315122669
(2016-01-20 10:38:42.669), creationTimestamp=1453315122685 (2016-01-20
10:38:42.685), vertexIdType=integer, edgeIdType=long]
==> GraphMetaData [getNumVertices()=5, getNumEdges()=5, memoryMb=3,
dataSourceVersion=1452083654000, creationRequestTimestamp=1453314938744
(2016-01-20 10:35:38.744), creationTimestamp=1453314938833 (2016-01-20
10:35:38.833), vertexIdType=integer, edgeIdType=long]
```

Java

```
G = session.readGraphWithProperties( G.getConfig(), true );

Deque<GraphMetaData> snapshots = session.getAvailableSnapshots( G );
```

Python

```
G = session.read_graph_with_properties(G.config,update_if_not_fresh=True)
```

Note that there are two `GraphMetaData` objects in the call for available snapshots, one with 4 vertices and 4 edges and one with 5 vertices and 5 edges.

5. Verify that the graph variable points to the newly loaded graph using `getNumVertices()` and `getNumEdges()` methods.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> G.getNumVertices()  
==> 5  
opg4j> G.getNumEdges()  
==> 5
```

Java

```
int vertices = G.getNumVertices();  
long edges = G.getNumEdges();
```

Python

```
vertices = G.num_vertices  
edges = G.num_edges
```

29.8.3 Creating a Snapshot via ChangeSet

You can create a graph snapshot with `ChangeSet` via the PGX Java API. When you want to create the graph from a persistent data source, you can use `PgxSession.readGraphWithProperties()` with the `snapshots_source` configuration option set to `CHANGE_SET`.

You can create a snapshot via `ChangeSet` by performing the following steps:

1. Create a snapshot of a transient graph from database:

-
- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> var builder = session.createGraphBuilder()  
opg4j> builder.addEdge(1, 2)  
opg4j> builder.addEdge(2, 3)  
opg4j> builder.addEdge(2, 4)  
opg4j> builder.addEdge(3, 4)  
opg4j> builder.addEdge(4, 2)  
opg4j> var graph = builder.build()
```

Java

```
import oracle.pgx.api.*;  
  
GraphBuilder<Integer> builder = session.createGraphBuilder();  
  
builder.addEdge(1, 2);  
builder.addEdge(2, 3);  
builder.addEdge(2, 4);  
builder.addEdge(3, 4);  
builder.addEdge(4, 2);  
  
PgxGraph graph = builder.build();
```

Python

```
builder = session.create_graph_builder()  
  
builder.add_edge(1, 2)  
builder.add_edge(2, 3)  
builder.add_edge(2, 4)  
builder.add_edge(3, 4)  
builder.add_edge(4, 2)  
  
graph = builder.build()
```

-
2. Create a `ChangeSet` from `graph` and populate it. The following example shows adding a new edge between vertices 1 and 4:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var changeSet = graph.<Integer>createChangeSet()  
opg4j> changeSet.addEdge(6, 1, 4)
```

Java

```
import oracle.pgx.api.*;  
GraphChangeSet<Integer> changeSet = graph.createChangeSet();  
changeSet.addEdge(6, 1, 4);
```

Python

```
changeSet = graph.create_change_set()changeSet.add_edge(1,4,6)
```

-
3. Create a second snapshot using `GraphChangeSet.buildNewSnapshot()` as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var secondSnapshot = changeSet.buildNewSnapshot()  
opg4j> session.getAvailableSnapshots(secondSnapshot).size()  
==> 2
```

Java

```
PgxGraph secondSnapshot = changeSet.buildNewSnapshot();  
System.out.println( session.getAvailableSnapshots(secondSnapshot).size() );
```

Python

```
second_snapshot = change_set.build_new_snapshot()  
print(len(session.get_available_snapshots()))
```

Thus two snapshots, referenced via the variables `graph` and `secondSnapshot` are created.

29.8.4 Checking Out the Latest Snapshots of a Graph

With multiple snapshots of a graph being available and regardless of their source, you can check out a specific snapshot using the `PgxSession.setSnapshot()` method. You can use the `LATEST_SNAPSHOT` constant of `PgxSession` to easily check out the latest available snapshot, as shown in the following example:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> session.setSnapshot( G, PgxSession.LATEST_SNAPSHOT )
==> null
opg4j> session.getCreationTimestamp()
==> 1453315122685
```

Java

```
session.setSnapshot( G, PgxSession.LATEST_SNAPSHOT );
System.out.println(session.getCreationTimestamp());
```

See the printed timestamp to verify the most recent snapshot.

29.8.5 Checking Out Different Snapshots of a Graph

You can also check out a specific snapshot, again using the `PgxSession.setSnapshot()`.

For example, consider the following two snapshots of a graph:

```
==> GraphMetaData [getNumVertices()=4, getNumEdges()=4, memoryMb=0,
dataSourceVersion=1453315103000, creationRequestTimestamp=1453315122669
(2016-01-20 10:38:42.669), creationTimestamp=1453315122685 (2016-01-20
10:38:42.685), vertexIdType=integer, edgeIdType=long]
==> GraphMetaData [getNumVertices()=5, getNumEdges()=5, memoryMb=3,
dataSourceVersion=1452083654000, creationRequestTimestamp=1453314938744
(2016-01-20 10:35:38.744), creationTimestamp=1453314938833 (2016-01-20
10:35:38.833), vertexIdType=integer, edgeIdType=long]
```

To check out a specific snapshot of the graph, you must pass the `creationTimestamp` of the snapshot you want to load to `setSnapshot()`.

For example, if `G` is pointing to the newest graph with 5 vertices and 5 edges, but you want to analyze the older graph, you need to set the snapshot to 1453315122685.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> G.getNumVertices()  
==> 5  
opg4j> G.getNumEdges()  
==> 5  
opg4j> session.setSnapshot( G, 1453315122685 )  
==> null  
opg4j> G.getNumVertices()  
==> 4  
opg4j> G.getNumEdges()  
==> 4
```

Java

```
session.setSnapshot(G,1453315122685);
```

Python

```
session.set_snapshot(G,1453315122685)
```

Note that setting the snapshot, changes the number of vertices and edges from 5 to 4.

Alternatively, you can also retrieve the creation timestamp of each snapshot from its associated `GraphMetaData` object via the `GraphMetaData.getCreationTimestamp()` method. The easiest way to get the `GraphMetaData` information of all the snapshots is to use the `PgxSession.getAvailableSnapshots()` method, which returns a collection of `GraphMetaData` information of each snapshot ordered by creation timestamp from the most recent to the oldest.

29.8.6 Directly Loading a Specific Snapshot of a Graph

You can also load a specific snapshot of a graph directly using the `PgxSession.readGraphAsOf()` method. This is a shortcut for loading a graph with `readGraphWithProperties()` followed by a `setSnapshot()`. Consider two snapshots of a graph that are already loaded into the PGX session. The following example shows how to get a reference to a specific snapshot:

1. Get a graph configuration for the graph:

-
- [JShell](#)
 - [Java](#)

- [Python](#)

JShell

```
opg4j> var config =
GraphConfigFactory.forAnyFormat().fromPath("<path_to_json>")
==> {"format":"adj_list", ... }
```

Java

```
GraphConfig config =
GraphConfigFactory.forAnyFormat().fromPath("<path_to_json>");
```

Python

```
config = GraphConfigFactory.for_any_format().from_path("<path_to_json>")
```

-
2. Check the loaded snapshots for this graph config using `getAvailableSnapshots()`:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> session.getAvailableSnapshots(G)
==> GraphMetaData [getNumVertices()=4, getNumEdges()=4, memoryMb=0,
dataSourceVersion=1453315103000, creationRequestTimestamp=1453315122669
(2016-01-20 10:38:42.669), creationTimestamp=1453315122685 (2016-01-20
10:38:42.685), vertexIdType=integer, edgeIdType=long]
==> GraphMetaData [getNumVertices()=5, getNumEdges()=5, memoryMb=3,
dataSourceVersion=1452083654000, creationRequestTimestamp=1453314938744
(2016-01-20 10:35:38.744), creationTimestamp=1453314938833 (2016-01-20
10:35:38.833), vertexIdType=integer, edgeIdType=long]
```

Java

```
Deque<GraphMetaData> snapshots = session.getAvailableSnapshots(G);
```

Python

```
session.get_available_snapshots(G)
```

3. Check out the snapshot of the graph which has 4 vertices and 4 edges and having the timestamp 1453315122685:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var G = session.readGraphAsOf( config, 1453315122685 )
==> PGX Graph named 'sample' bound to PGX session 'a1744e86-65fb-4bd1-
b2dc-5458b20954a9' registered at PGX Server Instance running in embedded
mode
opg4j> G.getNumVertices()
==> 4
opg4j> G.getNumEdges()
==> 4
```

Java

```
PgxGraph G = session.readGraphAsOf( config, 1453315122685 );
```

Python

```
G = read_graph_as_of(config, creation_timestamp=1453315122685)
```

29.9 Labels and Properties

You can perform various actions on the graph property and label values by executing PGQL queries.

- [Setting and Getting Property Values](#)
- [Getting Label Values](#)

29.9.1 Setting and Getting Property Values

Getting Property Values

You can obtain the vertex or edge property values by executing a `SELECT` PGQL query on the graph.

For example:

-
- [JShell](#)

- [Java](#)

JShell

```
opg4j> session.queryPgql("SELECT e.src_id, e.dest_id, e.amount FROM MATCH
(n:Account) -[e:Transfers]-> (m:Account) on bank_graph").print()
```

Java

```
...
...
PgxGraph g = session.getGraph("bank_graph");
String query =
    "SELECT e.src_id, e.dest_id, e.amount FROM MATCH (n:Account) -
[e:Transfers]-> (m:Account)";
g.queryPgql(query).print();
```

The resulting property values may appear as:

src_id	dest_id	amount
1	259	1000
1	418	1000
1	584	1000
1	644	1000
1	672	1000
2	493	1000
2	546	1000
2	693	1000
2	833	1000
2	840	1000

Setting Property Values

You can set the vertex or edge property values by executing insert or update PGQL queries on the graph.

For example, to set a new vertex account ID on a graph using `INSERT` query:

- [JShell](#)

- [Java](#)

JShell

```
opg4j> PgxGraph g = session.getGraph("bank_graph_analytics")
g ==> PgxGraph[name=bank_graph_analytics,N=1000,E=5001,created=1616312153556]
```

```
opg4j> PgxGraph g_mutable = g.clone("bank_graph_analytics_copy")
g_mutable ==>
PgxGraph[name=bank_graph_analytics_copy,N=1000,E=5001,created=1616312413799]
opg4j> g_mutable.executePgql("INSERT VERTEX v LABELS (Accounts) PROPERTIES
( v.id = 1001)")
```

Java

```
...
...
PgxGraph g1 = session.readGraphWithProperties("bank_graph_analytics.json");
PgxGraph g2 = g1.clone("bank_graph_analytics_copy");
g2.executePgql("INSERT VERTEX v " +
               "          LABELS ( Accounts ) " +
               "          PROPERTIES ( v.id = 1001 )");
```

29.9.2 Getting Label Values

You can retrieve the vertex or edge label values of a graph as shown:

```
PgxGraph g = session.getGraph("bank_graph_analytics");
String query =
    "SELECT LABEL(v), COUNT(*) "
    + "FROM MATCH (v) "
    + "GROUP BY LABEL(v) "
    + "ORDER BY COUNT(v) DESC";
PgqlResultSet resultSet = g.queryPgql(query);
resultSet.print();
```

The result may appear as shown:

```
+-----+
| LABEL(n) | COUNT(*) |
+-----+
| ACCOUNT  | 1000     |
+-----+
```

29.10 Filter Expressions

This guide explains the usage of filter expressions.

Filter expressions are applied in the following scenarios:

- **Path-Finding:** Include only specific vertices and edges in a path
- **Sub-Graphs:** Include only specific vertices and edges in a subgraph
- **Set creation:** Create a vertex or edge set and include only specific vertices or edges

There are two types of filter expressions:

- **Vertex filters:** Evaluated on each vertex

- **Edge filters:** Evaluated on each edge, including the two vertices it connects.

These filter expressions will evaluate to `true` if the current edge or vertex matches the expression or to `false` if it does not. Filter expressions are stateless and side-effect free.

The following short example below will evaluate to `true` for all edges where the source vertex's string property name is "PGX".

```
src.name="PGX"
```

- [Syntax](#)
- [Type System](#)
- [Path Finding Filters](#)
- [Subgraph Filters](#)
- [Operations on Filter Expressions](#)

29.10.1 Syntax

Trivial Expressions

Always evaluates to `true`:

```
true
```

Always evaluates to `false`:

```
false
```

Constants

Legal constants are integer, long and floating point numbers of single and double precision as well as strings literals and `true` and `false`. Long constants need to be suffixed with `L` or `l`. Floating point numbers are treated as double precision numbers by default. To force a certain precision you can use `f` or `F` for single precision and `d` or `D` for double precision floating point numbers. String literals are UTF-8 character sequences, surrounded by single or double quotation marks.

```
25
4294967296L
0.62f
0.33d
"Double quoted string"
'Single quoted string'
```

Vertex and Edge Identifiers

Depending on the filter type, different identifiers are valid.

Vertex Filter

Vertex filter expressions have only one keyword that addresses the vertex in the current context.

`vertex` denotes the vertex that is currently being evaluated by the filter expression.

vertex

Edge Filter

Edge filter expressions have several keywords that addresses the edge or its vertices in the current context.

edge denotes the edge that is currently being evaluated by the filter expression.

edge

dst denotes the destination vertex of the current edge. dst is only valid in the subgraph context.

dst

src denotes the source vertex of the current edge. src is only valid in the subgraph context.

src

Properties

Filter expressions can access the values of vertex and edge properties.

<id>.<property>

where:

- <id>: is any vertex or edge identifier (that is, src, dst, vertex, edge).
- <property>: is the name of a vertex or edge property.

 Note

This has to be the name of an edge property if the identifier is edge. Otherwise it has to be a vertex property.

If the property name is a reserved name in the filter expression syntax or contains spaces, it must be quoted in single or double quotes.

The following code accesses the 'cost' property of the source vertex.

src.cost

Temporal properties support values comparison (constants and property values) using special constructors. The default temporal formats are shown in the following table:

Table 29-4 Default Temporal Formats

Property Type	Constructor
DATE	date ('yyyy-MM-dd HH:mm:ss')
LOCAL_DATE	date 'yyyy-MM-dd'
TIME	time 'HH:mm:ss'
TIME_WITH_TIMEZONE	time 'HH:mm:ss+/-XXX'
TIMESTAMP	timestamp 'yyyy-MM-dd HH:mm:ss'
TIMESTAMP_WITH_TIMEZONE	timestamp 'yyyy-MM-dd HH:mm:ss+/-XXX'

The following expression accesses the property 'timestamp_withTZ' of an edge and checks if it is equal to 3/27/2007 06:00+01:00.

```
edge.timestamp_withTZ = timestamp'2007-03-2706:00:00+01:00'
```

Note

Properties of type date can only be checked for equality. date type usage is deprecated since version 2.5, instead use local date or timestamp types that support all operations.

Methods

Filter expressions support the following functions:

Degree Functions

1. `outDegree()` returns the number of outgoing edges of the vertex identifier. `degree()` is a synonym for `outDegree`.

```
int <id>.degree()
int <id>.outDegree()
```

The following example determines whether the `out-degree` of the source vertex is greater than three:

```
src.degree() > 3
```

2. `inDegree()` returns the number of incoming edges of the vertex identifier.

```
int <id>.inDegree()
```

Label Functions

1. `hasLabel()` checks if a vertex has a label.

```
boolean <id>.hasLabel('<label>')
```

The following example determines whether a vertex has the label "city":

```
vertex.hasLabel('city')
```

2. `label()` returns the label of an edge.

```
string <id>.label()
```

The following expression checks whether the label of an edge is "clicked_by":

```
edge.label() = 'clicked_by'
```

Relational Expressions

To compare values (e.g., property values or constants), filter expressions provide the comparison operators listed below. Note: Both `==` and `=` are synonyms.

```
==
=
!=
<
<=
>
>=
```

The following example checks whether the "cost" property of the source vertex is lower than or equals to 1.23.

```
src.cost <= 1.23
```

Vertex ID Comparison

It is also possible to filter for vertices with a specific vertex ID.

```
<id> = <vertex_id>
```

The following example determines whether the source vertex of an edge has the vertex ID "San Francisco"

```
src = "San Francisco"
```

Regular Expressions

Strings can be matched using regular expressions.

```
<string expression> =~ '<regexexpression>'
```

The following example checks if the edge label starts with a lowercase letter and ends with a number:

```
edge.label() =~ '^[a-z].[0-9]$'
```

Note

The syntax followed for the pattern on the right-hand side, is [Java REGEX](#).

Type Conversions

The following syntax allows converting the type of <expression> to <type>.

```
(<type>) <expression>
```

The following example converts the value of the 'cost' property of the source vertex to an integer value:

```
(int) src.cost
```

Boolean Expressions

Filter expressions can be composed to form other filter expressions. This can be done using the Boolean operators && (and), || (or) and ! (not).

Note

Only boolean operands can be composed.

```
(! true) || false  
edge.cost < INF && dst.visited = false  
src.degree() < 10 || !(dst.visited)
```

Arithmetic Expressions

Any numeric expression can be combined using arithmetic expressions. The available arithmetic operators are: +, -, *, /, %.

Note

These operators only work on numeric operands.

```
1 + 5
-vertex.degree()
edge.cost * 2 > 5
src.value * 2.5 = (dst.inDegree() + 5) / dst.outDegree()
```

Operator Precedence

Operator precedences are shown in the following list, from highest precedence to the lowest. An operator on a higher level is evaluated before an operator on a lower level.

1. + (unary plus), - (unary minus)
2. *, /, %
3. +, -
4. =, !=, <, >, <=, >=, =~
5. NOT
6. AND
7. OR

Syntactic Sugar

`both` and `any` denote the source and destination vertex of the current edge. They can be used to express a condition that should be `true` for both or at least either one of the two vertices. These keywords are only valid in an edge filter expression. To use them in a vertex filter results in a runtime type-checking exception.

```
both
any
```

The filter expressions inside the following examples are equivalent:

```
both.property = 1
src.property = 1 && dst.property = 1

any.degree() > 1
src.degree() > 1 || dst.degree() > 1
```

29.10.2 Type System

Filter expressions are a very simple type system. There are only the following 13 types:

1. integer (can be abbreviated in expressions with `int`)
2. long
3. float
4. double
5. boolean

6. string
7. date
8. time
9. time with timezone
10. timestamp
11. timestamp with timezone
12. vertex
13. edge

Conversions are only allowed from one numeric type to another numeric type (i.e. integer, float, double, long).

Comparisons require both sides to be of the same (or convertible) type.

29.10.3 Path Finding Filters

Filters can be used to limit the analyzed edges when searching for a shortest path between a source and destination vertex in a graph.

An edge filter expression is evaluated against each edge that is visited during the traversal of the graph. If the filter evaluates to `false` on an edge, this edge will be ignored and will not appear in the resulting shortest path.

It is also possible to use a vertex filter for path finding.

A vertex filter expression is evaluated against each vertex that is visited during the traversal of the graph, except for the source and destination vertex.

If the filter evaluates to `false` on a vertex, the edge to this vertex and all outgoing edges of the vertex will be ignored. The vertex will not appear in the resulting shortest path.

The source and destination vertex can be any vertex in the graph and the filter is not evaluated for them.

29.10.4 Subgraph Filters

Edge Filters

An edge filter expression is evaluated for each edge in the graph. The edge filter has access to the source and destination vertex of each edge and all of its properties.

If the filter expression evaluates to `true`, the edge and both the source and destination vertex will appear in the subgraph.

Vertex Filters

A vertex filter expression is evaluated for every vertex in the graph.

Every vertex for which the filter expression evaluates to `true` will appear in the subgraph.

Every edge connecting two vertices for which the expression evaluates to `true` will also appear in the subgraph.

Result Set Filters

Result set edge and vertex filters allow the creation of edge and vertex sets out of a given PGQL result set.

Vertex and Edge Collection Filters

Vertex and edge collection filters allow the creation of edge and vertex filters out of a given vertex and edge collection.

29.10.5 Operations on Filter Expressions

This section explains the various operations that you can perform on filter expressions.

- [Defining Filter Expressions](#)
- [Defining Result Set Filters](#)
- [Creating a Subgraph from PGQL Result Set](#)
- [Defining Collection Filters](#)
- [Creating a Subgraph from Collection Filters](#)
- [Combining Filter Expressions](#)
- [Creating a Subgraph Using Filter Expressions with Partitioned IDs](#)

29.10.5.1 Defining Filter Expressions

You can define a new vertex filter, as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var vertexFilter = VertexFilter.fromExpression("vertex.name = 'PGX'")
```

Java

```
VertexFilter vertexFilter = VertexFilter.fromExpression("vertex.name =  
'PGX'");
```

Python

```
from pypgx.api.filters import VertexFilter  
vertex_filter = VertexFilter.from_expression("vertex.name = 'PGX'")
```

You can define a new edge filter, as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var edgeFilter = EdgeFilter.fromExpression("edge.cost > 5")
```

Java

```
EdgeFilter edgeFilter = EdgeFilter.fromExpression("edge.cost > 5");
```

Python

```
from pypgx.api.filters import EdgeFilter
edge_filter = EdgeFilter.from_expression("edge.cost > 5")
```

29.10.5.2 Defining Result Set Filters

You can define a result set vertex filter, as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
// Evaluates query on graph g to obtain a result set
opg4j> var resultSet = g.queryPsql("SELECT x FROM MATCH (x) WHERE x.age > 24")
// Define a filter on the result set for the column "x"
opg4j> var vertexFilter = VertexFilter.fromPsqlResultSet(resultSet, "x")
// Obtain a vertex set
opg4j> var vertexSet = g.getVertices(vertexFilter)
```

Java

```
// Evaluates query on graph g to obtain result set
PsqlResultSet resultSet = g.queryPsql("SELECT x FROM MATCH (x) WHERE x.age >
24");
// Define a filter on the result set for the column "x"
VertexFilter vertexFilter = VertexFilter.fromPsqlResultSet(resultSet, "x");
```

```
// Obtain a vertex set
VertexSet vertexSet = g.getVertices(vertexFilter);
```

Python

```
>>> from pypgx.api.filters import VertexFilter
# Evaluates query on graph g to obtain a result set
>>> result_set = g.query_pgql("SELECT x FROM MATCH (x) WHERE x.age > 24")
# Define a filter on the result set for the column "x"
>>> vertex_filter = VertexFilter.from_pgql_result_set(result_set, "x")
# Obtain a vertex set
>>> vertex_set = g.get_vertices(vertex_filter)
```

You can define a result set edge filter, as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// Evaluates query on graph g to obtain result set
opg4j> var resultSet = g.queryPgql("SELECT e FROM MATCH ()-[e]->() WHERE
e.weight >= 8")
// Define a filter on the result set for the column "e"
opg4j> var edgeFilter = EdgeFilter.fromPgqlResultSet(resultSet, "e")
// Obtain an edge set
opg4j> var edgeSet = g.getEdges(edgeFilter)
```

Java

```
// Evaluates query on graph g to obtain result set
PgqlResultSet resultSet = g.queryPgql("SELECT e FROM MATCH ()-[e]->() WHERE
e.weight >= 8");
// Define a filter on the result set for the column "e"
EdgeFilter edgeFilter = EdgeFilter.fromPgqlResultSet(resultSet, "e");
// Obtain an edge set
EdgeSet edgeSet = g.getEdges(edgeFilter);
```

Python

```
>>> from pypgx.api.filters import EdgeFilter
# Evaluates query on graph g to obtain a result set
>>> result_set = g.query_pgql("SELECT e FROM MATCH ()-[e]->() WHERE e.weight
>= 8")
# Define a filter on the result set for the column "e"
```

```
>>> edge_filter = EdgeFilter.from_pgql_result_set(result_set, "e")
# Obtain an edge set
>>> edge_set = g.get_edges(edge_filter)
```

29.10.5.3 Creating a Subgraph from PGQL Result Set

A subgraph can be obtained from a PGQL result set using result set filters.

You can create a subgraph from a result set vertex filter, as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
// Evaluates query on graph g to obtain result set
opg4j> var resultSet = g.queryPgql("SELECT x FROM MATCH (x) WHERE x.age > 24")
// Define a filter on the result set for the column "x"
opg4j> var resultSetVertexFilter = VertexFilter.fromPgqlResultSet(resultSet,
"x")
// Create a subgraph of g containing the matched vertices in the resultSet
and the edges that connect them if any.
opg4j> var newGraph = g.filter(resultSetVertexFilter)
```

Java

```
// Evaluates query on graph g to obtain result set
PgqlResultSet resultSet = g.queryPgql("SELECT x MATCH (x) WHERE x.age > 24");
// Define a filter on the result set for the column "x"
VertexFilter resultSetVertexFilter =
VertexFilter.fromPgqlResultSet(resultSet, "x");
// Create a subgraph of g containing the matched vertices in the resultSet
and the edges that connect them if any.
PgxGraph newGraph = g.filter(resultSetVertexFilter);
```

Python

```
from pypgx.api.filters import VertexFilter
# Evaluates query on graph g to obtain a result set
>>> result_set = g.query_pgql("SELECT x MATCH (x) WHERE x.age > 24")
# Define a filter on the result set for the column "x"
>>> result_set_vertex_filter = VertexFilter.from_pgql_result_set(result_set,
"x")
# Create a subgraph of g containing the matched vertices in the resultSet and
the edges that connect them if any
>>> new_graph = g.filter( result_set_vertex_filter)
```

You can create a subgraph from a result set edge filter, as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// Evaluates query on graph g to obtain result set
opg4j> var resultSet = g.queryPgql("SELECT e FROM MATCH ()-[e]->() WHERE
e.cost < 100")
// Define a filter on the result set for the column "e"
opg4j> var resultSetEdgeFilter = EdgeFilter.fromPgqlResultSet(resultSet, "e")
// Create a subgraph of g containing the matched edges in the resultSet and
their corresponding source and destination vertices.
opg4j> var newGraph = g.filter(resultSetEdgeFilter)
```

Java

```
// Evaluates query on graph g to obtain result set
PgqlResultSet resultSet = g.queryPgql("SELECT e FROM MATCH ()-[e]->() WHERE
e.cost < 100");
// Define a filter on the result set for the column "e"
EdgeFilter resultSetEdgeFilter = EdgeFilter.fromPgqlResultSet(resultSet, "e");
// Create a subgraph of g containing the matched edges in the resultSet and
their corresponding source and destination vertices.
PgxGraph newGraph = g.filter(resultSetEdgeFilter);
```

Python

```
from pypgx.api.filters import EdgeFilter
# Evaluates query on graph g to obtain a result set
>>> result_set = g.query_pgql("SELECT e FROM MATCH ()-[e]->() WHERE e.cost <
100")
# Define a filter on the result set for the column "e"
>>> result_set_edge_filter = EdgeFilter.from_pgql_result_set(result_set, "e")
# Create a subgraph of g containing the matched edges in the resultSet and
their corresponding source and destination vertices
>>> new_graph = g.filter( result_set_edge_filter)
```

29.10.5.4 Defining Collection Filters

You can define a vertex collection filter, as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// Obtain a vertex collection from an algorithm, query execution or any other
way
opg4j> VertexCollection<?> vertexCollection = ...
// Define a filter from the collection
opg4j> var vertexFilter = VertexFilter.fromCollection(vertexCollection)
```

Java

```
// Obtain a vertex collection from an algorithm, query execution or any other
way
VertexCollection<?> vertexCollection = ...
// Define a filter from the collection
VertexFilter vertexFilter = VertexFilter.fromCollection(vertexCollection);
```

Python

```
from pypgx.api.filters import VertexFilter
# Obtain a vertex collection from an algorithm, query execution or any other
way
vertex_collection = ...
# Define a filter from the collection
vertex_filter = VertexFilter.from_collection(vertex_collection)
```

You can define a edge collection filter, as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// Obtain an edge collection from an algorithm, query execution or any other
way
opg4j> EdgeCollection edgeCollection = ...
// Define a filter from the collection
opg4j> var edgeFilter = EdgeFilter.fromCollection(edgeCollection)
```

Java

```
// Obtain an edge collection from an algorithm, query execution or any other
way
EdgeCollection edgeCollection = ...
// Define a filter from the collection
EdgeFilter edgeFilter = EdgeFilter.fromCollection(edgeCollection);
```

Python

```
from pypgx.api.filters import EdgeFilter
# Obtain an edge collection from an algorithm, query execution or any other
way
edge_collection = ...
# Define a filter from the collection
edge_filter = EdgeFilter.from_collection(edge_collection)
```

29.10.5.5 Creating a Subgraph from Collection Filters

A subgraph can be obtained by using vertex or edge collection filters.

You can create a subgraph from vertex collection filter, as shown in the following code:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
// Obtain a vertex collection from an algorithm, query execution or any other
way
opg4j> VertexCollection<?> vertexCollection = ...
// Define a filter from the collection
opg4j> var vertexFilter = VertexFilter.fromCollection(vertexCollection)
// Create a subgraph of g containing the matched vertices in the vertex
collection and the edges that connect them if any.
opg4j> var newGraph = g.filter(vertexFilter)
```

Java

```
// Obtain a vertex collection from an algorithm, query execution or any other
way
VertexCollection<?> vertexCollection = ...
// Define a filter from the collection
VertexFilter vertexFilter = VertexFilter.fromCollection(vertexCollection);
// Create a subgraph of g containing the matched vertices in the vertex
```

collection and the edges that connect them if any.
`PgxGraph newGraph = g.filter(vertexFilter);`

Python

```
from pypgx.api.filters import VertexFilter
# Obtain a vertex collection from an algorithm, query execution or any other
way
vertex_collection = ...
# Define a filter from the collection
vertex_filter = VertexFilter.from_collection(vertex_collection)
# Create a subgraph of g containing the matched vertices in the vertex
collection and the edges that connect them if any.
new_graph = g.filter(vertex_filter)
```

You can create a subgraph from edge collection filter, as shown in the following code:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// Obtain an edge collection from an algorithm, query execution or any other
way
opg4j> EdgeCollection edgeCollection = ...
// Define a filter from the collection
opg4j> var edgeFilter = EdgeFilter.fromCollection(edgeCollection)
// Create a subgraph of g containing the matched edges in the collection and
their corresponding source and destination vertices.
opg4j> var newGraph = g.filter(edgeFilter)
```

Java

```
// Obtain an edge collection from an algorithm, query execution or any other
way
EdgeCollection edgeCollection = ...
// Define a filter from the collection
EdgeFilter edgeFilter = EdgeFilter.fromCollection(edgeCollection);
// Create a subgraph of g containing the matched edges in the collection and
their corresponding source and destination vertices.
PgxGraph newGraph = g.filter(edgeFilter);
```

Python

```
from pypgx.api.filters import EdgeFilter
# Obtain an edge collection from an algorithm, query execution or any other
way
edge_collection = ...
# Define a filter from the collection
edge_filter = EdgeFilter.from_collection(edge_collection)
# Create a subgraph of g containing the matched edges in the collection and
their corresponding source and destination vertices.
new_graph = g.filter(edge_filter)
```

29.10.5.6 Combining Filter Expressions

Any filter expression used for subgraph filtering, can be combined with any other filter expression to form a new filter expression.

Filters can be combined using the following operations:

- intersection
- union

The intersection of two filters will only keep a vertex or edge, if both filters would accept it. Note that the intersection of two filters will not behave as an **AND** in the filter expression.

The union of two filters will keep a vertex or edge, if one of the filters would accept it. Note that the union of filters will not behave as an **OR** in the filter expression.

In the following example an edge filter is intersected with a vertex filter. The resulting subgraph will only include vertices that have the name 'PGX' and will only include edges that have a cost greater than 5.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var edgeFilter = EdgeFilter.fromExpression("edge.cost > 5")
opg4j> var vertexFilter = VertexFilter.fromExpression("vertex.name = 'PGX'")
opg4j> var combinedFilter = edgeFilter.intersect(vertexFilter)
```

Java

```
EdgeFilter edgeFilter = EdgeFilter.fromExpression("edge.cost > 5");
VertexFilter vertexFilter = VertexFilter.fromExpression("vertex.name =
'PGX'");
GraphFilter combinedFilter = edgeFilter.intersect(vertexFilter);
```

Python

```
from pypgx.api.filters import VertexFilter
from pypgx.api.filters import EdgeFilter
edge_filter = EdgeFilter.from_expression("edge.cost > 5")
vertex_filter = VertexFilter.from_expression("vertex.name = 'PGX'")
combined_filter = edge_filter.intersect(vertex_filter)
```

In contrast, the subgraph created by the union of those filters will include vertices that either have the name 'PGX' or that has an incoming or outgoing edge with a cost greater than 5. It will also include edges with a cost greater than 5, as well as edges for which the source and destination vertex have the name 'PGX'.

29.10.5.7 Creating a Subgraph Using Filter Expressions with Partitioned IDs

You can create a subgraph using filter expressions with partitioned IDs.

For example, the following creates a subgraph that contains only a single vertex with ID Account(1):

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> PgxGraph subgraph = g.filter(VertexFilter.fromExpression("vertex = 'Accounts(1)'))
subgraph ==> PgxGraph[name=sub-graph_26,N=1,E=0,created=1630414040396]
```

Java

```
PgxGraph subgraph = g.filter(VertexFilter.fromExpression("vertex = 'Accounts(1)'));
```

Python

```
subgraph = graph.filter(VertexFilter.from_expression("vertex = 'Accounts(1)'))
```

The following example creates a subgraph that contains only a single edge with ID Transfers(1), and two accompanying vertices:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> PgxGraph subgraph = g.filter(EdgeFilter.fromExpression("edge =  
'Transfers(1)'" ))  
subgraph ==> PgxGraph[name=sub-graph_27,N=2,E=1,created=1630414144529]
```

Java

```
PgxGraph subgraph = g.filter(EdgeFilter.fromExpression("edge =  
'Transfers(1)'" ));
```

Python

```
subgraph = graph.filter(EdgeFilter.from_expression("edge = 'Transfers(1)'" ))
```

29.11 Advanced Task Scheduling Using Execution Environments

This guide shows how you can use the advanced scheduling features of the enterprise scheduler.

The following topics provide more detailed information on enabling and scheduling tasks using the execution environment:

- [Prerequisites for Using the Enterprise Scheduler](#)
- [Enabling Enterprise Scheduler Features](#)
- [Retrieving and Inspecting the Execution Environment](#)
- [Modifying and Submitting Tasks Under an Updated Environment](#)
- [Using Lambda Syntax](#)
- [Enterprise Scheduler Configuration Guide](#)

29.11.1 Prerequisites for Using the Enterprise Scheduler

- Ensure that you meet the following system prerequisites to use the enterprise scheduler feature of the graph server (PGX):
 - **Operating System:** Linux (x86_64)
 - The following shared libraries are required:
 - * The GNU C Library - libc.so.6 (GLIBC_2.6)
 - * The GNU dynamic linker/loader - ld-linux-x86-64.so.2 (GLIBC_2.3)
 - * The POSIX Threading Library - libpthread.so.0 (GLIBC_2.3.2)

- * The Standard Math Library - libm.so.6 (GLIBC_2.2.5)
 - * The Realtime Extensions library - librt.so.1 (GLIBC_2.2.5)
 - * The NUMA policy support library - libnuma.so.1 (libnuma_1.2)
 - * The GCC low-level runtime library - libgcc_s.so.1 (GCC_3.4)
 - * The GNU C++ Library - libstdc++.so.6 (GLIBCXX_3.4.19 and CXXABI_1.3.5)
- Ensure that you set the `scheduler` parameter in the `pgx.conf` file as shown:
`"scheduler": "enterprise_scheduler"`

Note

When using the enterprise scheduler, if the graph server (PGX) fails to start with the following error message in the log file - The enterprise scheduler backend is not supported on this system, then note that the server no longer falls back to the basic scheduler.

If you wish to use the basic scheduler then you must set the scheduler parameter in the `pgx.conf` file as shown:

```
"scheduler": "basic_scheduler"
```

29.11.2 Enabling Enterprise Scheduler Features

You can enable the enterprise scheduler features, by setting the flag `allow_override_scheduling_information` of the the graph server (PGX) configuration file to `true`:

```
{"allow_override_scheduling_information":true}
```

See [Configuration Parameters for the Graph Server \(PGX\) Engine](#) for all configuration options of the graph server (PGX).

29.11.3 Retrieving and Inspecting the Execution Environment

Execution environments are bound to a session. You can retrieve the execution environment for a session by calling `getExecutionEnvironment()` on a `PgxSession`:

- [JShell](#)
- [Java](#)

JShell

```
opg4j> execEnv.getValues()
==> [analysis-pool.max_num_threads=4, analysis-pool.weight=4, analysis-
pool.priority=MEDIUM, io-pool.num_threads_per_task=4, fast-track-analysis-
pool.max_num_threads=4, fast-track-analysis-pool.weight=1, fast-track-
analysis-pool.priority=HIGH]
```

Java

```
import oracle.pgx.api.*;
import java.util.List;
import java.util.Map.Entry;

List<Entry<String, Object>> currentValues = execEnv.getValues();
for (Entry<String, Object> value : currentValues) {
    System.out.println(value.getKey() + " = " + value.getValue());
}
```

See [Enterprise Scheduler Configuration Guide](#) for the values of an unmodified execution environment.

To retrieve the sub-environments use the `getIoEnvironment()`, `getAnalysisEnvironment()` and `getFastAnalysisEnvironment()` methods. Each sub-environment has their own `getValues()` method for retrieving the configuration of the sub-environment.

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var ioEnv = execEnv.getIoEnvironment()
ioEnv ==> IoEnvironment[pool=io-pool]
opg4j> ioEnv.getValues()
$5 ==> {num_threads_per_task=4}

opg4j> var analysisEnv = execEnv.getAnalysisEnvironment()
analysisEnv ==> CpuEnvironment[pool=analysis-pool]
opg4j> analysisEnv.getValues()
$7 ==> {max_num_threads=4, weight=4, priority=MEDIUM}

opg4j> var fastAnalysisEnv = execEnv.getFastAnalysisEnvironment()
fastAnalysisEnv ==> CpuEnvironment[pool=fast-track-analysis-pool]
opg4j> fastAnalysisEnv.getValues()
$9 ==> {max_num_threads=4, weight=1, priority=HIGH}
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.executionenvironment.*;
import java.util.Map;

IoEnvironment ioEnv = execEnv.getIoEnvironment();
CpuEnvironment analysisEnv = execEnv.getAnalysisEnvironment();
CpuEnvironment fastAnalysisEnv = execEnv.getFastAnalysisEnvironment();

for (Entry<String, Object> value : ioEnv.getValues().getEntrySet()) {
```

```

        System.out.println(value.getKey() + " = " + value.getValue());
    }

    for (Entry<String, Object> value : analysisEnv.getValues().getEntrySet()) {
        System.out.println(value.getKey() + " = " + value.getValue());
    }

    for (Entry<String, Object> value : fastAnalysisEnv.getValues().getEntrySet())
    {
        System.out.println(value.getKey() + " = " + value.getValue());
    }

```

29.11.4 Modifying and Submitting Tasks Under an Updated Environment

You can modify an Input/Output (IO) environment in the number of threads by using the `setNumThreadsPerTask()` method of the `IoEnvironment`. The value is updated immediately and all tasks that are submitted after updating it are executed with the updated value.

- [JShell](#)
- [Java](#)

JShell

```

opg4j> ioEnv.setNumThreadsPerTask(8)
opg4j> var g = session.readGraphWithProperties(...)
==> PgxGraph[name=graph,N=3,E=6,created=0]

```

Java

```

import oracle.pgx.api.*;
import oracle.pgx.api.executionenvironment.*;

ioEnv.setNumThreadsPerTask(8);
PgxGraph g = session.readGraphWithProperties(...);

```

You can reset an environment to their initial values by calling the `ioEnv.reset()` method. Additionally, you can reset all environments at once by calling `execEnv.reset()` on the `ExecutionEnvironment` class.

You can modify CPU environments in their weight, priority and maximum number of threads using the `setWeight()`, `setPriority()` and `setMaxThreads()` methods:

- [JShell](#)

- [Java](#)

JShell

```
opg4j> analysisEnv.setWeight(50)
opg4j> fastAnalysisEnv.setMaxNumThreads(1)
opg4j> var rank = analyst.pagerank(g)
rank ==> VertexProperty[name=pagerank,type=double,graph=my-graph]
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.executionenvironment.*;

analysisEnv.setWeight(50);
fastAnalysisEnv.setMaxThreads(1);
Analyst analyst = session.createAnalyst();
VertexProperty rank = analyst.pagerank(g);
```

29.11.5 Using Lambda Syntax

Generally you can perform the following actions in the environment:

1. Set up the execution environment
2. Execute task
3. Reset execution environment

All these actions can be combined and performed in a single step using the `set` method. For each `set` method there is a method using the `with` prefix which takes the updated value and a lambda which should be executed using the updated value.

For example, use `withNumThreadsPerTask()` instead of `setNumThreadsPerTask()` as shown:

-
- [JShell](#)
 - [Java](#)

JShell

```
opg4j> var g = ioEnv.withNumThreadsPerTask(8, () ->
session.readGraphWithProperties(...))
==> PgxGraph[name=graph,N=3,E=6,created=0]
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.executionenvironment.*;
```

```
PgxGraph g = ioEnv.withNumThreadsPerTask(8, () ->
session.readGraphWithProperties(...));
```

The preceding code execution is equivalent to the following sequence of actions:

```
var oldValue = ioEnv.getNumThreadsPerTask()
ioEnv.setNumThreadsPerTask(currentValue)
var g = session.readGraphWithProperties(...)
ioEnv.setNumThreadsPerTask(oldValue)
```

29.11.6 Enterprise Scheduler Configuration Guide

This chapter describes the extra configuration options for the enterprise scheduler.

① Note

These configuration options are only available if the `scheduler` configuration variable is set to `enterprise_scheduler` in [Configuration Parameters for the Graph Server \(PGX\) Engine](#).

The configuration is divided into the following two parts:

1. `enterprise_scheduler_config`: for setting details about how tasks should be scheduled
2. `enterprise_scheduler_flags`: where you can configure the enterprise scheduler in more detail

Enterprise Scheduler Fields

Field	Type	Description	Default
<code>analysis_task_config</code>	object	Configuration for analysis tasks.	weight <no-of-CPUs> priority medium max_threads <no-of-CPUs>
<code>fast_analysis_task_config</code>	object	Configuration for fast analysis tasks.	weight 1 priority high max_threads <no-of-CPUs>

Field	Type	Description	Default
max_num_concurrent_io_tasks	integer	Maximum number of concurrent io tasks at a time.	3
num_io_threads_per_task	integer	Number of io threads to use per task.	<no-of-cpus>

Analysis Task Config Fields

Field	Type	Description	Default
max_threads	integer	A hard limit on the number of threads to use for a task.	<i>required</i>
priority	enum[high, medium, low]	The priority of the task. Threads are given to the task with the highest priority at the moment of execution. If there are more threads that have the highest priority, threads are given to the tasks according to their weight	<i>required</i>
weight	integer	The weight of the task. Threads are given to tasks proportionally to their weight. Tasks with higher weight will get more threads than tasks with lower weight. Tasks with the same weight will get the same amount of threads.	<i>required</i>

Enterprise Scheduler Flags

Field	Type	Description	Default
show_allocations	boolean	If true show memory allocation information.	false
show_environment	boolean	If true show version numbers and main environment settings at startup.	false
show_logging	boolean	If true enable summary logging. This is available even in non-debug builds and includes information such as the machine hardware information obtained at start-up, and per-job / per-loop information about the workload.	false
show_profiling	boolean	If true show profiling information.	false
show_scheduler_state	boolean	If true dump scheduler state on each update.	false
show_warnings	boolean	If true enable warnings. These are non-fatal errors. For example, if a NUMA-aware allocation cannot be placed on the intended socket.	true

Example 29-4 Custom Enterprise Scheduler Configuration

This configuration sets the number of io threads per task to 16, increases the maximum number of concurrent io tasks to 5. It also sets the configuration for fast analysis tasks to have a weight of 1, priority of "high" and sets a limit to the maximum number of threads used to 1.

```
{
  "enterprise_scheduler_config": {
    "num_io_threads_per_task": 16,
    "max_num_concurrent_io_tasks": 5,
    "fast_analysis_task_config": {
      "weight": 1,
      "priority": "high",
      "max_threads": 1
    }
  }
}
```

Example 29-5 Using the Enterprise Scheduler Flags

This configuration enables extra logging output from the enterprise scheduler.

```
{
  "enterprise_scheduler_flags": {
    "show_logging": true
  }
}
```

29.12 Admin API

This guide shows how to use the graph server (PGX) Admin API to inspect the server state including sessions, graphs, tasks, memory and thread pools.

- [Get a Server Instance](#)
- [Get Inspection Data](#)
- [Get Active Sessions](#)
- [Get Cached Graphs](#)
- [Get Published Graphs](#)
- [Get Currently Loading Graphs](#)
- [Get Tasks](#)
- [Get Available Memories](#)

29.12.1 Get a Server Instance

You can get a PGX Instance as shown in the following code:

-
- [Java](#)
 - [Python](#)

Java

```
import oracle.pgx.api.*;
ServerInstance instance = Pgx.getInstance(Pgx.EMBEDDED_URL);
```

Python

```
instance = pypgx.get_session(base_url = "url")
```

29.12.2 Get Inspection Data

Inspection data is information about the server state.

You can get the inspection data using the following code. Note that you must the `PGX_SERVER_GET_INFO` permission to access the server state data.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
var serverState = instance.getServerState()
```

Java

```
JsonNode serverState = instance.getServerState();
```

Python

```
server_state = instance.get_server_state()
```

This returns a `JsonNode` which contains all the administration information, such as number of graphs loaded, number of sessions, memory usage for graphs, properties, and so on.

```
{
  "cached_graphs": [],
  "published_graphs": [],
  "graphs_currently_loading": [],
  "sessions": [],
  "tasks": [],
  "pools": [],
```

```

    "memory": {}
  }

```

Note that the `sessions` parameter lists all the sessions and the memory used by the sessions along with the user information for each session.

```

{
  "session_id": "530b5f9a-75c4-4838-9cc3-44df44b035c5",
  "source": "testServerState",
  "user": "user1",    // session user information
  ...
}

```

29.12.3 Get Active Sessions

`serverState.get("sessions")` returns an array of current active sessions. Each entry contains information about a session.

```

{
  "session_id": "530b5f9a-75c4-4838-9cc3-44df44b035c5",
  "source": "testServerState",
  "user": "user1",
  "task_timeout_ms": 0,
  "idle_timeout_ms": 0,
  "alive_ms": 237,
  "total_analysis_time_ms": 115,
  "state": "RELEASED",
  "private_graphs": [
    {
      "name": "anonymous_graph_1",
      "creation_timestamp": 1589317879755,
      "is_transient": true,
      "memory": {
        "topology_bytes": 46,
        "key_mapping_bytes": 30,
        "persistent_property_mem_bytes": 0,
        "transient_property_mem_bytes": 0
      },
      "vertices_num": 1,
      "edges_num": 0,
      "persistent_vertex_properties": [
      ],
      "persistent_edge_properties": [
      ],
      "transient_vertex_properties": [
      ],
      "transient_edge_properties": [
      ]
    }
  ],
}

```

```

    "published_graphs":[
      {
        "name":"multigraph",
        "creation_timestamp":1589317879593,
        "is_transient":false,
        "memory":{
          "topology_bytes":110,
          "key_mapping_bytes":56,
          "persistent_property_mem_bytes":64,
          "transient_property_mem_bytes":0
        },
        "vertices_num":2,
        "edges_num":6,
        "persistent_vertex_properties":[
          {
            "loaded":true,
            "mem_size_bytes":16,
            "name":"tProp",
            "type":"string"
          }
        ],
        "persistent_edge_properties":[
          {
            "loaded":true,
            "mem_size_bytes":48,
            "name":"cost",
            "type":"double"
          }
        ],
        "transient_vertex_properties":[

        ],
        "transient_edge_properties":[

        ]
      }
    ]
  }
}

```

The following table explains session information fields:

Table 29-5 Session Information Options

Field	Description
sessionID	Session ID generated by the graph server (PGX)
source	Descriptive string identifying the client session
user	Session owner
task_timeout_ms	Timeout to interrupt long-running tasks submitted by sessions (algorithms, I/O tasks) in milliseconds. Set to zero for infinity/no timeout.
idle_timeout_ms	Timeout of idling sessions in milliseconds. Set to zero for infinity/no timeout.
alive_ms	Session's age in milliseconds
total_analysis_time_ms	Total session's executing time in milliseconds

Table 29-5 (Cont.) Session Information Options

Field	Description
state	Current session of the session can be Idle, Submitted, Released or Terminating
private_graphs	Session bounded graphs
published_graphs	Published graphs pointed to from the session

Note

The `is_transient` field indicates if the graph is transient. A graph is transient if it is not loaded from an external source.

29.12.4 Get Cached Graphs

The server state contains also cached graph information `serverState.get("cached_graphs")` which returns a collection of graphs cached in memory. Each entry contains information about a graph as shown:

```
{
  "name": "sf-1589317879394",
  "creation_timestamp": 1589317879394,
  "vertex_properties": [
    {
      "loaded": true,
      "mem_size_bytes": 478504,
      "name": "prop1",
      "type": "double"
    }
  ],
  "edge_properties": [
    {
      "loaded": true,
      "mem_size_bytes": 1197720,
      "name": "cost",
      "type": "double"
    },
    {
      "loaded": true,
      "mem_size_bytes": 598860,
      "name": "0",
      "type": "integer"
    }
  ],
  "memory": {
    "topology_bytes": 3921814,
    "key_mapping_bytes": 1407466,
    "property_mem_bytes": 2275084
  },
  "vertices_num": 59813,
```

```

    "edges_num":149715
  }

```

The following table explains graph information fields:

Table 29-6 Graph Information

Field	Description
name	Name of the graph.
creation_timestamp	Creation timestamp of the graph.
vertex_properties	List of vertex properties, each entry contains the name, type, memory size used by the property, and a boolean flag to indicate if the property is loaded into memory.
edge_properties	List of edges properties, similar to vertex properties.
memory	Memory size used by the whole graph (topology, key mappings and properties).
vertices_num	Number of vertices.
edges_num	Number of edges.

29.12.5 Get Published Graphs

`serverState.get("published_graphs")` returns a list of published graphs.

Each graph entry contains information about the published graph, similar to `cached_graphs`.

29.12.6 Get Currently Loading Graphs

`serverState.get("graphs_currently_loading")` returns progress information about graphs which are currently loading.

Each entry, corresponding to one graph, is shown as follows:

```

{
  "name": "anonymous_graph_1",
  "session_id": "530b5f9a-75c4-4838-9cc3-44df44b035c5",
  "start_loading_timestamp": 1605468453030,
  "elapsed_loading_time_ms": 281742,
  "num_vertices_read": 10000000,
  "num_edges_read": 196500000,
  "num_edge_providers_loaded": 1,
  "num_edge_providers_remaining": 9,
  "num_vertex_providers_loaded": 1,
  "num_vertex_providers_remaining": 0,
  "loading_phase": "reading edges",
  "loading_phase_start_timestamp": 1605468453085,
  "loading_phase_elapsed_time_ms": 281687,
  "loading_phase_state": "current vertex provider index: 1, number of
vertices read for prorvider: 0, current edge provider index: 1, number of
edges read for prorvider: 76,500,000"
}

```

The `name` field contains a temporary name of the graph. It may not be equal to the name that is assigned to graph after loading.

Fields indicating the number of read vertices and edges are updated in regular intervals of 10,000 entities.

The field `loading_phase` indicates the current phase during graph loading. Valid values are "reading edges" or "building graph indices". For some loading phases, the field `loading_phase_state` contains a string with additional information on the phase. However, not all loading phases provide this additional information.

29.12.7 Get Tasks

`serverState.get("tasks")` returns the last 100 queued tasks.

Each task has a type, the pool to be executed on (the task might be already executed) and other status fields (`{Queued|Started|Done}` time), and a `sessionid` if the task belongs to a session.

29.12.8 Get Available Memories

This section contains a map of available memories, the key is the hostname and the value is a list of current available memories (managed and unmanaged). Each entry contains how much memory is free, used and the maximum available memory.

29.13 PgxFrames Tabular Data-Structure

`PgxFrame` is a data-structure to load, store and manipulate tabular data. It contains rows and columns. A `PgxFrame` can contain multiple columns where each column consist of elements of the same data type, and has a name. The list of the columns with their names and data types defines the schema of the frame. (The number of rows in the `PgxFrame` is not part of the schema of the frame.)

`PgxFrame` provides some operations that also output `PgxFrames` (described later in the tutorial). Those operations can be performed in-place (meaning that the frame is mutated during the operation) in order to save memory. In place operations should be used whenever possible. However, we provide out-place variants, i.e., a new frame is created during the operation.

The following table lists all the in-place operations along with the respective out-place operations:

Table 29-7 Mapping between In-Place and Out-Place Operations

In-place operations	Out-place operations
<code>headInPlace</code>	<code>head</code>
<code>tailInPlace</code>	<code>tail</code>
<code>flattenAllInPlace</code>	<code>flattenAll</code>
<code>renameColumnInPlace</code>	<code>renameColumn</code>
<code>renameColumnsInPlace</code>	<code>renameColumns</code>
<code>selectInPlace</code>	<code>select</code>

29.13.1 Converting PgqlResultSet to a PgxFFrame

The following example describes how to save the `PgqlResultSet` to a `PgxFFrame`.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var pg = session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL)
opg4j> var rs = pg.queryPgql("SELECT e.* FROM MATCH (v1:Accounts)-
[e:Transfers]->(v2:Accounts) LIMIT 5")
opg4j> var rsFrame = rs.toFrame()
opg4j> rsFrame.print()
```

```
+-----+
| FROM_ACCT_ID | TO_ACCT_ID | AMOUNT | DESCRIPTION |
+-----+
| 999          | 934        | 1000.0 | transfer    |
| 999          | 71         | 1000.0 | transfer    |
| 999          | 839        | 1000.0 | transfer    |
| 999          | 891        | 1000.0 | transfer    |
| 999          | 919        | 1000.0 | transfer    |
+-----+
```

```
$4 ==> oracle.pgx.api.frames.internal.PgxFFrameImpl@39a1c200
```

Java

```
import oracle.pgx.api.frames.*;
```

```
PgxGraph pg = session.readGraphByName("BANK_GRAPH",GraphSource.PG_PGQL);
PgqlResultSet rs = pg.queryPgql("SELECT e.* FROM MATCH (v1:Accounts)-
```

```
[e:Transfers]->(v2:Accounts) LIMIT 5");
PgxFFrame rsFrame = rs.toFrame();
rsFrame.print();
```

Python

```
>>> pg = session.read_graph_by_name('BANK_GRAPH', 'pg_pgql')
>>> rs = pg.query_pgql("SELECT e.* FROM MATCH (v1:Accounts)-[e:Transfers]-
>(v2:Accounts) LIMIT 5")
>>> rs_frame = rs.to_frame()
>>> rs_frame.print()
```

FROM_ACCT_ID	TO_ACCT_ID	AMOUNT	DESCRIPTION
1	418	1000.0	transfer
1	584	1000.0	transfer
1	644	1000.0	transfer
1	672	1000.0	transfer
1	259	1000.0	transfer

Converting PgqlResultSet to pandas DataFrame

You can also save the `PgqlResultSet` to pandas `DataFrame` as shown in the following example:

```
>>> rs.to_pandas()
  FROM_ACCT_ID  TO_ACCT_ID  AMOUNT  DESCRIPTION
0           999          934   1000.0    transfer
1           999           71   1000.0    transfer
2           999          839   1000.0    transfer
3           999          891   1000.0    transfer
4           999          919   1000.0    transfer
```

29.13.2 Storing a PgxFFrame to a Database

When storing a `PgxFFrame` to a database, the frame is stored as a table, where the columns correspond to the columns of the `PgxFFrame` and the rows correspond to the rows of the `PgxFFrame`. Note that the column order preservation may or may not happen when storing a `PgxFFrame` in the database. Also, you can store a `PgxFFrame` containing CLOB data type columns to the database.

The following example shows how to store the `PgxFFrame` in the database. The example assumes that you are storing the `PgxFFrame` in the current logged in schema.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> rsFrame.write().
        db().                // select the "format" to be relational
db
        name("F1").          // name of the frame
        tablename("T1").      // name of the table in which the data
must be stored
        overwrite(true).      // indicates that if there is a table
with the same name, it will be overwritten (truncated)
        connections(16).      // indicates that 16 connections can be
used to store in parallel
        store()

```

Java

```

rsFrame.write()
    .db()           // select the "format" to be relational db
    .name("F1")     // name of the frame
    .tablename("T1") // name of the table in which the data must be
stored
    .overwrite(true) // indicates that if there is a table with the same
name, it will be overwritten (truncated)
    .connections(16) // indicates that 16 connections can be used to store in
parallel
    .store();

```

Python

```

>>> (
...     rs_frame.write().
...     name('F1').      # name of the frame
...     db().            # select the "format" to be relational db
...     table_name('T1'). # name of the table in which the data must be stored
...     overwrite(True).  # indicates that if there is a table with the same
name, it will be overwritten (truncated)
...     connections(16).  # indicates that 16 connections can be used to
store in parallel
...     store()
... )

```

Alternatively, you can also store the `PgxFrame` in a different schema as shown in the following example. Ensure that you have `CREATE TABLE` privilege when writing to a different schema:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
// store as table in the database using jdbc + username + password
opg4j> rsFrame.write().
    db().                      // select the "format" to be relational
db
    name("framename").        // name of the frame
    tablename("tablename").    // name of the table in which the data
must be stored
    overwrite(true).          // indicates that if there is a table
with the same name, it will be overwritten (truncated)
    connections(16).          // indicates that 16 connections can be
used to store in parallel
    jdbcUrl("<jdbcUrl>").
    username("<db_username>").
    password("<password>").
    store()
```

Java

```
rsFrame.write()
    .db()                      // select the "format" to be relational db
    .name("framename")         // name of the frame
    .tablename("tablename")     // name of the table in which the data must be
stored
    .overwrite(true)           // indicates that if there is a table with the
same name, it will be overwritten (truncated)
    .connections(16)           // indicates that 16 connections can be used to
store in parallel
    .jdbcUrl("<jdbcUrl>")
    .username("<db_username>")
    .password("<password>")
    .store();
```

Python

```
>>> (
...     rs_frame.write().
...     name('frame_name').    # name of the frame
...     db().                  # select the "format" to be relational db
...     table_name('table_name'). # name of the table in which the data must
be stored
...     overwrite(True).       # indicates that if there is a table with
the same name, it will be overwritten (truncated)
...     connections(16).       # indicates that 16 connections can be
used to store in parallel
...     jdbc_url("<jdbc_url>").
...     username("<db_username>").
...     password("<password>").
...     store()
... )
```

29.13.3 Storing a PgxFFrame to a CSV File

In order to write a `PgxFFrame` to a CSV file, you first need to explicitly authorize access to the corresponding directories by defining a directory object pointing to the directory (on the graph server) where the file needs to be written.

```
CREATE OR REPLACE DIRECTORY graph_files AS '/tmp';  
GRANT READ, WRITE ON DIRECTORY graph_files TO GRAPH_DEVELOPER;
```

Also, note the following:

- The directory in the `CREATE DIRECTORY` statement must exist **on the graph server (PGX)**.
- The directory must be writable at the OS level by the graph server (PGX).

The preceding code grants the privileges on the directory to the `GRAPH_DEVELOPER` role. However, you can also grant permissions to an individual user:

```
GRANT WRITE ON DIRECTORY graph_files TO <graph_user>;
```

You can then save a `PgxFFrame` to a CSV file as shown in the following example:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> rsFrame.write().overwrite(true).csv("/tmp/Transfers.csv")
```

Java

```
rsFrame.write().overwrite(true).csv("/tmp/Transfers.csv");
```

Python

```
>>> rs_frame.store("/tmp/Transfers.csv")
```

29.13.4 Union of PGX Frames

You can join two `PgxFFrames` that have compatible columns (that is, same type and order).

-
- [JShell](#)

- [Java](#)
- [Python](#)

JShell

```
opg4j> <firstFrame>.union(<secondFrame>).print()
```

Java

```
<firstFrame>.union(<secondFrame>).print();
```

Python

```
<first_frame>.union(<second_frame>).print()
```

The rows of the resulting `PgxFrame` are the union of the rows from the two original frames.

Note that the union operation does not remove duplicate rows that resulted by joining the two frames.

29.13.5 Joining PGX Frames

You can join two frames whose rows are correlated through one of the columns using the `join` functionality. This allows us to combine frames by checking for equality between rows for a specific column.

Assume there are two `PgxFrames` as shown:

```
//exampleFrame
+-----+
--+
| name      | age | salary      | married | tax_rate | random      |
| date_of_birth |
+-----+
--+
| John      | 27  | 4133300.0   | true    | 11.0     | 123456782   |
| 1985-10-18 |
| Albert    | 23  | 5813000.5   | false   | 12.0     | 124343142   |
| 2000-01-14 |
| Heather   | 28  | 1.0130302E7 | true    | 10.5     | 827520917   |
| 1985-10-18 |
| Emily     | 24  | 9380080.5   | false   | 13.0     | 128973221   |
| 1910-07-30 |
| "D'Juan"  | 27  | 1582093.0   | true    | 11.0     | 92384       |
| 1955-12-01 |
+-----+
--+

//moreInfoFrame
+-----+
```

name	title
John	Software Engineering Manager
Albert	Sales Manager
Emily	Operations Manager

The following example calls the `join` method to join `exampleFrame` and `moreInfoFrame`. The API uses the `name` column as `joinKeyColumn` to join the two frames. The column prefixes specified in the API are `leftFrame` and `rightFrame`.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> exampleFrame.join(moreInfoFrame, "name", "leftFrame",
"rightFrame").print()
```

Java

```
exampleFrame.join(moreInfoFrame, "name", "leftFrame", "rightFrame").print();
```

Python

```
>>> example_frame.join(
...     more_info_frame,
...     join_key_column="name",
...     left_prefix="leftFrame",
...     right_prefix="rightFrame").print()
```

Alternatively, you can also join the frames by providing `leftJoinKeyColumn` and `rightJoinKeyColumn`. In this case `joinKeyColumn` is omitted.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> exampleFrame.join(moreInfoFrame, "name", "name", "leftFrame",
"rightFrame").print()
```

Java

```
exampleFrame.join(moreInfoFrame, "name", "name", "leftFrame",
"rightFrame").print();
```

Python

```
>>> example_frame.join(
...     more_info_frame,
...     left_join_key_column="name",
...     right_join_key_column="name",
...     left_prefix="leftFrame",
...     right_prefix="rightFrame").print()
```

The resulting joined frame contains the columns of the two frames for the rows with the same name column as shown:

```
+-----+
+-----+
+-----+
| leftFrameName | leftFrameAge | leftFrameSalary | leftFrameMarried |
leftFrameTaxRate | leftFrameRandom | leftFrameDateOfBirth | rightFrameName |
| rightFrameTitle |
+-----+
+-----+
| John | 27 | 4133300.0 | true | |
11.0 | 123456782 | 1985-10-18 | | John |
| Software Engineering Manager |
| Albert | 23 | 5813000.5 | false | |
12.0 | 124343142 | 2000-01-14 | | Albert |
| Sales Manager |
| Emily | 24 | 9380080.5 | false | |
13.0 | 128973221 | 1910-07-30 | | Emily |
| Operations Manager |
+-----+
+-----+
+-----+
```

29.13.6 Printing the Content of a PgxFrame

You can observe the contents of a frame using the `print` functionality as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> exampleFrame.print()
```

Java

```
exampleFrame.print();
```

Python

```
example_frame.print()
```

The output appears as follows:

FROM_ACCT_ID	TO_ACCT_ID	AMOUNT	DESCRIPTION
2	546	1000.0	transfer
2	840	1000.0	transfer
2	493	1000.0	transfer
2	693	1000.0	transfer
2	833	1000.0	transfer

29.13.7 Destroying a PgxFFrame

PgxFrames consumes a lot of memory on the graph server (PGX) if they have a lot of rows or columns. Hence, it is necessary to close them with the `close()` operation. After this operation, the content of the `PgxFFrame` is not available anymore.

You can close a frame as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> exampleFrame.close()
```

Java

```
exampleFrame.close();
```

Python

```
example_frame.close()
```

29.13.8 Loading and Storing Vector Properties

You can load or store vector properties which are fundamental for PgxML functionality in the graph server (PGX) using PgxFrames.

In order to load a `PgxFrame` with vector properties, follow the steps as shown:

1. Create a **Session** and an **Analyst**:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/  
./bin/opg4j  
  
opg4j> import static  
oracle.pgx.api.frames.functions.ColumnRenaming.renaming  
opg4j> import static  
oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor  
opg4j> import oracle.pgx.api.frames.schema.*  
opg4j> import oracle.pgx.api.frames.schema.datatypes.*  
  
opg4j> var session = Pgx.createSession("my-session")  
opg4j> var analyst = session.createAnalyst()
```

Java

```
import oracle.pgx.api.*;  
import oracle.pgx.api.frames.*;  
import oracle.pgx.api.frames.functions.*;  
import oracle.pgx.api.frames.schema.*;  
import oracle.pgx.api.frames.schema.datatypes.*;  
import static oracle.pgx.api.frames.functions.ColumnRenaming.renaming;  
import static  
oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor;
```

```
PgxSession session = Pgx.createSession("my-session");
Analyst analyst = session.createAnalyst();
```

Python

```
session = pypgx.get_session(session_name="my-session")
analyst = session.create_analyst()
```

-
2. Create the `PgxFrame` schema, defining the columns as shown:
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vecFrameSchema = List.of(
    columnDescriptor("intProp", DataTypes.INTEGER_TYPE),
    columnDescriptor("intProp2", DataTypes.INTEGER_TYPE),
    columnDescriptor("vectProp", DataTypes.vector(DataTypes.FLOAT_TYPE, 3)),
    columnDescriptor("stringProp", DataTypes.STRING_TYPE),
    columnDescriptor("vectProp2", DataTypes.vector(DataTypes.FLOAT_TYPE, 2))
).toArray(new ColumnDescriptor[0])
```

Java

```
ColumnDescriptor[] vecFrameSchema = {
    columnDescriptor("intProp", DataTypes.INTEGER_TYPE),
    columnDescriptor("intProp2", DataTypes.INTEGER_TYPE),
    columnDescriptor("vectProp", DataTypes.vector(DataTypes.FLOAT_TYPE,
3)),
    columnDescriptor("stringProp", DataTypes.STRING_TYPE),
    columnDescriptor("vectProp2", DataTypes.vector(DataTypes.FLOAT_TYPE,
2))
};
```

Python

```
vec_frame_schema = [
    ("intProp", "INTEGER_TYPE"),
    ("intProp2", "INTEGER_TYPE"),
    ("vectProp", "VECTOR_TYPE(FLOAT_TYPE, 3)"),
    ("stringProp", "STRING_TYPE"),
    ("vectProp2", "VECTOR_TYPE(FLOAT_TYPE, 2)")
]
```

3. Load the PgxFFrame with the given schema from the specified path:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var vecFrame = session.readFrame().
    db().
    name("vector PgxFFrame").      //name of the PgxFFrame
    tablename("tablename").        // name of the table from where the data
must be loaded
    jdbcUrl("<jdbcUrl>").
    username("<username>").
    password("<password>").
    owner("owner").                // necessary if the table is owned by
another user
    connections(16).               // indicates that 16 connections can be
used to load in parallel
    columns(vecFrameSchema).       // columns to load
    load()
```

Java

```
PgxFFrame vecFrame = session.readFrame()
    .db()
    .name("vector PgxFFrame")      //name of the PgxFFrame
    .tablename("tablename")        // name of the table from where the data
must be loaded
    .jdbcUrl("<jdbcUrl>")
    .username("<username>")
    .password("<password>")
    .owner("owner")                // necessary if the table is owned by
another user
    .connections(16)               // indicates that 16 connections can be
used to load in parallel
    .columns(vecFrameSchema)       // columns to load
    .load();
```

Python

```
>>> vec_frame = (
...     session.read_frame().
...     name('vector PgxFFrame').  # name of the PgxFFrame
...     db().
...     table_name("FRAME_TBL").    # name of the table from where the
data must be loaded
```

```

...     jdbc_url("<jdbc_url>").
...     username("<username>").
...     password("<password>").
...     connections(16).           # indicates that 16 connections can be
used to load in parallel
...     columns(vec_frame_schema). # columns to load
...     load()
... )

```

The final result in the `PgxFrame` may appear as follows:

intProp	intProp2	vectProp	stringProp	vectProp2
0	2	0.1;0.2;0.3	testProp0	0.1;0.2
1	1	0.1;0.2;0.3	testProp10	0.1;0.2
1	2	0.1;0.2;0.3	testProp20	0.1;0.2
2	3	0.1;0.2;0.3	testProp30	0.1;0.2
3	1	0.1;0.2;0.3	testProp40	0.1;0.2

29.13.9 Flattening Vector Properties

You can split the vector properties into multiple columns using the `flattenAll()` operation.

For example, you can flatten the vector properties for the example explained in [Loading and Storing Vector Properties](#) as shown:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> vecFrame.flattenAll()
```

Java

```
vecFrame.flattenAll();
```

Python

```
vec_frame.flatten_all()
```

The resulting flattened PgxFFrame may appear as shown:

```
+-----+
+-----+
| intProp | intProp2 | vectProp_0 | vectProp_1 | vectProp_2 | stringProp |
| vectProp2_0 | vectProp2_1 |
+-----+
+-----+
| 0      | 2      | 0.1      | 0.2      | 0.3      | testProp0 |
0.1      | 0.2    |
| 1      | 1      | 0.1      | 0.2      | 0.3      | testProp10 |
0.1      | 0.2    |
| 1      | 2      | 0.1      | 0.2      | 0.3      | testProp20 |
0.1      | 0.2    |
| 2      | 3      | 0.1      | 0.2      | 0.3      | testProp30 |
0.1      | 0.2    |
| 3      | 1      | 0.1      | 0.2      | 0.3      | testProp40 |
0.1      | 0.2    |
+-----+
+-----+
```

29.13.10 PgxFFrame Helpers

PgxFFrame supports the following operations:

- `head`
- `tail`
- `select`
- `renameColumns`

Head Operation

The head operation can be used to only keep the first rows of a PgxFFrame. (The result is deterministic only for ordered PgxFFrame.)

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> vecFrame.head(2).print()
```

Java

```
vecFrame.head(2).print();
```

Python

```
vec_frame.head(2).print()
```

The output appears as follows:

```
+-----+
| intProp | intProp2 | vectProp    | stringProp | vectProp2 |
+-----+
| 0       | 2       | 0.1;0.2;0.3 | testProp0  | 0.1;0.2   |
| 1       | 1       | 0.1;0.2;0.3 | testProp10 | 0.1;0.2   |
+-----+
```

Tail Operation

The `tail` operation can be used to only keep the last rows of a `PgxFrame`. (The result is deterministic only for ordered `PgxFrame`).

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> vecFrame.tail(2).print()
```

Java

```
vecFrame.tail(2).print();
```

Python

```
vec_frame.tail(2).print()
```

The output appears as follows:

```
+-----+
| intProp | intProp2 | vectProp    | stringProp | vectProp2 |
+-----+
| 2       | 3       | 0.1;0.2;0.3 | testProp30 | 0.1;0.2   |
| 3       | 1       | 0.1;0.2;0.3 | testProp40 | 0.1;0.2   |
+-----+
```

Select Operation

The `select` operation can be used to keep only a specified list of columns of an input `PgxFrame`.

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var vecFrameSelected = vecFrame.select("vectProp2", "vectProp",
"stringProp")
```

Java

```
PgxFrame vecFrameSelected =
vecFrame.select("vectProp2", "vectProp", "stringProp");
```

Python

```
vec_frame_selected = vec_frame.select("vectProp2", "vectProp", "stringProp")
```

The result may appear as follows:

vectProp2	vectProp	stringProp
0.1;0.2	0.1;0.2;0.3	testProp0
0.1;0.2	0.1;0.2;0.3	testProp10
0.1;0.2	0.1;0.2;0.3	testProp20
0.1;0.2	0.1;0.2;0.3	testProp30
0.1;0.2	0.1;0.2;0.3	testProp40

Rename PgxFrame Columns

You can rename the columns in a `PgxFrame` to customized names as follows:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var vecFrameRenamed = vecFrame.renameColumns(
    renaming("vectProp2", "vectProp2_renamed"),
    renaming("vectProp", "vectProp_renamed"),
    renaming("stringProp", "stringProp_renamed")
)
```

Java

```
PgxFrame vecFrameRenamed = vecFrame.renameColumns(renaming("vectProp2",
"vectProp2_renamed"),
                                                    renaming("vectProp",
"vectProp_renamed"),
                                                    renaming("stringProp",
"stringProp_renamed"));
```

Python

```
vec_frame_renamed = vec_frame.rename_columns({"vectProp2":
"vectProp2_renamed", "vectProp": "vectProp_renamed", "stringProp":
"stringProp_renamed"})
```

The renamed PgxFrame appears as follows:

```
+-----+
---+
| intProp | intProp2 | vectProp_renamed | stringProp_renamed |
vectProp2_renamed |
+-----+
---+
| 0      | 2      | 0.1;0.2;0.3      | testProp0          |
0.1;0.2  |         |                   |                     |
| 1      | 1      | 0.1;0.2;0.3      | testProp10         |
0.1;0.2  |         |                   |                     |
| 1      | 2      | 0.1;0.2;0.3      | testProp20         |
0.1;0.2  |         |                   |                     |
| 2      | 3      | 0.1;0.2;0.3      | testProp30         |
0.1;0.2  |         |                   |                     |
| 3      | 1      | 0.1;0.2;0.3      | testProp40         |
0.1;0.2  |         |                   |                     |
+-----+
---+
```

29.13.11 Converting a PgxFrame to PgqlResultSet

You can convert a PgxFrame to PgqlResultSet as follows:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var resultSet = exampleFrame.toPgqlResultSet()
```

Java

```
PgqlResultSet resultSet = exampleFrame.toPgqlResultSet();
```

Python

```
result_set = example_frame.to_pgql_result_set()
```

You can view the content of the result set through the usual `PgqlResultSet` APIs. The output appears as follows:

from_acct_id	to_acct_id	amount	description
1	418	1000.0	transfer
1	584	1000.0	transfer
1	644	1000.0	transfer
1	672	1000.0	transfer
1	259	1000.0	transfer

29.13.12 PgxFFrame to Pandas DataFrame Conversions

You can save a `PgxFFrame` to a `pandas DataFrame` as shown in the following example:

```
>>> pandas_data_frame = example_frame.to_pandas()
```

Similarly, you can load a `PgxFFrame` from a `pandas DataFrame` as shown in the following example:

```
>>> example_frame = session.pandas_to_pgx_frame(pandas_data_frame, "example
frame")
```

29.13.13 Loading a PgxFFrame from a Database

You can load a `PgxFFrame` from relational tables in an Oracle database. Each column of the relational table will correspond to a column in the loaded frame. When loading a `PgxFFrame` from the database, the default behavior is to detect the table columns and load them all. If not

specified explicitly, the connection details of the current user and session are used and the columns are detected automatically. Also, you can load a `PgxFrame` from a database table containing CLOB data type columns.

The following describes the steps to load a `PgxFrame` from a database table:

1. Create a **Session** and an **Analyst**:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
cd /opt/oracle/graph/
./bin/opg4j

opg4j> import static
oracle.pgx.api.frames.functions.ColumnRenaming.renaming
opg4j> import static
oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor
opg4j> import oracle.pgx.api.frames.schema.*
opg4j> import oracle.pgx.api.frames.schema.datatypes.*

opg4j> var session = Pgx.createSession("my-session")
opg4j> var analyst = session.createAnalyst()
```

Java

```
import oracle.pgx.api.*;
import oracle.pgx.api.frames.*;
import oracle.pgx.api.frames.functions.*;
import oracle.pgx.api.frames.schema.*;
import oracle.pgx.api.frames.schema.datatypes.*;
import static oracle.pgx.api.frames.functions.ColumnRenaming.renaming;
import static
oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor;

PgxSession session = Pgx.createSession("my-session");
Analyst analyst = session.createAnalyst();
```

Python

```
session = pypgx.get_session(session_name="my-session")
analyst = session.create_analyst()
```

2. Load a `PgxFrame`. The example assumes that you are loading the `PgxFrame` from the current logged in schema.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var exampleFrame = session.readFrame().
...>      db().
...>      name("Transfers").      // name of the frame
...>      tablename("T1").        // name of the table from where the
data must be loaded
...>      connections(16).        // indicates that 16 connections can be
used to load in parallel
...>      load()
```

Java

```
PgxFrame exampleFrame = session.readFrame()
    .db()
    .name("Transfers")      // name of the frame
    .tablename("T1")        // name of the table from where the data must
be loaded
    .connections(16)        // indicates that 16 connections can be used to
load in parallel
    .load();
```

Python

```
>>> example_frame = (
...     session.read_frame().
...     name('Transfers').   # name of the frame
...     db().
...     table_name('T1').    # name of the table from where the data must
be loaded
...     connections(16).     # indicates that 16 connections can be used
to load in parallel
...     load()
... )
```

3. If only a subset of the columns must be loaded, then you can specify the columns as shown in the following example. Note that the following example loads the `PgxFrame` from a different schema.

- [JShell](#)
- [Java](#)

- Python

JShell

```
opg4j> session.registerKeystore("<pathToKeystore>",
"<keystorePassword>".toCharArray())
opg4j> var exampleFrame = session.readFrame().
...>     db().
...>     name("Transfers"). // name of the frame
...>     tablename("T1").   // name of the table from where the data
must be loaded
...>     jdbcUrl("<jdbcUrl>").
...>     username("<username>").
...>     keystoreAlias("<keystoreAlias>").
...>     connections(16).   // indicates that 16 connections can be
used to load in parallel
...>     columns(
...>         columnDescriptor("FROM_ACCT_ID", DataTypes.INTEGER_TYPE),
...>         columnDescriptor("TO_ACCT_ID", DataTypes.INTEGER_TYPE)
...>     ). // columns to load
...>     load()
```

Java

```
session.registerKeystore("<pathToKeystore>",
"<keystorePassword>".toCharArray())
PgxFrames exampleFrame = session.readFrame()
    .db()
    .name("Transfers") // name of the frame
    .tablename("T1")   // name of the table from where the data must be
loaded
    .jdbcUrl("<jdbcUrl>")
    .username("<username>")
    .keystoreAlias("<keystoreAlias>")
    .connections(16) // indicates that 16 connections can be used to load
in parallel
    .columns(
        columnDescriptor("FROM_ACCT_ID", DataTypes.INTEGER_TYPE),
        columnDescriptor("TO_ACCT_ID", DataTypes.INTEGER_TYPE)
    ) // columns to load
    .load();
```

Python

```
>>> session.register_keystore("<pathToKeystore>", "<keystorePassword>")
>>> example_frame = (
...     session.read_frame().
...     name('Transfers'). # name of the frame
...     db().
...     table_name('T1').  # name of the table from where the data must
be loaded
...     jdbc_url('<jdbc_url>').
...     username('<username>').
...     keystore_alias('<keystore_alias>').
```

```

...     connections(16).      # indicates that 16 connections can be used
to load in parallel
...     columns(
...         [
...             ('FROM_ACCT_ID', 'INTEGER_TYPE'),
...             ('TO_ACCT_ID', 'INTEGER_TYPE')
...         ]
...     ). # columns to load
...     load()
...     )

```

You can also create a graph from the `PgxFrame(s)`. See [Creating a Graph from Multiple PgxFrame Objects](#) for more information.

29.13.14 Loading a PgxFrame from a CSV File

In order to load a `PgxFrame` from a CSV file, you first need to explicitly authorize access to the corresponding directories by defining a directory object pointing to the directory (on the graph server) where the file needs to be written.

```

CREATE OR REPLACE DIRECTORY graph_files AS '/tmp';
GRANT READ, WRITE ON DIRECTORY graph_files TO GRAPH_DEVELOPER;

```

Also, note the following:

- The directory in the `CREATE DIRECTORY` statement must exist **on the graph server (PGX)**.
- The directory must be readable at the OS level by the graph server (PGX).

The preceding code grants the privileges on the directory to the `GRAPH_DEVELOPER` role. However, you can also grant permissions to an individual user:

```
GRANT READ ON DIRECTORY graph_files TO <graph_user>;
```

You can then load a `PgxFrame` from a CSV file as shown in the following example:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```

opg4j> import oracle.pgx.api.frames.schema.datatypes.*
opg4j> import static
oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor

opg4j> var exampleFrame = session.readFrame().csv().
...>     name("transfersFrame").

```

```
...> columns(
...>     columnDescriptor("from_acct_id", DataTypes.INTEGER_TYPE),
...>     columnDescriptor("to_acct_id", DataTypes.INTEGER_TYPE),
...>     columnDescriptor("amount", DataTypes.FLOAT_TYPE),
...>     columnDescriptor("description", DataTypes.STRING_TYPE)
...> ).
...> load("/tmp/Transfers.csv")
```

Java

```
import oracle.pgx.api.frames.schema.datatypes.*;
import static oracle.pgx.api.frames.schema.ColumnDescriptor.columnDescriptor;

PgxFFrame exampleFrame = session.readFrame().csv().
    name("transfersFrame").
    columns(
        columnDescriptor("from_acct_id", DataTypes.INTEGER_TYPE),
        columnDescriptor("to_acct_id", DataTypes.INTEGER_TYPE),
        columnDescriptor("amount", DataTypes.FLOAT_TYPE),
        columnDescriptor("description", DataTypes.STRING_TYPE)
    ).
    load("/tmp/Transfers.csv");
```

Python

```
>>> example_frame = session.read_frame(). \
...     csv(). \
...     name('transfers_frame'). \
...     columns([('from_acct_id', 'INTEGER_TYPE'),
...             ('to_acct_id', 'INTEGER_TYPE'),
...             ('amount', 'FLOAT_TYPE'),
...             ('description', 'STRING_TYPE')]). \
...     load('/tmp/Transfers.csv')
```

29.13.15 Loading a PgxFFrame from Client-Side Data

You can also load PgxFFrame(s) directly from client-side data.
The following describes the steps to load a PgxFFrame from client-side data:

1. Create a **Session** and an **Analyst**:
See step-1 in [Loading a PgxFFrame from a Database](#) for the code examples.
2. Define a frame schema to load a PgxFFrame from client side data. For example, the following shows a frame schema defined with various data types:

-
- [JShell](#)
 - [Java](#)

- [Python](#)

JShell

```
opg4j> var exampleFrameSchema = List.of(
    columnDescriptor("name", DataTypes.STRING_TYPE),
    columnDescriptor("age", DataTypes.INTEGER_TYPE),
    columnDescriptor("salary", DataTypes.DOUBLE_TYPE),
    columnDescriptor("married", DataTypes.BOOLEAN_TYPE),
    columnDescriptor("tax_rate", DataTypes.FLOAT_TYPE),
    columnDescriptor("random", DataTypes.LONG_TYPE),
    columnDescriptor("date_of_birth", DataTypes.LOCAL_DATE_TYPE)
)
```

Java

```
List<ColumnDescriptor> exampleFrameSchema = Arrays.asList(
    columnDescriptor("name", DataTypes.STRING_TYPE),
    columnDescriptor("age", DataTypes.INTEGER_TYPE),
    columnDescriptor("salary", DataTypes.DOUBLE_TYPE),
    columnDescriptor("married", DataTypes.BOOLEAN_TYPE),
    columnDescriptor("tax_rate", DataTypes.FLOAT_TYPE),
    columnDescriptor("random", DataTypes.LONG_TYPE),
    columnDescriptor("date_of_birth", DataTypes.LOCAL_DATE_TYPE)
);
```

Python

```
example_frame_schema = [
    ("name", "STRING_TYPE"),
    ("age", "INTEGER_TYPE"),
    ("salary", "DOUBLE_TYPE"),
    ("married", "BOOLEAN_TYPE"),
    ("tax_rate", "FLOAT_TYPE"),
    ("random", "LONG_TYPE"),
    ("date_of_birth", "LOCAL_DATE_TYPE")
]
```

3. Define data as per the schema.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> Map<String, Iterable<?>> exampleFrameData = Map.of(
    "name", Arrays.asList("Alice", "Bob", "Charlie"),
    "age", Arrays.asList(25, 27, 29),
    "salary", Arrays.asList(10000.0, 15000.0, 20000.0),
    "married", Arrays.asList(false, false, true),
    "tax_rate", Arrays.asList(0.21, 0.26, 0.32),
    "random", Arrays.asList(2394293898324L, 45640604960495L,
12312323409087654L),
    "date_of_birth", Arrays.asList(
        LocalDate.of(1990, 9, 15),
        LocalDate.of(1991, 11, 4),
        LocalDate.of(1993, 10, 4)
    )
)
```

Java

```
Map<String, Iterable<?>> exampleFrameData = new HashMap<>();
exampleFrameData.put("name", Arrays.asList("Alice", "Bob", "Charlie"));
exampleFrameData.put("age", Arrays.asList(25, 27, 29));
exampleFrameData.put("salary", Arrays.asList(10000.0, 15000.0, 20000.0));
exampleFrameData.put("married", Arrays.asList(false, false, true));
exampleFrameData.put("tax_rate", Arrays.asList(0.21, 0.26, 0.32));
exampleFrameData.put("random", Arrays.asList(2394293898324L,
45640604960495L, 12312323409087654L));
exampleFrameData.put("date_of_birth",
    Arrays.asList(LocalDate.of(1990, 9, 15),
        LocalDate.of(1991, 11, 4),
        LocalDate.of(1993, 10, 4)
    )
);
```

Python

```
from datetime import date

example_frame_data = {
    "name": ["Alice", "Bob", "Charlie"],
    "age": [25, 27, 29],
    "salary": [10000.0, 15000.0, 20000.0],
    "married": [False, False, True],
    "tax_rate": [0.21, 0.26, 0.32],
    "random": [2394293898324, 45640604960495, 12312323409087654],
    "date_of_birth": [date(1990, 9, 15),
        date(1991, 11, 4),
        date(1993, 10, 4)]
}
```

4. Load the frame as shown:

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var exampleFrame = session.createFrame(exampleFrameSchema,
exampleFrameData, "example frame")
```

Java

```
PgxFrame exampleFrame = session.createFrame(exampleFrameSchema,
exampleFrameData, "example frame");
```

Python

```
example_frame=session.create_frame(example_frame_schema,example_frame_data,
'example frame')
```

-
5. You can also load the frame incrementally as you receive more data:
-

-
- [JShell](#)
 - [Java](#)
 - [Python](#)

JShell

```
opg4j> var exampleFrameBuilder =
session.createFrameBuilder(exampleFrameSchema);
opg4j> exampleFrameBuilder.addRows(exampleFrameData)
opg4j> Map<String, Iterable<?>> exampleFrameDataPart2 = Map.of(
    "name", Arrays.asList("Dave"),
    "age", Arrays.asList(26),
    "salary", Arrays.asList(18000.0),
    "married", Arrays.asList(true),
    "tax_rate", Arrays.asList(0.30),
    "random", Arrays.asList(456783423423L),
    "date_of_birth", Arrays.asList(LocalDate.of(1989, 9, 15))
)
opg4j> exampleFrameBuilder.addRows(exampleFrameDataPart2)
opg4j> var exampleFrame = exampleFrameBuilder.build("example frame")
```

Java

```

PgxFrameworkBuilder exampleFrameBuilder =
session.createFrameBuilder(exampleFrameSchema);
exampleFrameBuilder.addRows(exampleFrameData);
Map<String, Iterable<?>> exampleFrameDataPart2 = new HashMap<>();
exampleFrameDataPart2.put("name", Arrays.asList("Dave"));
exampleFrameDataPart2.put("age", Arrays.asList(26));
exampleFrameDataPart2.put("salary", Arrays.asList(18000.0));
exampleFrameDataPart2.put("married", Arrays.asList(true));
exampleFrameDataPart2.put("tax_rate", Arrays.asList(0.30));
exampleFrameDataPart2.put("random", Arrays.asList(456783423423L));
exampleFrameDataPart2.put("date_of_birth",
    Arrays.asList(LocalDate.of(1989, 9, 15))
);
exampleFrameBuilder.addRows(exampleFrameDataPart2);
PgxFramework exampleFrame = exampleFrameBuilder.build("example frame");

```

Python

```

example_frame_builder = session.create_frame_builder(example_frame_schema)
example_frame_builder.add_rows(example_frame_data)
example_frame_data_part_2 = {
    "name": ["Dave"],
    "age": [26],
    "salary": [18000.0],
    "married": [True],
    "tax_rate": [0.30],
    "random": [456783423423],
    "date_of_birth": [date(1989, 9, 15)]
}
example_frame_builder.add_rows(example_frame_data_part_2)
example_frame = example_frame_builder.build("example frame")

```

-
6. Finally, you can also load a frame from a Pandas dataframe in Python as shown:

```

import pandas as pd
example_pandas_dataframe = pd.DataFrame(data=example_frame_data)
example_frame = session.pandas_to_pgx_frame(example_pandas_dataframe,
"example frame")

```

You can also create a graph from the `PgxFramework(s)`. See [Creating a Graph from Multiple PgxFramework Objects](#) for more information.

29.13.16 Creating a Graph from Multiple PgxFramework Objects

You can create a `PgxFrameworkGraph` with vertex `PgxFramework(s)` and edge `PgxFramework(s)`.

Consider the following `PgxFramework` objects:

```

people
+-----+

```

id	name
1	Alice
2	Bob
3	Charlie

houses

identification	location
1	Road 1
2	Street 5
3	Avenue 4

knows

src	dst
1	1
2	3
3	2

lives

source	destination
1	2
2	1
3	3

You can now create a `PgxGraph` as shown in the following examples:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var graphFromFramesCreator = session.createGraphFromFrames("example
graph")
opg4j> graphFromFramesCreator.vertexProvider("people", people).label("people")
opg4j> graphFromFramesCreator.vertexProvider("houses",
houses).vertexKeyColumn("identification")
opg4j> graphFromFramesCreator.edgeProvider("knows", "people", "people",
knows).edgeKeyColumn("identifier")
opg4j> var edge_provider = graphFromFramesCreator.edgeProvider("lives",
"people", "houses", lives)
```

```

opg4j> edge_provider.edgeKeyColumn("id")
opg4j> edge_provider.sourceVertexKeyColumn("source")
opg4j> edge_provider.destinationVertexKeyColumn("destination")
opg4j> edge_provider.label("lives")
opg4j> graphFromFramesCreator.partitioned(true)
opg4j> graphFromFramesCreator.vertexIdStrategy(IdStrategy.PARTITIONED_IDS)
opg4j> graphFromFramesCreator.vertexIdStrategy(IdStrategy.KEYS_AS_IDS)
opg4j> var graph = graphFromFramesCreator.create()

```

Java

```

PgxFramework graphFromFramesCreator =
session.createGraphFromFrames("example graph");
graphFromFramesCreator.vertexProvider("people", people).label("people");
graphFromFramesCreator.vertexProvider("houses",
houses).vertexKeyColumn("identification");
graphFromFramesCreator.edgeProvider("knows", "people", "people",
knows).edgeKeyColumn("identifier");
PgxEdgeProviderFromFramesCreator edgeProvider =
graphFromFramesCreator.edgeProvider("lives", "people", "houses", lives);
edgeProvider.edgeKeyColumn("id");
edgeProvider.sourceVertexKeyColumn("source");
edgeProvider.destinationVertexKeyColumn("destination");
edgeProvider.label("lives");
graphFromFramesCreator.partitioned(true);
graphFromFramesCreator.vertexIdStrategy(IdStrategy.PARTITIONED_IDS);
graphFromFramesCreator.edgeIdStrategy(IdStrategy.KEYS_AS_IDS);
PgxFramework graph = graphFromFramesCreator.create();

```

Python

```

vertex_providers_from_frames = [
    session.vertex_provider_from_frame("person",
                                       people,
                                       vertex_key_column="id",
                                       label="people"),
    session.vertex_provider_from_frame("house",
                                       frame = houses,
                                       vertex_key_column = "identification")
]
edge_providers_from_frames = [
    session.edge_provider_from_frame("person_knows_person",
                                     source_provider = "person",
                                     destination_provider = "person",
                                     frame = knows,
                                     source_vertex_column="src",
                                     destination_vertex_column="dst",
                                     edge_key_column="identifier"),
    session.edge_provider_from_frame("person_lives_at_house",
                                     source_provider = "person",
                                     destination_provider = "house",
                                     frame = lives,
                                     source_vertex_column="source",
                                     destination_vertex_column="destination",

```

```
        edge_key_column="id",  
        label="lives")  
]  
graph = session.graph_from_frames("example graph",  
    vertex_providers_from_frames,  
    edge_providers_from_frames,  
    partitioned=True,  
    vertex_id_strategy="partitioned_ids",  
    edge_id_strategy="keys_as_ids"  
)
```

Working with Files Using the Graph Server (PGX)

This chapter describes in detail about working with different file formats to perform various actions like loading, storing, or exporting a graph using the Graph Server (PGX).

In order to read or write files, you need to explicitly authorize access to the corresponding directories by defining a directory object pointing to the directory (on the graph server) that contains the files to read or write.

```
CREATE OR REPLACE DIRECTORY graph_files AS '/data/graphs/my_graphs';  
GRANT READ, WRITE ON DIRECTORY graph_files TO GRAPH_DEVELOPER;
```

Also, note the following:

- The directory in the `CREATE DIRECTORY` statement must exist **on the graph server (PGX)**.
- The directory must be readable (and/or writable) at the OS level by the graph server (PGX).

The preceding code grants the privileges on the directory to the `GRAPH_DEVELOPER` role. However, you can also grant permissions to an individual user:

```
GRANT READ ON DIRECTORY graph_files TO <graph_user>;
```

- [Exporting a Graph into Multiple Files](#)

30.1 Loading Graph Data from Files

You can load graph data from multiple file formats (such as `.csv`, `.xml`, and `.pgb`).

Loading a Graph Using `session.readGraphFiles()` API

When loading graph from `CSV` files, ensure that the files have a header which provide the names of the columns to be loaded as properties. The header must follow a specific format. See [Comma-Separated Values \(CSV\)](#) for an example of a `CSV` file with header details.

The graph server (PGX) uses this header to determine the name and types of the properties to load, as well as the column to be used as vertex (or edge) ID, the columns that indicate the source and destination vertex ID for edges, and the column to be loaded as vertex or edge label.

You can then use the `PgxSession.readGraphFiles()` API to load the graph. This method takes the following three arguments:

- Path to the vertex file

- Path to the edge file
 - Name of the graph
-

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
opg4j> var loadedGraph = session.readGraphFiles("<path/vertices.csv>", "<path/edges.csv>", "<graph_name>")
```

Java

```
import oracle.pgx.api.PgxSession;
import oracle.pgx.api.PgxGraph;

PgxSession session = Pgx.createSession("NewSession");
PgxGraph loadedGraph = session.readGraphFiles("<path/vertices.csv>", "<path/edges.csv>", "<graph_name>");
```

Python

```
session = pypgx.get_session(session_name="<session_name>")
loaded_graph = session.read_graph_files("<path/vertices.csv>", "<path/edges.csv>", "<graph_name>")
```

Loading a Graph Using a GraphConfigBuilder Object

You can create a graph configuration object for your graph data files and then load the graph into the graph server (PGX) as shown:

- [JShell](#)
- [Java](#)

JShell

```
opg4j> var vertexProviderConfig = new
FileEntityProviderConfigBuilder(ProviderFormat.CSV).
...>   addUri("sample.vertices.csv").
...>   setName("vertices").
...>   setKeyType(IdType.INTEGER).
...>   setKeyColumn(1).
```

```

...> build()
vertexProviderConfig ==> {"key_type":"integer","props":
[],"key_column":1,"name":"vertices","format":"csv","uris":
["sample.vertices.csv"],

30.1.1 Graph Configuration for Loading from File

For graphs in the CSV format, the columns used to specify the key column, source column, destination column (for partitioned graphs) need to be either all specified, or none. If none are specified, the graph server (PGX) assumes the key column is the first (for vertex files) or missing (for edge files), followed by source and destination column (for edge files), and then by the property columns according to their order in the graph configuration.

Partitioned Graphs

In order to load a partitioned graph from supported files, you must set the following additional graph configuration fields.

Table 30-1 Loading a Partitioned Graph From File - Additional Graph Configuration Options

Field	Type	Description	Default
format	enum[pgb, csv, rdbms, es]	Provider format.	<i>required</i>
name	string	Entity provider name.	<i>required</i>
attributes	object	Additional attributes needed to read/write the graph data.	null
destination_vertex_provider	string	Name of the destination vertex provider to be used for this edge provider.	null
detect_gzip	boolean	Enable or disable automatic gzip compression detection when loading graphs.	true
error_handling	object	Error handling configuration.	null
has_keys	boolean	Indicates if the provided entities data have keys.	true
header	boolean	First line of file is meant for headers, such as EdgeId, SourceId, DestId, EdgeProp1, and EdgeProp2	false
key_type	enum[int, integer, long, string]	Type of the keys.	long
keystore_alias	string	Alias to the keystore to use when connecting to database.	null
label	string	Label for the entities loaded from this provider.	null
loading	object	Loading specific configuration.	null
local_date_formats	array of string	Array of local_date formats to use when loading and storing local_date properties. See DateTimeFormatter for a documentation of the format string.	[]
password	string	Password to use when connecting to database.	null
point2d	string	Longitude and latitude as floating point values separated by a space.	0.0 0.0
props	array of object	Specifies the properties associated with this entity provider.	[]

Table 30-1 (Cont.) Loading a Partitioned Graph From File - Additional Graph Configuration Options

Field	Type	Description	Default
separator	string	A series of single-character separators for tokenizing. The characters ", {, }, and \n cannot be used as separators. Default value is , for CSV files, and \t for other formats. The first character will be used as a separator when storing.	null
source_vertex_provider	string	Name of the source vertex provider to be used for this edge provider.	null
storing	object	Storing specific configuration.	null
time_format	array of string	The time format to use when loading and storing time properties. See DateTimeFormatter for a documentation of the format string.	[]
time_with_timezone_format	array of string	The time with timezone format to use when loading and storing time with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_format	array of string	The timestamp format to use when loading and storing timestamp properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_with_timezone_format	array of string	The timestamp with timezone format to use when loading and storing timestamp with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
uris	array of string	List of unified resource identifiers.	[]
vector_component_delimiter	character	Delimiter for the different components of vector properties.	;

The key column, source column, destination column can be configured with the following CSV specific fields:

Table 30-2 CSV Specific Options for Partitioned Graphs

Field	Type	Description	Default
format	enum[pgb, csv, rdbms, es]	Provider format.	<i>required</i>
name	string	Entity provider name.	<i>required</i>
attributes	object	Additional attributes needed to read/write the graph data.	null
destination_column	value	Name or index (starting from 1) of column corresponding to edge destination (for CSV format only).	null

Table 30-2 (Cont.) CSV Specific Options for Partitioned Graphs

Field	Type	Description	Default
destination_vertex_provider	string	Name of the destination vertex provider to be used for this edge provider.	null
detect_gzip	boolean	Enable or disable automatic gzip compression detection when loading graphs.	true
error_handling	object	Error handling configuration.	null
has_keys	boolean	Indicates if the provided entities data have keys.	true
header	boolean	First line of file is meant for headers, such as EdgeId, SourceId, DestId, EdgeProp1, EdgeProp2.	false
key_column	value	Name or index (starting from 1) of column corresponding to keys (for CSV format only)	null
key_type	enum[int, integer, long, string]	Type of the keys.	long
keystore_alias	string	Alias to the keystore to use when connecting to database.	null
label	string	Label for the entities loaded from this provider.	null
loading	object	Loading-specific configuration.	null
local_date_formats	array of string	Array of local_date formats to use when loading and storing local_date properties. See DateTimeFormatter for a documentation of the format string.	[]
password	string	Password to use when connecting to database.	null
point2d	string	Longitude and latitude as floating point values separated by a space.	0.0 0.0
props	array of object	Specifies the properties associated with this entity provider.	[]

Table 30-2 (Cont.) CSV Specific Options for Partitioned Graphs

Field	Type	Description	Default
separator	string	A series of single-character separators for tokenizing. The characters <code>,</code> , <code>{</code> , <code>}</code> , and <code>\n</code> cannot be used as separators. Default value is <code>,</code> for CSV files, and <code>\t</code> for other formats. The first character will be used as a separator when storing.	null
source_column	value	Name or index (starting from 1) of column corresponding to edge source (for CSV format only).	null
source_vertex_provider	string	Name of the source vertex provider to be used for this edge provider.	null
storing	object	Storing-specific configuration.	null
time_format	array of string	The time format to use when loading and storing time properties. See DateTimeFormatter for a documentation of the format string.	[]
time_with_timezone_format	array of string	The time with timezone format to use when loading and storing time with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_format	array of string	The timestamp format to use when loading and storing timestamp properties. See DateTimeFormatter for a documentation of the format string.	[]
timestamp_with_timezone_format	array of string	The timestamp with timezone format to use when loading and storing timestamp with timezone properties. See DateTimeFormatter for a documentation of the format string.	[]
vector_component_delimiter	character	Delimiter for the different components of vector properties.	<code>;</code>

30.1.2 Specifying the File Path

The following examples show how to specify the file path for various file formats.

For formats that contain vertices and edges specified in one file (for example, EdgeList), use `uris` as shown in the following code:

```
{"uris":["path/to/file.format"]}
```

For formats that require separate files for edges and vertices (for example, FlatFile), use `vertex_uris` and `edge_uris` as shown in the following code:

```
{"vertex_uris":["vertices1.format","vertices2.format"],"edge_uris":  
["edges1.format","edges2.format"]}
```

PGX will parse graphs in most of the plain text formats in parallel if the graph data is split into multiple files, as shown in the following code:

```
{"uris":["file1.format","file2.format",...,"fileN.format"]}
```

30.1.3 Supported File Access Protocols

The graph server (PGX) supports loading from graph configuration files and graph data files over various protocols and virtual file systems. The type of file system or protocol is determined by the scheme of the uniform resource identifier (URI):

- local file system (`file:`) - this is also the default if the given URI does not contain any scheme
- classpath (`classpath:` or `res:`)
- HTTPS (`https:`)
- FTPS (`ftps:`)
- various archive formats (`zip:`, `jar:`, `tar:`, `tgz:`, `tbz2:`, `gz:` and `bz2:`). The URI format is `scheme://arch-file-uri[!absolute-path]` (if you would like to use the `!` as a literal file-name character it must be escaped using `%21`).

For example, `jar:../lib/classes.jar!/META-INF/graph.json`.

Paths may be nested as in `tar:gz:https://anyhost/dir/mytar.tar.gz!/mytar.tar!/path/in/tar/graph.data`.

Note

Relative paths are always resolved relative to the parent directory of the configuration file.

30.1.4 Plain Text Formats

The graph server (PGX) supports the following plain-text formats:

- Comma-Separated Values (CSV)

- Adjacency List (ADJ_LIST)
- Edge List (EDGE_LIST)
- Two Tables (TWO_TABLES)
- Flat File (FLAT_FILE)

① Note

Starting from Graph Server and Client Release 25.1, Adjacency List (ADJ_LIST), Edge List (EDGE_LIST), Two Tables (TWO_TABLES), and Flat File (FLAT_FILE) formats are deprecated.

Note that loading graphs from files encoded in UTF-8 without *Byte Order Mark* (BOM) is only supported. Therefore, to successfully load graph from files, ensure text-based provider files are UTF-8 encoded without a BOM.

Parsing of Vertices

PGX supports three types of vertex identifies (id): `integer`, `long` and `string`. The type defaults to `integer`, but can be configured through the `vertex_id_type` option in the graph configuration.

Parsing of Edges

Of the various formats and protocols supported by graph server (PGX), only CSV and flat file parsing support edge identifiers. For all other data sources, the id of an edge is PGX's internal id, which is an integer from zero to `num_edges - 1`.

Parsing of Properties

`string` properties, spatial properties (currently only `point2d`) and temporal properties (`date`, `local_date`, `time`, `timestamp`, `time_with_timezone` and `timestamp_with_timezone`) must be quoted ("`<string>`") only if they contain a separator character (usually `,` for CSV and `'` for Edge List and Adjacency List) or if they contain `"` or `\n`.

`date` properties are parsed using Java's `SimpleDateFormat` utility, instantiated with the format string `yyyy-MM-dd HH:mm:ss` unless specified otherwise in the graph configuration. All other types of temporal properties are parsed using Java's `DateTimeFormatter` utility.

`point2d` can be specified by its longitude followed by its latitude, separated by a space. Both longitude and latitude are doubles. For example, `"-74.0445 40.6892"` is the representation of a `point2d` instance representing the location of the Statue of Liberty.

Boolean values are interpreted as `true` if the value is `true` (ignoring case), `Y` (ignoring case) or `1`, `false` otherwise. The suggested notation for `false` is `false` (ignoring case), `N` (ignoring case) or `0`. All other types are parsed using the `parseXXX()` functions of its corresponding Java type, for example, `Integer.parseInt(...)` for integer types.

Vector properties are supported in the Adjacency List (ADJ_LIST), Comma-Separated Values (CSV), Edge List (EDGE_LIST), and Two Tables text (TWO_TABLES) formats. Vector properties with vector components of type `integer`, `long`, `float` and `double` can be loaded from these formats. In order to specify that a vertex or edge property is a vector property, the `dimension` field of the graph property configuration must be set to the dimension of the vector and be a strictly positive integer value. A vector value is represented in the supported text formats by the list of the vector components values separated by the vector component delimiter. By default the vector component delimiter is `;`, but this delimiter can be changed by

changing the `vector_component_delimiter` graph configuration entry. Therefore a 3-dimensional vector of doubles could for example look like `0.1;0.0004;3.14` in the text file if the vector component delimiter is `;`.

Separators

When using single file formats, IDs and properties are separated with `tab` or one single space (`"\t "`) by default, for multiple file formats comma (`" , "`) is used instead. However, PGX allows to configure the separator string.

Parallel Loading

The following formats support parallel loading from multiple files:

- CSV (specify multiple files in `vertex_uris` and/or `edge_uris`)
- Adjacency List (specify multiple files in `uris`)
- Edge List (specify multiple files in `uris`)
- Two Tables (specify multiple files in `vertex_uris` and/or `edge_uris`)
- Flat File (specify multiple files in `vertex_uris` and/or `edge_uris`)

Legend

The following abbreviations are used to specify text formats:

- V = Vertex Key
- VG = Neighbor Vertex
- VL = Vertex Labels
- VP = Vertex Property
- VPK = Vertex Property Key
- VPT = Vertex Property Type
- EL = Edge Label
- EP = Edge Property
- EPK = Edge Property Key
- EPT = Edge Property Type

For example `<V-2, VG-4>` or `<V-2, VG-4>` denotes the 4th neighbor of the 2nd vertex.

- [Comma-Separated Values \(CSV\)](#)
- [Adjacency List \(ADJ_LIST\)](#)
- [Edge List \(EDGE_LIST\)](#)
- [Two Tables \(TWO_TABLES\)](#)

30.1.4.1 Comma-Separated Values (CSV)

The CSV format is a text file format with vertices and edges stored in different files. Each line of the files represents a vertex or an edge. The vertex key and labels, the edge key, source, destination and label, and the attached properties are stored in the order specified by the file header (first line) and the configuration.

A graph with `V` vertices, having `N` vertex properties and `K` neighbors each, and `E` edges, having `M` edge properties, would be represented in CSV as shown:

```
vertices.csv
```

```
<V-1>,<VL-1>,<V-1, NP-1>,...,<V-1, NP-N>
<V-2>,<VL-2>,<V-2, NP-1>,...,<V-2, NP-N>
...
<V-V>,<VL-N>,<V-V, NP-1>,...,<V-V, NP-N>
```

```
edges.csv
```

```
<E-1>,<V-1>,<V-1, VG-1>,<EL-1>,<E-1, EP-1>,...,<E-1, EP-M>
...
<E-K>,<V-1>,<V-1, VG-K>,<EL-N>,<E-K, EP-1>,...,<E-K, EP-M>
<E-K+1>,<V-2>,<V-2, VG-1>,<EL-N+1>,<E-K+1, EP-1>,...,<E-K+1, EP-M>
...
<E-V*K>,<V-V>,<V-V, VG-K>,<EL-V*K>,<E-V*K, EP-1>,...,<E-V*K, EP-M>
```

Example 30-1 Loading graph from a CSV file with header details

The following examples shows a graph configuration file for loading a graph with two vertices and two edges:

```
vertices.csv
```

```
key,integer_prop,string_prop
1,33,"Alice"
2,42,"Bob"
```

```
edges.csv
```

```
source,dest,integer_prop,string_prop
1,2,0,"baz"
2,2,-12,"bat"
```

The corresponding graph configuration file is as shown:

```
{
  "name": "simple graph",
  "vertex_providers": [
    {
      "format": "csv",
      "header": true,
      "name": "vertices",
      "key_type": "integer",
      "key_column": "key",
      "props": [
        {
          "name": "integer_prop",
          "type": "integer"
        },
        {
          "name": "string_prop",
          "type": "string"
        }
      ]
    },
    {
      "uris": ["vertices.csv"]
    }
  ]
}
```

```

    ],
    "edge_providers": [
      {
        "format": "csv",
        "name": "edges",
        "header": true,
        "source_vertex_provider": "vertices",
        "destination_vertex_provider": "vertices",
        "source_column": "source",
        "destination_column": "dest",
        "props": [
          {
            "name": "integer_prop",
            "type": "integer"
          },
          {
            "name": "string_prop",
            "type": "string"
          }
        ],
        "uris": ["edges.csv"]
      }
    ]
  }
}

```

Example 30-2 Loading graph from a CSV file without header details

The following examples shows a graph configuration file for loading a graph with two vertices and two edges:

vertices.csv

```

1,33,"Alice"
2,42,"Bob"

```

edges.csv

```

1,2,0,"baz"
2,2,-12,"bat"

```

The corresponding graph configuration file is as shown. Note that the column indices are given in place of the column names.

```

{
  "name": "simple graph",
  "vertex_providers": [
    {
      "format": "csv",
      "name": "vertices",
      "key_type": "integer",
      "key_column": 1,
      "props": [
        {
          "name": "integer_prop",

```

```

        "type": "integer",
        "column": 2
    },
    {
        "name": "string_prop",
        "type": "string",
        "column": 3
    }
],
"uris": ["vertices.csv"]
}
],
"edge_providers": [
{
    "format": "csv",
    "name": "edges",
    "source_vertex_provider": "vertices",
    "destination_vertex_provider": "vertices",
    "source_column": 1,
    "destination_column": 2,
    "props": [
        {
            "name": "integer_prop",
            "type": "integer",
            "column": 3
        },
        {
            "name": "string_prop",
            "type": "string",
            "column": 4
        }
    ],
    "uris": ["edges.csv"]
}
]
}

```

If no column indices are set in the configuration file, the columns are assumed to be in the following order:

- For vertex files: - Vertex ID - Vertex labels (if present) - Vertex properties in the order they are declared in the configuration
- For edge files: - Edge ID (if present) - Edge source - Edge destination - Edge label (if present) - Edge properties in the order they are declared in the configuration

Therefore the earlier configuration is equivalent to:

```

{
    "name": "simple graph",
    "vertex_providers": [
        {
            "format": "csv",
            "name": "vertices",
            "props": [
                {
                    "name": "integer_prop",

```

```

        "type": "integer",
        "column": 2
      },
      {
        "name": "string_prop",
        "type": "string",
        "column": 3
      }
    ],
    "uris": ["vertices.csv"]
  }
],
"edge_providers": [
  {
    "format": "csv",
    "name": "edges",
    "source_vertex_provider": "vertices",
    "destination_vertex_provider": "vertices",
    "props": [
      {
        "name": "integer_prop",
        "type": "integer",
        "column": 3
      },
      {
        "name": "string_prop",
        "type": "string",
        "column": 4
      }
    ],
    "uris": ["edges.csv"]
  }
]
}

```

30.1.4.2 Adjacency List (ADJ_LIST)

Note

Adjacency List (ADJ_LIST) format is deprecated. Instead, use Comma-Separated Values (CSV) format.

The Adjacency List format is a text file format containing a list of neighbors from a vertex, per line. The format is extended to encode properties. The following shows a graph with V vertices, having N vertex properties and M edge properties:

```

<V-1> <V-1, VP-1> ... <V-1, VP-N> <V-1, VG-1> <EP-1> ... <EP-M> <V-1, VG-2> <EP-1> ...
<EP-M>
<V-2> <V-2, VP-1> ... <V-2, VP-N> <V-2, VG-1> <EP-1> ... <EP-M> <V-2, VG-2> <EP-1> ...
<EP-M>
...
<V-V> <V-V, VP-1> ... <V-V, VP-N> <V-V, VG-1> <EP-1> ... <EP-M> <V-V, VG-2> <EP-1> ...
<EP-M>

```

Note that trailing separators will be considered as errors. For example, if whitespace is used to separate the properties, then any trailing whitespace will cause an exception to be raised.

Example 30-3 Graph in Adjacency List Format

This example shows a graph with 4 vertices (1, 2, 3 and 4), each having a double and a string property, and 3 edges, each having a boolean and a date property, encoded in Adjacency List format:

```
1 8.0 "foo"
2 4.3 "bar" 1 false "1985-10-18 10:00:00"
3 6.1 "bax" 2 true "1961-12-30 14:45:14" 4 false "2001-01-15 07:00:43"
4 17.78 "f00"
```

Note

ADJ_LIST is more space efficient than EDGE_LIST. This is because vertices are first defined and then the edges are being created, indicating that we are repeating each vertex at least once. EDGE_LIST is a lot easier to read but if you wish to store big graphs, then ADJ_LIST is recommended in order to save disk space.

30.1.4.3 Edge List (EDGE_LIST)

Note

Edge List (EDGE_LIST) format is deprecated. Instead, use Comma-Separated Values (CSV) format.

The Edge List format is a text file format starting with a section with one vertex per line, followed by a section with one edge per line. If a vertex does not have any labels or properties, it is possible to omit the vertex in the first section, but still specify edges for the vertex in the second section.

```
EdgeList      := {Vertex '\n'}* '\n' {Edge '\n'}*

Vertex        := VertexId '*' VertexLabels? PropertyValue*
VertexId      := Integer | Long | String
VertexLabels  := {' ' String* '}'

Edge          := SrcVertex DstVertex EdgeLabel? PropertyValue*
SrcVertex     := VertexId
DstVertex     := VertexId
EdgeLabel     := String

PropertyValue := Integer | Long | Double | Float | Boolean | String | Date
```

The vertices start with an identifier (VertexId), followed by a *, an optional set of vertex labels (VertexLabels?) and the vertex properties (PropertyValue*). A vertex identifier is either an Integer, a Long, or a String. Furthermore, vertex labels are zero or more Strings between curly braces ('{' String* '}').

The edges start with source and destination vertex identifiers (SrcVertex DstVertex), followed by optional edge label (EdgeLabel?) and the edge properties (PropertyValue*). The edge label is a String.

Example 30-4 Graph in Edge List format

This example shows a graph with two vertices and two edges, with labels and properties:

```
1 * { "Person" "Male" } "Mario" 15
2 * { "Person" "Male" } "Luigi" 14
1 2 "likes" 3.5
2 1 "likes" 2.1
```

The two vertices (lines 1-2) have identifiers 1 and 2 and both have the labels "Person" and "Male", a string property ("Mario" and "Luigi") and an integer property (15 and 14). There is an edge from vertex 1 to vertex 2 (line 3) with label "likes" and a double property with value 3.5, and another edge from vertex 2 to vertex 1 with label "likes" and a double property with value 2.1.

The following shows the corresponding graph configuration:

```
{
  "format":"edge_list",
  "uri":"example.edgelist",
  "vertex_id_type":"long",
  "vertex_labels":true,
  "edge_label":true,
  "vertex_props":[
    {
      "name":"name",
      "type":"string"
    },
    {
      "name":"age",
      "type":"int"
    }
  ],
  "edge_props":[
    {
      "name":"rating",
      "type":"double"
    }
  ],
  "loading_options": {
    "load_vertex_labels":true,
    "load_edge_label":true
  },
  "separator":" "
}
```

30.1.4.4 Two Tables (TWO_TABLES)

Note

Two Tables (TWO_TABLES) format is deprecated. Instead, use Comma-Separated Values (CSV) format.

When configured to use `file` as datastore, the Two Tables format becomes a text file format similar to the Edge List format, with the only difference that the vertices and edges are stored in two different files. The vertices file contains vertex IDs followed by vertex properties. The edges file contains the source vertices and target vertices, followed by edge properties.

A graph with V vertices, having N vertex properties and M edge properties would be represented in two files as shown in the following:

vertices.ttt:

```
<V-1> <V-1, NP-1> ... <V-1, NP-N>
<V-2> <V-2, NP-1> ... <V-2, NP-N>
...
<V-V> <V-V, NP-1> ... <V-V, NP-N>
```

edges.ttt:

```
<V-1> <V-1, VG-1> <EP-1> ... <EP-M>
<V-1> <V-1, VG-2> <EP-1> ... <EP-M>
...
<V-V> <V-V, VG-1> <EP-1> ... <EP-M>
```

Example 30-5 Graph in Two Tables Text format

The following example shows the graph of 4 vertices (1, 2, 3 and 4), each having a `double` and a `string` property, and 3 edges, each having a `boolean` and a `date` property, encoded in Two Tables Text format:

vertices.ttt:

```
1 8.0 "foo"
2 4.3 "bar"
3 6.1 "bax"
4 17.78 "f00"
```

edges.ttt:

```
2 1 false "1985-10-18 10:00:00"
3 2 true "1961-12-30 14:45:14"
3 4 false "2001-01-15 07:00:43"
```

Note

If you are planning on storing big graphs you must consider Two Tables Text format in order to save disk space.

30.1.5 XML File Formats

Graph ML

Note

XML-based Graph ML format is deprecated.

The graph server (PGX) supports loading graphs from files using the XML-based Graph ML format. Graphs already in memory may also be exported into GraphML files. See [GraphML specification](#) for a detailed description of the XML schema.

PGX GraphML Limitation

PGX does not support all features of the GraphML format. Some of the limitations are:

- If the graph is undirected (`edgedefault="undirected"`), then edge properties are not supported
- All vertices (edges) must have the same amount and type of vertex (edge) properties
- `port`, `default`, and `hyperedge` are not supported

Example 30-6

The following example graph consists of 3 vertices and 3 edges. Each vertex has an integer property named `number` and each edge has a string property named `label`. Note that the edges are directed and that the strings for the property do not have to be put in (double) quotation marks.

```
<?xml version="1.0" encoding="UTF-8"?>
<graphml xmlns="http://graphml.graphdrawing.org/xmlns">
  <key attr.name="number" attr.type="integer" for="node" id="number"/>
  <key attr.name="label" attr.type="string" for="edge" id="label"/>
  <graph edgedefault="directed">
    <node id="1">
      <data key="number">2</data>
    </node>
    <node id="2">
      <data key="number">45</data>
    </node>
    <node id="3">
      <data key="number">83</data>
    </node>
    <edge target="2" source="1">
      <data key="label">this graph</data>
    </edge>
    <edge source="3" target="2">
      <data key="label">forms a</data>
    </edge>
    <edge target="1" source="3">
      <data key="label">triangle</data>
    </edge>
  </graph>
</graphml>
```

Caution

Due to the verbose nature of XML, the GraphML format comes with a large overhead compared to other file-based graph formats. You must use a different format if you want to consider the load or store performance and file size as important factors.

30.1.6 Binary File Formats

PGX Binary Format (PGB)

PGX binary format (.pgb) is the proprietary binary format for graph server (PGX), which allows fast and efficient file processing. Fundamentally, the file is a binary dump of the graph and property data. Bytes are written in network byte order (big endian).

Type Encoding

Table 30-3 Type Encoding

Value	Type	Size in bytes
0	Boolean	1
1	Integer	4
2	Long	8
3	Float	4
4	Double	8
7	String	varies
11	Vertex labels	varies
13	Local date	4
14	Time	4
15	Timestamp	8
16	Time with time zone	8
17	Timestamp with time zone	12
18	Vector property	variable: <sizeof component-type> * <dimension>

File Layout

Table 30-4 File Layout

Size in bytes	Description	Required	Comment
4	magic word	Yes	0x99191191
4	vertex size	Yes	Allowed values are 4 and 8.
4	edge size	Yes	Allowed values are 4 and 8.
<vertex size>	number of vertices	Yes	
<edge size>	number of edges	Yes	
<edge size> * (<numVertices> + 1)	edge begin array	Yes	
<vertex size> * <numEdges>	destination vertex array	Yes	
1	component bitmap	Yes	<ul style="list-style-type: none"> 0x0001: node keys 0x0002: vertex labels 0x0004: edge label 0x0008: edge keys other bits: reserved

Table 30-4 (Cont.) File Layout

Size in bytes	Description	Required	Comment
4	vertexKey type	No	Only present if <i>component bitmap</i> & 0x0001 == 0x0001. See Table 30-3 for type encoding.
<vertex key layout>	vertex keys	No	Only present if <i>component bitmap</i> & 0x0001 == 0x0001.
4	edgeKey type	No	Only present if <i>component bitmap</i> & 0x0008 == 0x0008. See Table 30-3 for type encoding
<numEdges> * 8	edge keys	No	Only present if <i>component bitmap</i> & 0x0008 == 0x0008.
4	number of vertex properties	Yes	
<num vertex properties> * <property layout>	property data	Yes	See Table 30-10 .
4	number of edge properties	Yes	
<num edge properties> * <property layout>	property data	Y	See Edge Property Layout .
<vertex labels layout>	vertex labels	No	Only present if <i>component bit</i> & 0x0002 == 0x0002.
<edge labels layout>	edge label	No	Only present if <i>component bit</i> & 0x0004 == 0x0004.
4	number of shared pools	Yes	
<shared pools size>	shared pools	No	
<property names size>	property names	No	Only present if <i>component bit</i> & 0x0010 == 0x0010. See Table 30-19 .

Vertex Key Layout

The layout of vertex keys depends on the vertexKey type. PGB supports integer, long and string vertex keys.

Table 30-5 Integer Vertex Keys

Size in bytes	Description	Required	Comment
<numVertices> * 4	key data	Yes	For each vertex, the corresponding integer key value.

Table 30-6 Long Vertex Keys

Size in bytes	Description	Required	Comment
<numVertices> * 8	key data	Yes	For each vertex, the corresponding long key value.

Table 30-7 String Vertex Keys

Size in bytes	Description	Required	Comment
4	compression scheme	Yes	reserved (must be 0)
8	property size	Yes	size of each element in bytes in the following data
<number of keys> * <string key element layout>	string key data	Yes	content of the vertex keys (see Table 30-5)

Table 30-8 String Key Element Layout

Size in bytes	Description	Required	Comment
4	string length	Yes	length of the string in bytes
<string length>	string key data	Yes	content of the string as bytes, No zero-character

Property Layout

The following shows the special layout for string properties, and for vector properties:

Table 30-9 Primitive Type Layout

Size in bytes	Description	Required	Comment
4	property type	Yes	See Table 30-3 for type encoding.
8	property size	Yes	Size of the property data in bytes
<property size>	property data	Yes	Stored as <numVertices/numEdges> * <type size>

Table 30-10 Vector Property Layout

Size in bytes	Description	Comment
4	vector type mark	Always equal to 18.
8	size of vector property data and extra fields	dataSize = <sizeof component-type> * <dimension> + 8 (The 8 extra bytes are for the added following 2 extra fields in the vector property header.)
4	vector component data type	Valid types are integer, long, float, double. Encoded with the value specified in Table 30-3 .
4	vector dimension	Number of components per vector value. Must be greater than 0 to be a valid vector property.
dataSize - 8	data	Stored as array of length * ` in which the value of the j-th component of the vector for the i-th entity is at position i * + j`.

Table 30-11 String Type Layout

Size in bytes	Description	Required	Comment
4	property type	Yes	Must be 7.
8	property size	Yes	Size of the following data in bytes.
1	reserved	Yes	Reserved (must be 0).
<dictionary layout>	dictionary	Yes	String dictionary used in the property
<numVertices/ numEdges> * 8	property content	Yes	Content of the string property, stored as IDs that refer to the strings in the dictionary.

Table 30-12 String Dictionary Layout

Size in bytes	Description	Required	Comment
1	reserved	Yes	Reserved (must be 0).
8	number of strings	Yes	Number of strings in the following dictionary.
<number of strings> * <dictionary element layout>	dictionary data	Yes	See Table 30-13 .

Table 30-13 String Dictionary Element Layout

Size in bytes	Description	Required	Comment
8	string id	Yes	Unique ID of the string.
4	string length	Yes	Length of the string in bytes.
<string length>	string data	Yes	Content of the string as bytes, No zero-character

Vertex Labels Layout**Table 30-14 Vertex Labels Layout**

Size in bytes	Description	Required	Comment
4	type	Yes	Must be 11.
8	size	Yes	Size of the following data in bytes.
<dictionary layout>	dictionary	Yes	String dictionary used in the vertex labels.
<numVertices + 1> * 8	string id begin array	Yes	<string ids> offset array for each vertex.
8	number of string ids	Yes	The number of string ids.
<number of string ids> * 8	string ids	Yes	Array of string ids in the string dictionary.

Edge Label Layout

The edge label layout follows the string type layout.

Shared Pools Layout

Table 30-15 Shared Pools Layout

Size in bytes	Description	Required	Comment
1	type	Yes	1: enum, 2: prefixed

Table 30-16 Type == Enum

Size in bytes	Description	Required	Comment
8	num strings	Yes	
<number of strings> * <string table layout>	dictionary data	Yes	See Table 30-18 .

Table 30-17 Type == Prefix

Size in bytes	Description	Required	Comment
8	num prefixes	Yes	
<number of prefixes> * <string table layout>	dictionary data	Yes	See Table 30-18 .
8	num suffixes	Yes	
<number of suffixes> * <string table layout>	dictionary data	Yes	See Table 30-18 .

Table 30-18 String Table for Shared Pools

Size in bytes	Description	Required	Comment
8	string id	Yes	String can be literal (in case of enum) or prefix/suffix (in case of prefix).
4	string length	Yes	
<string length>	string data	Yes	

Property Names Layout**Table 30-19 Property Names Layout**

Size in bytes	Description	Required	Comment
8	size	Yes	String can be literal (in case of enum) or prefix/suffix (in case of prefix).
<sum of size of vertex property names>	vertex property names	No	Follows the String Key Element Layout. See Table 30-8 .
<sum of size of edge property names>	edge property names	No	Follows the String Key Element Layout. See Table 30-8 .

30.2 Loading Graph Data in Parallel from Multiple Files

You can load a graph in parallel using multiple files.

The following example demonstrates how to load graph data from multiple files.

For example, consider a vertex file split into four partitions as shown:

vertex_file1

```
1,Color,1,red,,
2,Color,1,yellow,,
```

vertex_file2

```
3,Color,1,blue,,
4,Color,1,green,,
```

vertex_file3

```
5,Color,1,orange,,
6,Color,1,white,,
```

vertex_file4

```
7,Color,1,black,,
```

The edge file is split into two partitions as shown:

edge_file1

```
1,1,2,edge1,Weight,4,,1.0,
```

```
2,2,3,edge2,Weight,4,,2.0,
3,3,4,edge3,Weight,4,,3.0,
```

```
edge_file2
```

```
4,4,5,edge4,Weight,4,,4.0,
5,5,6,edge5,Weight,4,,5.0,
6,6,7,edge6,Weight,4,,6.0,
```

The following graph configuration can be used to load the graph data from four vertex files and two edge files into the same graph. Note that all the `uris` are specified inside the JSON graph configuration.

```
{
  "format": "flat_file",
  "vertex_uris": ["vertex_file1", "vertex_file2", "vertex_file3",
"vertex_file4"],
  "edge_uris": ["edge_file1", "edge_file2"],
  "separator": ",",
  "edge_props": [
    {
      "name": "Weight",
      "type": "double"
    }
  ],
  "vertex_props": [
    {
      "name": "Color",
      "type": "string"
    }
  ]
}
```

You can also create a graph configuration with multiple file partitions using Java as shown:

```
FileGraphConfig config = GraphConfigBuilder
    .forFileFormat(Format.FLAT_FILE)
    .setSeparator(",")
    .addVertexUri("vertex_file1")
    .addVertexUri("vertex_file2")
    .addVertexUri("vertex_file3")
    .addVertexUri("vertex_file4")
    .addEdgeUri("edge_file1")
    .addEdgeUri("edge_file2")
    .addVertexProperty("Color", PropertyType.STRING)
    .addEdgeProperty("Weight", PropertyType.DOUBLE)
    .build();
```

The graph configuration in the preceding code samples include one double edge property named `weight` and one string vertex property named `color`.

You can now load the graph data from the files as explained in [Loading Graph Data from Files](#).

The graph server (PGX) will automatically load the graph in parallel, using one thread for each file. This means that a graph can be loaded in parallel with as many threads as files are given depending on the configured parallelism for the graph server (PGX) instance.

Since the graph configuration will be used for all of the specified files, it is crucial to use the same format for all these files, that is, using the same separator, having the same defined properties, complying with the same format specification.

30.3 Exporting Graphs Into a File

The graph server (PGX) allows the client to export a currently loaded graph into a file.

Using the `store()` method on any `PgxGraph` object, the client can specify which file format to store the graph in. The client can also dynamically select the set of properties to be stored with the graph, that is, not all the properties need to be exported. The client can specify a `CompressionScheme` to use when storing as shown:

Table 30-20 Files CompressionScheme

CompressionScheme	Supported Formats
NONE	All formats
GZIP	ADJ_LIST, EDGE_LIST, FLAT_FILE, TWO_TABLES (text)

The client can export to multiple files as well.

When PGX exports the specified graph into a file, PGX also creates a graph config which the client receives as return value. This is to help loading the created graph instance later.

When exporting graph data into multiple files a `FileGraphStoringConfig` can be used which contains the following JSON fields:

Table 30-21 Graph Configuration when Exporting Graph into Multiple Files

Field	Type	Description	Default
<code>base_path</code>	<code>string</code>	Base path to use for storing a graph; file paths will be constructed using the following format <code>_. _</code> , that is, <code>parent_path/my_graph_1.edges</code> .	<code>null</code>
<code>compression_scheme</code>	<code>enum[none, gzip]</code>	The scheme to use for compression, or none to disable compression.	<code>none</code>
<code>delimiter</code>	<code>character</code>	Delimiter character used as separator when storing. The characters <code>"</code> , <code>{</code> , <code>}</code> and <code>\n</code> cannot be used as delimiters.	<code>null</code>
<code>edge_extension</code>	<code>string</code>	The extension to use when creating edge file partitions.	<code>edges</code>

Table 30-21 (Cont.) Graph Configuration when Exporting Graph into Multiple Files

Field	Type	Description	Default
initial_partition_index	integer	The value used as initial partition index, that is, initial_partition_index=1024 -> my_graph_1024.edges , my_graph_1025.edges .	1
num_partitions	integer	The number of partitions that should be created, when exporting to multiple files.	1
row_extension	string	The extension to use when creating row file partitions.	rows
vertex_extension	string	The extension to use when creating vertex file partitions.	nodes

- [Exporting a Graph to Disk](#)

30.3.1 Exporting a Graph to Disk

You can save a graph loaded into memory to the disk in various formats. Therefore you can make sub-graphs and graph data computed at run time through analytics persistent, for future use. The resulting file can be used later as input for the graph server (PGX).

Consider the following example where a graph is loaded into memory and PageRank analysis is executed on the graph.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
var g = session.readGraphWithProperties("<path_to_json>")
var rank = analyst.pagerank(g, 0.001, 0.85, 100)
```

Java

```
PgxGraph g = session.readGraphWithProperties("<path_to_json>");
Analyst analyst = session.createAnalyst();
VertexProperty<Integer, Double> rank = analyst.pagerank(g, 0.001, 0.85, 100);
```

Python

```
g = session.read_graph_with_properties("<path_to_json>")
analyst = session.create_analyst()
rank = analyst.pagerank(g, 0.001, 0.85, 100)
```

You can now store the graph, together with the result of the PageRank analysis and all original edge properties, as a file in edge-list format, on disk. When a graph is stored, you need to specify the graph format, a path where the file should be stored, the properties to store and a flag that specifies whether or not a file should be overwritten should a file with the same name already exist.

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
var config = g.store(Format.EDGE_LIST, "<file-path>", List.of(rank),
EdgeProperty.ALL, false)
```

Java

```
var config = g.store(Format.EDGE_LIST, "<file-path>", List.of(rank),
EdgeProperty.ALL, false);
```

Python

```
config = g.store('edge_list', "<file-path>", vertex_properties = [rank],
overwrite= False)
```

The graph data can now be found under the file path. The graph configuration returned by the `store` method can be used to load the new graph back into memory. To persist the graph configuration to disk as well, you can use the config's `toString` method to get a JSON representation:

- [JShell](#)
- [Java](#)
- [Python](#)

JShell

```
var path = Paths.get("<file-path>")
Files.writeString(path, config.toString())
```

Java

```
import apache.commons.io.*; // PGX contains a version of Apache Commons IO
...
FileUtils.write(new File("<file-path>"), config.toString());
```

Python

```
with open("<file-path>", "w"):
    f.write(str(config))
```

30.4 Exporting a Graph into Multiple Files

You can store a graph into multiple files using the `store` method. Most parameters are the same, as if storing to a single file. However, the main difference lies in specifying how to partition the data.

You can partition the data in either of the following two ways:

- specifying a `FileGraphStoringConfig` (see [Table 30-21](#) for more information)
- specifying a base path and the number of partitions

Export into Multiple Files Using `FileGraphStoringConfig`

You can specify a more detailed way of creating the multiple partitions used to store the graph by using the `FileGraphStoringConfig`. You can create a `FileGraphStoringConfig` object using a `FileGraphStoringConfigBuilder`.

For example, the following code specifies that the storing should be done into four partitions using the specified base path and using zero as the initial index for the partitioning. It also contains the file extension to use for vertex files and for edge files and finally it sets comma as the delimiter to be used when storing the graph data:

```
FileGraphStoringConfig storingConfig = new
FileGraphStoringConfigBuilder(basePath) //
    .setNumPartitions(4) //
    .setInitialPartitionIndex(0) //
    .setVertexExtension(vertexExtension) //
    .setEdgeExtension(edgeExtension) //
    .setDelimiter(',') //
    .build();
```

You can also partition all tables equally using the `numPartitions` parameter. This implies that all tables are exported into the same number of files.

If you do not want to partition the tables equally, you can either create one `PartitionedGraphConfig` which contains for each provider a `FileGraphStoringConfig` (see [Table 30-21](#)) or we can use a version of `store()` that takes two maps of `FileGraphStoringConfigs`, one for the vertex tables and one for the edge tables.

For the first option, you can create for each vertex and edge table a `FileGraphStoringConfig` and put it into a `FileEntityProviderConfig` using `setStoringOptions` in the builder of `FileEntityProviderConfig`. The providers are then added to the `PartitionedGraphConfig` as edge and vertex providers using `addVertexProvider()` and `addEdgeProvider()` in the builder of `PartitionedGraphConfig`. Later you can use the `store()` method which takes the `PartitionedGraphConfig` as parameter.

The second option creates for every edge and vertex table a storing configuration, adds those into a vertex provider and an edge provider map and calls the corresponding `store()` method with these maps as parameters.

For example:

```
FileGraphStoringConfig vertexStoringConfig1 = new
FileGraphStoringConfigBuilder(basePath + "_vertexTable1") //
    .setNumPartitions(4) //
    .setInitialPartitionIndex(0) //
    .setVertexExtension(vertexExtension) //
    .setDelimiter(',') //
    .build();

FileGraphStoringConfig vertexStoringConfig2 = new
FileGraphStoringConfigBuilder(basePath + "_vertexTable2") //
    .setNumPartitions(4) //
    .setInitialPartitionIndex(0) //
    .setVertexExtension(vertexExtension) //
    .setDelimiter(',') //
    .build();

FileGraphStoringConfig edgeStoringConfig1 = new
FileGraphStoringConfigBuilder(basePath + "_edgeTable1") //
    .setNumPartitions(4) //
    .setInitialPartitionIndex(0) //
    .setEdgeExtension(edgeExtension) //
    .setDelimiter(',') //
    .build();

Map<String, FileGraphStoringConfig> vertexStoringConfigs = new HashMap<>();
vertexStoringConfigs.put("vertexTable1", vertexStoringConfig1);
vertexStoringConfigs.put("vertexTable2", vertexStoringConfig2);

Map<String, FileGraphStoringConfig> edgeStoringConfigs = new HashMap<>();
edgeStoringConfigs.put("edgeTable1", edgeStoringConfig);
```

Export into Multiple Files without FileGraphStoringConfig

If you only need to specify how many partitions are required and the base name to be used, it is simpler to use `store()` method by only specifying those parameters. Following this procedure, the graph server (PGX) will use defaults for the other fields. See [Table 30-21](#) for more information on default values.

Export into Multiple Files Using a Graph Configuration Object

An alternate way for exporting into multiple files is by creating a `FileGraphStoringConfig` and putting it into a `Graph Configuration` object using `setStoringOptions` in its builder, and then using the corresponding version of the `store()` method.

Log Management in the Graph Server (PGX)

The graph server (PGX) internally uses the SLF4J interface with Logback as the default logger implementation.

- [Configuring Logback Logging](#)

31.1 Configuring Logback Logging

The default Logback logging configuration file is located in `/etc/oracle/graph/logback-server.xml`. This configuration file contains the target location for the logs in `/var/log/oracle/graph/`. Additionally, the rolling file appenders are also defined in this configuration file.

Note

- Logback is configured to roll the log files based on both log size (250 MB) and date.
- Log files are automatically saved in a compressed format in subdirectories, one directory per month. There can be multiple files on a given day.
- Also, each startup of the graph server(PGX) triggers a new log file.

The Logback configuration file is picked up automatically by the the graph server(PGX). To use this configuration in your java application, you can set the `logback.configurationFile` system variable when launching the JVM:

```
java -Dlogback.configurationFile=$PGX_HOME/conf/logback.xml ...
```

Changing Logging Level During a JShell Session

When connected to the graph server using JShell, you can use the `loglevel(String loggerName, String levelName)` function to quickly change the logging level of any logger. For example:

```
loglevel("oracle.pgx", "debug")
loglevel("ROOT", "info")
loglevel("org.apache.hadoop", "off")
```

Logging in a Web Application Server

The `graph-server-webapp-<version>.war` file in the `oracle-graph-webapps-<version>.zip` download package contains the `logback.xml`. This file determines what should be logged in the web application running on the application server of your choice. The file is located in the folder `WEB-INF/classes` inside the `graph-server-webapp-<version>.war` file. By default, only errors are logged. But you can change this file if you want more logging in your web server. You must restart the web server after you change the file, for the change to take effect.

Part VIII

Supplementary Information for Property Graph Support

This document has the following appendixes.

- [Mapping Graph Server Roles to Default Privileges](#)
- [Disabling Transport Layer Security \(TLS\) in Graph Server](#)
- [Migrating Property Graph Applications from Before Release 21c](#)
If you are migrating from a previous version of Oracle Spatial and Graph to Release 21c, you may need to make some changes to existing property graph-related applications.
- [Upgrading From Graph Server and Client 20.4.x to 21.x](#)
If you are upgrading from Graph Server and Client 20.4.x to 21.x version, you may need to create new roles in database and migrate authorization rules from `pgx.conf` file to the database. Also, starting from Graph Server and Client Release 21.1, TLS is enforced at the time of the RPM file installation.
- [Third-Party License Information for Oracle Graph Server and Client](#)
This appendix contains licensing information about third-party products included with Oracle Graph Server and Client.

A

Mapping Graph Server Roles to Default Privileges

The following table describes the graph server (PGX) roles and the default privileges that are created in [Basic Steps for Using an Oracle Database for Authentication](#):

Table A-1 Mapping Graph Server Roles to Default Privileges

Roles	Description	Permission
GRAPH_ADMINISTRATOR	User who performs operations on the graph server (PGX) using the Java API. (As compared to running start and stop operations as an OS user.)	PGX_SESSION_CREATE PGX_SERVER_GET_INFO PGX_SERVER_MANAGE
GRAPH_DEVELOPER	User who creates graphs, publishes graphs, modifies graphs, queries graphs, and views graphs using the Java API or SQLcl or the graph visualization application.	PGX_SESSION_CREATE PGX_SESSION_NEW_GRAPH PGX_SESSION_GET_PUBLISHED_GRAPH PGX_SESSION_MODIFY_MODEL PGX_SESSION_READ_MODEL
GRAPH_USER	User who queries graphs and views graphs Java API or SQLcl or the graph visualization application.	PGX_SESSION_CREATE PGX_SESSION_GET_PUBLISHED_GRAPH

B

Disabling Transport Layer Security (TLS) in Graph Server

For demonstration or evaluation purposes, it is possible to turn off transport layer security (TLS) of the graph server.

Caution

This is **not** recommended for production. In a secure configuration, the server must always have TLS enabled.

The following instructions only apply if you installed the graph server via the RPM package.

Note

If you deployed the graph server into your own web server (such as Weblogic or Apache Tomcat), please refer to the manual of your web server for TLS configuration.

1. Edit `/etc/oracle/graph/server.conf` to change `enable_tls` to `false`.
2. Optionally, if you are using [Graph Server REST API Version 1](#) (cookie-based authentication), then perform the following by editing the `WEB-INF/web.xml` file inside the `/opt/oracle/graph/pgx/server/graph-server-webapp-25.3.0.war` file:

- a. Replace ``https`` with ``http`` for the ``pgx.base_url`` property. For example:

```
<context-param>
  <param-name>pgx.base_url</param-name>
  <param-value>http://localhost:7007</param-value>
</context-param>
```

- b. Configure the cookies to be sent over non-secure connections by setting `<secure>false</secure>` as follows:

```
<session-config>
  <tracking-mode>COOKIE</tracking-mode>
  <cookie-config>
    <secure>false</secure>
  </cookie-config>
  ...
</session-config>
```

3. Restart the server.

```
sudo systemctl restart pgx
```

The graph server now accepts connections over HTTP instead of HTTPS.

On Oracle Linux 7, you can execute the following script to perform the preceding four steps all at once:

```
echo "$(jq '.enable_tls = false' /etc/oracle/graph/server.conf)" > /etc/
oracle/graph/server.conf
WAR=$(find /opt/oracle/graph/pgx/server -name '*.war')
TMP=$(mktemp -d)
cd $TMP
unzip $WAR WEB-INF/web.xml
sed -i 's|<secure>true</secure>|<secure>false</secure>|' WEB-INF/web.xml
sed -i 's|https://|http://|' WEB-INF/web.xml
sudo zip $WAR WEB-INF/web.xml
rm -r $TMP
sudo systemctl restart pgx
```

C

Migrating Property Graph Applications from Before Release 21c

If you are migrating from a previous version of Oracle Spatial and Graph to Release 21c, you may need to make some changes to existing property graph-related applications.

Also note that Oracle Graph Server and Client is required for property graph applications. This can be downloaded from [Oracle Software Delivery Cloud](#) or from [Oracle Downloads](#) page.

Security-Related Changes

The Property Graph feature contains a series of enhancements to further strengthen the security of the property graph component of product. The following enhancements may require manual changes to existing graph applications so that they continue to work properly.

- **Graph configuration files now require sensitive information such as passwords to be stored in Java Keystore files**
If you use graph configuration files you are required to use Java Keystore files to store sensitive information such as passwords. (See [Store the Database Password in a Keystore](#) for how to create and reference such a keystore.)

All existing graph configuration files with secrets in them must be migrated to the keystore-based approach.

- **In a three-tier deployment, access to the PGX server file system requires a directories allowlist**
By default, the PGX server does not allow remote access to the local file system. This can be explicitly allowed, though, in `/etc/oracle/graph/pgx.conf` by setting `allow_local_filesystem` to `true`. If you set `allow_local_filesystem` to `true`, you must also specify a list of directories that are allowed to be accessed, by setting `datasource_dir_whitelist`. For example:

```
"allow_local_filesystem": true,  
"datasource_dir_whitelist": ["/scratch/data1", "/scratch/data2"]
```

This will allow remote users to read and write data on the server's file-system from and into `/scratch/data1` and `/scratch/data2`.

- **In a three-tier deployment, reading from remote locations into PGX is no longer allowed by default**
Previously, PGX allowed graph data to be read from remote locations over FTP or HTTP. This is no longer allowed by default and requires explicit opt-in by the server administrator. To opt-in, specify the `allowed_remote_loading_locations` configuration option in `/etc/oracle/graph/pgx.conf`. For example:

```
allowed_remote_loading_locations: ["*"]
```

In addition:

- The ftp and http protocols are no longer supported for loading or storing data because they are unencrypted and thus insecure.

- Configuration files can no longer be loaded from remote locations, but must be loaded from the local file system.
- **Removed shell command line options**
The following command line options of the Groovy-based `opg` shell have been removed and will no longer work:
 - `--attach` - the shell no longer supports attaching to existing sessions via command line
 - `--password` - the shell will prompt now for the password

Also note that the Groovy-based shell has been deprecated, and you are encourage to use the new JShell-based shell instead (see [Interactive Graph Shell CLIs](#)).

- **Changes to PGX APIs**
The following APIs no longer return graph configuration information:
 - `ServerInstance#getGraphInfo()`
 - `ServerInstance#getGraphInfos()`
 - `ServerInstance#getServerState()`

The REST API now identifies collections, graphs, and properties by UUID instead of a name.

The namespaces for graphs and properties are session private by default now. This implies that some operations that would previously throw an exception due to a naming conflict could succeed now.

`PgxGraph#publish()` throws an exception now if a graph with the given name has been published before.

Migrating Data to a New Database Version

Oracle Graph Server and Client works with older database versions. (See [Verifying Database Compatibility](#) for information.) If as part of your upgrade you also upgraded your Oracle Database, you can migrate your existing graph data that was stored using the Oracle Property Graph format by invoking the following helper script in your database after the upgrade:

```
sqlplus> EXECUTE mdsys.opg.migrate_pg_to_current(graph_name=>'mygraph');
```

The preceding example migrates the property graph *mygraph* to the current database version.

Uninstalling Previous Versions of Property Graph Libraries

This is only necessary if you are using Oracle Database versions 19c.

Use of the Property Graph feature of Oracle Database now requires Oracle Graph Server and Client that is installed separately. After you have completed the Graph Server and Client installation, complete the preceding migration steps (if needed), and confirmed that everything is working well, it is recommended that you remove the binaries of **older** graph installations from your Oracle Database installation by performing the following un-install steps:

1. Make sure the Property Graph mid-tier components are not in use on the target database host. For example, ensure that there is no application running which uses any files under `$ORACLE_HOME/md/property_graph`. Examples of such an application are a running PGX server on the same host as the database or a client application that references the JAR files under `$ORACLE_HOME/md/property_graph/lib`.

It is **not** necessary to shut down the database to perform the uninstall. The Oracle database itself does not reference or use any files under `$ORACLE_HOME/md/property_graph`.

2. Remove the files under `$ORACLE_HOME/md/property_graph` on your database host. On Linux, you can copy the following helper script to your database host and run it with as the DBA operating system user: `/opt/oracle/graph/scripts/patch-opg-oracle-home.sh`

D

Upgrading From Graph Server and Client 20.4.x to 21.x

If you are upgrading from Graph Server and Client 20.4.x to 21.x version, you may need to create new roles in database and migrate authorization rules from `pgx.conf` file to the database. Also, starting from Graph Server and Client Release 21.1, TLS is enforced at the time of the RPM file installation.

One of the main enhancements of Graph Server and Client Release 21.1 is moving the graph access permissions from the `pgx.conf` file to the database.

In order to comply with this feature you must perform the database actions explained in the following sections:

Creating additional roles in the database

- See [Basic Steps for Using an Oracle Database for Authentication](#) for more information on manually creating the roles in the database with the default set of privileges.
- [Mapping Graph Server Roles to Default Privileges](#) in the appendix for more details on the default mappings.

Migrating authorization rules

You must execute database `GRANTS` for user-added mappings contained in the `pgx.conf` file when upgrading to 21.x.

The following examples explain the various scenarios where migration of authorization rules may or may not apply.

Example D-1 Migrating user-added mappings to database

To migrate the following user-added mappings in `pgx.conf` file:

```
...
"authorization": [{
  "pgx_role": "GRAPH_DEVELOPER",
  "pgx_permissions": [{
    "grant": "PGX_SESSION_ADD_PUBLISHED_GRAPH"
  }],
  ...
}
```

You must execute the following `GRANT` statement in the database used by 21.x:

```
GRANT PGX_SESSION_ADD_PUBLISHED_GRAPH TO GRAPH_DEVELOPER
```

Example D-2 Migrating user-added file system authorization rules to database

To migrate the following user-added file system authorization rules in `pgx.conf` file:

```
...
"file_locations": [{
  "name": "my_graph_data",
  "location": "/opt/oracle/graph/data"
}],
"authorization": [{
  "pgx_role": "GRAPH_DEVELOPER",
  "pgx_permissions": [{
    "file_location": "my_graph_data",
    "grant": "read"
  }],
}],
...
```

You must execute the following `GRANT` statement in the database used by 21.x:

```
CREATE OR REPLACE DIRECTORY my_graph_data AS '/opt/oracle/graph/data'
GRANT READ ON DIRECTORY my_graph_data TO GRAPH_DEVELOPER
```

Example D-3 User-added graph authorization rules for preloaded graphs**Note**

No migration required for user-added graph authorization rules for preloaded graphs.

You must not migrate user-added graph authorization rules for preloaded graphs (as shown in the following code) as these rules continue to be configured in `pgx.conf` file.

```
"preload_graphs": [{
  "path": "/data/my-graph.json",
  "name": "global_graph"
}],
"authorization": [{
  "pgx_role": "GRAPH_DEVELOPER",
  "pgx_permissions": [{
    "preload_graph": "global_graph",
    "grant": "read"
  }],
}],
...
```

Self-signed TLS certificate now generated upon RPM installation

In Graph Server and Client 21.x the RPM installation generates a self-signed certificate into `/etc/oracle/graph`, which the server uses to enable TLS by default.

According to security best practices, access to the certificate is restricted to the `oraclegraph` operating system user. The implication of this is that you no longer can start the graph server

via the `/opt/oracle/graph/pgx/bin/start-server` script, even if your user is part of the `oraclegraph` group. Instead, manage the lifecycle of the graph server via `systemctl` commands. For example:

```
sudo systemctl start pgx
```

Another possible option is to change the ownership of the certificate as shown:

```
sudo chown <youruser> /etc/oracle/graph/server_key.pem
```

Turning off TLS is not recommended as it reduces the security of your connection. However, if you must do so, see [Disabling Transport Layer Security \(TLS\) in Graph Server](#) for more details.

E

Third-Party License Information for Oracle Graph Server and Client

This appendix contains licensing information about third-party products included with Oracle Graph Server and Client.

Eclipse Public License - v 2.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

- a) in the case of the initial Contributor, the initial content Distributed under this Agreement, and
- b) in the case of each subsequent Contributor:
 - i) changes to the Program, and
 - ii) additions to the Program;
 where such changes and/or additions to the Program originate from and are Distributed by that particular Contributor. A Contribution "originates" from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include changes or additions to the Program that are not Modified Works.

"Contributor" means any person or entity that Distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions Distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement or any Secondary License (as applicable), including Contributors.

"Derivative Works" shall mean any work, whether in Source Code or other form, that is based on (or derived from) the Program and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship.

"Modified Works" shall mean any work in Source Code or other form that results from an addition to, deletion from, or modification of the contents of the Program, including, for purposes of clarity any new file

in Source Code form that contains any contents of the Program. Modified Works shall not include works that contain only declarations, interfaces, types, classes, structures, or files of the Program solely in each case in order to link to, bind by name, or subclass the Program or Modified Works thereof.

"Distribute" means the acts of a) distributing or b) making available in any manner that enables the transfer of a copy.

"Source Code" means the form of a Program preferred for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Secondary License" means either the GNU General Public License, Version 2.0, or any later versions of that license, including any exceptions or additional permissions as identified by the initial Contributor.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, Distribute and sublicense the Contribution of such Contributor, if any, and such Derivative Works.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in Source Code or other form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to Distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

e) Notwithstanding the terms of any Secondary License, no Contributor makes additional grants to any Recipient (other than those set forth in this Agreement) as a result of such Recipient's receipt of the Program under the terms of a Secondary License (if permitted under the terms of Section 3).

3. REQUIREMENTS

3.1 If a Contributor Distributes the Program in any form, then:

- a) the Program must also be made available as Source Code, in accordance with section 3.2, and the Contributor must accompany the Program with a statement that the Source Code for the Program is available under this Agreement, and informs Recipients how to obtain it in a reasonable manner on or through a medium customarily used for software exchange; and
- b) the Contributor may Distribute the Program under a license different than this Agreement, provided that such license:
 - i) effectively disclaims on behalf of all other Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;
 - ii) effectively excludes on behalf of all other Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;
 - iii) does not attempt to limit or alter the recipients' rights in the Source Code under section 3.2; and
 - iv) requires any subsequent distribution of the Program by any party to be under a license that satisfies the requirements of this section 3.

3.2 When the Program is Distributed as Source Code:

- a) it must be made available under this Agreement, or if the Program (i) is combined with other material in a separate file or files made available under a Secondary License, and (ii) the initial Contributor attached to the Source Code the notice described in Exhibit A of this Agreement, then the Program may be made available under the terms of such Secondary Licenses, and
- b) a copy of this Agreement must be included with each copy of the Program.

3.3 Contributors may not remove or alter any copyright, patent, trademark, attribution notices, disclaimers of warranty, or limitations of liability ("notices") contained within the Program from any copy of the Program which they Distribute, provided that Contributors may add their own appropriate notices.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such

Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT PERMITTED BY APPLICABLE LAW, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT PERMITTED BY APPLICABLE LAW, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be Distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to Distribute the Program (including its Contributions) under the new version.

Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved. Nothing in this Agreement is intended to be enforceable by any entity that is not a Contributor or Recipient. No third-party beneficiary rights are created under this Agreement.

Exhibit A - Form of Secondary Licenses Notice

"This Source Code may also be made available under the following Secondary Licenses when the conditions for such availability set forth in the Eclipse Public License, v. 2.0 are satisfied: {name license(s), version(s), and exceptions or additional permissions here}."

Simply including a copy of this Agreement, including this Exhibit A is not sufficient to license the Source Code under Secondary Licenses.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

GNU GENERAL PUBLIC LICENSE Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your

freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of

running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of

Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent

infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>
```

```
This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License along
with this program; if not, write to the Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.
```

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may

be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

CLASSPATH EXCEPTION

Linking this library statically or dynamically with other modules is making a combined work based on this library. Thus, the terms and conditions of the GNU General Public License version 2 cover the whole combination.

As a special exception, the copyright holders of this library give you permission to link this library with independent modules to produce an executable, regardless of the license terms of these independent modules, and to copy and distribute the resulting executable under terms of your choice, provided that you also meet, for each linked independent module, the terms and conditions of the license of that module. An independent module is a module which is not derived from or based on this library. If you modify this library, you may extend this exception to your version of the library, but you are not obligated to do so. If you do not wish to do so, delete this exception statement from your version.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to

communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. **Grant of Copyright License.** Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. **Grant of Patent License.** Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. **Redistribution.** You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution

notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. **Submission of Contributions.** Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. **Trademarks.** This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. **Disclaimer of Warranty.** Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. **Limitation of Liability.** In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

a) in the case of the initial Contributor, the initial content Distributed under this Agreement, and

b) in the case of each subsequent Contributor:
i) changes to the Program, and
ii) additions to the Program;

where such changes and/or additions to the Program originate from and are Distributed by that particular Contributor. A Contribution "originates" from a Contributor if it was added to the Program by

such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include changes or additions to the Program that are not Modified Works.

"Contributor" means any person or entity that Distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions Distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement or any Secondary License (as applicable), including Contributors.

"Derivative Works" shall mean any work, whether in Source Code or other form, that is based on (or derived from) the Program and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship.

"Modified Works" shall mean any work in Source Code or other form that results from an addition to, deletion from, or modification of the contents of the Program, including, for purposes of clarity any new file in Source Code form that contains any contents of the Program. Modified Works shall not include works that contain only declarations, interfaces, types, classes, structures, or files of the Program solely in each case in order to link to, bind by name, or subclass the Program or Modified Works thereof.

"Distribute" means the acts of a) distributing or b) making available in any manner that enables the transfer of a copy.

"Source Code" means the form of a Program preferred for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Secondary License" means either the GNU General Public License, Version 2.0, or any later versions of that license, including any exceptions or additional permissions as identified by the initial Contributor.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, Distribute and sublicense the Contribution of such Contributor, if any, and such Derivative Works.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in Source Code or other form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to Distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

e) Notwithstanding the terms of any Secondary License, no Contributor makes additional grants to any Recipient (other than those set forth in this Agreement) as a result of such Recipient's receipt of the Program under the terms of a Secondary License (if permitted under the terms of Section 3).

3. REQUIREMENTS

3.1 If a Contributor Distributes the Program in any form, then:

a) the Program must also be made available as Source Code, in accordance with section 3.2, and the Contributor must accompany the Program with a statement that the Source Code for the Program is available under this Agreement, and informs Recipients how to obtain it in a reasonable manner on or through a medium customarily used for software exchange; and

b) the Contributor may Distribute the Program under a license different than this Agreement, provided that such license:

- i) effectively disclaims on behalf of all other Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;

- ii) effectively excludes on behalf of all other Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;

- iii) does not attempt to limit or alter the recipients' rights in the Source Code under section 3.2; and

- iv) requires any subsequent distribution of the Program by any party to be under a license that satisfies the requirements of this section 3.

3.2 When the Program is Distributed as Source Code:

a) it must be made available under this Agreement, or if the Program (i) is combined with other material in a separate file or files made available under a Secondary License, and (ii) the initial Contributor attached to the Source Code the notice described in Exhibit A of this Agreement, then the Program may be made available under the terms of such Secondary Licenses, and

b) a copy of this Agreement must be included with each copy of the Program.

3.3 Contributors may not remove or alter any copyright, patent, trademark, attribution notices, disclaimers of warranty, or limitations of liability ("notices") contained within the Program from any copy of the Program which they Distribute, provided that Contributors may add their own appropriate notices.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT PERMITTED BY APPLICABLE LAW, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, AND TO THE EXTENT

PERMITTED BY APPLICABLE LAW, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be Distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to Distribute the Program (including its Contributions) under the new version.

Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved. Nothing in this Agreement is intended to be enforceable by any entity that is not a Contributor or Recipient. No third-party beneficiary rights are created under this Agreement.

Exhibit A - Form of Secondary Licenses Notice

"This Source Code may also be made available under the following Secondary Licenses when the conditions for such availability set forth in the Eclipse Public License, v. 2.0 are satisfied: {name license(s), version(s), and exceptions or additional permissions here}."

Simply including a copy of this Agreement, including this Exhibit A is not sufficient to license the Source Code under Secondary Licenses.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

The GNU General Public License (GPL) Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor
Boston, MA 02110-1335
USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

8. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties

who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may

differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

One line to give the program's name and a brief idea of what it does.
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but

WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1335 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type
`show w'. This is free software, and you are welcome to redistribute
it under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the
program `Gnomovision' (which makes passes at compilers) written by
James Hacker.
```

```
signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

CLASSPATH EXCEPTION

Linking this library statically or dynamically with other modules is making a combined work based on this library. Thus, the terms and conditions of the GNU General Public License version 2 cover the whole combination.

As a special exception, the copyright holders of this library give you permission to link this library with independent modules to produce an executable, regardless of the license terms of these independent modules, and to copy and distribute the resulting executable under terms of your choice, provided that you also meet, for each linked independent module, the terms and conditions of the license of that module. An independent module is a module which is not derived from or based on this library. If you modify this library, you may extend this exception to your version of the library, but you are not obligated to do so. If you do not wish to do so, delete this exception statement from your version.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but

excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed

as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. **Submission of Contributions.** Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. **Trademarks.** This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. **Disclaimer of Warranty.** Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. **Limitation of Liability.** In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include

the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to

communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution

notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. **Submission of Contributions.** Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. **Trademarks.** This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. **Disclaimer of Warranty.** Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. **Limitation of Liability.** In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Apache License

Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and

may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

- (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
- (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a

result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

== Apache License Version 2.0

Apache License

Version 2.0, January 2004

<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity

exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses

granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions

of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity

on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions

for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier

identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

The GNU General Public License (GPL)

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program),

the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

One line to give the program's name and a brief idea of what it does.

Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'. This is free software, and you are welcome to redistribute it under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program
'Gnomovision' (which makes passes at compilers) written by James Hacker.

signature of Ty Coon, 1 April 1989

Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

"CLASSPATH" EXCEPTION TO THE GPL

Certain source files distributed by Oracle America and/or its affiliates are subject to the following clarification and special exception to the GPL, but only where Oracle has expressly included in the particular source file's header the words "Oracle designates this particular file as subject to the "Classpath" exception as provided by Oracle in the LICENSE file that accompanied this code."

Linking this library statically or dynamically with other modules is making a combined work based on this library. Thus, the terms and conditions of the GNU General Public License cover the whole combination.

As a special exception, the copyright holders of this library give you permission to link this library with independent modules to produce an executable, regardless of the license terms of these independent modules, and to copy and distribute the resulting executable under terms of your choice, provided that you also meet, for each linked independent module, the terms and conditions of the license of that module. An independent module is a module which is not derived from or based on this library. If you modify this library, you may extend this exception to your version of the library, but you are not obligated to do so. If you do not wish to do so, delete this exception statement from your version.

ADDITIONAL INFORMATION ABOUT LICENSING

Certain files distributed by Oracle America, Inc. and/or its affiliates are subject to the following clarification and special exception to the GPLv2, based on the GNU Project exception for its Classpath libraries, known as the GNU Classpath Exception.

Note that Oracle includes multiple, independent programs in this software package. Some of those programs are provided under licenses deemed incompatible with the GPLv2 by the Free Software Foundation and others. For example, the package includes programs licensed under the Apache License, Version 2.0 and may include FreeType. Such programs are licensed to you under their original licenses.

Oracle facilitates your further distribution of this package by adding the Classpath Exception to the necessary parts of its GPLv2 code, which permits you to use that code in combination with other independent modules not licensed under the GPLv2. However, note that this would not permit you to commingle code under an incompatible license with Oracle's GPLv2 licensed code by, for example, cutting and pasting such code into a file also containing Oracle's GPLv2 licensed code and then distributing the result.

Additionally, if you were to remove the Classpath Exception from any of the files to which it applies and distribute the result, you would likely be required to license some or all of the other code in that distribution under the GPLv2 as well, and since the GPLv2 is incompatible with the license terms of some items included in the distribution by Oracle, removing the Classpath Exception could therefore effectively compromise your ability to further distribute the package.

Failing to distribute notices associated with some files may also create unexpected legal consequences.

Proceed with caution and we recommend that you obtain the advice of a lawyer skilled in open source matters before removing the Classpath Exception or making modifications to this package which may subsequently be redistributed and/or involve the use of third party software.

Version: 2.17.1

Apache License

Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and

attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate

as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.
5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A

PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Apache License

Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You

meet the following conditions:

- (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
- (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
- (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

- 5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
- 6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
- 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
- 8. Limitation of Liability. In no event and under no legal theory,

whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. **Accepting Warranty or Additional Liability.** While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of

this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of,

publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work

by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Licensed under the Apache License, Version 2.0 (the "License");
you may not use this file except in compliance with the License.
You may obtain a copy of the License at

<http://www.apache.org/licenses/LICENSE-2.0>

Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

APACHE TOMCAT SUBCOMPONENTS:

Apache Tomcat includes a number of subcomponents with separate copyright notices and license terms. Your use of these subcomponents is subject to the terms and conditions of the following licenses.

For the Eclipse JDT Core Batch Compiler (ecj-x.x.x.jar) component:

Eclipse Public License - v 1.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS ECLIPSE PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and

b) in the case of each subsequent Contributor:

i) changes to the Program, and

ii) additions to the Program;

where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor" means any person or entity that distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

2. GRANT OF RIGHTS

a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to

reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

- a) it complies with the terms and conditions of this Agreement; and
- b) its license agreement:
 - i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;
 - ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;
 - iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and
 - iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

- a) it must be made available under this Agreement; and
- b) a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the

Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. The Eclipse Foundation is the initial Agreement Steward. The Eclipse Foundation may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

JavaScript Extension Toolkit (JET)

===== Apache-2.0 =====

The following applies to all products licensed under the Apache 2.0 License:

You may not use the identified files except in compliance with the Apache License, Version 2.0 (the "License.")

You may obtain a copy of the License at <http://www.apache.org/licenses/LICENSE-2.0>. A copy of the license is also reproduced below.

Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.

See the License for the specific language governing permissions and limitations under the License.

Apache License
Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work

(an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

- (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
- (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

- 5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
- 6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
- 7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
- 8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all

other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

NT Technology: HERE Data

Vendor: Navigation Technologies

Version: All

ORACLE MAPS end users terms (<https://maps.oracle.com/elocation/terms.html>) AND NOTICES (<http://maps.oracle.com/elocation/supplierterms.html>) must be used and provided to end users. This can be fulfilled by linking the terms to the map in your application or by adding the links to the terms and condition to the product user guides. IN ADDITION, THE ORACLE MAPS CLOUD SERVICE ENTERPRISE HOSTING AND DELIVERY POLICIES (<https://www.oracle.com/assets/maps-cloud-hd-policies-2767907.pdf>) must be referenced by all applications using the service. This can be fulfilled by linking TO THE DOCUMENT OR PROVIDING A COPY OF THEM TO USERS WITH OTHER LICENSING MATERIALS. Please contact Legal and/or the Spatial LOB with any questions. Please verify the links before inclusion.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction,

and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions.

Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

Mozilla Public License, version 2.0

1. Definitions

1.1. "Contributor"

means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software.

1.2. "Contributor Version"

means the combination of the Contributions of others (if any) used by a Contributor and that particular Contributor's Contribution.

1.3. "Contribution"

means Covered Software of a particular Contributor.

1.4. "Covered Software"

means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof.

1.5. "Incompatible With Secondary Licenses"

means

- a. that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or
- b. that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License.

1.6. "Executable Form"

means any form of the work other than Source Code Form.

1.7. "Larger Work"

means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software.

1.8. "License"

means this document.

1.9. "Licensable"

means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License.

1.10. "Modifications"

means any of the following:

- a. any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or
- b. any new file in Source Code Form that contains any Covered Software.

1.11. "Patent Claims" of a Contributor

means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version.

1.12. "Secondary License"

means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses.

1.13. "Source Code Form"

means the form of the work preferred for making modifications.

1.14. "You" (or "Your")

means an individual or a legal entity exercising rights under this License. For legal entities, "You" includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license:

- a. under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and
- b. under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted by a Contributor:

- a. for any code that a Contributor has removed from Covered Software; or
- b. for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or
- c. under Patent Claims infringed by Covered Software in the absence of its Contributions.

This License does not grant any rights in the trademarks, service marks, or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

- a. such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of the Executable Form how they can obtain a copy of such Source Code Form by

reasonable means in a timely manner, at a charge no more than the cost of distribution to the recipient; and

- b. You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form under this License.

3.3. Distribution of a Larger Work

You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s).

3.4. Notices

You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices to the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms

You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that any such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for any liability incurred by such Contributor as a result of warranty, support, indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation

If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Termination

- 5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance.

Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice.

- 5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.
- 5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination.

6. Disclaimer of Warranty

Covered Software is provided under this License on an "as is" basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the Covered Software is free of defects, merchantable, fit for a particular purpose or non-infringing. The entire risk as to the quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You (not any Contributor) assume the cost of any necessary servicing, repair, or correction. This disclaimer of warranty constitutes an essential part of this License. No use of any Covered Software is authorized under this License except under this disclaimer.

7. Limitation of Liability

Under no circumstances and under no legal theory, whether tort (including negligence), contract, or otherwise, shall any Contributor, or anyone who distributes Covered Software as permitted above, be liable to You for any direct, indirect, special, incidental, or consequential damages of any character including, without limitation, damages for lost profits, loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This limitation of liability shall not apply to liability for death or personal injury resulting from such party's negligence to the extent applicable law prohibits such limitation. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so this exclusion and limitation may not apply to You.

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a party's ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor.

10. Versions of the License

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses

If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice

This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this file, You can obtain one at <http://mozilla.org/MPL/2.0/>.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

Exhibit B - "Incompatible With Secondary Licenses" Notice

This Source Code Form is "Incompatible With Secondary Licenses", as defined by the Mozilla Public License, v. 2.0.

Version: 11.13.5

Document Attribution Report for Release Project Graph Visualization Toolkit 25.3.0.0.0

Important

This report assists doc writers with creating a License Information User Manual (LIUM). In most cases, you cannot copy and paste the report into the LIUM without first editing the "License Information" field text. Oracle Legal usually provides instructions provided in the license text that must be removed. For example, if a record contains "Include the following verbatim in the Document", you should not include that sentence in the LIUM.

The report has predefined "Approved" and "Non-Approved" reports on Commercial and Open Source 3rd party business approvals. If there are records listed in the "Non-Approved" reports, those records are mapped to the release but have not been fully approved yet. As such, you should not include those records in the LIUM that is posted on OTN.

Locate the predefined reports as follows:

Locate the drop-down menu at the middle-top of the report.

Click on a specific report.

Wait for the results.

To Filter on Release use the Action drop down:

Click Actions > Filter.

Select the Release column.

Select the operator "=" (or "in" to filter on multiple Releases).

Select the Release from the Expression drop down and Click "Apply".

Report should then filter on Release selected.

If you see this icon in the Component(s) column, the 'Attribution Requirement' flag for this component is null. Please contact your attorney or Release Manager to have this field fixed.

If you see this icon in the Component(s) column, it means the requested product is either not mapped to the correct release or the scope of BA has not been set. Please reach out to your attorney or Release Manager to resolve the issue.

 - administrator dashboard for the graph server, [4](#)

I

- import graph data from Neo4j, [6](#)

J

- Jupyter Notebook, [2](#)

L

- labels and properties for SQL property graphs, [6](#)
- loading graph into graph server (PGX)
 - PGQL property graphs, [1](#)
 - SQL property graphs, [1](#)
 - with composite keys, [17](#)
- log management in the graph server (PGX), [1](#)

M

MATCHNUM in GRAPH_TABLE, [14](#)
 memory consumption by the graph server, [1](#)
 memory usage dashboard, [2](#)
[migrate_pgql_to_sql\(\)](#), [5](#)
 migrating PGQL to SQL property graph, [5](#)
 mixed property types, [8](#)

O

OPG4J shell, [4](#)
 OPG4Py shell, [6](#)
 OPTIONAL MATCH, [17](#)
 Oracle Graph clients
 Java client, [35](#)
 from Oracle Graph Server and Client
 downloads, [35](#)
 on Maven Central, [37](#)
 Python client, [40](#)
 from Oracle Graph server and Client
 downloads, [42](#)
 from PyPI, [41](#)
 in embedded mode, [43](#)
 upgrade, [41](#)
 Oracle Graph Server (PGX)
 configuration
 graph server configuration parameters in
 server.conf file, [2](#)
 runtime configuration parameters in
 pgx.conf file, [1](#)
 connecting to the graph server, [5](#)
 installation, [3](#)
 deploy to Apache Tomcat, [9](#)
 deploy to Oracle WebLogic server, [10](#)
 deploying behind a load balancer, [1](#)
 rpm, [4](#)
 kerberos enabled authentication, [32](#)
 learn about the graph server, [5](#)
 log management, [1](#)
 starting the graph server, [1](#)
 using the graph server, [1](#)
 working with files, [1](#)

P

path variables, [4](#)
 PATH_NAME in GRAPH_TABLE, [15](#)
 PGQL (Property Graph Query Language), [1](#)
 PGQL property graphs, [1](#)
 creating graphs, [1](#)
 GraphSON file import, [9](#)
 metadata tables, [4](#)
 privileges, [8](#)
 quick start, [1](#)

PgxML for Graphs, [1](#)
 DeepWalk Algorithm, [2](#)
 Pg2vec Algorithm, [143](#)
 Supervised GraphWise Algorithm, [15](#)
 Unsupervised GraphWise Algorithm, [77](#), [126](#)
 property graph
 architecture, [3](#)
 introduction, [1](#)
 Property Graph Query Language (PGQL), [1](#)

Q

quickstart container image
 Docker, [1](#), [12](#)
 Podman, [1](#), [12](#)

R

REST endpoints for the graph server, [1](#)
 v1
 cancel an asynchronous query execution,
 [23](#)
 check asynchronous query completion,
 [20](#)
 get graphs, [16](#)
 get user, [19](#)
 login, [15](#)
 logout, [19](#)
 retrieve asynchronous query result, [21](#)
 run a PGQL query, [16](#)
 run a PGQL query asynchronously, [20](#)
 v2
 cancel an asynchronous query execution,
 [14](#)
 check asynchronous query completion,
 [12](#)
 get an authentication token, [1](#)
 get graphs for a driver, [4](#)
 get the database version, [8](#)
 get user, [9](#)
 refresh an authentication token, [3](#)
 retrieve asynchronous query result, [12](#)
 run a PGQL query, [5](#)
 run a PGQL query asynchronously, [10](#)

S

schema visualization, [3](#)
 sessions, [27](#)
 administrator dashboard for the graph server,
 [3](#)
 create, [28](#)
 destroy, [30](#)
 update, [28](#)
 setting up TLS (Transport layer Security), [45](#)
 using self-signed server keystore, [46](#)

SQL Developer

- querying PGQL property graphs, [21](#)
- querying SQL property graphs, [43](#)

SQL graph queries, [1](#)

- aggregate functions, [16](#)
- at specific SCN, [18](#)
- complex path patterns, [11](#)
- ELEMENT_NUMBER, [15](#)
- graph pattern, [2](#)
- MATCHNUM, [14](#)
- ONE ROW PER clause, [13](#)
- PATH_NAME, [15](#)
- variable length path pattern, [10](#)

SQL property graphs, [1](#)

- create a SQL property graph, [1](#)
- drop a SQL property graph, [15](#)
- granting privileges, [11](#)
- metadata tables, [12](#)
- quick start, [2](#)
- rename a SQL property graph, [15](#)

SQL property graphs (*continued*)

- revalidate a SQL property graph, [14](#)
- SQL graph queries, [1](#)
 - examples, [19](#)
- using JSON columns, [15](#)
- visualization using APEX Graph Visualization plug-in, [1](#)

SQLcl, [18](#)

- subgraph loading for PGQL property graphs, [8](#)
- subgraph loading for SQL property graphs, [12](#)

T

- trusted mode, [8](#)
- tuning SQL property graphs, [40](#)

V

- vertex graph element tables, [4](#)
- vertex table keys for SQL property graphs, [4](#)
